# **1 Important Information**

This manual contains all AMOs and their parameters and a short description of their meaning.

A detailed description of the features that can be activated/deactivated with these AMO parameters can be found in the following deocumentations:

- OpenScape 4000 V7, Section 3 - Feature Usage Examples
- OpenScape 4000 V7, Section 4 - IP Solutions

## 2 ACDGP - Automatic Call Distribution Groups

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Descriptions</a>        |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

AMO ACDGP provides the capability to ADD static data for ACD Groups, as well as to CHANGE, DELETE, DISPLAY, and REGENERATE the associated data.

An ACD group is associated with the following attributes:

PhoneMail (PM) groups:

Service Access Number (PMSAN)

NORMAL groups:

a search method, one supervisor, various call waiting LED values, and may be designated as the primary group of its supervisor. The search methods are Linear (LIN), Circular (CIRC), and First In / First Out (FIFO). In the LIN search method, the search for the first available agent is performed in a linear fashion, always beginning with the first agent positioned in the group. The CIRC method starts with the position immediately following the last agent that was found to be available, and continues searching the list by position in a circular manner until an available agent is found. The FIFO method selects the agent who has been available the longest, without regard to the position of the agent in the group.

Each normal ACD group must be assigned to a supervisor. By default, the first group assigned to a supervisor is set as the primary group of the supervisor. As additional groups are assigned to the same supervisor, the craft may designate a different group to be the primary group by setting parameter PRIMARY to YES. Each supervisor with at least one group must have one and only one primary group.

The call waiting LED values are used to notify the agents in the group when the number of calls queued to the group have reached a certain level. The LED will remain off until the number of calls reaches the ON value. The LED flashes, then winks when those values are reached. Conversely, when the number of calls declines to less than the assigned LED value, the LED responds accordingly. The LED thresholds are specified by parameters ON, FLASH, and WINK. The values for these parameters must be set up as ON<FLASH<WINK.

The number of agents in an ACD group is maintained by AMO AGENT, and the system maximum for each group is 400 agents.

## ACDGP - Automatic Call Distribution Groups

### Interrelationships

If the search method is changed from CIRCULAR or LINEAR to FIFO, or vice versa, all agents in the group must be logged off by the AMO prior to the change. The agents are not allowed to log back on until the change has been completed. All agents marked as autologon will be automatically logged on by the AMO following completion of the change.

Every ACD PM group is bind to a Service Access Number.

## 2.1 Interrelationships

- AMO ACDRT : Configures ACD Routing Tables which may assign steps which will route to an ACD group (RTGRP). If an ACD group is referenced in an ART that group cannot be deleted.
- AMO AGENT : Configures ACD agents which can be assigned to ACD groups by AMO ACDGP. To delete an ACDGP you must first remove all the agents assigned to that ACDGP.
- AMO DIMSU : Determines the number of ACD groups which can be set up in the system.
- AMO SDAT : Set the supervisor ACD attribute to an already created extension. This extension can be used for supervisor extension SUPEXT in AMO ACDGP.
- AMOs SBCSU : Configures STNOs that can become the attribute for ACD supervisor set, which is assigned as SUPEXT by AMO ACDGP.
- AMO ZAND : Sets the ACD feature on or off. ACD groups can not be added or changed if the ACD feature is off.
- AMO-RICHT : SAN must be configured
- AMO-DNIT : Determines the GRPPN. To enter a GRPPN you must first set it in AMO-DNIT

## 2.2 Functions of the AMO

- [ADD-ACDGP](#) : ADD static ACD group data
- [CHANGE-ACDGP](#) : CHANGE static ACD group data
- [DELETE-ACDGP](#) : DELETE static ACD group data
- [DISPLAY-ACDGP](#) : DISPLAY static ACD group data

- **REGENERATE-ACDGP** : REGENERATE static ACD group data

### 2.2.1 ADD-ACDGP

A new ACD group is created by means of the function ADD-ACDGP. Parameter ACDGRP describes which group of the possible 255 groups is to be created. If parameter ACDGRP is not entered, the AMO will assign the first free group number. It is an error to enter an ACDGRP which is used by another group. The remaining parameters describe the ACD group to be created.

In creating a new ACD group, the supervisor extension for that ACD group must be assigned. The supervisor extension for an ACD group must be configured by AMO SDAT with the attribute for ACD supervisor set.

The LED option is defaulted to NO. If the LED option is set to YES for an ACD group, then the LED values are required and must be set for ON, FLASH, and WINK.

The search method is optional, and is defaulted to FIFO by the AMO.

In case of PM group, the PMSAN must be configured by AMO-RICHT. ADD-RICHT:PM,<IDX>,,,<SAN>,<NAME>; where AMO RICHT's index can be between 1 and 10 and the SAN value must be equal to the PMSAN value of AMO-ACDGP.

#### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-ACDGP    | <pre>[ACDGP=&lt;number&gt;],  TYPE=PM, PMSAN=&lt;keynum&gt;  TYPE=NORMAL, [SEARCH=&lt;param&gt;], SUPEXT=&lt;number&gt; , [PRIMARY=&lt;param&gt;]  , LED=YES , ON=&lt;number&gt;, FLASH=&lt;number&gt;, WINK=&lt;number&gt;, GRPPN=&lt;number&gt;, GRPN AME=&lt;text&gt;;  , LED=NO; , GRPPN=&lt;number&gt;, GRPNAME=&lt;text&gt;;</pre> |

#### Examples

1. Create ACD group #1 assigned to supervisor 233601 with circular search.

Input:

## ACDGP - Automatic Call Distribution Groups

### Functions of the AMO

ADD-

```
ACDGP:ACDGRP=1,TYPE=NORMAL,SEARCH=CIRC,SUPEXT=233601,LED=YES,ON=6,FLASH=13,WINK=20;
```

Output:

```
H01: ACD GROUP ACDGRP=1 HAS BEEN ADDED.
```

2. Create ACD group #2 assigned to supervisor 233601 as primary group, with FIFO search method, without LED option.

Input:

```
ADD-ACDGP:ACDGRP=2,TYPE=NORMAL,SUPEXT=233601,PRIMARY=YES,LED=NO;
```

Output:

```
H01: ACD GROUP ACDGRP=2 HAS BEEN ADDED.
```

3. Create another group assigned to supervisor 233601 with linear search.

Input:

ADD-

```
ACDGP:TYPE=NORMAL,SEARCH=LIN,SUPEXT=233601,LED=YES,ON=6,FLASH=13,WINK=20;
```

Output:

```
H01: ACD GROUP ACDGRP=3 HAS BEEN ADDED.
```

4. Create ACD PM group

Input:

```
ADD-ACDGP:ACDGRP=12,TYPE=PM,PMSAN=123#;
```

Output:

```
H02: ACD GROUP ACDGRP=12 HAS BEEN ADDED AS A PHONEMAIL GROUP.
```

### 2.2.2 CHANGE-ACDGP

Parameters of a created ACD group can be changed by means of the function CHANGE-ACDGP. With the exception of ACDGRP, all parameters are optional, but at least one of the optional parameters must be entered for a change of attribute data to occur.

An ACD group, i.e., the only, and therefore the primary group of a supervisor, may be assigned to a different supervisor. An ACD group that is the primary group, but not the only group assigned to a

supervisor may not be assigned to a different supervisor until one of the other groups is changed to become the primary group of the present supervisor.

If the search method is changed from CIRCULAR or LINEAR to FIFO, or vice versa, all agents in the group are blocked by the AMO prior to the change. The agents are not allowed to log back on until the change has been completed. All agents marked as autologon are automatically logged on by the AMO following completion of the change.

CHANGE-ACDGP is used in order to delete GRPNAME and GRPPN. For GRPPN the user must enter '00000' and for GRPNAME '\*\*\*\*\*' must be entered.

In case of PM group, the new PMSAN must be configured by AMO-RICHT.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-ACDGP | ACDGP=<number>,<br>  TYPE=PM, PMSAN=<keynum><br>  TYPE=NORMAL, [SEARCH=<param>], [SUPEXT=<number>]<br>, [PRIMARY=<param>]<br> , [LED=YES]<br>, [ON=<number>], [FLASH=<number>], [WINK=<number>], [GRPPN=<number>], [GRPNAME=<text>];<br> , [LED=NO]<br>, [GRPPN=<number>], [GRPNAME=<text>]; |

### Examples

1. Change ACD group #1 to supervisor 233622.

Input:

```
CHANGE-ACDGP:ACDGRP=1, SUPEXT=233622;
```

Output:

```
H04: THE ACD GROUP 1 HAS BEEN CHANGED.
```

2. Change ACD group search method and turn on the LED option.

Input:

```
CHANGE-ACDGP:ACDGRP=2, SEARCH=LIN, LED=YES, ON=4, FLASH=10, WINK=15;
```

## ACDGP - Automatic Call Distribution Groups

### Functions of the AMO

Output:

H04: ACD GROUP ACDGRP=2 HAS BEEN CHANGED.

### 2.2.3 DELETE-ACDGP

Created ACD groups are deleted by means of the function DELETE ACDGP. Only the group number has to be entered to cancel an ACD group. When a request is entered for deleting an ACD group, the AMO requires that there are no agents assigned to the group. A group may not be deleted until all the agents assigned to it have been reassigned or deleted using AMO AGENT.

An ACD group, i.e., the only, and therefore the primary group of a supervisor, may be deleted. An ACD group that is the primary group, but not the only group assigned to a supervisor, may not be deleted until one of the other groups is changed to become the primary group of the present supervisor.

An ACD group can not be deleted if the group is reference by routing tables (AMO-ACDRT).

#### Procedure Overview

| Command Code | Parameter        |
|--------------|------------------|
| DELETE-ACDGP | ACDGRP=<number>; |

#### Examples

1. Delete ACD group #2.

Input:

DEL-ACDGP:ACDGRP=2;

Output:

F13: THE SPECIFIED ACD GROUP IS CONFIGURED AS A PRIMARY GROUP.  
IT CAN BE DELETED ONLY AFTER ASSIGNING  
AN OTHER GROUP TO BE THE PRIMARY GROUP  
OF SUPERVISOR SUPEXT=@@@@@.

2. Delete ACD group #1.

Input:

DEL-ACDGP:ACDGRP=1;

Output:

H03: ACD GROUP ACDGRP=1 HAS BEEN DELETED.

## 2.2.4 DISPLAY-ACDGP

The parameters of one or more ACD groups can be displayed by means of the function DISPLAY-ACDGP.

There are several ways to request a display. A range of ACD Groups may be displayed with ACDGRP as the lower range and upper range of the display. If the ACDGRP is not entered, all ACD groups on system are displayed. One particular ACDGRP may be displayed, or several groups may be displayed by chaining the ACDGRPs.

For example:

|                                    |                      |
|------------------------------------|----------------------|
| ALL ACD GROUPS:                    | DISP-ACDGP:;         |
| ONE SPECIFIC GROUP:                | DISP-ACDGP:5;        |
| ACD GROUPS WITHIN A CERTAIN RANGE: | DISP-ACDGP:2&&5;     |
| SEVERAL GROUPS:                    | DISP-ACDGP:1&3&4&10; |

All ACD groups assigned to a supervisor extension may be displayed by entering the SUPEXT. ACD groups may also be displayed by a search method, or by primary status. To display the agents assigned to an ACD group, use AMO AGENT.

Parameters SUPEXT, SEARCH and PRIMARY belong to the same group which means only one parameter is allowed to be entered at one time. If ACDGRP is not entered, then display will be done for all groups in the system.

When initiating this function, the following checks are performed. Each check produces a reaction and a prompt or end.

### Procedure Overview

| Command Code  | Parameter                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------|
| DISPLAY-ACDGP | [ACDGRP=<number>], { [SUPEXT=<number>]<br>[, [SEARCH=<param>], [PRIMARY=<param>], [TYPE=<param>]]}; |

### Examples

1. Display ACD groups 1 and 5.

Input:

DISP-ACDGP:ACDGRP=1&5;

Output:

```
+-----+-----+-----+-----+-----+-----+-----+-----+
|ACDGRP | #AGTS  | SUPEXT | SEARCH | PRIMARY | ON    | FLASH | WINK |
+-----+-----+-----+-----+-----+-----+-----+-----+
```

## ACDGP - Automatic Call Distribution Groups

### Functions of the AMO

|             |   |        |      |     |    |    |    |
|-------------|---|--------|------|-----|----|----|----|
| 1           | 5 | 233601 | CIRC | NO  | 13 | 18 | 20 |
| TYP: NORMAL |   | PMSAN: |      |     |    |    |    |
| 5           | 8 | 233635 | LIN  | YES | 5  | 10 | 15 |
| TYP: NORMAL |   | PMSAN: |      |     |    |    |    |

### 2. Display all primary ACD groups.

#### Input:

DISP-ACDGP:PRIMARY=YES;

#### Output:

| ACDGRP      | #AGTS | SUPEXT | SEARCH | PRIMARY | ON | FLASH | WINK |
|-------------|-------|--------|--------|---------|----|-------|------|
| 2           | 15    | 233601 | LIN    | YES     | 0  | 0     | 0    |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |
| 5           | 8     | 233635 | CIRC   | YES     | 4  | 8     | 16   |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |
| 8           | 17    | 233623 | CIRC   | YES     | 0  | 0     | 0    |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |
| 11          | 22    | 233618 | FIFO   | YES     | 11 | 22    | 44   |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |

### 3. Display ACD groups with LINEAR search method from group 2 to group 30.

#### Input:

DISP-ACDGP:ACDGRP=2&&30,SEARCH=LIN;

#### Output:

| ACDGRP      | #AGTS | SUPEXT | SEARCH | PRIMARY | ON | FLASH | WINK |
|-------------|-------|--------|--------|---------|----|-------|------|
| 2           | 15    | 233601 | LIN    | YES     | 0  | 0     | 0    |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |
| 4           | 8     | 233623 | LIN    | NO      | 4  | 8     | 16   |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |
| 9           | 17    | 233623 | LIN    | NO      | 8  | 17    | 34   |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |

|             |    |        |     |     |   |    |    |
|-------------|----|--------|-----|-----|---|----|----|
| 14          | 22 | 233618 | LIN | NO  | 0 | 0  | 0  |
| TYP: NORMAL |    | PMSAN: |     |     |   |    |    |
| 19          | 15 | 233603 | LIN | NO  | 7 | 15 | 30 |
| TYP: NORMAL |    | PMSAN: |     |     |   |    |    |
| 25          | 17 | 233611 | LIN | YES | 8 | 14 | 17 |
| TYP: NORMAL |    | PMSAN: |     |     |   |    |    |

### 4. Display all ACD Groups assigned to supervisor 233635

Input:

DISP-ACDGP:SUPEXT=233635;

Output:

| ACDGRP      | #AGTS | SUPEXT | SEARCH | PRIMARY | ON | FLASH | WINK |
|-------------|-------|--------|--------|---------|----|-------|------|
| 3           | 15    | 233635 | CIRC   | NO      | 7  | 15    | 30   |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |
| 4           | 8     | 233635 | LIN    | NO      | 4  | 8     | 16   |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |
| 5           | 8     | 233635 | LIN    | YES     | 5  | 10    | 15   |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |
| 13          | 17    | 233635 | CIRC   | NO      | 8  | 17    | 34   |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |
| 22          | 17    | 233635 | FIFO   | NO      | 0  | 0     | 0    |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |
| 24          | 22    | 233635 | FIFO   | NO      | 11 | 22    | 44   |
| TYP: NORMAL |       | PMSAN: |        |         |    |       |      |

## 2.2.5 REGENERATE-ACDGP

The function REGENERATE-ACDGP is used for regenerating ACDGPs in the same order as in ADD-ACDGP format.

ACD groups may be regenerated for a single group, several groups or a range of groups.

## ACDGP - Automatic Call Distribution Groups

### Functions of the AMO

#### Procedure Overview

| Command Code     | Parameter          |
|------------------|--------------------|
| REGENERATE-ACDGP | [ACDGRP=<number>]; |

#### Examples

1. Regenerate all ACD groups.

Input:

```
REG-ACDGP;;
```

Output:

```
ADD-ACDGP:1,NORMAL,CIRC,233601,NO,YES,13,20,30;  
ADD-ACDGP:2,NORMAL,LIN,233601,YES,NO;  
ADD-ACDGP:3,NORMAL,CIRC,233635,NO,YES,7,15,30;  
ADD-ACDGP:4,NORMAL,LIN,233635,NO,YES,4,8,16;  
ADD-ACDGP:5,NORMAL,LIN,233635,YES,YES,5,10,15;  
ADD-ACDGP:8,NORMAL,CIRC,233623,YES,NO;  
ADD-ACDGP:9,NORMAL,LIN,233623,NO,YES,8,17,34;  
ADD-ACDGP:11,NORMAL,FIFO,233618,YES,YES,11,22,44;  
ADD-ACDGP:13,NORMAL,CIRC,233635,NO,8,17,34;  
ADD-ACDGP:14,NORMAL,LIN,233618,NO,NO;  
ADD-ACDGP:19,NORMAL,LIN,233603,NO,YES,7,15,30;  
ADD-ACDGP:21,NORMAL,FIFO,233603,YES,7,15,30;  
ADD-ACDGP:22,NORMAL,FIFO,233635,NO,NO;  
ADD-ACDGP:24,NORMAL,FIFO,233635,NO,YES,11,22,44;  
ADD-ACDGP:25,NORMAL,LIN,233611,YES,YES,8,14,17;
```

2. Regenerate ACD groups 1, 5 and 8.

Input:

```
REG-ACDGP:1&5&8;
```

Output:

```
ADD-ACDGP:1,NORMAL,CIRC,233601,NO,YES,13,20,30;  
ADD-ACDGP:5,NORMAL,LIN,233635,YES,YES,5,10,15;  
ADD-ACDGP:8,NORMAL,CIRC,233623,YES,NO;
```

3. Regenerate ACD groups 10 through 19.

Input:

```
REG-ACDGP:10&&30;
```

Output:

```
ADD-ACDGP:11,NORMAL,FIFO,233618,YES,YES,11,22,44;  
ADD-ACDGP:13,NORMAL,CIRC,233635,NO,YES,8,17,34;  
ADD-ACDGP:14,NORMAL,LIN,233618,NO,NO;  
ADD-ACDGP:19,NORMAL,LIN,233603,NO,YES,7,15,30;
```

## 2.3 Parameter Descriptions

|         |                           |                                                                                                                                                                  |

## 2.4 Error Messages and Advisories

**Note:**

AMO ACDGP communicates with the call processing subsystem when performing various commands. Some of the error and advisory messages reflect a negative response from Call Processing during requests from the AMO to log off, log on, or block an agent group.

## ACDGP - Automatic Call Distribution Groups

### Error Messages and Advisories

For some types of commands, AMO ACDGP sends a message to Call Processing (request to block an Agent Group) prior to changing the static database. If the request fails (negative ack from Call Processing), the static database is not changed. error message F17 reflects this.

### 2.4.1 Error Messages

|------------------------------------|----------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>   | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Descriptions</a> |                                               |

By means of AMO ACDRS, a customer-specific route can be established for each Route Control Group (RCG) by assigning a Day Shift Number (DSNUM) to each day of the week for the RCGs. The DSNUM indicates the Day Shift selection to be used by a RCG for a given day.

A Day Shift entry is created by assigning SHIFTS to a DSNUM. A SHIFT denotes the ending time for a specific shift, as well as the ACD Routing Table (ART) and End of Shift (EOS) to be assigned to calls arriving during that shift. The DSNUM identifies the Day Shift table entry to be used for storing all the shifts for a specific Day. There is no limit to the number of shifts assigned to a DSNUM as long as the shift pool of 20400 shifts is not exhausted. A DSNUM must have shifts assigned for a 24 hour period. The craft must assign the default EOS (23:59) with the ACD Route Table Default (ARTDEF) parameter, but it can be set to any user configured ART. The EOS will be set to NO.

The craft may create up to 1020 DSNUMs with an average of 20 shifts each for a total of 20400 SHIFTS.

A DSNUM may be assigned to multiple RCGs for various days of the week. A DSNUM cannot be deleted if it is being referenced in the Route Selection table.

AMO ACDRS supports Calendar Routing; i.e. the ability to set ACD routing based on calendar (special) dates.

Calendar Routing allows the customer to set up a route for each Route Control Group (RCG) by assigning special dates and Day Shift Numbers (DSNUM) to the Calendar Routing Table.

The DSNUM indicates the Day Shift selection to be used by the RCG for specific date(s).

The special dates can be specified for any year within the range entity 1996 - 2095 and can be a single date entity or a range of dates entity. The Route Selection Table for a RCG must be set up prior to assigning Calendar Routing to the RCG.

The input will require a Start Date, an End Date, and the DSNUM associated with that RCG. This creates a range entity which can have any length from one day to one year.

The special date(s) configured for a RCG is independent from the special dates configured for others RCGs. This allows each RCG to be configured with its own set of special dates.

There are some general rules that are followed for Calendar Routing.

## ACDRS - ACD Route Selection

### Restrictions

- The total number of entries supported in the Calendar Routing table is limited to 32000 entries.
- Nonrepeating date entities that coincide or overlap repeating date entities take precedence over those repeating date entities.
- Date entities of the same type (nonrepeating or repeating) cannot coincide or overlap.
- When entering an end date parameter, the end year must be specified if a start year is specified. Also, the end year must be greater than or equal to the start year for a nonrepeating date entity or a '\*' for a repeating date entity when the start year has been entered.

### End of Shift Description

Every EOS time has, independent from the RCG, its EOS Group, which will be generated automatically. When calls arrive during a SHIFT, they are queued to the EOS Group until they are answered or until the end-shift time arrives. If the latter happens and EOS parameter is set to YES, the calls are then rerouted back through the Route Selection Process. If the EOS=NO, the calls will not be rerouted when the SHIFT ends. In this case the SHIFT has to answer all waiting calls.

## 3.1 Restrictions

This description is valid from SP300E-V3.0

## 3.2 Interrelationships

- AMO DNIT : A RCG must have a route selection defined before it can be referenced in the DNI table.
- AMO ACDRT : A RCG cannot be assigned an ART until that ART has been created by AMO ACDRT.
- AMO ACDSO : A RCG cannot have route selection defined unless the RCG has been created by AMO ACDSO.
- AMO ZAND : The ACD feature has to be turned on by AMO ZAND.

### 3.3 Functions of the AMO

- [ADD-ACDRS](#) : Create route selection information
- [CHANGE-ACDRS](#) : Change route selection information
- [DELETE-ACDRS](#) : Delete route selection information
- [DISPLAY-ACDRS](#) : Display route selection information
- [REGENERATE-ACDRS](#) : Regenerate route selection information

#### 3.3.1 ADD-ACDRS

By means of the function ADD-ACDRS, route selection information may be created. Two shifts are usually set up when a DSNUM is created. The first SHIFT created is assigned the ART and EOS values that were input. The EOS is defaulted to NO if not entered. Since each Day Shift must be set up for all 24 hours of a day, the AMO defaults the last shift of the day (23:59) and then creates this shift as input by the user in parameter ARTDEF. The default EOS for shift 23:59 will be NO. This defaulted shift may be modified using the CHANGE function.

To create a Day Shift that has all 24 hours assigned to the same ART and EOS, the user enters 23:59 for the SHIFT. The values entered for parameters ART and EOS will be assigned and will also overwrite the ART entered for ARTDEF and the default EOS value (NO).

If a DSNUM is not entered, the AMO will use the first available DSNUM. There are 1020 possible DSNUMs that provide at least one entry for each RCG. The craft may assign an average of 20 shifts per DSNUM for a system maximum of 20400 SHIFTS.

After a DSNUM has been created, it may be assigned to RCGs. A DSNUM may be assigned to multiple RCGs for various normal days of a week and special (Calendar Routing) date entities.

The Route Selection Table for a RCG must be set up prior to assigning Calendar Routing to the RCG.

When setting Calendar Routing, a start date and an end date must be specified when creating a range entity for a special date.

The start date is considered to be the first date within the range entity and the end date is considered to be the last date within the range entity.

If an end date is not given, it is assumed to be the same as the start date creating a range entity of one day. Also, if the year is not entered, it is assumed to be a repeating (indefinite) year assignment.

## ACDRS - ACD Route Selection

### Functions of the AMO

A RCG cannot be assigned DSNUMs unless the ACD feature is set to RELEASED by AMO ZAND.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-ACDRS    | <pre>  TYPE=DS, [DSNUM=&lt;number&gt;], SHIFT=&lt;number&gt; , ART=&lt;number&gt;, [EOS=&lt;param&gt;] , ARTDEF=&lt;number&gt;;    TYPE=RS, RCG=&lt;number&gt;, SUN=&lt;number&gt;, MON=&lt;number&gt; , TUE=&lt;number&gt;, WED=&lt;number&gt;, THU=&lt;bumber&gt; , FRI=&lt;number&gt;, SAT=&lt;number&gt;;    TYPE=CR, RCG=&lt;number&gt; , [STARTYR=&lt;key-num&gt;], STARTMON=&lt;number&gt;, STARTDAY=&lt;number&gt; , [ENDYR=&lt;key-num&gt;], [ENDMON=&lt;number&gt;], [ENDDAY=&lt;number&gt;] , DSNUM=&lt;number&gt;;</pre> |

### Examples:

1. Add a day shift that has all 24 hours assigned to ART 28, with an EOS group.

#### Input:

```
ADD-ACDRS:TYPE=DS, SHIFT=23-59, ART=28, EOS=YES, ARTDEF=28;
```

Output (the AMO will use the DSNUM 10, because it is the first DSNUM available):

```
H01: DAY SHIFT SCHEME DSNUM=10 HAS BEEN CREATED.
```

2. Assigned route selection for RCG 5, with Day Shift 10 on MON through Fri and Day Shift 2 on Sat and Sun.

#### Input:

```
ADD-
ACDRS:TYPE=RS, RCG=5, SUN=2, MON=10, TUE=10, WED=10, THU=10, FRI=10, SAT
=2;
```

#### Output:

```
H02: ROUTE SELECTION TABLE RCG=5 HAS BEEN CREATED.
```

3. Add a day shift with the first shift ending at 8:29 am, assigned to ART 17, with no EOS group. Also create the default shift for 11:59 pm at ART 21.

**Input:**

```
ADD-ACDRS:TYPE=DS,SHIFT=8-29,ART=17,ARTDEF=21;
```

Output (the AMO will use the DSNUM 11, because it is the first DSNUM available):

```
H01: DAY SHIFT SCHEME DSNUM=11 HAS BEEN CREATED.
```

4. December 25, considered a repeating holiday, is to be added to the Calendar Routing Table for RCG=1. December 25 will use the routing specified for DSNUM=101.

**Input:**

```
ADD-  
ACDRS:TYPE=CR,RCG=1,STARTMON=12,STARTDAY=25,ENDMON=12,ENDDAY=25,  
DSNUM=101;
```

**Output:**

```
H18: THE ENTERED DATES HAVE BEEN ADDED TO THE CALENDAR ROUTING  
TABLE.
```

5. July 28, 1997, needs to be added to the Calendar Routing Table for RCG=2 as a non-repeating special date. This date will use the routing specified for DSNUM=103. Since this is a single day range entity, the end date is not input and defaults to the start date.

**Input:**

```
ADD-  
ACDRS:TYPE=CR,RCG=2,STARTYR=1997,STARTMON=7,STARTDAY=28,DSNUM=10  
3;
```

**Output:**

```
H18: THE ENTERED DATES HAVE BEEN ADDED TO THE CALENDAR ROUTING  
TABLE.
```

6. December 28 through January 2 need to be added to the Calendar Routing Table for RCG=2 as a repeating special date. These dates will use the routing specified for DSNUM=105.

**Input:**

```
ADD-  
ACDRS:TYPE=CR,RCG=2,STARTYR=*,STARTMON=12,STARTDAY=28,ENDYR=*,EN  
DMON=1,ENDDAY=2,  
DSNUM=105;
```

**Output:**

## **ACDRS - ACD Route Selection**

### Functions of the AMO

H18: THE ENTERED DATES HAVE BEEN ADDED TO THE CALENDAR ROUTING TABLE.

### 3.3.2 CHANGE-ACDRS

By means of the function CHANGE-ACDRS, route selection information may be modified.

The CHANGE action performs the following functions:

- adding a new SHIFT to a Day Shift
- changing a current SHIFT of a Day Shift
- deleting a current SHIFT of a Day Shift
- for Route Selection and Calendar Routing, changing of the DSNUM for specific RCG(s)

If the Day Shift is to be changed, the AMO searches the Day Shift Table entry for the SHIFT time. If the input SHIFT does not exist, then the shift is added for the DSNUM, and set to the ART number entered. When adding a shift to a DSNUM, the ART parameter is required. The EOS will default to NO. If the SHIFT already exists, the ART and/or the EOS input will be changed. Either the ART or EOS must be entered.

To delete a shift from a DSNUM, set the ART to equal 0. A shift may be deleted if the ACD feature is set to blocked, but a shift may not be added or changed if the ACD feature is set to blocked. Note that shift 23:59 may never be deleted.

The Day Shift assignments in the Route Selection table may be changed for a RCG for any number of days.

For Calendar Routing the CHANGE function can be used to change a specific DSNUM for a single date entity or a range of date entities. However, the Craft is not allowed to expand, change or decrease the value of an existing range entity. Thus, to modify a range entity, the Craft must use the DELETE and ADD functions.

A RCG cannot have its DSNUM changed unless the ACD feature is set to RELEASED by the AMO ZAND.

#### Note:

To change a single or a range of special date entities, the Craftsperson must input into the starting date. Entering any date other than the starting date within a range entity will cause an error to be displayed and the function to be aborted.

#### Procedure Overview

| Command Code | Parameter                               |
|--------------|-----------------------------------------|
| CHANGE-ACDRS | TYPE=DS, DSNUM=<number>, SHIFT=<number> |

## ACDRS - ACD Route Selection

### Functions of the AMO

| Command Code | Parameter                                                                                                                                         |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
|              | , { (min 1) ART=<number>, EOS=<param> } ;                                                                                                         |
|              | TYPE=RS, RCG=<number>, { (min 1) SUN=<number><br>, MON=<number>, TUE=<number><br>, WED=<number>, THU=<number><br>, FRI=<number>, SAT=<number> } ; |
|              | TYPE=CR, RCG=<number><br>, STARTYR=<key-num>, STARTMON=<number>, STARTDAY=<number><br>, DSNUM=<number>;                                           |

#### Examples:

1. Add a shift ending at 4:59 pm to day shift number 10. Assign this new shift to ART 33, with an EOS group.

##### Input:

CHA-ACDRS: TYPE=DS, DSNUM=10, SHIFT=16-59, ART=33, EOS=YES;

##### Output:

H03: DAY SHIFT SCHEME DSNUM=10 HAS BEEN CHANGED.  
H11: ATTENTION! THE MODIFIED DAY SHIFT SCHEME DSNUM=11  
IS STILL REFERENCED IN ROUTE SELECTION TABLES..

2. Change the Day Shift Number for Tue and Wed to 14 for RCG number 5.

##### Input:

CHA-ACDRS: TYPE=RS, RCG=5, TUE=14, WED=14;

##### Output:

H04: ROUTE SELECTION TABLE RCG=5 HAS BEEN CHANGED.

3. Change special Calendar Routing date July 28, 1997 of RCG=2 from DSNUM=103 to DSNUM=110.

##### Input:

CHA-  
ACDRS: TYPE=CR, RCG=2, STARTYR=1997, STARTMON=7, STARTDAY=28, DSNUM=110;

##### Output:

H21: CALENDAR ROUTING TABLE RCG=2 HAS BEEN CHANGED.

### 3.3.3 DELETE-ACDRS

By means of the function DELETE-ACDRS, Route Selection and Calendar Routing information may be deleted.

A DSNUM cannot be deleted if it is referenced in the Route Selection table.

A DSNUM, RCG route selection or Calendar Routing tables can be deleted without regard to whether or not the ACD feature is set to BLOCKED.

A RCG Route Selection Table cannot be deleted if it is referenced in the Directory Number Information (DNIT) table; however, all entries in the Calendar Routing table can be deleted for an RCG without regard to referencing.

Note: To delete a single or a range of special date entities, the Craftsperson MUST input into the starting date. Entering any date other than the starting date within a range entity will cause an error to be displayed and the function to be aborted.

#### Procedure Overview

| Command Code | Parameter                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| DELETE-ACDRS | TYPE=DS, DSNUM=<number>;<br><br>  TYPE=RS, RCG=<number>;<br><br>  TYPE=CR, RCG=<number><br>, STARTYR=<key-num>, STARTMON=<number>, STARTDAY=<number>; |

#### Examples:

1. Delete Day Shift number 24.

Input:

```
DEL-ACDRS:TYPE=DS,DSNUM=24;
```

Output:

```
H05: DAY SHIFT SCHEME DSNUM=24 HAS BEEN DELETED.
```

2. Delete the route selection entry for RCG 5.

Input:

```
DEL-ACDRS:TYPE=RS,RCG=5;
```

Output:

## ACDRS - ACD Route Selection

### Functions of the AMO

H06: ROUTE SELECTION TABLE RCG=5 HAS BEEN DELETED.

#### 3. Delete special date July 28,1997 of RCG=2.

##### Input:

DEL-ACDRS:TYPE=CR,RCG=2,STARTYR=1997,STARTMON=7,STARTDAY=28;

##### Output:

H19: THE ENTERED DATES HAVE BEEN DELETED FROM THE CALENDAR ROUTING TABLE.

#### 4. Delete special dates Jan 2 through Jan 6, 1997 of RCG=10.

##### Input:

DEL-ACDRS:TYPE=CR,RCG=10,STARTYR=1997,STARTMON=1,STARTDAY=2;

##### Output:

H19: THE ENTERED DATES HAVE BEEN DELETED FROM THE CALENDAR ROUTING TABLE..

#### 5. Delete special repeating dates December 28 through January 2 of RCG=2.

##### Input:

DEL-ACDRS:TYPE=CR,RCG=2,STARTYR=\*,STARTMON=12,STARTDAY=28;

##### Output:

H19: THE ENTERED DATES HAVE BEEN DELETED FROM THE CALENDAR ROUTING TABLE..

## 3.3.4 DISPLAY-ACDRS

By means of the function DISPLAY-ACDRS, all Route Selection and Calendar Routing entries are displayed.

There are several ways to display the route selection information:

- Display Day Shift 5:

DIS-ACDRS,TYPE=DS,DSNUM=5;

- Display all Day Shifts that reference ART 23:

DIS-ACDRS,TYPE=DS,ART=23;

- Display all Day Shifts referenced in RCG 44:

DIS-ACDRS,TYPE=DS,RCG=44;

- Display route selection for RCGs 8 through 11:

`DIS-ACDRS,TYPE=RS,RCG=8&&11;`

- Display all RCGs that reference DSNUM 12:

`DIS-ACDRS,TYPE=RS,DSNUM=12;`

There are several ways to display Calendar Routing dates:

- Display all Calendar Routing information:

`DIS-ACDRS,TYPE=CR;`

- Display all Calendar Routing information for RCG 44:

`DIS-ACDRS,TYPE=CR,RCG=44;`

- Display Calendar Routing information for RCGs 6 through 9:

`DIS-ACDRS,TYPE=CR,RCG=6&&9;`

Only one of the optional parameters for the Day Shift Table (following the TYPE = DS branch) may be entered. If none of the optional parameters are entered for the TYPE = DS, then all SHIFTS for all DSNUMs and Calendar Routing dates will be displayed.

Only one of the optional parameters for the Route Selection table (following the TYPE = RS branch) may be entered. If none of the optional parameters are entered for the TYPE = RS, then the route selection for all the RCGs will be displayed.

If no parameters are entered, all DS, RS and CR entries will be displayed (DIS-ACDRS;).

There are no error messages associated with DISPLAY-ACDRS.

### Procedure Overview

| Command Code  | Parameter                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-ACDRS | [TYPE=DS], { (max 1) DSNUM=<number>,ART=<number><br>,RCG=<number>} ;<br><br>  [TYPE=RS], { (max 1) RCG=<number>,DSNUM=<number>} ;<br><br>  [TYPE=CR], [RCG=<number>} ;<br><br>  [TYPE=ALL] ; |

### Example:

1. Display Day Shift numbers 5 through 11.

Input:

## ACDRS - ACD Route Selection

### Functions of the AMO

DISP-ACDRS:TYPE=DS,DSNUM=5&&11;

Output:

| DSNUM | SHIFT | ART | EOS |
|-------|-------|-----|-----|
| 5     | 7:59  | 18  | NO  |
| 5     | 11:59 | 24  | YES |
| 5     | 12:59 | 16  | NO  |
| 5     | 16:59 | 24  | YES |
| 5     | 23:59 | 27  | NO  |
| DSNUM | SHIFT | ART | EOS |
| 7     | 23:59 | 48  | NO  |
| DSNUM | SHIFT | ART | EOS |
| 9     | 6:59  | 19  | NO  |
| 9     | 10:59 | 33  | YES |
| 9     | 11:59 | 17  | NO  |
| 9     | 15:59 | 33  | YES |
| 9     | 23:59 | 38  | NO  |
| DSNUM | SHIFT | ART | EOS |
| 10    | 0:29  | 60  | NO  |
| 10    | 1:29  | 72  | NO  |
| 10    | 2:29  | 53  | NO  |
| 10    | 2:59  | 51  | NO  |
| 10    | 3:29  | 76  | NO  |
| 10    | 4:29  | 81  | YES |
| 10    | 22:59 | 27  | NO  |
| 10    | 23:19 | 28  | NO  |
| 10    | 23:29 | 119 | NO  |
| 10    | 23:39 | 85  | NO  |
| 10    | 23:49 | 49  | NO  |
| 10    | 23:59 | 73  | NO  |

**Example:**

2. Display Route Selection table for RCGs number 23, 25, and 28.

Input:

DIS-ACDRS:TYPE=RS,RCG=23&25&28;

Output:

| RCG | SUN | MON | TUE | WED | THU | FRI | SAT |
|-----|-----|-----|-----|-----|-----|-----|-----|
| 23  | 7   | 5   | 5   | 5   | 5   | 5   | 7   |
| 25  | 18  | 18  | 18  | 18  | 18  | 22  | 22  |

|    |   |    |    |    |    |    |   |
|----|---|----|----|----|----|----|---|
| 28 | 7 | 13 | 13 | 13 | 13 | 13 | 7 |
|----|---|----|----|----|----|----|---|

**Example:**

3. Display Day Shifts referenced by RCG number 23.

Input:

DISP-ACDRS:TYPE=DS,RCG=23;

Output:

|       |       |     |     |     |     |     |     |  |
|-------|-------|-----|-----|-----|-----|-----|-----|--|
|       |       |     |     |     |     |     |     |  |
| DSNUM | SHIFT | ART | EOS |     |     |     |     |  |
| 5     | 7:59  | 18  | NO  |     |     |     |     |  |
| 5     | 11:59 | 24  | YES |     |     |     |     |  |
| 5     | 12:59 | 16  | NO  |     |     |     |     |  |
| 5     | 16:59 | 24  | YES |     |     |     |     |  |
| 5     | 23:59 | 27  | NO  |     |     |     |     |  |
|       |       |     |     |     |     |     |     |  |
| DSNUM | SHIFT | ART | EOS |     |     |     |     |  |
| 7     | 23:59 | 48  | NO  |     |     |     |     |  |
|       |       |     |     |     |     |     |     |  |
| RCG   | SUN   | MON | TUE | WED | THU | FRI | SAT |  |
| 23    | 7     | 5   | 5   | 5   | 5   | 5   | 7   |  |

**Example:**

4. Display Day Shifts that reference ART 24.

Input:

DISP-ACDRS:TYPE=DS,ART=24;

Output:

| ART 24 |       |     |     |
|--------|-------|-----|-----|
| DSNUM  | SHIFT | ART | EOS |
| 5      | 7:59  | 18  | NO  |
| 5      | 11:59 | 24  | YES |
| 5      | 12:59 | 16  | NO  |
| 5      | 16:59 | 24  | YES |
| 5      | 23:59 | 27  | NO  |
| DSNUM  | SHIFT | ART | EOS |

## ACDRS - ACD Route Selection

### Functions of the AMO

|       |       |    |     |
|-------|-------|----|-----|
| 13    | 11:59 | 24 | YES |
|       | 16:59 | 16 | YES |
|       | 23:59 | 27 | NO  |
| ----- |       |    |     |
| 33    | 11:59 | 24 | YES |
|       | 16:59 | 18 | YES |
|       | 23:59 | 27 | NO  |
| ----- |       |    |     |

#### Example:

5. Display all RCGs that reference DAY SHIFT numbers 12 AND 34.

Input:

DIS-ACDRS:TYPE=RS,DSNUM=12&34;

Output:

|          |     |     |     |     |     |     |     |  |
|----------|-----|-----|-----|-----|-----|-----|-----|--|
| -----    |     |     |     |     |     |     |     |  |
| DSNUM 12 |     |     |     |     |     |     |     |  |
| RCG      | SUN | MON | TUE | WED | THU | FRI | SAT |  |
| 13       | 12  | 12  | 34  | 34  | 34  | 34  | 34  |  |
| 15       | 12  | 28  | 28  | 28  | 28  | 28  | 12  |  |
| 38       | 12  | 13  | 13  | 13  | 13  | 13  | 12  |  |
| -----    |     |     |     |     |     |     |     |  |
| DSNUM 34 |     |     |     |     |     |     |     |  |
| RCG      | SUN | MON | TUE | WED | THU | FRI | SAT |  |
| 13       | 12  | 12  | 34  | 34  | 34  | 34  | 34  |  |
| 18       | 34  | 34  | 34  | 34  | 34  | 22  | 22  |  |
| 142      | 34  | 23  | 23  | 34  | 34  | 34  | 34  |  |
| -----    |     |     |     |     |     |     |     |  |

#### Example:

6. Display all Calendar Routing Information for RCGs 6 through 9.

Input:

DIS-ACDRS:TYPE=CR,RCG=6&&9;

Output:

|     |       |            |            |
|-----|-------|------------|------------|
| RCG | DSNUM | START DATE | END DATE   |
| 6   | 2     | 01/01/1997 | 01/05/1997 |
| 6   | 3     | 02/26/1997 | 03/03/1997 |

|         |   |         |    |         |            |         |            |         |
|---------|---|---------|----|---------|------------|---------|------------|---------|
|         | 7 |         | 44 |         | 02/29/2000 |         | 03/10/2000 |         |
| +-----+ |   | +-----+ |    | +-----+ |            | +-----+ |            | +-----+ |
|         | 8 |         | 17 |         | 12/25/*    |         | 12/25/*    |         |
| +-----+ |   | +-----+ |    | +-----+ |            | +-----+ |            | +-----+ |
|         | 9 |         | 6  |         | 10/14/1997 |         | 10/14/1997 |         |
| +-----+ |   | +-----+ |    | +-----+ |            | +-----+ |            | +-----+ |
|         | 9 |         | 12 |         | 05/24/1997 |         | 05/26/1997 |         |
| +-----+ |   | +-----+ |    | +-----+ |            | +-----+ |            | +-----+ |

### 3.3.5 REGENERATE-ACDRS

By means of the function REGENERATE-ACDRS, ADD and CHANGE commands are generated to recreate the Day Shift, RCG Route Selection and the Calendar Routing table entries.

Table regeneration of AMO-ACDRS will be done as follows:

TYPE = DS will regenerate the Day Shift table only.

TYPE = RS will cause both the Day Shift table and RCG route selection table to be regenerated. The RCG route selection table cannot be regenerated without the Day Shift table.

TYPE = ALL will cause all 3 tables to be regenerated.

There are no error/advisory messages associated with REGENERATE-ACDRS.

#### Procedure Overview

| Command Code     | Parameter                                                                                                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REGENERATE-ACDRS | [TYPE=DS], [DSNUM=<number>;<br><br>  [TYPE=RS], [RCG=<number>;<br><br>  [TYPE=CR], [RCG=<number>], [STARTYR=<key-num>]<br>, [STARTMON=<number>], [STARTDAY=<number>;<br><br>[TYPE=ALL]; |

#### Example:

1. Regenerate all Day Shift tables.

Input:

REG-ACDRS: TYPE=DS;

Output:

## ACDRS - ACD Route Selection

| Default Value   | : none                                                                                                                                     |

## 3.5 Error Messages and Advisories

### 3.5.1 Error Messages

F01: THE ACD FEATURE IS DEACTIVATED.  
ACTIVATE IT WITH THE FOLLOWING COMMAND:  
CHANGE-ZAND:TYPE=ACD,ACDALLOW=YES;

F02: ROUTE SELECTION TABLE FOR RCG=@@@ HAS ALREADY BEEN CREATED.

F03: THERE IS NO DAY SHIFT SCHEME WITH DSNUM=@@@.  
CREATE IT WITH THE FOLLOWING COMMAND:  
ADD-ACDRS:TYPE=DS,DSNUM=@@@,SHIFT=<?>,ART=<?>,ARTDEF=<?>;

F04: THE RCG=@@@ IS NOT YET CONFIGURED AS A ROUTE CONTROL GROUP.  
USE THE FOLLOWING COMMAND TO ADD THIS NUMBER  
TO THE SET OF RESERVED 'RCG' INDICES:  
CHANGE-ACDSD:TYPE=CAFRCG,RCG=@@@,CAFDN=<?>;

## ACDRS - ACD Route Selection

### Error Messages and Advisories

F05: CANNOT DELETE DAY SHIFT SCHEME DSNUM=@@@ - IT IS STILL  
REFERENCED IN THE ROUTE SELECTION TABLE (RS)  
OR THE CALENDAR ROUTING TABLE (CR).  
DISPLAY REFERENCES WITH THE FOLLOWING COMMANDS:  
DISP-ACDRS:TYPE=RS; DISP-ACDRS:TYPE=CR;

F06: CANNOT DELETE ROUTE SELECTION TABLE FOR RCG=@@@.  
IT IS STILL REFERENCED IN THE  
DIRECTORY NUMBER INFORMATION TABLE (DNI).  
DISPLAY REFERENCES WITH THE FOLLOWING COMMAND:  
DISP-DNIT:TBL=DNI;

F07: THERE IS NO ACD ROUTING TABLE WITH ART=@@@.  
CREATE IT WITH THE FOLLOWING COMMAND:  
ADD-ACDRT:ART=@@@,MAXSTEP=<?>;

F08: MEMORY RESERVED FOR DAY SHIFTS SCHEMES IS INSUFFICIENT.  
ALLOCATE ADDITIONAL MEMORY WITH THE FOLLOWING COMMAND:  
ADD-DIMSU:ACDSHIFT=<?>;

F09: THE PARAMETER 'ART' MUST BE SPECIFIED IF A NEW  
SHIFT END TIME IS TO BE ADDED TO A DAY SHIFT SCHEME  
(IF THE VALUE ENTERED FOR 'SHIFT'  
DID NOT EXIST BEFORE IN THE GIVEN 'DSNUM')

F10: THE END-OF-SHIFT TABLE (EOS) IS FULL.  
IN ORDER TO ASSIGN THE VALUE EOS=YES TO A DAY SHIFT  
AN OTHER DAY SHIFT HAVING EOS=YES MUST BE DELETED  
OR BE RESET TO THE VALUE EOS=NO.

F11: THE DAY SHIFT TABLE IS FULL.  
NO MORE DAY SHIFT SCHEMES (DSNUM)  
OR SHIFT END TIMES (SHIFT) MAY BE ADDED.

F12: THERE IS YET NO ROUTE SELECTION TABLE SET UP  
FOR ROUTE CONTROL GROUP RCG=@@@.

F13: CANNOT DELETE THE LAST SHIFT END TIME  
(SHIFT=23-59) FROM A DAY SHIFT SCHEME.

F14: THE SPECIFIED COMBINATION OF 'ART' AND 'EOS' IS ALREADY  
PRESENT IN THE GIVEN DAY SHIFT SCHEME. NEW VALUES FOR  
'ART' AND/OR 'EOS' MUST BE ENTERED TO CHANGE DATA.

F15: INCORRECT VALUE FOR SHIFT HOURS WITHIN PARAMETER 'SHIFT'.  
POSSIBLE VALUES: 0 TO 23

F16: THE SHIFT END TIME (SHIFT) TO BE DELETED VIA ENTERING  
ART=0 IS NOT PRESENT IN THE GIVEN DAY SHIFT SCHEME.

F17: THE FIRST 15 ACD ROUTING TABLES (ART 1-15) ARE NOT  
ASSIGNABLE TO DAY SHIFTS (SEE AMO ACDRT).

F18: NOT NEEDED FOR ACD-G.

F19: MEMORY RESERVED FOR CALENDAR ROUTING IS INSUFFICIENT.  
ALLOCATE ADDITIONAL MEMORY WITH THE FOLLOWING COMMAND:  
ADD-DIMSU:ACDCALEN=<?>;

F20: COULD NOT CHANGE OR DELETE ENTRY BECAUSE THE  
STARTING DATE ENTERED IS NOT PRESENT IN THE  
ROUTE SELECTION TABLE SPECIFIED BY THE RCG.

F21: THIS DATE IS ALREADY USED FOR CALENDAR ROUTING BY THE  
ROUTE SELECTION TABLE BELONGING TO THE SPECIFIED 'RCG'

F22: THE ENTERED DATE OR DATE RANGE IS INVALID.

F23: CALENDAR ROUTING TABLE COULD NOT BE ADDED BECAUSE THERE IS  
NO ROUTE SELECTION TABLE SET UP FOR THE SPECIFIED 'RCG'

F24: CANNOT DELETE ROUTE SELECTION TABLE FOR RCG=@@@.  
IT IS STILL REFERENCED IN THE CALENDAR ROUTING TABLE (CR).  
DISPLAY REFERENCES WITH THE FOLLOWING COMMAND:  
DISP-ACDRS:TYPE=CR;

### 3.5.2 Advisories

H01: DAY SHIFT SCHEME DSNUM=@@@@ HAS BEEN CREATED

H02: ROUTE SELECTION TABLE RCG=@@@@ HAS BEEN CREATED.

H03: DAY SHIFT SCHEME DSNUM=@@@@ HAS BEEN CHANGED.

H04: ROUTE SELECTION TABLE RCG=@@@@ HAS BEEN CHANGED.

H05: DAY SHIFT SCHEME DSNUM=@@@@ HAS BEEN DELETED.

H06: ROUTE SELECTION TABLE RCG=@@@@ HAS BEEN DELETED.

H07: THERE ARE NO ROUTE SELECTION TABLES USING  
DAY SHIFT SCHEME DSNUM=@@@@.

H08: THERE ARE NO DAY SHIFTS SCHEMES USING  
ACD ROUTING TABLE ART=@@@@.

H09: DAY SHIFT SCHEME DSNUM=@@@@ HAS NOT BEEN CREATED.

H10: ROUTE SELECTION TABLE RCG=@@@@ HAS NOT BEEN CREATED.

H11: ATTENTION! THE MODIFIED DAY SHIFT SCHEME DSNUM=@@@@  
IS STILL REFERENCED IN ROUTE SELECTION TABLES.

H12: DAY SHIFT SCHEME DSNUM=@@@@ HAS ALREADY BEEN CREATED.

H13: PARAMETER 'EOS' IS IGNORED IN CASE  
ART=0 (DELETING A SHIFT END TIME).

H14: CHANGE IN THE END OF SHIFT TABLE (EOS) CAUSED  
A NEGATIVE RESPONSE FROM CALL PROCESSING.

H15: SHIFT END TIME SHIFT=@@-@@ HAS BEEN DELETED BECAUSE OF COMMAND INPUT ART=0.

H16: SHIFT END TIME SHIFT=@@-@@ HAS BEEN CHANGED.

H17: SHIFT END TIME SHIFT=@@-@@ HAS BEEN ADDED

H18: THE ENTERED DATES HAVE BEEN ADDED  
TO THE CALENDAR ROUTING TABLE.

## ACDRS - ACD Route Selection

### Error Messages and Advisories

H19: THE ENTERED DATES HAVE BEEN DELETED  
FROM THE CALENDAR ROUTING TABLE.

H20: THERE ARE NO ENTRIES IN THE CALENDAR ROUTING TABLE  
FOR THE PARAMETERS ENTERED.

H21: CALENDAR ROUTING TABLE RCG=@@@ HAS BEEN CHANGED.

## 4 ACDRT - ACD Routing Tables

|                    |                        |                               |
|--------------------|------------------------|-------------------------------|
| Restrictions       | Functions of the AMO   | Error Messages and Advisories |
| Interrelationships | Parameter Descriptions |                               |

AMO ACDRT provides the functions for creating and maintaining ACD Routing Tables (ARTs).

An ART may consist of up to 64 Steps. The maximum number of ARTs is 4000 when fully dimensioned and each ART contains 16 or less steps. Memory space is allocated in 16 step blocks for each ART (an ART of 17 steps will be allocated space for 32 steps). Since the maximum number of ARTs is based on ARTs consisting of 16 steps, the actual maximum may be below 4000. The maximum number of ARTs is also affected by the amount of available memory (see AMO DIMSU).

The steps that may be input are: Conditional Routing (COND), Route to Offsite Number (RTOFF), Route to Extension (RTEXT), Route to Recorded Announcement (RTREC), Route to Music (RTMUS), Route to Agent (RTAGT), Route to Group (RTGRP), Wait x Seconds (WTSEC), GOTO Step (GOSTEP), Skip (SKIP), Delay Ringback (DELAYRB), and Disconnect (DISCON).

The first ART is initialized to DISCON. It is not administrable, but the user can display it. The SET function applies to the next 14 ARTs that are accessible only by service personnel. The default Step for ARTs 2-15 is DISCON. ARTs 2-15 cannot be accessed by the ADD, CHANGE, DELETE, or COPY functions. The user can display ARTs 1-4000, but can only regenerate ARTs 2-4000. ARTs 16-4000 are administrable via the ADD, CHANGE, DISPLAY, REGENERATE, DELETE, COPY and TEST functions.

The routing steps described below may be used in any order or combination with certain conditions applying to some of the steps:

- Conditional Routing (COND):
  - used as a conditional GOTO step.
  - if the condition specified evaluates to false, then routing continues with the next step, otherwise, when true, routing continues at the specified step.
  - is based on an ACD group dynamic variables (status).
  - is controlled by the number of agents available (AGTAVL), the number of agents logged on (AGTLGN), the number of calls queued (CALQED), or the age of the oldest call in queue in minutes and seconds (OLDINQ).

- cannot reference a step beyond the ARTs maximum step.
- Disconnect (DISCON):
  - the system disconnects the call.
  - used to handle after hours calls.
  - should be preceded by a route to recorded announcement.
  - should be a final logical step.
- GOTO Step x (GOSTEP):
  - the system routes the call to the specified step number.
  - if step x is less than the current step, then all steps from step x to the GOTO cannot be a Delay Ringback or Route to Group step. This will prevent the call from queuing multiple times.
  - cannot reference a step beyond the ARTs maximum step.
- Route to Agent (RTAGT):
  - call is routed to the specified agent logon ID.
  - agent logon ID will be verified.
  - if the agent cannot receive the call, the call advances to the next step.
  - route to agent cannot follow a route to group step if the agent belongs to the same ACD group that is configured in the route to group step.
- Route to Extension (RTEXT):
  - will route call to specified extension.
  - the AMO will verify that the extension number is valid.
  - the AMO will store the digit string.
  - if the extension cannot be alerted, the call advances to the next step.
  - may be an ACD routing number, a NON-ACD extension, or an ACD extension, but cannot have a SIDANI (SA) routing type (see AMO DNIT).
  - an error will be output if the extension number is not in the same DPLN group created for ACD in AMO ZAND (defaulted to DPLN group 0) and is not a subscriber or a routing number with a digit analysis of STN, ATND, HUNT, or ATNDIND (via ADD-WABE) or DNI (ADD-DNIT, TBL=DNI).

- all extensions of digit analysis type ATND must be associated with an attendant code via AMO VFGKZ and all extensions of digit analysis result STN or ATNDIND must have been associated with a device by AMOs SCSU/SBCSU/SSCSU or ACSU respectively, or an error will result.
- Route to Group x (RTGRP):
  - call is routed to the specified group number.
  - if there are no available agents, the call is queued and routing continues with the next step.
  - cannot appear more than once in the same ART for the same Group x.
  - cannot be followed by Route to agent in Group X.
  - group number will be verified.
- Route to Music (RTMUS):
  - the system routes the call to the specified ACD music number.
  - should be followed by a Wait x step, which indicates the length of time a caller listens to music before routing to next step.
  - music recorder number will be verified.
- Route to Offsite Number (RTOFF):
  - can route call to an offsite number.
  - can route to a Phonemail server (2 string formats are possible):  
String format for route to Phonemail with mailbox number:

aaaaaaACDmm...m

where:

|        |                                                                  |
|--------|------------------------------------------------------------------|
| aaaaaa | => 1 to 6 digits to indicate the Phonemail access number.        |
| ACD    | => string to identify route to a Phonemail or Voice Mail server. |
| mm...m | => 1 to n digits to indicate the Phonemail mailbox number.       |

String format for route to Phonemail with CP mailbox (general mailbox) number:

aaaaaaACD

where:

|        |                                                                 |
|--------|-----------------------------------------------------------------|
| aaaaaa | => 1 to 6 digits to indicate the Phonemail access number        |
| ACD    | => string to identify route to a Phonemail or Voice Mail server |

- can route to a Voice Mail server (only one string format is possible):

String format for route to Voice Mail with mailbox number:

aaaaaaACDmm...m

where:

aaaaaa => 1 to 6 digits to indicate the Phonemail access number

ACD => string to identify route to a Phonemail or Voice Mail server

mm...m => 1 to n digits to indicate the Voice Mail mailbox number

- the AMO will not verify the number.
- the AMO will store the digit string.
- public access code is required for public network.
- the public access code (leading the route to offsite number) must be configured for the same DPLN group as defined for ACD by AMO ZAND (TYPE=ACD, parameter ACDDPLN).
- Route to Recording (RTREC):
  - the system routes the call to the specified ACD recorded announcement.
  - announcement must be fixed start.
  - announcement recorder number will be verified.
- Wait x (WTSEC):
  - causes call to "remain" at previous step for x seconds.
  - entering a wait time as the first step causes the caller to hear ringback for that specified length of time.
  - times are entered in increments of 5 seconds with a maximum of 300 seconds.
  - 0 seconds causes caller to wait until call is answered, received, disconnected, etc.
- Skip (SKIP)
  - has no effect on call; routing continues with next step.
- Delay Ringback (DELAYRB)
  - should be first step in an ART.
  - can be used for external, CORNET and internal ACD calls.
  - if after DELAYRB step comes RTGRP step, the caller will hear ringback tone.

- if after DELAYRB step comes RTGRP and RTREC steps, if the ACD group can not be accessed, the caller will hear the recorded announcement.
- if after DELAYRB step comes RTGRP and RTMUS steps, if the ACD group can not be accessed, the caller will hear the specified music.
- if after DELAYRB step comes RTGRP and DISCON steps, and no queue is possible, the caller will be disconnected.
- Wait for an application (WTAPPL)
  - A step of type DELAYRB must not occur together with a WTAPPL step in the same ART
  - Only the (new) command HEARTCND is allowed before WTAPPL
  - Other ART steps can be configured after the WTAPPL command. Steps of type GOSTEP may be used to go back to a step containing the WTAPPL command, except if there is a RTGRP step configured between the WTAPPL and the GOSTEP commands.
- Route to heartbeat destination (RTHEART)
- Conditional routing to heartbeat destination(HEARTCND)

### **Inserting/Deleting ART Steps**

AMO ACDRT also supports inserting and deleting ART steps within an existing ART through the use of the CHANGE and SET functions. When an insert or delete is done, any GOTO steps (both regular GOTO steps and conditional GOTO steps) that are affected by the operation within the affected ART are adjusted accordingly.

### **Insert Action**

ACDRT performs three major checks prior to doing the insertion of an ART step into the ART. If any one of these checks fails, the craft is presented with an error message and the insertion is aborted.

First, ACDRT checks to see if there is enough room in the ART for another step. The test for enough room is to see if there is a SKIP step in the last position within the ART. If there isn't, an error message is displayed to indicate that the insert could not be accomplished due to insufficient table size. The craft is advised to increase the size of the table.

Then, ACDRT checks to see if there are any GOTO steps within the ART that point to the last step (which must be a SKIP). If there are any, an error is posted to inform the craft that the insert could not be done.

## ACDRT - ACD Routing Tables

### Restrictions

Finally, ACDRT tests the validity of the new step. The tests for validity are the same as have always been used for changing ART steps from the SKIP default to some other action. If the step is not valid, an error is posted and processing is terminated.

Assuming all of the above checks passed successfully, the step is inserted into the ART.

**Note:** When inserting a new GOTO step or a Conditional step that contains a GOTO step, the GOTO step number (specified by GSTEP or CGSTEP within the command) must be the current step number of the step to go to. The GSTEP/CGSTEP number will then be adjusted properly after the insertion using the GOTO step adjustment logic.

### Delete Action

ACDRT performs two major checks prior to deleting an ART step.

First, it checks to see if the step to be deleted is referenced by any existing GOTO (regular and conditional) steps. If it is, an error message is displayed to indicate that the deletion could not be accomplished.

Second, ACDRT tests if the step being deleted is a Route to Recorded Announcement and if there is a Disconnect step further in the ART. If so, an advisory is displayed to inform the craft that the Disconnect should be preceded by a Route to Recorded Announcement step. This is only an advisory; therefore, the deletion is still performed.

Assuming the first check passed successfully, the step is deleted from the ART. All of the steps that were after the deleted step are shifted back one position and the last step in the ART is marked as a SKIP step.

## 4.1 Restrictions

This description is valid from HiPath 4000 V1.0.

## 4.2 Interrelationships

- AMO ACDGP
  - AMO AGENT
  - AMO RCSU
- References for ACD groups, Agents and Recordings must be initiated by the AMOs ACDGP, AGENT and RCSU respectively prior to use.

- AMO ACSU                      Extensions referenced by AMO ACDRT must be set up by the AMOs ACSU, DNIT, SA, SCSU/SBCSU/SSCSU and VFGKZ.
- AMO DNIT
- AMO SA
- AMOs SCSU/SBCSU/SSCSU
- AMO VFGKZ
- AMO ACDRS                      An ART must be created by AMO ACDRT prior to use in AMO ACDRS.  
An ART may not be deleted until all references to it are removed by AMO ACDRS.
- AMO ACDSO                      The length of Agent Identification will be set by AMO ACDSO.
- AMO ZAND                      The ACD feature has to be turned on by AMO ZAND.  
In addition, it can define a specific DPLN group to be used for ACD.

## 4.3 Functions of the AMO

- [ADD-ACDRT](#)                      : Create an ACD Routing Table
- [CHANGE-ACDRT](#)                      : Change, add, insert or delete steps in ACD Routing Tables
- [DELETE-ACDRT](#)                      : Delete an ACD Routing Table
- [DISPLAY-ACDRT](#)                      : Display ACD Routing Tables
- [REGENERATE-ACDRT](#)                      : Regenerate ACD Routing Tables
- [COPY-ACDRT](#)                      : Copy an existing ACD Routing Table
- [SET-ACDRT](#)                      : Modify ACD Routing Tables 2 to 15
- [TEST-ACDRT](#)                      Display the dial plan groups used in the steps RTOFF and RTEXT.

### 4.3.1 ADD-ACDRT

The ADD-ACDRT function creates ACD routing tables.

With ADD-ACDRT, ARTs can be added by specifying the ART number (ART) and the maximum number of steps (MAXSTEP) for a table. This creates an ART with the first step initialized to disconnect (DISCON) and the remaining steps to skip (SKIP).

#### Procedure Overview

| Command Code | Parameter                       |
|--------------|---------------------------------|
| ADD-ACDRT    | ART=<number>, MAXSTEP=<number>; |

## ACDRT - ACD Routing Tables

### Functions of the AMO

#### Example:

Create a new ART with a MAXSTEP of 10 and assign it number 16.

Input:

```
ADD-ACDRT:ART=16,MAXSTEP=10;
```

Output:

```
H01: ACD ROUTING TABLE=16 HAS BEEN CREATED.
```

```
H04: THE UPPER LIMIT FOR THE NUMBER OF ART STEPS HAS BEEN SET TO  
MAXSTEP=10.
```

### 4.3.2 CHANGE-ACDRT

The CHANGE ACDRT function modifies steps in ACD routing tables 16 or greater.

This function is used to change, insert, and delete steps in an existing ART using the step modify mode (TYPE=ARTSTEP, INSSTEP, and DELSTEP, respectively). This function is also used to change the maximum number of steps (MAXSTEP) for an existing ART using the table modify mode (TYPE=MAX).

When using MAXSTEP to decrease the number of steps, the steps that are to be "deleted" are checked. If these steps are referenced in a goto (GSTEP) or conditional (COND) step, an error is generated.

If the VALOLD parameter is specified for testing the oldest call in a queue, then the number of minutes and seconds are entered using the following format:

mmm-ss

Minutes may be entered alone. If seconds are to be specified, both minutes and seconds must be entered, even when minutes are zero as shown:

| Entered | Minutes | Seconds |
|---------|---------|---------|
| 0-35    | 0       | 35      |
| 2-0     | 2       | 0       |
| 2       | 2       | 0       |
| 0-0     | 0       | 0       |
| 0       | 0       | 0       |

## Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

1. Change step 15 of ART 30 to Disconnect.

Input:

## ACDRT - ACD Routing Tables

### Functions of the AMO

CHANGE-ACDRT: ART=30,TYPE=ARTSTEP,STEP=15,ACT=DISCON;

#### Output:

H09: A STEP WITH THE DISCON-STATEMENT SHOULD BE  
PRECEDED BY A STEP WITH THE RTREC-STATEMENT.

H10: THE DISCON-STATEMENT SHOULD BE THE FINAL  
LOGICAL STEP OF AN ACD ROUTING TABLE.

H05: THE ACTION OF THE STATEMENT CONTAINED IN STEP  
ART:STEP=30:15  
HAS BEEN CHANGED TO ACT=DISCON.

## 2. Change Step 9 of ART 16 to a Route to Offsite

Step with a directory number of 008979948800.

#### Input:

CHANGE-  
ACDRT:ART=16,TYPE=ARTSTEP,STEP=9,ACT=RTOFF,DIRNUM=008979948800;  
0;

#### Output:

H05: THE ACTION OF THE STATEMENT CONTAINED IN STEP  
ART:STEP=16:09

HAS BEEN CHANGED TO ACT=RTOFF.

H23: PLEASE CHECK THAT THE DIGIT ANALYSIS RESULT FOR  
THE STATION NUMBER DIRNUM=008979948800 ENTERED IS  
ALSO VALID FOR DPLN GROUP DPLNGRP=0.  
(SEE AMO ZAND, TYPE=ACD, ACDDPLN=0)."

## 3. Change Step 9 of ART 32 to a Route to Phonemail Server, with phonemail access number 328670, and mailbox number 2345.

#### Input:

CHANGE-  
ACDRT:ART=32,TYPE=ARTSTEP,STEP=9,ACT=RTOFF,DIRNUM=328670ACD2345;  
45;

#### Output:

H05: THE ACTION OF THE STATEMENT CONTAINED IN STEP  
ART:STEP=32:09

HAS BEEN CHANGED TO ACT=RTOFF.

## 4. Change Step 8 of ART 33 to a Route to Phonemail Server, with phonemail access number 725884, and CP mailbox number (general mailbox number).

#### Input:

CHANGE-  
ACDRT:ART=33,TYPE=ARTSTEP,STEP=8,ACT=RTOFF,DIRNUM=725884ACD;  
8;

#### Output:

H05: THE ACTION OF THE STATEMENT CONTAINED IN STEP  
ART:STEP=33:08

HAS BEEN CHANGED TO ACT=RTOFF.

5. Change Step 5 of ART 34 to a Route to Voice Mail Server, with voice mail access number 556677, and mailbox number 4423.

**Input:**

CHANGE-  
ACDRT:ART=34,TYPE=ARTSTEP,STEP=5,ACT=RTOFF,DIRNUM=556677ACD44  
23;

**Output:**

H05: THE ACTION OF THE STATEMENT CONTAINED IN STEP  
ART:STEP=34:05  
HAS BEEN CHANGED TO ACT=RTOFF.

6. Change step 1 of ART 18 to a Conditional step for ACD group number 75 (ACDGRP), and go to step 5 (GSTEP) if agents available (TEST) is greater than 5 (VALAGT).

**Input:**

CHANGE-  
ACDRT:ART=18,TYPE=ARTSTEP,STEP=1,ACT=COND,CACDGRP=75,CGSTEP=5  
, TEST=AGTAVLGT,VALAGT=5;

**Output:**

H05: THE ACTION OF THE STATEMENT CONTAINED IN STEP  
ART:STEP=18:01  
HAS BEEN CHANGED TO ACT=COND.

7. Change step 6 of ART 18 to a Conditional step for ACD group number 43 (ACDGRP), and go to step 9 (GSTEP) if oldest call in queue (TEST) is less than 3 minutes and 20 seconds (VALOLD).

**Input:**

CHANGE-  
ACDRT:ART=18,TYPE=ARTSTEP,STEP=6,ACT=COND,CACDGRP=43,CGSTEP=9  
, TEST=OLDINQLT,VALOLD=3-20;

**Output:**

H05: THE ACTION OF THE STATEMENT CONTAINED IN STEP  
ART:STEP=18:06  
HAS BEEN CHANGED TO ACT=COND.

8. Change step 2 of ART 25 to a Delay Ringback step.

**Input:**

CHANGE-ACDRT:ART=25,TYPE=ARTSTEP,STEP=2,ACT=DELAYRB;

**Output:**

F35: THE DELAY RINGBACK STATEMENT (DELAYRB ) IS ONLY ALLOWED  
AS THE FIRST STEP OF AN ACD ROUTING TABLE.

## ACDRT - ACD Routing Tables

### Functions of the AMO

9. Insert GOTO step with GSTEP=15 at step position 5 of ART 20.  
(Assume the ART has 32 steps and at least one other GOTO step will be adjusted.)

Input:

```
CHANGE-ACDRT:ART=20,TYPE=INSSTEP,STEP=5,ACT=GOSTEP,GSTEP=15;
```

Output:

```
H18: STEP ART:STEP=20:5 HAS BEEN INSERTED.  
H20: AT LEAST ONE (CONDITIONAL) JUMP STATEMENT HAS BEEN  
ADJUSTED.
```

10. Insert a Route to Agent step at step position 4 of ART 10 (which is a full ART).

Input:

```
CHANGE-  
ACDRT:ART=10,TYPE=INSSTEP,STEP=4,ACT=RTAGT,AGTID=123456;
```

Output:

```
F38: THIS ACD ROUTING TABLE IS FULL.  
USE THE FOLLOWING COMMAND TO RAISE THE  
UPPER LIMIT (MAXSTEP) FOR THE NUMBER OF ART STEPS:  
CHANGE-ACDRT:TYPE=MAX,MAXSTEP=<?>;
```

11. Insert a Route to Music step at step 8 of ART 25 (but there is a GOTO step in step position 3 within the ART that points to the last SKIP step in the ART).

Input:

```
CHANGE-ACDRT:ART=25,TYPE=INSSTEP,STEP=8,ACT=RTMUS,MUSNUM=5;
```

Output:

```
F39: THE LAST 'SKIP' STATEMENT OF THE ART MAY NOT BE  
THE TARGET OF A (CONDITIONAL) JUMP STATEMENT.
```

12. Delete step 2 from ART 25, but step 2 is referenced by the GOTO step in position 6 within the ART.

Input:

```
CHANGE-ACDRT:ART=25,TYPE=DELSTEP,STEP=2;
```

Output:

```
F40: STEP ART:STEP=25:2 CAN NOT BE DELETED  
BECAUSE IT IS USED AS THE TARGET OF THE (CONDITIONAL)  
JUMP STATEMENT CONTAINED IN STEP STEP=6.
```

13. Delete step 3 from ART 30 (ART 30 has 12 step positions, and a GOTO must be adjusted).

Input:

CHANGE-ACDRT:ART=30,TYPE=DELSTEP,STEP=3;

Output:

H19: STEP ART:STEP=25:3 HAS BEEN DELETED.  
H20: AT LEAST ONE (CONDITIONAL) JUMP STATEMENT HAS BEEN ADJUSTED.

14. Delete the RTREC step in position 8 in ART 20, but there is a DISCON step in position 10 within the ART. The ART has 20 step positions.

Input:

CHANGE-ACDRT:ART=20,TYPE=DELSTEP,STEP=8;

Output:

H19: STEP ART:STEP=20:8 HAS BEEN DELETED.  
H21: THE RTREC-STATEMENT HAS BEEN DELETED, NOW THERE STANDS A DISCON-STATEMENT.  
H09: A STEP WITH THE DISCON-STATEMENT SHOULD BE PRECEDED BY A STEP WITH THE RTREC-STATEMENT.

### 4.3.3 DELETE-ACDRT

An ACD Routing Table is deleted with the DELETE-ACDRT function.

To delete an ART, only the ART number is specified. A routing table cannot be deleted if referenced in the ACD Route Selection Table - see AMO ACDRS.

When initiating this function, the following checks are performed. Each check produces a reaction and a prompt or end.

#### Procedure Overview

| Command Code | Parameter     |
|--------------|---------------|
| DELETE-ACDRT | ART=<number>; |

#### Examples:

1. Delete ACDRT 33

Input:

DELETE-ACDRT:ART=33;

Output:

H06: ACD ROUTING TABLE ART=33 HAS BEEN DELETED.

2. Delete ACDRT 19 and 42

Input:

DELETE-ACDRT:ART=19&42;

Output:

H06: ACD ROUTING TABLE ART=19 HAS BEEN DELETED.  
H06: ACD ROUTING TABLE ART=42 HAS BEEN DELETED.

4.3.4 DISPLAY-ACDRT

DISPLAY-ACDRT displays the ARTs and Steps.

Using the DISPLAY-ACDRT function, a single, chained, or range of ARTs may be displayed. If the ART parameter is omitted, all tables will be displayed. If the step parameter is omitted, all steps will be displayed. The step parameter accepts chained and ranges of values.

Procedure Overview

| Command Code  | Parameter                        |
|---------------|----------------------------------|
| DISPLAY-ACDRT | [ART=<NUMBER>], [STEP=<NUMBER>]; |

Examples:

1. DISPLAY ALL steps for ART 33

Input:

DISPLAY-ACDRT:ART=33;

Output:

|                                            |        |            |       |                    |          |       |
|--------------------------------------------|--------|------------|-------|--------------------|----------|-------|
| -----+-----                                |        |            |       |                    |          |       |
| ART 33                                     |        | MAXSTEP 11 |       | ACDRS REFERENCES 3 |          |       |
| +-----+-----+-----+-----+-----+-----+----- |        |            |       |                    |          |       |
| STEP                                       | ACTION | PARMETER   | VALUE | GSTEP              | TEST     | VALUE |
| +-----+-----+-----+-----+-----+-----+----- |        |            |       |                    |          |       |
| 1                                          | COND   | ACDGRP     | 5     | 7                  | AGTAVLLT | 10    |
| 2                                          | SKIP   |            |       |                    |          |       |
| 3                                          | RTGRP  | ACDGRP     | 5     |                    |          |       |
| 4                                          | RTMUS  | MUSNUM     | 21    |                    |          |       |
| 5                                          | WAIT   | SEC        | 0     |                    |          |       |
| 6                                          | DISCON |            |       |                    |          |       |
| 7                                          | COND   | ACDGRP     | 9     | 11                 | AGTAVLLT | 1     |
| 8                                          | RTGRP  | ACDGRP     | 9     |                    |          |       |
| 9                                          | RTREC  | RECNUM     | 41    |                    |          |       |
| 10                                         | WAIT   | SEC        | 30    |                    |          |       |
| 11                                         | DISCON |            |       |                    |          |       |
| +-----+-----+-----+-----+-----+-----+----- |        |            |       |                    |          |       |

2. DISPLAY steps 1, 5 and 9 for ART 33

Input:

DISPLAY-ACDRT:ART=33,STEP=1&5&9;

Output:

|                      |        |          |       |                    |          |       |  |
|----------------------|--------|----------|-------|--------------------|----------|-------|--|
| ART 33    MAXSTEP 11 |        |          |       | ACDRS REFERENCES 3 |          |       |  |
| STEP                 | ACTION | PARMETER | VALUE | GSTEP              | TEST     | VALUE |  |
| 1                    | COND   | ACDGRP   | 5     | 7                  | AGTAVLLT | 10    |  |
| 5                    | WAIT   | SEC      | 0     |                    |          |       |  |
| 9                    | RTREC  | RECNUM   | 41    |                    |          |       |  |

### 4.3.5 REGENERATE-ACDRT

REGENERATE-ACDRT for ARTs 2-15 regenerates commands to recreate an ART using the SET-ACDRT function. REGENERATE-ACDRT for ARTs 16-4000 regenerates commands to recreate an ART using the ADD-ACDRT and CHANGE-ACDRT functions. ARTs 2-4000 can be regenerated by omitting the ART parameter, or a single, chained, or range of ARTs can be specified.

#### Procedure Overview

| Command Code     | Parameter        |
|------------------|------------------|
| REGENERATE-ACDRT | [ART=<NUMBER>] ; |

#### Examples:

##### 1. Regenerate ART 16

Input:

```
REGENERATE-ACDRT:ART=16;
```

Output:

```
ADD-ACDRT:16,4;
CHANGE-ACDRT:16,ARTSTEP,1,COND,75,AGTAVLGT,5,3;
CHANGE-ACDRT:16,ARTSTEP,2,RTOFF,00897994880;
CHANGE-ACDRT:16,ARTSTEP,3,RTGRP,5;
CHANGE-ACDRT:16,ARTSTEP,4,DISCON;
```

##### 2. Regenerate all ACDRTs

Input:

```
REGENERATE-ACDRT;
```

Output:

```
SET-ACDRT:2,MAX,1;

### 4.3.6 COPY-ACDRT

The COPY-ACDRT function copies ACD routing tables.

With COPY-ACDRT, ARTs can be copied from existing ARTs by specifying the ART number (ART) to copy from and the desired new ART number (NEWART) to be assigned.

#### Procedure Overview

| Command Code | Parameter                      |
|--------------|--------------------------------|
| COPY-ACDRT   | ART=<NUMBER>, NEWART=<NUMBER>; |

#### Example:

Copy an ART from an existing ART.

Input:

COPY-ACDRT:ART=54,NEWART=97;

Output:

H07: ACD ROUTING TABLE=97 HAS BEEN CREATED AS A COPY OF TABLE ART=54.

### 4.3.7 SET-ACDRT

The SET-ACDRT function modifies ACD routing tables 2 to 15.

This function is used to change, insert, and delete steps in an existing ART using the step modify mode (TYPE=ARTSTEP, INSSTEP, and DELSTEP, respectively). This function is also used to change the maximum number of steps (MAXSTEP) for ARTs 2 to 15 using the table modify mode (TYPE=MAX).

SET-ACDRT may only be used by service personnel.

When using MAXSTEP to decrease the number of steps, the steps that are to be "deleted" are checked. If these steps have not been set to skip steps, or if the steps are referenced in a GOTO (GSTEP) or conditional (COND) step, an error will be generated.

If the VALOLD parameter is specified for testing the oldest call in a queue, the number of minutes and seconds will be entered using the following format:

mmm-ss

Minutes may be entered alone. If seconds are to be specified, both minutes and seconds must be entered, even when minutes are zero as shown:

| Entered | Minutes | Seconds |
|---------|---------|---------|
| 0-35    | 0       | 35      |
| 2-0     | 2       | 0       |
| 2       | 2       | 0       |
| 0-0     | 0       | 0       |
| 0       | 0       | 0       |

### Procedure Overview

| Command Code | Parameter                                       |
|--------------|-------------------------------------------------|
| SET-ACDRT    | ART=<NUMBER>,<br> , TYPE=MAX, MAXSTEP=<number>; |

## ACDRT - ACD Routing Tables

### Functions of the AMO

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <pre>  ,TYPE={ARTSTEP,INSSTEP},STEP=&lt;number&gt;  ,ACT=&lt;DELAYRB&gt;;  ,ACT=&lt;DISCON&gt;;  ,ACT=&lt;SKIP&gt;;  ,ACT=&lt;GOSTEP&gt;,GSTEP=&lt;number&gt;;  ,ACT=&lt;WTSEC&gt;,SEC=&lt;number&gt;;  ,ACT=&lt;RTAGT&gt;,AGTID=&lt;number&gt;;  ,ACT=&lt;RTEXT&gt;,EXTNUM=&lt;number&gt;;  ,ACT=&lt;RTGRP&gt;,ACDGRP=&lt;number&gt;;  ,ACT=&lt;RTMUS&gt;,MUSNUM=&lt;number&gt;;  ,ACT=&lt;RTOFF&gt;,DIRNUM=&lt;number&gt;;  ,ACT=&lt;RTREC&gt;,RECNUM=&lt;number&gt;;  ,ACT=&lt;WTAPPL&gt;,APPLSEC=&lt;number&gt;;  ,ACT=&lt;RHEART&gt;;  ,ACT=&lt;HEARTCND&gt;,APPLNAM=&lt;string&gt;,HEARTSEC=&lt;number&gt;, CONDSTEP=&lt;number&gt;;  ,ACT=COND,CACDGRP=&lt;number&gt;,CGSTEP=&lt;number&gt;  ,TEST=CALQEDEQ,VALCAL=&lt;number&gt;;  ,TEST=CALQEDNE,VALCAL=&lt;number&gt;;  ,TEST=CALQEDLT,VALCAL=&lt;number&gt;;  ,TEST=CALQEDGT,VALCAL=&lt;number&gt;;  ,TEST=OLDINQEQ,VALOLD=&lt;number&gt;;  ,TEST=OLDINQNE,VALOLD=&lt;number&gt;;  ,TEST=OLDINQLT,VALOLD=&lt;number&gt;;  ,TEST=OLDINQGT,VALOLD=&lt;number&gt;;  ,TEST=AGTLGNEQ,VALAGT=&lt;number&gt;;  ,TEST=AGTLGNNE,VALAGT=&lt;number&gt;;  ,TEST=AGTLGNLT,VALAGT=&lt;number&gt;;  ,TEST=AGTLGNGT,VALAGT=&lt;number&gt;;  ,TEST=AGTAVLEQ,VALAGT=&lt;number&gt;;  ,TEST=AGTAVLNE,VALAGT=&lt;number&gt;;  ,TEST=AGTAVLLT,VALAGT=&lt;number&gt;;  ,TEST=AGTAVLGT,VALAGT=&lt;number&gt;;  ,TYPE=DELSTEP,STEP=&lt;number&gt;; </pre> |

#### Examples:

1. Change step 1 of ART 2 to SKIP.

Input:

```
SET-ACDRT: ART=2,TYPE=ARTSTEP,STEP=1,ACT=SKIP;
```

Output:

```

H05: THE ACTION OF THE STATEMENT CONTAINED IN STEP
ART:STEP=2:01
HAS BEEN CHANGED TO ACT=SKIP.

```

Refer to CHANGE function for more examples.

### 4.3.8 TEST-ACDRT

The TEST-ACDRT function displays the dial plan groups used in the steps RTOFF and RTEXT.

Using TEST-ACDRT the craft can compare the ACD dial plan groups configured by AMO ZAND (parameter ACDDPLN) with the dial plans used in ACD routing tables in steps 'Route to Offsite Number (RTOFF)' and 'Route to Extension (RTEXT)'.

If in the table produced by TEST-ACDRT no access code appears for an ACD dial plan group number configured by AMO ZAND, then we know that no ACD calls will be routed to that ACD destination.

#### Procedure Overview

| Command Code | Parameter |
|--------------|-----------|
| TEST-ACDRT   | ;         |

#### Example:

Check if the configured route to offsite and route to extension steps will still be valid after changing the ACD dial plan group in AMO ZAND to 3 (AMO ZAND, ACD, ACDDPLN).

Input:

TEST-ACDRT;

Output:

|                                    |                     |       |            |
|------------------------------------|---------------------|-------|------------|
| +-----+-----+-----+-----+          |                     |       |            |
| ACDDPLN = 3 (AMO ZAND:ACD,ACDDPLN) |                     |       |            |
| +-----+-----+-----+-----+          |                     |       |            |
| ART:STEP                           | DIRNUM (RTOFF STEP) | CD    | DPLN GROUP |
| +-----+-----+-----+-----+          |                     |       |            |
| 17:3                               | 098984637           | 0     | 0          |
| +-----+-----+-----+-----+          |                     |       |            |
|                                    |                     | 0     | 1          |
| +-----+-----+-----+-----+          |                     |       |            |

|                                    |                     | ----- | 12         |
|                                    |                     | ----- | 13         |
|                                    |                     | ----- | 14         |
|                                    |                     | ----- | 15         |

#### COMMENTS:

- In ART 17, STEP 3 there is a route to offsite number configured. The string "-----" in the row corresponding to the dial plan group within column CD (call destination) means that

- a) either the access code 0 is not configured in the dial plan 3,
- b) or the access code 0 is configured, but there is no route associated with this access code.

The ACD destination is unreachable in both cases.

- In ART 18, STEP 3 there is a route to extension, in fact a HUNT GROUP with number 8888. The repetition of this number in the row corresponding to dial plan group 3 (in column CD) means that this number is defined by AMO WABE and consequently no problem will occur after changing the ACD dial plan (ACDDPLN) to 3 using AMO ZAND.

## 4.4 Parameter Descriptions

|        |                  |                           |                                              |
|--------|------------------|---------------------------|----------------------------------------------|
| ACDGRP | ACD Group number |                           |                                              |
|        | Type of Input    | : single value, mandatory |                                              |

## 5 ACDSD - ACD System Data

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

AMO ACDSD maintains the ACD system data. The AMO supports three tables: System Table, Message Table, and Route Control Group Table. The actions performed by this AMO are: CHANGE, DISPLAY, and REGENERATE.

### System Table

The System Table contains eight fields: FEATURE, AGTIDLEN, QFACTOR, AGTTARGET, DELAYRBT, SMTIMER, SERVCOUT and MONPIN.

The System Table parameters are modified by the CHANGE command except when the FEATURE is blocked by AMO-ZAND.

The AGTIDLEN determines the length of the ACD agent id. Its value range is from 1 to 6 digits.

The QFACTOR is the length of the waiting time spent in a queue after which the priority of all calls in a queue is upgraded. Its value ranges from 0 to 300 seconds with increments of 5 seconds. A QFACTOR value which is not an increment of 5 seconds, is rounded up or down to ensure multiples of 5 only. If the QFACTOR value is less than 5, it is rounded up to 5 seconds since 0 has a special significance. The value of 0 seconds indicates that a priority is not changed for an ACD call. Call Processing is sent an event when the QFACTOR is modified from a zero value to a non-zero value (see CHANGE action).

The AGTTARGET determines if the ACD agent is targeted by the agent's ID number or by the agent's logged on EXTENSION. This is used by the ACD features Silent/Tone Monitoring, Control of Agent Features and Short Message service. In the short message service, when the AGTTARGET is set to EXTENSION, the agent does not have to be logged on in order to receive messages. If the AGTTARGET is set to ID, the agent must be logged on in order to receive messages.

For AGTIDLEN, QFACTOR, and AGTTARGET, there are default values set in the Database.

The DELAYRBT is the Delay Ringback timer (used for internal and external calls). Its value range is from 1 to 25 seconds. This timer must be set lower than the lowest T310 timer of any of the PRI public network switches which are connected to the Hicom CBX. For details on the carrier's T310 timer value, the craftperson should contact the local carrier's Technical Representative.

The Silent/Tone Monitoring Connection Delay Timer (SMTIMER) controls the amount of time used by ACD Call Processing to establish an initial connection to an agent to be monitored or to re-establish a subsequent connection to an agent being monitored. The values for silent/tone monitoring connection delay time can be one of two values; 500 or 3000msecs.

The SERVCOUT field allows the activation and deactivation of the Service Out feature on an ACD system-wide basis. The Service Out feature puts an ACD agent's phone into an "unavailable" mode for Ring-No-Answer situations. The SERVCOUT field when set to YES, indicates the Service Out feature is active (default) and, when set to NO, indicates the Service Out feature is not active.

With the MONPIN flag it can be set if the system should protect the Silent/Tone Monitoring feature with a security PIN code.

#### Message Table

The Message Table contains two fields: MESSAGE and MSGTYPE. The MESSAGE field is a text field of up to 24 characters initialized to blanks by Database.

The MSGTYPE field selects among the seventeen message records which fall into three categories: EMERGENCY, AGENT and SUPERVISOR. One of the records holds an emergency message. There are 8 further records for "agent to supervisor messages (SPV)", and 8 further records for "supervisor to agent messages (AGT)". The text of all seventeen messages can be modified by the craftsperson through the CHANGE action.

#### Route Control Group Table

The third table is the Route Control Group table. This table is indexed by the RCG field and contains the internal directory number field (CAFDN). The RCG is initialized for use in the system when it receives a CAFDN value. The Digit Analysis Result (DAR) of this internal number must be set to 'RCG' by AMO WABE. The RCG value ranges from 1 to 1020. The CAFDN is the directory number pertaining to a RCG with a value range from 1 to 6 digits. A RCG's CAFDN value can only be assigned or unassigned. It may not be changed from one extension to another. In order to change a CAFDN value, first delete the CAFDN and the RCG, then add back the RCG with its new CAFDN value. The value is required, therefore a default value is not given.

AMO DIMSU controls the memory allocations for the RCG table.

## 5.1 Restrictions

This description is valid from HiPath 4000 V1.0

## 5.2 Interrelationships

- AMO ACDRS : Before using the RCG in the route selection AMO ACDRS checks if it has been created. AMO ACDSD can not delete a RCG that is being used in the route selection table.
- AMO AGENT : AMO ACDSD can not change the agent ID length until all ACD agents are deleted.
- AMO CTIME : The user must assure that the delay ringback timer (DELAYRBT) is greater or equal than the ACL route request timer (ROUTEREQ). Else the Call Bridge can not route the ACD call because the delay ringback timer has been expired before the ACL route request timer.
- AMO DIMSU : Dimensioning of ACD Route Control Groups (ACDRCG).
- AMO DNIT : Before using the RCG in the Directory Number Identification table AMO DNIT checks if it has been created.
- AMO XAPPL : Can set RCG(s) as a monitored element. AMO ACDSD can not delete a RCG which is being monitored.
- AMO ZAND : Activates the ACD feature. No changes (CHANGE-ACDSD) can be performed unless the ACD feature is turned on.
- AMO WABE : Sets the Digit Analysis Result (DAR) of the CAFDN value for RCG.

## 5.3 Functions of the AMO

- [CHANGE-ACDSD](#) : Change ACD system data
- [DISPLAY-ACDSD](#) : Display ACD system data
- [REGENERATE ACDSD](#) : Regenerate ACD system data

### 5.3.1 CHANGE-ACDSD

No changes can be performed unless the ACD feature is turned on (see AMO ZAND). The CHANGE function serves for modifying the ACD system data.

## Functions of the AMO

AGTIDLEN cannot be changed if there are ACD agents configured in the system (see AMO AGENT).

The branch TYPE=MSG is used for changing the message texts.

The branch TYPE=CAFRCG is used to update the assignment of a Control Agent Facilities Directory Number (CAFDN) to a Route Control Group. The CAFDN must have a digit analysis result DAR=RCG set by AMO WABE. If an asterisk is entered (CAFDN = \*) the number is set to NULL and the RCG is deleted. A RCG cannot be deleted if it is referenced by the Route Selection Table (AMO ACDRS).

## Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-ACDSD | TYPE=SYS, [AGTIDLEN=<number>], [QFACTOR=<number><br>, [AGTTARGET=<param>], [DELAYRBT=<number><br>, [SMTIMER=<number>], [SERVCOUT=<param> ]<br>, [MONPIN=<param>], [AGTFWD=<param>]<br>, [NACDAWK=<param>];<br><br>  TYPE=MSG, MESSAGE=<string><br>  , MSGCAT=AGT   SPV, MSGNUM=<number>;<br>  , MSGCAT=EMER;<br><br>  TYPE=CAFRCG, RCG=<number>, CAFDN=<key-num>; |

1. In the system table, set agent ID length to 4, set QFACTOR to 20 and the agent target to ID.

CHANGE-ACDSD:TYPE=SYS,AGTIDLEN=4,QFACTOR=20,AGTARGT=ID;

Output:

H02: THE REQUIRED AGENT IDENTIFIER LENGTH HAS BEEN  
CHANGED TO AGTIDLEN=4 DIGITS.

H05: THE TYPE OF AGENT IDENTIFICATION (TARGET TYPE)  
HAS BEEN CHANGED TO AGTTARGET=ID.

H06: THE WAITING TIME FOR ACQUIRING THE NEXT HIGHEST CALL  
PRIORITY HAS BEEN CHANGED TO QFACTOR=20 SECONDS.

## 2. In the system table, set delay ringback timer to 13.

### Input:

CHANGE-ACDSD:TYPE=SYS,DELAYRBT=13;

### Output:

H01: THE DELAY RINGBACK TIMER SETTING HAS BEEN CHANGED TO  
DELAYRBT=13 SECONDS. THIS SETTING MAY NOT BE  
LESS THAN THE ACL ROUTE REQUEST TIMER SETTING, ELSE THE  
CALL BRIDGE CAN'T ROUTE THE ACD CALL BECAUSE THE DELAY  
RINGBACK TIMER EXPIRES BEFORE THE ACL ROUTE REQUEST TIMER.  
(SEE AMO CTIME, ROUTEREQ).

## 3. In the message table, change the agent's message number 4 (sent by the supervisor) to "call 4".

### Input:

CHANGE-ACDSD:TYPE=MSG,MESSAGE="CALL 4",MSGCAT=AGT,MSGNUM=4;

### Output:

H03: THE CAF DIRECTORY NUMBER FOR RCG (CAFDN) HAS  
BEEN ASSIGNED TO ROUTE CONTROL GROUP RCG=4.

## 4. In the CAFRCG table, change route control group number 6 to have directory number 542341.

### Input:

CHANGE-ACDSD:TYPE=CAFRCG,RCG=6,CAFDN=542341;

### Output:

H04: THE CAF DIRECTORY NUMBER FOR RCG (CAFDN) HAS  
BEEN ASSIGNED TO ROUTE CONTROL GROUP RCG=6.

## 5.3.2 DISPLAY-ACDSD

All ACD system data are displayed through the use of function  
DISPLAY-ACDSD. It displays the tables SYS, MSG, and CAFRCG. The  
tables can be displayed one by one, in chain, or all. If no value is  
entered, all three tables are displayed.

Additionally, as information for service personnel, the ACD lodens/ltg lines are shown.

There are no error messages associated with the function DISPLAY-ACDSD.

**Procedure Overview**

| Command Code  | Parameter                                                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-ACDSD | [TYPE=SYS] ;<br><br>  [TYPE=MSG<br>  , [MSGCAT=AGT SPV] , [MSGNUM=<number>] ;<br>  , [MSGCAT=EMER] ;<br><br>  [TYPE=CAFRCG] , [RCG=<number>] ; |

**Examples:**

1. Display system table.

Input:

DISP-ACDSD:TYPE=SYS;

Output:

|                 |      |               |      |       |       |      |                  |     |      |  |

5.3.3 REGENERATE ACDSD

A craftsperson can regenerate any of the ACD System Data AMO commands through the use of function REGENERATE-ACDSD.

There are no error/advisory messages associated with the function REGENERATE-ACDSD.

**Attention:** Output will be suppressed for REGENERATE-ACDSD if the ACD feature is not activated (CHANGE-ZAND:TYPE=ACD,ACDALLOW=NO;) !

Procedure Overview

| Command Code     | Parameter                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REGENERATE-ACDSD | [TYPE=SYS] ;<br><br>  [TYPE=MSG], [MSGCAT=<param>];<br>  , [MSGCAT=AGT SPV], [MSGNUM=<number>];<br>  , [MSGCAT=EMER];<br><br>  [TYPE=CAFRCG], [RCG=<number>]; |

**Examples:**

1. Regenerate the System Table.

Input:

REGEN-ACDSD:SYS;

Output:

CHANGE-ACDSD:SYS,6,20,ID,13,500,YES,NO,YES,NO;

2. Regenerate all ACDSD's Tables; System, Message, and Route Control Group.

Input:

REGEN-ACDSD;

Output:

CHANGE-ACDSD:SYS,6,20,ID,13,500,YES,NO,YES,NO;  
CHANGE-ACDSD:MSG,"MESSAGE 1: SUPV TO AGENT",AGT,1;  
CHANGE-ACDSD:MSG,"MESSAGE 2: SUPV TO AGENT",AGT,2;  
CHANGE-ACDSD:MSG,"MESSAGE 3: SUPV TO AGENT",AGT,3;  
CHANGE-ACDSD:MSG,"MESSAGE 4: SUPV TO AGENT",AGT,4;  
CHANGE-ACDSD:MSG,"MESSAGE 5: SUPV TO AGENT",AGT,5;  
CHANGE-ACDSD:MSG,"MESSAGE 6: SUPV TO AGENT",AGT,6;  
CHANGE-ACDSD:MSG,"MESSAGE 7: SUPV TO AGENT",AGT,7;  
CHANGE-ACDSD:MSG,"MESSAGE 8: SUPV TO AGENT",AGT,8;  
CHANGE-ACDSD:MSG,"MESSAGE 1: AGENT TO SUPV",SPV,1;  
CHANGE-ACDSD:MSG,"MESSAGE 2: AGENT TO SUPV",SPV,2;  
CHANGE-ACDSD:MSG,"MESSAGE 3: AGENT TO SUPV",SPV,3;  
CHANGE-ACDSD:MSG,"MESSAGE 4: AGENT TO SUPV",SPV,4;  
CHANGE-ACDSD:MSG,"MESSAGE 5: AGENT TO SUPV",SPV,5;  
CHANGE-ACDSD:MSG,"MESSAGE 6: AGENT TO SUPV",SPV,6;  
CHANGE-ACDSD:MSG,"MESSAGE 7: AGENT TO SUPV",SPV,7;  
CHANGE-ACDSD:MSG,"MESSAGE 8: AGENT TO SUPV",SPV,8;  
CHANGE-ACDSD:MSG,"EMERGENCY: AGENT TO SUPV",EMER;  
CHANGE-ACDSD:CAFRCG,1,43201;  
CHANGE-ACDSD:CAFRCG,2,43202;  
CHANGE-ACDSD:CAFRCG,3,43203;  
CHANGE-ACDSD:CAFRCG,4,43204;

## 5.4 Parameter Description

|                 |                          |
|-----------------|--------------------------|
| AGTFWD          | Forward of agents        |
| Type of Input   | : single value, optional |
| Possible Values | : YES                    |
|                 | NO                       |

## ACDSD - ACD System Data

### Parameter Description

|           |                                                 |                                                                        |
|-----------|-------------------------------------------------|------------------------------------------------------------------------|
|           | Default Value                                   | : NO                                                                   |
| AGTIDLEN  | ACD Agent's ID Length                           |                                                                        |
|           | Type of Input                                   | : single value, optional                                               |
|           | Possible Values                                 | : numeric, 1-6                                                         |
|           | Default Value                                   | : 6 (database default)                                                 |
| AGTTARGET | ACD Agent Target                                |                                                                        |
|           | Type of Input                                   | : single value, optional                                               |
|           | Possible Values                                 | : EXT                      Extension of Agent                          |
|           |                                                 | ID                      Identification Number of Agent                 |
|           | Default Value                                   | : EXT (database default)                                               |
| CAFDN     | Control Agent Facility Directory Number for RCG |                                                                        |
|           | Type of Input                                   | : single value, mandatory                                              |
|           | Possible Values                                 | : 0-9,*, up to 6 characters                                            |
|           | Default Value                                   | : none                                                                 |
| DELAYRBT  | Delay Ringback Timer                            |                                                                        |
|           | Type of Input                                   | : single value, optional                                               |
|           | Possible Values                                 | : numeric, 1-25                                                        |
|           | Default Value                                   | : 5 (database default)                                                 |
| MESSAGE   | Message Text                                    |                                                                        |
|           | Type of Input                                   | : single value, mandatory                                              |

## 6 ACMSM - ACL Manager Communication Parameters

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO ACMSM ( ACL Manager Specification of Communication Parameters ) specifies all parameters needed by the ACL Manager to allow communication between an ACL application and the ACL Complex .

Before executing the ADD-ACMSM command, one must execute first ADD-CPSM / CPTP command in order to configure the port on the server and the physical communication parameters of the application.

The execution of DELETE-CPSM / CPTP command has to be immediately followed by the execution of DELETE-ACMSM command .

One must also execute the ADD-XAPPL command before executing ADD-ACMSM.

ADD-XAPPL configures an application number for the ACL application as well as the CP specific information for the ACL application .The execution of ADD-XAPPL is not necessary for the configuration of the Message Trace Function. However, the assignment of an application number for the Message Trace Function should be coordinated with the application numbers already configured through ADD-XAPPL.

Depending on whether the ACL application is host-based or server-based, the relationships between fields in the commands CPSM, CPTP, XAPPL and ACMSM are shown in the Tables below:

### HOST-Based Application:

| AMO             | CPSM    | CPTP (LAN)        | XAPPL  | ACMSM   |
|-----------------|---------|-------------------|--------|---------|
| Matching Fields | EMSAPPL | EMSAPPL           |        | PBXAPPL |
|                 | DPAPPL  | DPAPPL            | APPLDP | ACLAPPL |
|                 | PROCID  | DPPROC            |        | PROCID  |
|                 |         | NO<br>(TYPE=APPL) | APPLNO | APPLNO  |
|                 | UNIT    |                   | UNIT   | UNIT    |

## ACMSM - ACL Manager Communication Parameters

### Restrictions

#### SERVER-Based Application:

| AMO             | CPSM    | CPTP (LAN)        | XAPPL  | ACMSM   |
|-----------------|---------|-------------------|--------|---------|
| Matching Fields | EMSAPPL | EMSAPPL           | APPLDP | ACLAPPL |
|                 | DPAPPL  | DPAPPL            |        | PBXAPPL |
|                 | PROCID  | DPPROC            |        | PROCID  |
|                 |         | NO<br>(TYPE=APPL) | APPLNO | APPLNO  |
|                 | UNIT    |                   | UNIT   | UNIT    |

## 6.1 Restrictions

This description is valid from SP300E-V2.0

## 6.2 Interrelationships

- AMO CPSM      Communication Parameters for Data Link  
  
Is required by all ACL applications: host-based and server-based;  
it has the role to establish the communication parameters between CMS and the ACL application(s) or CMS
- AMO CPTP      Communication Parameters for TCP/IP connection.
- AMO XAPPL      Data Processing Applications  
  
Is required by all ACL applications:  
host-based and server-based;  
it has the role to establish the configuration of CP specific information for ACL applications.
- AMO BCSM      Board Configuration Service Module  
  
Only required if ACL appl. on host computer
- AMO TCSM      Terminal Configuration, Service Module  
  
Only required if ACL appl. on host computer
- AMO LCSM      Line Configuration in a Server  
  
Only required if ACL appl. on host computer

## 6.3 Functions of the AMO

- **ADD-ACMSM** : ACL Manager Specific Configuration
- **CHANGE-ACMSM** : Change communication parameters
- **DELETE-ACMSM** : Delete communication parameters
- **DISPLAY-ACMSM** : Interrogate the communication parameters
- **REGENERATE-ACMSM** : Regenerate the database for the communication parameters

### 6.3.1 ADD-ACMSM

This function is used to configure the ACL application communication parameters, for the ACL Manager.

#### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-ACMSM    | <pre>[UNIT=&lt;param&gt;],APPLNO=&lt;number&gt;  ,TYPE=TRACE,ACLAPPL=&lt;string&gt;,PBXAPPL=&lt;string&gt; ,PROCID=&lt;string&gt;;  ,TYPE=ACLAPPL,ACLAPPL=&lt;string&gt;,PBXAPPL=&lt;string&gt; ,PROCID=&lt;string&gt;,ACCESS=&lt;param&gt;,[PASSWD=&lt;string&gt;]  ,[PACKAGE=Y],MAXSBYTE=&lt;number&gt;,MAXRBYTE=&lt;number&gt;;  ,[PACKAGE=N];</pre> |

#### Examples

1. Create a configuration for the host-based application "DECAPPL" and which enables message packaging.

Input:

```
ADD-ACMSM:A1,16,ACLAPPL,"DECAPPL","ACM","H1",CB,"DECPWD",Y,500,750;
```

Output:

Start- and End message

2. Create a configuration for the host-based application "DICAPPL" and which disables message packaging.

Input:

```
ADD-ACMSM:A1,17,ACLAPPL,"DICAPPL","ACM","H1",CB,,N;
```

Output:

Start- and End message

3. Create a configuration for the ACL Message Trace Function.

Input:

ADD-ACMSM:A1,18,TRACE,"TRACE","ACM","TRACEPRC";

Output:

Start- and End message

6.3.2 CHANGE-ACMSM

This command is used to modify parameter values in the database. It may only be executed if the ACL application has already been configured ( with ADD-ACMSM ).

Once configured , the values for parameters UNIT, APPLNO, TYPE , ACLAPPL, PBXAPPL and PROCID are not allowed to be changed. New values for these parameters must be configured with ADD-ACMSM command.

All other parameter values in the database can be changed by entering the value PARAMETER for the parameter CHTYPE.

The Event Stream to an application can be turned on/off by entering the value STREAM for the parameter CHTYPE.

Procedure Overview

| Command Code | Parameter                                                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-ACMSM | [UNIT=<param>],APPLNO=<number><br> ,CHTYPE=STREAM,STREAM=<param>;<br> ,CHTYPE=PARAMETER,[PASSWD=<string>]<br> ,[PACKAGE=Y],MAXSBYTE=<number>,MAXRBYTE=<number>;<br> ,[PACKAGE=N]; |

Examples

1. Turn on the event stream to the application 16 .

Input:

CHANGE-ACMSM:A1,16,STREAM,ON;

Output:

Start- and End message

2. For application 6 disable message packaging.

Input:

CHANGE-ACMSM:A1,6,PARAMETER,,N;

Output:

Start- and End message

3. For application 99 , disable message packaging, and change the password.

Input:

CHANGE-ACMSM:A1,99,PARAMETER,"PARPWD",N;

Output:

Start- and End message

4. For the application 17 ,enable message packaging.

Input:

CHANGE-ACMSM:A1,17,PARAMETER,Y,500,800;

Output:

Start- and End message

## 6.3.3 DELETE-ACMSM

This command is used to delete configurations, for the ACL applications, from the database.

An application is indicated by its application number.

If the user enters value "ALL" for the parameter APPLIC, all configurations for ACL applications in the specified unit will be deleted from the database.

If the user wants to delete from the database only one configuration , she/he must enter value "ONE" for the parameter APPLIC and then specify the ACL application number.

### Procedure Overview

| Command Code | Parameter                                                       |
|--------------|-----------------------------------------------------------------|
| DELETE-ACMSM | [UNIT=<param><br> ,APPLIC=ALL;<br> ,APPLIC=ONE,APPLNO=<number>; |

Examples

1. Delete from the database the configurations for the applications 17 and 99 in unit A1.

Input:

DELETE-ACMSM:A1,ONE,17;

Output:

Start- and End message

Input:

DELETE-ACMSM:A1,ONE,99;

Output:

Start- and End message

6.3.4 DISPLAY-ACMSM

This function is used to interrogate the specified parameters for the communication between an ACL application and the ACL Complex(s).

Procedure Overview

| Command Code  | Parameter                          |
|---------------|------------------------------------|
| DISPLAY-ACMSM | [UNIT=<param>], [APPLNO=<number>]; |

Examples

1. Output the link parameters for all applications in A1

Input:

DISPLAY-ACMSM: A1;

Output:

|        |      |          |           |                 |                  |
|--------|------|----------|-----------|-----------------|------------------|
| UNIT   | : A1 | TYPE     | : ACLAPPL |                 |                  |
| APPLNO | : 16 | ACLAPPL: | DECAPPL   | PBXAPPL: ACM    | PROCID: H1       |
|        |      | ACCESS   | : CB      | PASSWD : DECPWD |                  |
|        |      | PACKAGE: | YES       | MAXSBYTE: 500   | MAXRBYTE: 750    |
| UNIT   | : A1 | TYPE     | : ACLAPPL |                 |                  |
| APPLNO | : 6  | ACLAPPL: | DEXAPPL   | PBXAPPL: ACM    | PROCID: H1       |
|        |      | ACCESS   | : CB      | PASSWD : ASCPWD |                  |
|        |      | PACKAGE: | NO        |                 |                  |
| UNIT   | : A1 | TYPE     | : ACLAPPL |                 |                  |

+-----+-----+

```

## 6.3.5 REGENERATE-ACMSM

This function outputs the communication parameters in form of a command listing.

### Procedure Overview

| Command Code     | Parameter      |
|------------------|----------------|
| REGENERATE-ACMSM | [UNIT=<param>; |

### Example

Output all data as position-oriented ADD commands.

### Input:

REGENERATE-ACMSM:A1;

### Output:

```

ADD-
ACMSM:A1,16,ACLAPPL,"DECAPPL","ACM","H1",CB,"DECPWD",Y,500,750;
ADD-ACMSM:A1,6 ,ACLAPPL,"DEXAPPL","ACM","H1",CB,"ACSPWD,N;
ADD-
ACMSM:A1,13,ACLAPPL,"UNIXAPPL","ACM","APPLPROC",CB,"PDSPWD",N;
ADD-ACMSM:A1,18,TRACE,"TRACE","ACM","TRACEPRC";

```

## 6.4 Parameter Description

ACCESS            Accessible ACL Function

## ACMSM - ACL Manager Communication Parameters

### Parameter Description

Type of Input : single value, mandatory  
Possible Values : CB Call Bridge connection set-up (World, except USA)  
ECCS host-controlled connection set-up (USA only)

ACLAPPL ACL Application Name

Type of Input : single value, mandatory  
Possible Values : text, up to 8 characters

APPLIC Applications to be deleted

Type of Input : single value, mandatory  
Possible Values : ALL delete all parameters  
ONE delete one parameter

APPLNO ACL Application Number

Type of Input : single value, mandatory (ADD / CHANGE / DELETE,APPLIC=ONE)  
single value, optional (DISPLAY)  
Possible Values : numeric, 2-99

CHTYPE Type of change

Type of Input : single value, mandatory  
Possible Values : PARAMETER change parameter  
STREAM stream switch on/off

MAXSBYTE Send Message max. bytes number

Type of Input : single value, mandatory (ADD,TYPE=ACLAPPL,PACKAGE=Y)  
single value, optional  
(CHANGE,CHTYPE=PARAMETER,PACKAGE=Y)  
Possible Values : numeric, 256-1020

MAXRBYTE Receive Message max. bytes number

Type of Input : single value, mandatory (ADD,TYPE=ACLAPPL,PACKAGE=Y)  
single value, optional  
(CHANGE,CHTYPE=PARAMETER,PACKAGE=Y)

|         |                              |                            |
|---------|------------------------------|----------------------------|
|         | Possible Values              | : numeric, 256-1020        |
| PACKAGE | Enable Message Packaging     |                            |
|         | Type of Input                | : single value, optional   |
|         | Possible Values              | : N no                     |
|         |                              | Y yes                      |
| PASSWD  | Password                     |                            |
|         | Type of Input                | : single value, optional   |
|         | Possible Values              | : text, up to 8 characters |
|         | Default Value                | : blanks (no password)     |
|         | Default Value                | : N                        |
| PBXAPPL | Communication Partner Name   |                            |
|         | Type of Input                | : single value, mandatory  |
|         | Possible Values              | : text, up to 8 characters |
|         | Default Value                | :                          |
| PROCID  | Data Processing Processor ID |                            |
|         | Type of Input                | : single value, mandatory  |
|         | Possible Values              | : text, up to 8 characters |
|         | Default Value                | :                          |
| STREAM  | Event Stream ON/OFF          |                            |
|         | Type of Input                | : single value, mandatory  |
|         | Possible Values              | : OFF off                  |
|         |                              | ON on                      |
|         | Default Value                | : OFF                      |
| TYPE    | Application Type             |                            |
|         | Type of Input                | : single value, mandatory  |
|         | Possible Values              | : ACLAPPL acl application  |

## 6.5 Error Messages and Advisories

### 6.5.1 Error Messages

F01: APPLICATION NUMBER @@@ HAS NOT BEEN CONFIGURED.

F02: IN THE UNIT @@, THE NUMBER @@@ HAS ALREADY BEEN ASSIGNED TO THE APPLICATION @@@@.

F03: APPLICATION @@@ IS NOT CURRENTLY SIGNED ON.

F04: EVENT STREAM WAS TURNED OFF BY @@@ AND THEREFORE CANNOT BE TURNED ON BY THE AMO.

F05: THE COMBINATION ACLAPPL=@@@@@, PBXAPPL=@@@@@, PROCID=@@@@@ MAY ONLY BE USED ONCE.

F07: FOR THE UNIT @@ AND APPLNO @@@ EXIST NO CONFIGURATION IN THE DATABASE.

F08: EVENT STREAM SWITCHING ON/OFF CURRENTLY NOT ALLOWED.

F09: DATABASE IS FULL; NO MORE PARAMETER CONFIGURATIONS ALLOWED.

F10: TO ENABLE MESSAGE PACKAGING, THE MAXIMUM NUMBER OF BYTES ACL APPLICATION MAY RECEIVE IN ONE MESSAGE MUST BE ENTERED.

F11: THE ENTERED NAME @@@@@@ MUST NOT START WITH A BLANK.

F12: THE APPLICATION NUMBER @@@ IS ASSIGNED TO A TRACE FUNCTION.

F15: NO MESSAGE FROM ACL MANAGER

F16: TURN ON/OFF EVENT STREAM NOT POSSIBLE BECAUSE ACM IS NOT ACTIVE.

F17: TO ENABLE MESSAGE PACKAGING, THE MAXIMUM NUMBER OF BYTES ACL APPLICATION MAY SEND IN ONE MESSAGE MUST BE ENTERED.

F18: THE REASON @@@ RECEIVED FROM THE ACL MANAGER IS UNKNOWN.

F19: THE EVENT STREAM CAN NOT BE TURNED ON BY THE AMO BECAUSE IT WAS TURNED OFF BY ACM FLOW CONTROL.

F20: (CAN OCCUR ONLY IN USA SWITCHES)  
THE PARAMETER BRANCH ACCESS = CB CANNOT BE USED IN THE USA;  
IN THE USA ACCESS = ECCS MUST BE USED.

F21: THE PARAMETER BRANCH ACCESS = ECCS CANNOT BE USED;  
PLEASE USE, ACCESS = CB.

F22: DATA BASE CAN NOT BE ACCESSED.

## **6.5.2 Advisories**

H01: THE EVENT STREAM TO THE APPLICATION @@@ IS ALREADY @@@.  
H02: IN THE DATABASE NO CHANGE IS POSSIBLE.  
H03: NO ENTRY IN THE DATABASE.  
H04: THIS CONFIGURATION ALREADY EXISTS.  
H05: CHANGE STREAM IS INITIATED AND TIMER HAS BEEN SET UP.

## **ACMSM - ACL Manager Communication Parameters**

### Error Messages and Advisories

## 7 ACSU - Attendant Console Configuration

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Descriptions</a>        |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

Up to 64 attendant consoles (ATNDs) can be present in a system. They can be divided into up to 16 ATND groups.

ATNDs of type 4 (CORNET-TS on a Up0/E-interface) or PC-Application for ATND (CORNET-T on a Up0/E-interface) can be assigned at SLMO and SLMQ (except SLMQ3) boards and/or boards with the same functionality (SLOP2, STHC and SLMOP).

A mixed assignment of ATND types is possible.

### 7.1 Interrelationships

- AMO ACDRT : Administration of the ACD Routing Tables
- AMO COSSU : Administration of the classes of service
- AMO DIMSU : Administration of the database layout
- AMO HOTLN : Administration of hotline / offhook intercept
- AMO KNDEF : Administration of the virtual nodes
- AMO KNMAT : Assign of the default number if secret ATND number
- AMO LIN : Administration of the location identification number
- AMO NAVAR : Administration of static night switch option data
- AMO VFGR : Attendant console groups
- AMO WABE : Dialing plans, feature access codes Assignment of access codes and digit analysis results in the dial plans

### 7.2 Functions of the AMO

- [ADD-ACSU](#) : Create the static attendant console data
- [CHANGE-ACSU](#) : Change the static attendant console data
- [DELETE-ACSU](#) : Cancel an ATND or optional static ATND data
- [DISPLAY-ACSU](#) : Interrogate the static ATND data
- [REGENERATE-ACSU](#) : Regenerate the static ATND data

### 7.2.1 ADD-ACSU

This function is used to assign an attendant console.

The port location of the attendant console to be assigned is identified with the parameter PEN. An available port must be configured for this PEN. The suitable board type depends on the value of the parameter ACTYPE.

The ATND type is selected by the parameter ACTYPE.

The parameter SATNDNO determines whether the personal number of an ATND (ATNDNO)

- a) does appear on the display of an internal or external station (SATNDNO=NO),
- b) does not appear on the display of an internal or external station (SATNDNO=YES)
- c) or does not appear on the display of an external station (SATNDNO=ONLYEXT). A default number will be displayed. The default number is assigned by the AMO KNMAT.  
(CHANGE-  
KNMAT:NPI=ISDN,LEVEL=<nr>,DNNO=<nr>,DNNOL=OWN,M  
ODCON=OUT&REPEXT,  
NUMRED=<nr>;)

The parameter PUBNUM defines the public telephone number. Related to the public telephone number the type of number (TON) and the numbering plan identification can be entered. An entry for TON and NPI will be ignored if no value for PUBNUM is entered. An advisory message is displayed.

The following combinations of parameter NPI and TON are allowed:

| <b>NPI=ISDN(E.164)</b>                 | <b>NPI=PNP(private)</b>                  | <b>NPI=UNKNOWN</b> |
|----------------------------------------|------------------------------------------|--------------------|
| TON=INTERNAT<br>(international number) | TON=L2REGIO<br>(level 2 regional number) | TON=UNKNOWN        |
| TON=NATIONAL<br>(national number)      | TON=L1REGIO<br>(level 1 Regional number) |                    |
| TON=SUSCR<br>(subscriber number)       | TON=LOCAL<br>(local number)              |                    |
| TON=UNKNOWN<br>(unknown)               | TON=UNKNOWN<br>(unknown)                 |                    |
|                                        | TON=ABBR<br>(abbreviated number)         |                    |

## Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-ACSU     | ATNDNO=<number>, PEN=<gg-u-sss-cc>, DPLN=<number><br>, COS=<number>, [LCOSV=<number>], [SPDC1=<number>]<br>, [SPDC2=<number>, [LANG=<param>], [ACTYPE=<param>]<br>, [EOVR=<param>], [SATNDNO=<param>]<br>, [NNO=<number>], [SRCGRP=<number>], [CLASSMRK=<param>]<br>, [PUBNUM=<number>], [TON=<param>], [NPI=<param>];<br>, [STNOOOS=<number>], [STNOAPE=<param>],<br>, [AMOALTRT=<param>], [CLUSTID=<number>]; |

### Example

#### Adding an ATND

##### Input:

```
ADD-ACSU:ATNDNO=390, PEN=1-1-115-
7, DPLN=0, COS=1, LANG=GER, ACTYPE=ACWMQ;
```

##### Output:

```
H02 : ATNDNO 390 NEEDS TO BE ASSIGNED TO AN ATND GROUP
```

## 7.2.2 CHANGE-ACSU

The function CHANGE makes it possible to modify the parameters defined during creation.

In general, only the new parameter value is entered. The AMO carries out the necessary cross-checks to other data and replaces the old value by the new if the checks are positive. Only when the ATNDNO, which must always be specified for identification, is changed the new ATNDNO have to be specified in parameter NEWNO.

An attendant calling number (ATNDNO) or the feature access group (DPLN) may be changed only if the attendant calling number is not referenced in an ACD routing table. It has to be previously removed by AMO ACDRT.

## Procedure Overview

| Command Code | Parameter                                                                                                                                                                             |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-ACSU  | ATNDNO=<number>, {NEWNO=<number>, DPLN=<number><br>, COS=<number>, LCOSV=<number>, SPDC1=<number><br>, SPDC2=<number>, LANG=<param>, EOVR=<param><br>, SATNDNO=<param>, NNO=<number>, |

## ACSU - Attendant Console Configuration

### Functions of the AMO

| Command Code | Parameter                                                                                                                                                           |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | ,SRCGRP=<number>,CLASSMRK=<param><br>,PUBNUM=<number>,TON=<param>,NPI=<param>;<br>,[STNOOOS=<number>],[STNOAPE=<number>],<br>,[AMOALTRT=<param>],[CLUSTID=<number>; |

### 7.2.3 DELETE-ACSU

The ATND data is divided into optional data and data required for normal operation.

The parameter DELOPT is used to determine if the ATND is to be cancelled altogether, or whether and which optional data is to be cancelled.

When DELOPT = ALL is entered, the created ATND is cancelled so that the associated port location becomes free.

If an ATND entered as a hotline or offhook intercept destination is to be cancelled, an advisory is output that a new destination must be entered.

An ATND may be cancelled only if it is no longer integrated in an ATND group. It has to be previously removed by AMO VFGR.

An attendant may be cancelled only if it is no longer referenced in an ACD routing table. It has to be previously removed by AMO ACDRT.

#### Procedure Overview

| Command Code | Parameter                       |
|--------------|---------------------------------|
| DELETE-ACSU  | ATNDNO=<number>,DELOPT=<param>; |

### 7.2.4 DISPLAY-ACSU

This function makes it possible to output attendant console data.

If ATNDNO is entered, the data regarding the ATND are listed.

If parameter ATNDNO is not specified, the data of all the ATNDs existing in the system is listed.

#### Procedure Overview

| Command Code | Parameter         |
|--------------|-------------------|
| DISPLAY-ACSU | [ATNDNO=<number>; |

### Example

The data for ATNDNO 298 is to be displayed

Input:

DISPLAY-ACSU:ATNDNO=298;

Output:

| ASSIGNED DATA FOR ATTENDANT TERMINAL |      |      |          |  |         |  |            |  |  |
|--------------------------------------|------|------|----------|--|---------|--|------------|--|--|
| ATNDNO                               |      |      | 298      |  | ACTYPE  |  | ACWIN      |  |  |
| =====                                |      |      |          |  | ATNDGR  |  | 0          |  |  |
| -----                                |      |      |          |  | PEN     |  | 1-2- 25- 5 |  |  |
| SRCGRP                               |      |      | 0        |  | NNO     |  | 7- 1- 21   |  |  |
| DPLN                                 |      |      | 0        |  | SPDC1   |  | 0          |  |  |
| COS                                  |      |      | 1        |  | SPDC2   |  | 2          |  |  |
| LCOSV                                |      |      | 1        |  | LANG    |  | GER        |  |  |
| CLASSMRK                             | G711 | G729 |          |  | EOVR    |  | NO         |  |  |
|                                      |      |      |          |  | SATNDNO |  | NO         |  |  |
| PUBNUM                               |      |      | 7220     |  |         |  |            |  |  |
| TON                                  |      |      | NATIONAL |  |         |  |            |  |  |
| NPI                                  |      |      | ISDN     |  |         |  |            |  |  |
| STNOOOS                              |      |      | 456327   |  |         |  |            |  |  |
| STNOAPE                              |      |      |          |  |         |  |            |  |  |
| AMOALTRT                             | NO   |      |          |  | CLUSTID |  | 5          |  |  |

## 7.2.5 REGENERATE-ACSU

If ATNDNO is entered, the data regarding the ATND are regenerated.  
If parameter ATNDNO is not specified, the data of all the ATNDs existing in the system are regenerated.

### Procedure Overview

| Command Code    | Parameter           |
|-----------------|---------------------|
| REGENERATE-ACSU | [ATNDNO=<number>] ; |

## 7.3 Parameter Descriptions

## ACSU - Attendant Console Configuration

### Parameter Descriptions

|                 |        |                   |
|-----------------|--------|-------------------|
| Possible Values | : BRA  | = brazilian       |
|                 | CAT    | = catalan         |
|                 | CFR    | = canadian french |
|                 | CROAT  | = croatian        |
|                 | CZ     | = czech           |
|                 | DAN    | = danish          |
|                 | DUT    | = dutch           |
|                 | ENG    | = english         |
|                 | FIN    | = finnish         |
|                 | FRE    | = french          |
|                 | GER    | = german          |
|                 | GRE    | = greek           |
|                 | HU     | = hungarian       |
|                 | ITA    | = italian         |
|                 | NOR    | = norwegian       |
|                 | PO     | = polish          |
|                 | POR    | = portuguese      |
|                 | RUS    | = russian         |
|                 | SLOVAK | = slovakian       |
|                 | SLOVEN | = slovene         |
|                 | SPA    | = spanish         |
|                 | SWE    | = swedish         |
|                 | TUR    | = turkish         |
| Default Value   | : GER  |                   |

**LCOSV** LCR class of service for voice-services of this attendant

Type of Input : Single value,  
optional (ADD, CHANGE)

Possible Values : 1 - 1000 (ADD, CHANGE)

Default Value : 1

The AC is to be assigned a class of service which contains all LCR authorizations if possible.  
LCOSV = 1 is reserved for this purpose.

**NEWNO** New station number for the ATND

Type of Input : Single value  
optional

Possible Values : 0 - 9, up to 6 characters, NEWNO must exist in the numbering plan

|         |                                                     |                                                                                                                               |                                                                             |

## 7.4 Error Messages and Advisories

### 7.4.1 Error Messages

F01: ATNDNO <xxxxxxx> NOT ASSIGNED

F02: ATNDNO <xxxxxxx> ALREADY ASSIGNED

F03: PEN OCCUPIED OR SIGNED OFF

F06: THE ATTENDANT CONSOLES CANNOT BE ADDED; THE CONTRACTED NUMBER OF FLEX+TDM LICENSES <max> IS REACHED.  
PLEASE USE DISP-CODEW FOR DISPLAY OF THE CONTRACTED FEATURE PACKAGES.  
PLEASE CONTACT YOUR SERVICE CENTER IF YOU WISH TO ADD MORE ATTENDANT CONSOLES.

F08: PEN <gg-u-sss-cc> IS 'SIGNED\_OFF'.  
RELEASE WITH AMO BCSU OR USE AN OTHER PEN.

F09: MAXIMUM NUMBER OF ATNDS REACHED, ATNDNO <xxxxxxx> NOT ASSIGNED

F10: ATNDNO <xxxxxxx> IS STILL IN AN ATND GROUP; DELINK WITH AMO VFGR

F11: ATNDNO <xxxxxxx> CANNOT BE PROCESSED. IT IS STILL REFERENCED IN THE ACD ROUTING TABLE <art-no>.  
DELETE THE ATND BY AMO ACDRT FROM ROUTING TABLES BEFORE REPEATING THIS COMMAND.

F15: PEN ERROR; PERMISSIBLE RANGE FOR LTG: 1-<ltg\_max>

F16: CHANGING OF THE CALLING NUMBER IS ALLOWED BY A SINGLE VALUE FOR ATNDNO ONLY

F17: ATNDNO <xxxxxxx> ENTERED MORE THAN ONCE

F19: NO ADVANCE PROVISION FOR ATNDNO <xxxxxxx> IN DIAL PLAN

F20: NO ENTRY FOR VIRTUAL NODE ID IS EXISTING.  
ADD NO LESS THAN ONE ENTRY WITH AMO KDEF, TYPE=OWN.

F21: INADMISSIBLE VALUE FOR LTU ENTERED IN PEN PARAMETER

F24: LEVEL <x> OF NNO MAY NOT EXCEED <max\_val>

F25: PEN ERROR; SLOT FORMALLY INCORRECT

## ACSU - Attendant Console Configuration

### Error Messages and Advisories

F26: PEN ERROR; PERMISSIBLE RANGE FOR CIRCUIT NUMBER: <0-cct\_max>

F27: NO <bd-type> MODULE ASSIGNED AT THE PEN ENTERED

F29: INSUFFICIENT SUBUNIT RESOURCES FOR ATNDNO <xxxxxx>

F30: INSUFFICIENT DEVICE MEMORY FOR ATNDNO <xxxxxx>

F31: ATNDNO <xxxxxx>: NO MEMORY AVAILABLE FOR DEVICE SEARCH (RULO)  
(AMO DIMSU: PARAMETER <param>)

F32: THE SPECIFIED CLASS OF SERVICE DOES NOT HAVE UNRESTRICTED OUTWARD TOLL AND TIE ACCESS

F33: THE CLASS OF SERVICE SPECIFIED IS NOT ASSIGNED

F35: NNO IS NOT DEFINED IN THE VIRTUAL NODE TABLE (AMO KNDDEF)

F36: LTG <ltg> NOT ASSIGNED

F37: LTU <ltu> NOT ASSIGNED

F38: NO MODULE HAS BEEN ASSIGNED FOR THE SPECIFIED PEN

F39: ATNDNO <xxxxxx>: INVALID COMBINATION OF NPI=<npi> AND TON=<ton>

F40: INSUFFICIENT USER INDEX FOR ATNDNO <xxxxxx> (AMO DIMSU: PARAMETER STN)

F41: CLASSMRK: 'INIT' AND/OR 'NONE' CAN ONLY BE SET EXCLUSIVELY.

F42: STNOOS ^xxxxxxxxxxxxxxxxxxxxxxx^ DOES NOT LEAD TO A VALID DAR.

F43: STNOAPE ^xxxxxxxxxxxxxxxxxxxxxxx^ DOES NOT LEAD TO A VALID DAR.

F44: STNOOS ^xxxxxxxxxxxxxxxxxxxxxxx^ CAN NOT BE THE SAME AS ATNDNO.

F45: STNOAPE ^xxxxxxxxxxxxxxxxxxxxxxx^ CAN NOT BE THE SAME AS ATNDNO.

F46: STNOOS COULD NOT BE ADDED BECAUSE THERE IS NO ENOUGH MEMORY INCREASE MEMORY  
VIA ADD-DIMSU:ALTROUT=<?>;

F47: STNOAPE COULD NOT BE ADDED BECAUSE THERE IS NO ENOUGH MEMORY INCREASE MEMORY  
VIA ADD-DIMSU:ALTROUT=<?>;

F48: THE LCR CLASS OF SERVICE SPECIFIED IS NOT ASSIGNED

F49: THE CGW BOARD CONFIGURATION DATA HAS NOT YET BEEN SET UP  
( ADD-CGWB:LTU=@@, SLOT=@@@, SMODE=NORMAL)

F50: THE ATTENDANT CONSOLES CANNOT BE ADDED; THE CONTRACTED NUMBER  
THE PACKAGE COMSCENDO SECURITY LICENSE <xxxxxx> IS REACHED.  
PLEASE USE DISP-CODEW FOR DISPLAY OF THE CONTRACTED FEATURE PACKAGES.

F51: CGW MODULE IS CURRENTLY DEFINED AS A STANDBY BOARD, WHICH CANNOT BE USED FOR  
ACWINIP DEVICE CONFIGURATION  
( DISP-HFAB:MTYPE=STMIHFA2, LTU=<xx>, SLOT=<xxx>; )

F52: HMUSIC <xxx> IS NOT YET ASSIGNED ( ADD-RCSU:RECAPL=HMUSIC, )

F53: <xxxxxxxxxxxxxx> DPLN <xx> IS NOT ALLOWED FOR NODE <xxxxxxxxxxxxxx>.

F54: FOR PARAMETER IPPASSW EITHER 'NONE' OR AT LEAST  
6 ALPHA-NUMERICAL CHARACTERS MUST BE ENTERED

F55: THE ATTENDANT CONSOLES CANNOT BE ADDED; THE CONTRACTED NUMBER OF  
FLEX LICENSES <xxxxxxxxxx> IS REACHED.  
PLEASE USE DISP-CODEW FOR DISPLAY OF THE CONTRACTED FEATURE PACKAGES.  
PLEASE CONTACT YOUR SERVICE CENTER IF YOU WISH TO ADD MORE ATTENDANT CONSOLES.

## 7.4.2 Advisories

- H01: ATNDNO <xxxxxx> IS STILL ASSIGNED AS A HOTLINE OR OFFHOOK INTERCEPT DESTINATION
- H02: ATNDNO <xxxxxx> NEEDS TO BE ASSIGNED TO AN ATND GROUP
- H03: ATNDNO <xxxxxx>: TON AND NPI ARE IGNORED BECAUSE NO VALUE FOR PUBNUM IS EXISTING
- H05: THE CONTRACTED NUMBER OF FLEX LICENSES IS EXCEEDED.FLEX LICENSE IS MARKED AS TRIAL ENTITY.THE FEATURE FLEX LICENSE WILL BE DEACTIVATED,IF TRIAL MODE EXPIRES WITHOUT SUFFICIENT LICENSES.
- H06: FOR THE ATTENDANT CONSOLE <xxxxxx> NO ALTERNATE ROUTING NUMBER FOR OOS IS CONFIGURED,BUT THE ACTIVATION OF FEATURE ALTERNATE ROUTING HAS BEEN ALREDY DONE. PLEASE CONFIGURE SUBSEQUENTLY EITHER WITH AMO APRT A SOURCEGROUP OR WITH AMO ACSU A SUBSCRIBER INDIVIDUAL ALTERNATE ROUTING NUMBER FOR OOS.
- H07: ATNDNO @@@@: IPCODEC,DMCALLWD AND IPPASSW ARE IGNORED BECAUSE ATNDNO IS NOT TYPE OF ACWMQIP OR ACW2QIP.
- H08: ATNDNO @@@@: SECLEVEL IS IGNORED AS TDM AC SECURITY LEVEL CAN NOT BE SET TO STANDARD OR CIPHER.
- H09: SECLEVEL CHANGE WILL BE INITIATED AFTER DEACTIVATION AND RE-ACTIVATION OF THE SUBSCRIBER (RESTART-DSSU: TYPE=PEN OR TYPE=STNO)
- H10: Download of changed NEWNO and/or IPPASSW to the modules will be initiated after deactivation and re-activation of the circuit. ( RESTART-DSSU:TYPE=PEN,PEN1=<1>-<1-15,17-99>-@@@-@@@; )
- H11: NNO is ignored if VNR active.
- H12: ATNDNO @@@@: SECLEVEL IS IGNORED AS HFA AC SECURITY LEVEL CAN NOT BE SET TO STANDARD OR TRADITIONAL.
- H13: ATNDNO @@@@: SECLEVEL IS SET TO TRADITIO AS NO OTHER SECLEVEL IS ALLOWED FOR AC4.
- H14: ATNDNO @@@@: SECLEVEL IS IGNORED AS AC4 SECURITY LEVEL CAN ONLY BE SET TO TRADITIO.

## 7.4.3 List of Abbreviations

|                |                                         |
|----------------|-----------------------------------------|
| <art-no>       | number of ACD routing table             |
| <atnd-max>     | contracted number of attendant consoles |
| <bd_type>      | {SLMB, SLMO/SLMQ}                       |
| <cct_max>      | max number of circuits at the module    |
| <gg-uu-sss-cc> | PEN of the ATND: LTG-LTU-SLOT-CCT       |
| <ltg>          | LTG                                     |
| <ltg_max>      | max number of LTG in the system         |
| <ltu>          | LTU                                     |
| <ltu_max>      | max number of LTU in the system         |

## 8 ACTDA - Activation of User Features

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The AMO ACTDA is used to regenerate feature-specific data entered by a user via the terminal. The functions DISPLAY, REGENERATE, ADD and DELETE are implemented. The AMO enables these data to be saved while the software version (APS) is being changed.

Using the DISPLAY function, the user data recorded by ACTDA can be displayed on the administration and maintenance terminal.

A command batch is generated with the REGENERATE function, based on the user data. This command batch is used for reinitializing the database.

The ADD function initializes the database with the user data.

The AMO ACTDA is used mainly for regenerating data. In addition, it can be used for test purposes.

In special cases it can be necessary to deactivate the activated call forwarding of a station. This function has been implemented in the branch DELETE.

| TYPE   | Feature | Function                                                      |
|--------|---------|---------------------------------------------------------------|
| STN    | DND     | Do-not-disturb                                                |
|        | FWD     | Fixed / variable call forwarding                              |
|        | OPTISET | individual optiset E / optipoint 500 settings                 |
|        | OUTHUNT | switch out of hunt group                                      |
|        | RCUTOFF | Ringer Cutoff                                                 |
|        | REMIND  | Timed reminder                                                |
|        | REPSECR | Deputy for secretary                                          |
|        | RNGXFER | Ring transfer                                                 |
|        | VCR     | Voice call rejection                                          |
| ATNDGR | NOPT    | Night variant for ATNDGR                                      |
| ITR    | DNDGR   | Group do-not-disturb function                                 |
|        | ISTR    | Controlled station-to-station restriction                     |
|        |         | Controlled station-to-station restriction for all ISTR groups |
| MOBHFA | MLOGON  | LOGON of mobile HFA-user                                      |
|        | MLOGOFF | LOGOFF of mobile HFA-user                                     |

Table 1 User data administrated by ACTDA

## ACTDA - Activation of User Features

### Restrictions

Some user data is already administrated by other AMOs. These data are not additionally administrated by ACTDA.

| AMO   | Feature-specific data                                          |
|-------|----------------------------------------------------------------|
| CHESE | Secretarial transfer function destinations                     |
| ZIEL  | Individual speed dialing numbers                               |
|       | Call numbers for stored number redial                          |
|       | Name/repertory key data for DIGITEs                            |
|       | DSS (direct station selection) destinations                    |
|       | Messenger call destinations                                    |
|       | Name/repertory key data for ATNDs                              |
| TAPRO | Store key functions for DIGITEs                                |
| BERUM | Data for class-of-service changeovers (individual, group, all) |

Table 2      User data administrated by other AMOs

## 8.1 Restrictions

This description is valid from HiPath 4000 V2.0

## 8.2 Interrelationships

None

## 8.3 Functions of the AMO

- [ADD-ACTDA](#) : Create feature-specific user data
- [DELETE-ACTDA](#) : Delete feature-specific user data
- [DISPLAY-ACTDA](#) : Interrogate feature-specific user data
- [REGENERATE-ACTDA](#) : Regenerate feature-specific user data

### 8.3.1 ADD-ACTDA

Create the feature-specific user data in the database.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-ACTDA    | TYPE=STN, STNO=<number>,<br><br>FEATCD=FWD, CFVAR=<param>, DTYPE=<param>,<br>[ITYPE=<param>], SI=<param>, [DESTNO=<key-num>];<br><br>  FEATCD=DND;<br><br>  FEATCD=CWT;<br><br>  FEATCD=VCR;<br><br>  FEATCD=RNGXFER;<br><br>  FEATCD=REPSECR;<br><br>  FEATCD=REMIND, REMIND=<number>;<br><br>  FEATCD=OPTISET, { (min1) RINGVOL=<number>,<br>RINGSOUN=<number>, ALERTVOL=<number>,<br>CALLVOL=<number>, SPKRVOL=<number>,<br>ROOMCHAR=<param>, DISPCONT=<number>,<br>ROLLVOL=<number>, SLKCONT=<number>};<br><br>  FEATCD=RCUTOFF;<br><br>  FEATCD=VARRING, [RNGTIME=<number>];<br><br><br>  TYPE=ATNDGR; ATNDGR=<number>,<br>{ (min1) [NOPT=<number>], [ACT=<param>] };<br><br><br>  TYPE=ITR, [ITR=<number>], FEATCD=<param>;<br><br><br>  TYPE=MOBHFA,<br><br>  ACTION=MLOGON, HOMESTNO=<key-num>,<br>HOMEPIN=<string>, VISSTNO=<number>;<br><br>  ACTION=MLOGOFF, HOMESTNO=<key-num>, [COND=<param>]; |

#### Note:

If no entry is made for parameter ACT in the branch ATNDGR, the entered night option will be preselected, but not activated.

Call forwarding is not allowed between subscribers (source and destination) who belongs to the same ONS group.

#### Examples

1. Enter a variable call-forwarding destination (and activate) and enter a timed reminder for STN 62850.

Input:

ACTDA - Activation of User Features

Functions of the AMO

```
ADD-ACTDA:STN,62850,FWD,STATIONV,CFU,GEN,VCE,63627;  
ADD-ACTDA:STN,62850,REMIND,01130;
```

- 2. Activate night option 3 for ATND group 2.

Input:

```
ADD-ACTDA:ATNDGR,2,3,ACT;
```

Output:

```
H04 : NIGHT SWITCH FOR ATND GROUP 2 ACTIVATED.
```

- 3. Set maximum number of rings until call forwarding is executed.

Input:

```
ADD-  
ACTDA:TYPE=STN,STNO=37278,FEATCD=FWD,CFVAR=STATIONV,DTYPE=CFNR,  
ITYPE=GEN,SI=VCE,DESTNO=32149;  
ADD-ACTDA:TYPE=STN,STNO=37278,FEATCD=VARRING,RNGTIME=10;
```

8.3.2 DELETE-ACTDA

Deactivate the features FWD and 'Voice Call Rejection' for a station.

Procedure Overview

| Command Code | Parameter                                                                                                                                                                  |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DELETE-ACTDA | TYPE=<param>,STNO=<number>,<br><br>FEATCD=FWD,[CFVAR=<param>],[DTYPE=<param>],<br>[ITYPE=<param>],[SI=<param>;<br><br>  FEATCD=DND<br><br>  FEATCD=CWT<br><br>  FEATCD=VCR |

Example 1

Deactivate FWD for station 250123 in service FAX.

Input:

```
DELETE-ACTDA:STN,250123,FWD,,,FAX;
```

Note:

If one of the parameters CFVAR, DTYPE, ITYPE or SI is specified, only the corresponding forwarding destination is interrogated. For parameters that have not been specified, every possible value is interrogated. In the example above every FWD that has been found for service FAX is deactivated for the station.

### 8.3.3 DISPLAY-ACTDA

Interrogate the feature-specific data in the database for a specific station, ITR groups, or ATND groups.

#### Procedure Overview

| Command Code  | Parameter                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------|
| DISPLAY-ACTDA | [TYPE=STN], [STNO=<number>;<br><br>  [TYPE=ATNDGR], [ATNDGR=<number>;<br><br>  [TYPE=ITR], [ITR=<number>] |

#### Examples

1. Display the features for the stations 250200 to 250220.

Input:

DISPLAY-ACTDA:STN,250200&&250220;

Output:

```

+-----+
| STATION NUMBER 250200 |
+-----+
| DIVERSION      : |
| DESTINATION NUMBER | CFVAR | DTYPE | ITYPE | SI |
|                  |      |      |      |   |

|-------------------------------------------------------------|--|

### 8.3.4 REGENERATE-ACTDA

Regenerate the changed database entries.

#### Note

VCR deactivated by DELETE-ACTDA will not be regenerated!

#### Procedure Overview

| Command Code     | Parameter                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------|
| REGENERATE-ACTDA | [TYPE=STN], [STNO=<number>];<br><br>  [TYPE=ATNDGR], [ATNDGR=<number>];<br><br>  [TYPE=ITR], [ITR=<number>] |

#### Example

Regenerate the feature-specific data in the database.

Input:

REGENERATE-ACTDA;

Output:

ADD-ACTDA:STN,62850,FWD,STATIONV,CFBNR,GEN,VCE,636271154;  
ADD-ACTDA:STN,62850,REMIND,01130;  
ADD-ACTDA:ITR,,DNDGR;

## 8.4 Parameter Description

|        |                                                |                             |
|--------|------------------------------------------------|-----------------------------|
| ACT    | Activation parameter for night option          |                             |
|        | Type of Input                                  | : single value, optional    |
|        | Possible Values                                | : ACT activate night option |
| ACTION | mobile HFA logging action, branching parameter |                             |
|        | Type of Input                                  | : single value, mandatory   |

## ACTDA - Activation of User Features

### Parameter Description

|          |                                           |                                                                                                         |                                                                                                                  |
|----------|-------------------------------------------|---------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|

## ACTDA - Activation of User Features

### Error Messages and Advisories

Type of Input : single value, mandatory  
Possible Values : numeric,  
max. 12 digits

## 8.5 Error Messages and Advisories

### List of Abbreviations

<ft> Feature to be activated according to parameter FEATCD  
<si> Service indicator  
<stn> Type of station, to which the following number is referring  
<x> ... Numerical string (the maximum length is described by the number of "x" in the brackets)  
<loc> location of the HFA station (home-/visited station)  
<logtype> LOGON/LOGOFF of a HFA user  
<var> Call forwarding variant the value entered in parameter CFVAR

### 8.5.1 Error Messages

F01: <NTYP> <RNR> DOES NOT LEAD TO DAR STNO  
F02: <NTYP> <RNR> HAS NOT BEEN ASSIGNED  
F03: FOR STATION NO.<RNR> SERVICE <PERMSI>,  
NO <DEVTP> CALL FORWARDING DESTINATION IS ASSIGNED.  
F04: STATION NO.<RNR> IS A <DEVTP>-DEVICE.  
FOR PARAMETER SI THE FOLLOWING VALUES ARE ALLOWED:  
<PERMSI> (3 to 9 values)  
F05: ATND GROUP <VFGR>: NIGHT OPTION <NAVAR> IS NOT ASSIGNED  
F06: INTERNAL TRAFFIC RESTRICTION GROUP <xx> IS NOT ASSIGNED TO ANY TERMINAL DEVICE  
F07: USER <RNR> IS NOT THE EXECUTIVE IN AN EXEC/SECRETARY SYSTEM  
F08: USER <RNR> IS NOT THE SECRETARY IN AN EXEC/SECRETARY SYSTEM  
F10: NO REPR. HAS BEEN ASSIGNED TO SECRETARY <RNR> IN THE EXEC/SECR SYSTEM.  
F11: ON THE ENTRY OF CFVAR=STATIONV, PARAMETER DESTNO MUST BE ENTERED.  
F12: <RNR> IS A SYSTEM DEVICE. ON THE ENTRY OF CFVAR=DEVICEV,  
ONLY ONE VALUE IS ALLOWED FOR PARAMETER DTYPE.  
F13: THE TIME <ZEIT> SPECIFIED FOR PARAMETER REMIND IS IMPLAUSIBLE  
F14: REMINDER <xxxxx> IS NOT IN ALLOWED TIME INTERVAL.  
THE REMINDER HAS TO BE WITHIN THE NEXT 24 HOURS.  
F15: REMINDER <ZEIT> CANNOT BE ENTERED IN THE STATIC TIMED REMINDER MEMORY  
F16: A TIMED REMINDER HAS ALREADY BEEN ACTIVATED FOR ANATE <RNR>  
F17: NUMBER <NTYP> AND <rnr> MAY NOT BE THE SAME

F18: ATTENDANT GROUP <xx> HAS NOT BEEN ASSIGNED

F19: DESTNO <xxxxxx> LEADS TO AN EMERGENCY ROUTE  
AND MUST NOT BE USED AS FORWARDING DESTINATION.

F20: PARAMETER COMBINATION NOT ALLOWED.  
PERMISSIBLE COMBINATION:

| PARAMETER: | DFVAR    | DTYPE | ITYPE       |
|------------|----------|-------|-------------|
| VALUES:    | STATIONF | CFU   | GEN         |
|            | STATIONV | CFU   | INT,EXT,GEN |
|            |          | CFB   | GEN         |
|            |          | CFNR  | GEN         |
|            |          | CFBNR | GEN         |
|            |          | CFDEV | GEN         |
|            | SYSTEM   | CFU   | INT,EXT     |
|            |          | CFB   | INT,EXT     |
|            |          | CFNR  | INT,EXT     |
|            |          | CFDND | INT,EXT     |
|            | CLIENT   | CFU   | GEN         |
|            |          | CFNR  | GEN         |

F21: STATION NO <RNR> IS NOT OF TYPE OPTISET OR OPTIPOINT.

F22: THE DIVERSION POOL IS EMPTY. NO FURTHER FORWARDING  
DESTINATIONS CAN BE ASSIGEND.  
REMEDY: INCREASE PARAMETER AULZIEL IN AMO DIMSU.

F23: STATION <RNR> IS NO DIGITAL DEVICE.

VOICE CALL REJECT, THEREFORE, CAN NOT BE ACTIVATED.

F24: ON CFVAR = STATIONV, THE PARAMETERS DTYPE AND ITYPE MUST BE ENTERED

F25 ENTRY OF THE PARAMETERS DTYPE AND ITYPE IS ONLY POSSIBLE AT CFVAR = STATIONV.

F26: STATION NO <RNR> IS MAPPED TO STATION NO <xxxxxx> VIA AMO RUFUM  
PLEASE USE THIS AMO FOR FURTHER PROCESSING.

F27: ACD DESTINATION NUMBER <zielnr> DOES NOT LEAD TO AN ACD  
ROUT GROUP AND MAY NOT BE ENTERED AS A CFW-DESTINATION.

F28: STATION NO <RNR> IS NOT OF TYPE KEYSET.  
RINGER CUTOFF CAN NOT BE ACTIVATED.

F29: <DEVTP>-STATION NUMBER <RNR> IS NOT MEMBER OF A HUNT GROUP.

F30: NIGHT SWITCH FOR ATND GROUP <VFGR> CANNOT BE ACTIVATED:  
SOME ATNDS STILL IN DAYTIME MODE. ENSURE THAT ALL ATNDS ARE IN NIGHT MODE AND TRY  
AGAIN.

F31: NO ACKNOWLEDGEMENT RECEIVED FROM CALL PROCESSING WITHIN SPECIFIED TIME.

F32: THE ENTERED DESTINATION NUMBER WAS RECOGNIZED AS AN INVALID/INCOMPLETE  
LCR NUMBER, AND CANNOT BE PROCESSED FURTHER ON.

F33: DIVERSION TYPE CFDEV CAN NOT BE COMBINED WITH A VOICE SERVICE.

F34: THE VISITED STATION IS NOT IDLE.

F35: <LOGART> WAS REJECTED BY THE <PHONLOC> STATION.

F36: THE FEATURE IS BLOCKED AT THE <PHONLOC> NODE BY AMO FEASU.

F37: THE PIN OF THE HOME STATION OF THE MOBILE HFA USER IS NOT VALID (AMO PERSI).

F38: THE IP ADDRESS OF THE HOME BOARD OF THE HFA USER IS TEMPORARILY NOT AVAILABLE.

## ACTDA - Activation of User Features

### Error Messages and Advisories

- F39: THE LOGON / LOGOFF ACTION COULD NOT BE EXECUTED ON THE HOME NODE (EG. BOARD OR CIRCUIT OR TERMINAL OF HOME PORT OUT OF ORDER) .
- F40: THE PIN MUST NOT CONTAIN THE CHARACTER "#".
- F41: THE MESSAGE RECEIVED FROM CALL PROCESSING CAN NOT BE INTERPRETED. (EVENT-CODE OR SUBCODE OR LOGON-/LOGOFF RESULT FAULTY)
- F42: CALL FORWARDING IS NOT ALLOWED BETWEEN MEMBERS OF THE SAME ONS GROUP.
- F44: SINCE <NTYP> <RNR> IS A SIP SUBSCRIBER.  
ACTIVATION OF CALL FORWARDING IS NOT ALLOWED
- F45: THE VISITED STATION DOES NOT SUPPORT SPE.
- F46: THE HOME STATION DOES NOT SUPPORT SPE.
- F47: SIGNALLING PATH DOES NOT SUPPORT SPE.
- F48: DESTINATION NO. IS UNASSIGNED
- F49: SOURCE <NTYP> <RNR> DOES NOT HAVE A DEVICE CONFIGURED  
WITH THE VALUE ENTERED UNDER PARAMETER SERVICE INDICATOR(SI)
- F50: ZANDE/KEYSYS/LRNGCOFF IS SET TO YES, THEREFORE RINGER CUTOFF CAN BE  
ACTIVATED ONLY FROM DEVICE.

## 8.5.2 Advisories

- H01: NO FEATURES MANAGED BY ACTDA HAVE BEEN ACTIVATED
- H02: NO NUMBER HAS BEEN ASSIGNED IN THE SPECIFIED RANGE
- H03: FEATURE <LM> HAS NOT BEEN ACTIVATED FOR SUBSCRIBER <RNR>.
- H04: NIGHT SWITCH FOR ATND GROUP <VFGR> ACTIVATED.
- H07: THE FEATURES RNGXFER, REPSECR, REMIND AND CWT CANNOT BE  
ACTIVATED FOR FUNCTIONAL OR UFA DEVICES.
- H08: ON CFVAR = STATIONF AND CFVAR = SYSTEM, THE PARAMETERS DTYPE AND ITYPE ARE  
IGNORED.
- H09: ON THE ENTRY CFVAR=<AULVAR>, PARAMETER DESTNO IS IGNORED.
- H10: <DEVTYPE>-STATION NUMBER <RNR> IS ALREADY SWITCHED OUT OF THE HUNT GROUP.
- H11: <LOGART> WAS TRIGGERED.  
10 SECONDS WAITING TIME.
- H12: FOR STATION NO RNR, THE HARDWARE SETTINGS CONCERNING AUDIO ADJUSTMENTS,  
DISPLAY CONTRAST, LABELS CONTRAST, AND ROOMCHAR CAN ONLY BE CHANGED LOCALLY  
BY PHONE DUE TO OPENSTAGE OPS60/80 PHONE SPECIFICATION.
- H13: STNO RNR IS A KEYSET WITH LINETONE=YES. THE SETTING OF RINGVOL AND RINGSOUN  
IS NOT EFFECTIVE. THE LINES OF THE STATION CAN BE CONFIGURED INDIVIDUALLY  
WITH AMO KCSU, PARAMETERS RINGVOL AND RINGTYPE.

### Tabelle 1

- H14: Values greater than 3 for DISPCONT and/or SLKCONT are only allowed for OpenStage devices. The specified value will be ignored and the maximum possible value 3 for the actual device will be configured.
- H15: TO ACTIVATE THE RINGSOUN SETTING, SET USER->AUDIO->SETTINGS->RINGER TO 'NO RINGER FILE' AT THE OPENSTAGE 60/80 PHONE.
- H16: <DEVTYP>-STATION NO <RNR> IS ALREADY SWITCHED IN TO THE HUNT GROUP.
- H17 ON CFVAR = CLIENT, THE PARAMETER ITYPE IS IGNORED.

Tabelle 1

### 8.5.3 How the Output Messages are used for each Action

|         |   |                                      |                                      |                                      |                                      |                                     |                                      |                              |                              |                      |                      |

## **ACTDA - Activation of User Features**

### Error Messages and Advisories

## 9 AFR - Automatic fault report

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The AMO "AFR" can be used to control the three Logical Device Units (LDU) "Automatic Fault Report" (FAMAFR1,2,3). Wherever the term FAMAFR is referred to in this AMO description, the functions and/or procedures described apply in each case similarly to FAMAFR1, FAMAFR2 and FAMAFR3.

In addition, a high-priority fault report can be generated and sent to one FAMAFR each to test the entire transmission path and check out connection setup.

When fault transmission is deactivated, the fault reports in the memory are preserved, but no more fault reports are accepted from FAMAFR. Fault reports generated in the system are transmitted by FAMAFR to the service center or to the respective fault recording unit connected; The following parameters can be set for this purpose:

### Parameter list

- LDU (branch parameter - for whose FAMAFR the following applies)  
Selection of an FAMAFR for which the initiated actions or the following parameters apply.  
The parameter LDU can assume the values 'AFR1', 'AFR2', and 'AFR3'.
- TYPE (selection parameter for activate or deactivate)  
This parameter can be used to specify whether fault transmission (TYPE=LDU) is to be activated or deactivated and/or logging of fault reports on the service terminal (TYPE=PROT) is to be on or off.
- PAR (selection parameter for add or change)  
This parameter is used to specify whether the following parameters affect the fault transmission (PAR=LDU) or the fault pair list (PAR=TAB).
- DEL (selection parameter for delete)  
This parameters is used to specify whether entire fault pair list (DEL=ALL) or only one line of this fault pair list (DEL=LINE) is to be deleted. If only one line is to be deleted, its line number (FINO=1 ... 99) must also be specified.

### Parameter list for fault transmission (PAR=LDU)

- PRI (Priority Setting)  
Each fault report is given a certain priority.  
The parameter PRI defines the starting priority at which fault

reports must be transmitted instantly, and the finishing priority at which fault reports must be stored in Hicom.

The highest priority is one, the lowest eight.

- MAXF = Maximum number of high-priority fault reports which may be accepted during the supervision time.  
If the maximum number of fault reports is exceeded, an avalanche fault report will be generated 'F0000 M5 AVALANCHE FAULT HIGH PRIORITY SEE AD AMO-AFR' and sent to the respective service center connected. After the avalanche report has been sent, FAMAFR is deactivated.
- MAXFL = Maximum number of low-priority fault reports which may be accepted during the supervision time.  
If maximum number of fault reports exceeded -> avalanche fault report will be generated 'F0000 M5 AVALANCHE FAULT LOW PRIORITY SEE AD AMO-AFR' and sent to the respective service center connected. After the avalanche report has been sent, FAMAFR is deactivated.
- FSUPV (Supervision time for maximum number of fault reports)  
A certain maximum number of fault reports is allowed within the specified supervision time so that the service center will not be flooded with fault reports. The supervision time must be specified in minutes (0 ... 99).
- SETUPLT (Connection Setup Limit)  
This is the fault memory occupancy level starting at which an attempt is made to set up a connection to the service center connected in order to transfer the low-priority fault reports that have accumulated in the meantime. Limit values from 1% ... 90% may be specified.
- TRSTART (Start of Stored Fault Report Transmission to Network Control Center)  
Defines the time of day (0 ... 23 hours, 0 ... 59 minutes) at which the accumulated low-priority fault reports must be transmitted, regardless of the fault memory occupancy level.
- PERIOD  
Defines the number of days (0 ... 99) after which the recently accumulated low-priority fault reports must be transmitted.
- RETRLT (Retransmission Limit)  
Maximum number of successive attempts (0 ... 9) to transmit the contents of the fault memory if the preceding transmission was bad (within one connection).

- **ACTTIME (ACTIVATIONTIME AFTER SWITCH OFF THROUGH AVALANCHE)**  
Defines the period in minutes (0.. 60) of automatical activation after automatical switching off by message avalanche. During attitude of 0 min no automatical activation is required.
- **MNEGCALL (Maximum Negative Call Setup)**  
If value of this parameter is 0, AFR-Task works without counting unsuccessful dial-ups.  
If it is other than 0, an internal counter in AFR-Task counts the unsuccessful dial-ups to SC (SIRA, Manager). When the count reaches of the value of MNEGCALL the dial-up to the SC is blocked for 12h. Also the following advisory message will be displayed in this case:  
F6524 E8 N0103 NO ACT A1 SM-AM MAINTENANCE  
06-03-24 11:15:59  
ALARM CLASS: CENTRAL: 029  
  
FORMAT: 33  
WARNING BY AFR TASK: MAXIMUM OF UNSUCCESSFULLY DIAL UP IS REACHED  
SENDING TO SC IS BLOCKED FOR 12 HOURS (AFR2)

**Parameter list for the fault pair list (PAR=TAB)**

- **FNUM (F-number of a fault action start)**  
A fault number (5 characters, alphanumeric) is entered under FNUM.
- **FACTION (Start of fault action)**  
More specific details of the cause of the fault are given under FACTION. Together with FNUM, it characterizes the start of a fault.
- **ENUM (F-number of a fault action end)**  
The fault number (5 characters, alphanumeric) of the end of fault report is entered under ENUM.
- **EACTION (End of fault action)**  
The cause of the fault which has come to an end is entered under GACTION. Together with ENUM, it characterizes the end of a fault.
- **COMP (Number of following lines to be compared)**  
This parameter specifies the number of following lines (0 ... 5) containing module information, which are definitive for comparing the start of fault and end of fault report.
- **FSUPV (Supervision time for fault pair alarm)**  
A start of fault report is preserved in the fault memory for at least this period before it is transmitted. If the end of fault report is received before start of fault is reported (comparison with F-number, action and following lines), this pair will be deleted.

At the end of the supervision time, the fault report is transmitted according to its priority.  
The supervision time must be specified in minutes (0 ... 99).  
Single end of fault reports are also transmitted according to priority.

## 9.1 Interrelationships

If no link has been set up in the CMS database (AMO CPSM) for the FAMAFRx application, the corresponding LDU cannot be activated.

## 9.2 Functions of the AMO

- **ACTIVATE-AFR** : Activating FAMAFR and logging
- **DEACTIVATE-AFR** : Deactivating FAMAFR and logging
- **ADD-AFR** : Adding the parameters or the fault pair lists of an LDU&FAMAFR
- **CHANGE-AFR** : Changing the parameters of an LDU FAMAFR
- **DELETE-AFR** : Deleting pairs of an LDU FAMAFR
- **DISPLAY-AFR** : Displaying the parameters and the fault pair list of an LDU FAMAFR
- **OUTPUT-AFR** : Outputting the status information of an LDU FAMAFR
- **REGENERATE-AFR** : Regenerating the parameters and the fault pair lists of all 3 FAMAFRs
- **START-AFR** : Starting a fault transmission by generating a high-priority pseudo fault report

### 9.2.1 ACTIVATE-AFR

Activating an LDU FAMAFR and logging

#### Procedure Overview

| Command Code | Parameter                  |
|--------------|----------------------------|
| ACTIVATE-AFR | LDU=<param>, TYPE=<param>; |

#### Example

The LDU FAMAFR2 and logging are to be activated

Input:

```
ACTIVATE-AFR:AFR2,LDU&PROT;
```

## 9.2.2 DEACTIVATE-AFR

Deactivating an LDU FAMAFR and logging

### Procedure Overview

| Command Code   | Parameter                  |
|----------------|----------------------------|
| DEACTIVATE-AFR | LDU=<param>, TYPE=<param>; |

## 9.2.3 ADD-AFR

Adding the parameter list of an LDU FAMAFR or the fault pair list of an LDU FAMAFR. The parameter LDU is used to distinguish between FAMAFR1, FAMAFR2 and FAMAFR3. The branch parameter PAR is used to distinguish between the parameter list and the fault pair list.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-AFR      | <pre> LDU=&lt;param&gt;, PAR=LDU, PRI=&lt;number&gt;, MAXF=&lt;number&gt; , MAXFL=&lt;number&gt;, FSUPV=&lt;number&gt; , SETUPLT=&lt;number&gt;, TRSTART=&lt;number&gt; , PERIOD=&lt;number&gt;, RETRLT=&lt;number&gt;; [, ACTTIME=&lt;number&gt;, MNEGCALL=&lt;number&gt;];   PAR=TAB , FNUM=&lt;string&gt;, FACTION=&lt;param&gt; , ENUM=&lt;string&gt;, EACTION=&lt;param&gt; , COMP=&lt;number&gt;, FSUPV=&lt;number&gt;; </pre> |

### Example of adding an FAMAFR2 fault transmission :

Faults starting at priority level 4 are to be transmitted instantly. A maximum of 20 high-priority faults and 20 low-priority faults are to be accepted within 60 minutes. The contents of the fault memory are to be transmitted when the fault memory is 90% full of fault reports. The contents of the fault memory are transmitted to the fault recording unit connected every 2 days at 12.00 hours. Up to 9 successive attempts shall be made to transmit the faults. Further AFR should automatically be activated after 20 minutes in case of a message avalanche.

Input:

## AFR - Automatic fault report

### Functions of the AMO

```
ADD-AFR:AFR2,LDU,4,20,20,60,90,12-00,02,9,20;
```

How to insert an entry in the fault pair list of FAMAFR2 :

In the FAMAFR fault pair list, the start of fault report "F5388 OUTSERV" is to be entered with the end of fault report "F5389 INSERV". To allow the two reports to be assigned correctly, the first follow-up line (module information) must be analyzed. The start of fault report should be preserved in the fault memory for at least 10 minutes.

Input:

```
ADD-AFR:AFR2,TAB,F5388,OUTSERV,F5389,INSERV,1,10;
```

### 9.2.4 CHANGE-AFR

Changing the parameter list of an LDU FAMAFR. At least one of the parameters of the list must be specified.

#### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                         |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-AFR   | LDU=<param>, { PRI=<number>,MAXF=<number><br>,MAXFL=<number>,FSUPV=<number><br>,SETUPLT=<number>,TRSTART=<number><br>,PERIOD=<number>,RETRLT=<number>};<br>[,ACTTIME=<number>,MNEGCALL=<number>]; |

#### Example

In the FAMAFR2, change the priority of faults that are to be transmitted instantly, to 6, and set the maximum number of high-priority faults that are to be accepted within the time specified in parameter FSUPV to 10.

Input:

```
CHANGE-AFR:LDU=AFR2,PRI=6,MAXF=10;
```

### 9.2.5 DELETE-AFR

Deleting an entry or the entire the fault pair list of an FAMAFR

#### Procedure Overview

| Command Code | Parameter                                        |
|--------------|--------------------------------------------------|
| DELETE-AFR   | LDU=<param>,DEL=LINE,FINO=<number>;<br> DEL=ALL; |

**Example**

Deleting the second entry in the FAMAFR1 fault pair list

Input:

```
DELETE-AFR:AFR1,LINE,2;
```

**9.2.6 DISPLAY-AFR**

Displaying the FAMAFR parameter lists. Unless the branch parameter PAR is specified, both the parameter list and the fault pair list of the specified LDU FAMAFR will be displayed. Unless the parameter LDU is specified, the parameter lists and/or the fault pair lists of all 3 FAMAFRs will be displayed.

**Procedure Overview**

| Command Code | Parameter                     |
|--------------|-------------------------------|
| DISPLAY-AFR  | [LDU=<param>], [PAR=<param>]; |

**Example**

Displaying the parameter list and the fault pair list of FAMAFR2

Input:

```
DISPLAY-AFR:AFR2;
```

Output:

```
FAMAFR2
```

```
AUTOMATIC FAULT REPORT = ON
PRINTOUT AT EXCHANGE   = OFF
```

```
PARAMETER LIST
```

```

### 9.2.7 OUTPUT-AFR

Outputting the status information of an LDU FAMA FR in a list. If no parameter is specified, the status information of all 3 FAMA FRs will be output.

## Procedure Overview

### Example

## Outputting the LDU FAMAFR2 status information

Input:

```
OUTPUT- AFR: AFR2;
```

Output:

```

LDU FAMAFR2:          STATUS INFORMATION
=====

CONNECTION ESTABLISHED          : YES
LAST CONNECTION SETUP GOOD      : YES
CONNECTION FAULT REPORTED       : NO
FAULT AVALANCHE OCCURRED        : NO
DISK ACCESS POSSIBLE            : YES
FAULTS STORED                   : 20
FAULT MEMORY OCCUPANCY LEVEL     : 12 [%]
CONNECTING PATHS PROVIDED       : FAMAFR2

```

### 9.2.8 REGENERATE-AFR

Displaying the parameter list and the fault pair list in the form of commands for regeneration of all 3 FAMAFRs.

## Procedure Overview

### Example

Input:

REGENERATE-AFR;

## Output:

```

ACTIVATE-AFR: AFR1, LDU&PROT ;
ACTIVATE-AFR: AFR2, LDU&PROT ;
ACTIVATE-AFR: AFR3, LDU ;
ADD-AFR      : AFR1, LDU , 4 , 20 , 20 , 60 , 90 , 12-00 , 2 , 5 , 20 ;
DELETE-AFR   : AFR1, ALL ;
ADD-AFR      : AFR1, TAB,"F5388",OUTSERV,"F5389",INSERV,1,10;
ADD-AFR      : AFR2, LDU , 6 , 10 , 20 , 60 , 90 , 12-00 , 2 , 9 , 0 ;
DELETE-AFR   : AFR2, ALL ;
ADD-AFR      : AFR2, TAB,"F5388",OUTSERV,"F5389",INSERV,1,10;
ADD-AFR      : AFR3, LDU , 4 , 20 , 20 , 60 , 90 , 12-00 , 2 , 5 , 60 ;
DELETE-AFR   : AFR3, ALL ;
ADD-AFR      : AFR3, TAB,"F5388",OUTSERV,"F5389",INSERV,1,10;

```

## 9.2.9 START-AFR

Starting an LDU FAMAFR by generating a high-priority pseudo fault report

### Procedure Overview

| Command Code | Parameter    |
|--------------|--------------|
| START-AFR    | LDU=<param>; |

Example of starting the LDU FAMAFR3

Input:

```
START-AFR:AFR3;
```

## 9.3 Parameter Description

|         |                                                                                                                                                     |

## AFR - Automatic fault report

### Parameter Description

|         |                                         |                                                                                                                                           |          |
|---------|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|----------|
|         |                                         | mandatory                                                                                                                                 | (DELETE) |
|         | Possible Values                         | : ALL, LINE                                                                                                                               |          |
| EACTION | End of fault action                     |                                                                                                                                           |          |
|         | UNDEF means no analysis of fault action |                                                                                                                                           |          |
|         | Type of Input                           | : Single value                                                                                                                            |          |
|         |                                         | mandatory                                                                                                                                 | (ADD)    |
|         | Possible Values                         | : NOACT, ADVISORY, BDOOS, LBCOOS, LCXREST, CHANOOS, OUTSERV, INSERV, RESET, SCHASWU, SCHALTG, SOFTREST, ACTION04, HARDREST, RELOAD, UNDEF |          |
| ENUM    | F-number of a fault action end          |                                                                                                                                           |          |
|         | Type of Input                           | : Single value                                                                                                                            |          |
|         |                                         | mandatory                                                                                                                                 | (ADD)    |
|         | Possible Values                         | : Alphanumeric, 5 characters                                                                                                              |          |
| FACTION | Start of fault action                   |                                                                                                                                           |          |
|         | UNDEF means no analysis of fault action |                                                                                                                                           |          |
|         | Type of Input                           | : Single value                                                                                                                            |          |
|         |                                         | mandatory                                                                                                                                 | (ADD)    |
|         | Possible Values                         | : NOACT, ADVISORY, BDOOS, LBCOOS, LCXREST, CHANOOS, OUTSERV, INSERV, RESET, SCHASWU, SCHALTG, SOFTREST, ACTION04, HARDREST, RELOAD, UNDEF |          |
| FINO    | Entry number index in fault pair list   |                                                                                                                                           |          |
|         | Type of Input                           | : Single value                                                                                                                            |          |
|         |                                         | mandatory                                                                                                                                 | (DELETE) |
|         | Possible Values                         | : 1 to 99                                                                                                                                 |          |
| FNUM    | F-number of a fault action start        |                                                                                                                                           |          |
|         | Type of Input                           | : Single value                                                                                                                            |          |
|         |                                         | mandatory                                                                                                                                 | (ADD)    |

|          |                                                                   |                                                              |
|----------|-------------------------------------------------------------------|--------------------------------------------------------------|
|          | Possible Values                                                   | : Alphanumeric, 5 characters                                 |
| FSUPV    | Supervision time for fault pair alarm or maximum number of faults |                                                              |
|          | Type of Input                                                     | : Single value                                               |
|          |                                                                   | mandatory (ADD)                                              |
|          |                                                                   | Group parameter (CHANGE)                                     |
|          | Possible Values                                                   | : 0 to 99 (minutes)                                          |
| LDU      | Parameter for LDU FAMAFR addressed                                |                                                              |
|          | Type of Input                                                     | : Single value                                               |
|          |                                                                   | mandatory (ACTIVATE, DEACTIVATE, ADD, CHANGE, DELETE, START) |
|          |                                                                   | optional (DISPLAY, OUTPUT)                                   |
|          | Possible Values                                                   | : AFR1, AFR2, AFR3                                           |
| MAXF     | Maximum number of high-priority fault reports during FSUPV        |                                                              |
|          | Type of Input                                                     | : Single value                                               |
|          |                                                                   | mandatory (ADD)                                              |
|          |                                                                   | Group parameter (CHANGE)                                     |
|          | Possible Values                                                   | : 1 to 999                                                   |
| MAXFL    | Maximum number of low-priority fault reports during FSUPV         |                                                              |
|          | Type of Input                                                     | : Single value                                               |
|          |                                                                   | mandatory (ADD)                                              |
|          |                                                                   | Group parameter (CHANGE)                                     |
|          | Possible Values                                                   | : 1 to 999                                                   |
| MNEGCALL | Maximum negative call setup                                       |                                                              |
|          | Type of Input                                                     | : Single value, optional                                     |
|          |                                                                   | optional (ADD)                                               |
|          |                                                                   | Group parameter (CHANGE)                                     |
|          | Possible Values                                                   | : Numeric, 0-255                                             |
| PAR      | Selection parameter for LDU and fault pair table                  |                                                              |

## AFR - Automatic fault report

### Parameter Description

|         |                                                                  |                                                               |
|---------|------------------------------------------------------------------|---------------------------------------------------------------|
|         | Type of Input                                                    | : Single value<br>mandatory (ADD)<br>optional (DISPLAY)       |
|         | Possible Values                                                  | : LDU, TAB                                                    |
| PERIOD  | Number of days after which low-priority faults are transmitted   |                                                               |
|         | Type of Input                                                    | : Single value<br>mandatory (ADD)<br>Group parameter (CHANGE) |
|         | Possible Values                                                  | : 0 to 99 (days)                                              |

## 10 AGENT - ACD Agents

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

AMO AGENT provides the ability to add, change, display, delete, and regenerate agent attributes for Automatic Call Distribution (ACD).

### 10.1 Interrelationships

- AMO ACDGP : Configures ACD groups which can be assigned to agents by AMO AGENT.
- AMO ACDRT : Configures ACD Routing Tables which may assign steps which will route to an ACD agent (RTAGT) or to the extension number of an ACD agent (RTEXT). If an agent ID is referenced in an ART, that AGTID cannot be removed.
- AMO ACDSO : This AMO determines the length of the agent ID for the system.
- AMO CODEW : Codeword for administration block in SWU (number of agent IDs).
- AMO DIMSU : Determines the number of agent IDs which can be set up in the system.
- AMO SBCSU : Configures STNOs which can be assigned as AUTOEXT by AMO AGENT if the STNOs contain the AGENT and AUTOLOG attributes and assigns the STNO to a device which can be logged onto by an ACD agent.
- AMO SDAT : Set the ACD attributes to STNOs which are used by AMO AGENT (AUTOLOG, AGENT)
- AMO ZAND : Sets the ACD feature on or off. ACD agents cannot be added or changed if the ACD features is turned off.

### 10.2 Functions of the AMO

- [ADD-AGENT](#) : Add agent and his attributes to a specific group
- [CHANGE-AGENT](#) : Change agent attributes

## AGENT - ACD Agents

### Functions of the AMO

- **DELETE-AGENT** : Delete individual agent and his attributes from ACD group or autoextension only, for an agent
- **DISPLAY-AGENT** : Display agent attributes
- **REGENERATE-AGENT** : Regenerate agents

### 10.2.1 ADD-AGENT

A new agent and related attributes can be created with the action ADD. The ADD-AGENT command can be used to add an agent to a specific ACD group by entering the group number (ACDGRP). The agent can be positioned within the ACD Group as specified by parameter (AGTPOS), or can be assigned to the next available slot in the group's table by default. AGTPOS may not be a number greater than the next AVAILABLE position. If so, the agent still will be assigned to the next available position and an advisory message will be presented.

AGTID is the only way an agent can be recognized by the system, therefore, AGTID must be unique and is a required parameter. The AGTID length is in range of 1 to 6 digits, and is set by the AMO ACDSO

An agent can be a phonemail agent or a normal one. This is specified by parameter AGTTYPE (agent type). If it's a normal agent, the following attributes must/may be set:

Parameter AUTOWK is used to automatically place an agent in the work mode. This precludes an ACD agent from receiving incoming ACD calls for a programmed period of time following an ACD call, based on the individual agent's logon identification number. The time can be specified as either a discrete amount of time up to 5 minutes or as an indefinite time period. The 'autowork' option puts the agent into the work mode immediately following the completion of an ACD call. If the AUTOWK timer has been set to a discrete amount of time, the work mode is terminated and the available mode is activated by the system upon expiration of the agent's individual AUTOWK timer. The agent may also manually deactivate the work mode by depressing the available or unavailable key before the timer has expired. If the AUTOWK timer has been set to indefinite time, the agent must manually deactivate the work mode by depressing the available or unavailable key in order to receive incoming ACD calls. In either case, someone with CAF (ACD Control Agent Facility attribute) authorization can take the agent out of work mode and assign the agent to available or unavailable mode by entering an appropriate access code.

The range for AUTOWK is 0 to 9 seconds in intervals of 1, or 10 to 300 seconds in intervals of 5 (i.e. 10, 15, 20 ...). A special value of 299 may be used to indicate indefinite time. The AUTOWK parameter is an optional parameter with the default value of 0 to indicate AUTOWK is not invoked.

Parameter AUTOEXT is used to allow the system to automatically logon the agent following a system reload, hard restart, soft restart, or after

a status change which places the line in-service. This action causes the device associated with the agent's extension number to be placed in the Available mode. For lines equipped with an LED, the LED will be turned on. The AUTOEXT can be an extension of 1 to 6 digits, must be set up as a STNO by either AMOs SCSU, SBCSU or SSCSU, and must be set up with AUTOLOG attribute by AMO SDAT.

When an AUTOEXT is assigned to an agent through the ADD or CHANGE command, AMO AGENT requests CP to logon the agent upon completion of the configuration action. CP may not be able to logon the agent due to insufficient memory in DIMSU for the autologon parameter. When the memory allocation is increased, the AUTOLOG extension must be deactivated and activated to force the logon. If the logon fails because the line is not idle, then the extension must be deactivated and activated through AMO DSSU to ensure that the agent will be logged on upon completion of the call in progress.

Agents can be 'flexible' within the system and may be assigned to a specific group as needed by the supervisor. Flexible status is realized if an agent is added without a group number. Flexible agents are put into the 'blocked' mode, and stay in the 'blocked' mode until all the group associated data for the agent is added. AUTOWK is the only optional parameter that can be set for 'flexible' agents.

For a phonemail (PM) agent there are two attributes: PEN (port equipment number: ltg-ltu-slot-cct) and ISDN B channel (BCHAN). Both parameters must be set. A PM agent must be a member of a PM group (see AMO-ACDGP).

### Notes:

- The AGENT ID's (AGTID) must be stored sorted in numeric ascending order. The time required to resort the AGENT ID table is reduced if the AGENT ID's are ADDED in ascending order and DELETED in descending order. Since CP is blocked during any writes to the AGENT ID table, it is recommended that all changes to the AGENT ID table be done during times of minimum call traffic.
- An auto logon extension number (AUTOEXT) can only be logged on with its configured agent ID (AGTID).

### Procedure Overview

| Command Code | Parameter                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-AGENT    | AGTID=<number>, [ACDGRP=<number>], [AGTPOS=<number>]<br> AGTTYPE=NORMAL<br>, [AUTOWK=<number>], [AUTOEXT=<number>];<br> AGTTYPE=PM, PEN=<number>, BCHAN=<number>; |

## AGENT - ACD Agents

### Functions of the AMO

#### Examples:

1. Add an agent with agent identification number "1236" to the auto call distribution group number "4" at the next available position.

Input:

```
ADD-AGENT:AGTID=1236,ACDGRP=4, AGTTYPE=NORMAL;
```

Output:

```
H01: AGENT AGTID=1236 HAS BEEN ADDED.
```

2. Add an agent with agent identification number "3224" to the auto call distribution group number "4" positioned at the 12th slot in the group "4".

Input

```
ADD-AGENT:AGTID=3224,ACDGRP=4,AGTPOS=12,AGTTYPE=NORMAL;
```

Output:

```
H01: AGENT AGTID=3224 HAS BEEN ADDED.
```

3. Add an agent with agent identification number "3556" to the auto call distribution group number "4" positioned at the 15th slot in the group with AUTOWK value of 120 seconds, and automatic logon extension number of 7554.

Input:

```
ADD-AGENT:  
AGTID=3556,ACDGRP=4,AGTPOS=15,AGTTYPE=NORMAL,AUTOWK=120,AUTOEXT=  
7554;
```

Output:

```
H01: AGENT AGTID=3556 HAS BEEN ADDED.
```

4. Add an agent with agent identification number "9823" to the ACD system to be in "reserve" (flexible) not related to any group, with AUTOWK value of 130 seconds.

Input:

```
ADD-AGENT:AGTID=9823,AGTTYPE=NORMAL,AUTOWK=130;
```

Output:

```
H06: AGENT AGTID=@@@@@ HAS BEEN ADDED TO THE FLEXIBLE ACD GROUP.
```

5. Add a PM agent with agent identification number "1000" to the PM auto call distribution group number "5". The associated port equipment number is 1-2-103-0, the ISDN B channel is channel 1.

**Input:**

ADD-AGENT: AGTID=1000,ACDGRP=5,AGTTYPE=PM,PEN=1-2-103-0,  
BCHAN=1;

**Output:**

H01: AGENT AGTID=1000 HAS BEEN ADDED.

## 10.2.2 CHANGE-AGENT

An agent's attributes can be modified with the action CHANGE. Parameter AGTID is required to identify the agent and is mandatory. If changing the AGTID parameter, both the AGTID and NEWID must be presented within the CHANGE-AGENT command, where AGTID is the current agent's id and NEWID is the agent's new id. Parameter AGTPOS is optional for changing the agent position in the ACD group table. Parameters AUTOWK and AUTOEXT are for changing the autowork time and auto logon extension number and are optional. AUTOEXT must be a unique extension.

Parameter NEWID is used for changing an agent's identification number and has the same requirements as parameter AGTID. NEWID is an optional parameter for CHANGE-AGENT and must be present when changing the AGTID.

An AGTID cannot be changed to a NEWID if the AGTID is referenced in an ACD ART by AMO ACDRT.

A flexible agent (i.e. an agent without a group) can be assigned to a group using the CHANGE-AGENT action; and vice versa, an agent associated with a group can be removed from the group by changing the ACDGRP to zero. Changing the ACDGRP to zero causes that agent be placed in the blocked mode with no position or auto logon extension. An error message is generated when changing the ACDGRP to zero and specifying a AGTPOS or AUTOEXT.

If there is a change in ACDGRP, AUTOEXT, or AGTID for an agent, that agent will be logged off until the change has been completed.

If ACDGRP is changed, it must be kept in mind, that a PM agent must be a member of a PM group, a NORMAL agent can be either a member of a NORMAL group or a floating agent. The new ACDGRP value must represent the TYPE of the given agent.

An agent can not be changed to an ACD group if by doing so it causes an illegal step in an ACD routing table (ART). An ART cannot have a route to agent in group X following a route to group X. For more details regarding this restriction, see AMO ACDRT.

**Note:**

It is strongly advised that when a change is made for an agent position (AGTPOS parameter), that this change be done either during off hours or the period of lightest traffic. This is because if an agent whose position is queued is changed, the queue no longer reflects the correct position of its members and it may take some time to unqueue all agents whose group positions have been changed as a result of the "cha-agent" command (those agents whose positions follow the changed agent position). If no agent positions are queued when an agent's position is changed by AMO AGENT (most likely during off hours or periods of lightest traffic), then the queue, when formed as a result of heavier traffic, will always reflect the actual position of the agent.

**Procedure Overview**

| Command Code | Parameter                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------|
| CHANGE-AGENT | AGTID=<number>, { (min1) ACDGRP=<number>, AGTPOS=<number><br>, AUTOWK=<number>, AUTOEXT=<number><br>, NEWID=<number>}; |

**Examples:**

1. Change the agent with AGTID=3556 to group 6.

Input:

```
CHANGE-AGENT:AGTID=3556,ACDGRP=6;
```

Output:

```
H02: AGENT AGTID=3556 HAS BEEN CHANGED.
```

2. Change the agent with AGTID=3556 to group 6 at the position 2.

Input:

```
CHANGE-AGENT:AGTID=3556,ACDGRP6=6,AGTPOS=2;
```

Output:

```
H02: AGENT 3556 IS CHANGED.
```

3. Change the agent's id from AGTID=3556 to new id  
NEWID=2376,AUTOWK=60, and AUTOEXT=5634.

Input:

```
CHANGE-AGENT:AGTID=3556,NEWID=2376,AUTOWK=60,AUTOEXT=5634;
```

Output:

```
H02: AGENT AGTID=3556 HAS BEEN CHANGED.
```

4. Remove the agent with AGTID=3556 from group "4" and place him in "flexible" agents list.

Input:

CHANGE-AGENT:AGTID=3556,ACDGRP=0;

Output:

H07: AGENT AGTID=@@@@@@ HAS BEEN MOVED TO THE FLEXIBLE GROUP.

### 10.2.3 DELETE-AGENT

An agent with all related attributes may be deleted from an ACD group by the DELETE action. When deleting an agent, parameter AGTID is required. An agent cannot be deleted if it is being referenced in an ART set up by AMO ACDRT. An agent with the silent monitoring attribute can be deleted with no specific restriction.

The user deletes all agent attributes by specifying TYPE = ALL or omitting the TYPE parameter when deleting an agent.

Agents will be logged off before a delete.

Deletion of an agent (i.e. not the last agent) will compact the order of the agents; therefore, the agent position (AGTPOS) will change for some of the agents.

The user can optionally delete only the autoextension for an agent by indicating TYPE = AUTOEXT in a delete command. For this type of delete, no other agent attributes other than the autoextension is affected. The autoextension device itself is not deleted, only the reference to the autoextension in the database for the agent is deleted.

If an autoextension to be deleted has not been assigned to the agent, then error message F10 will be output. Autoextension can't be deleted from a PM agent.

#### Procedure Overview

| Command Code | Parameter                       |
|--------------|---------------------------------|
| DELETE-AGENT | AGTID=<number>, [TYPE=<param>]; |

#### Examples:

1. Delete the agent with identification number AGTID=1234.

Input:

DELETE-AGENT:AGTID=1234;

Output:

H03: AGENT AGTID=1234 HAS BEEN DELETED.

- 2. Delete the autoextension for agent whose identification number is 1234 (assumes that this agent has an autoextension)

Input:

DELETE-AGENT:AGTID=1234,TYPE=AUTOEXT;

Output:

H19: THE 'AUTOMATIC LOGON' FEATURE HAS BEEN  
WITHDRAWN FROM AGENT AGTID=1234.

**10.2.4 DISPLAY-AGENT**

The display action displays information about a specific agent, range of agents, or all agents associated with a specific group, all groups, or range of groups; or the ACD system as a whole. This information consists of the parameters which were configured by the ADD-AGENT action, i.e., agent's logon identification number (AGTID), group number (ACDGRP), agent position in the group (AGTPOS), agent type, auto work time (AUTOWK), agent extension if auto logon is set (AUTOEXT) or PEN and ISDB B channel.

Flexible agents can be displayed by displaying the group zero (i.e. ACDGRP=0).

If ACDGRP is not entered, all agents will be displayed sorted by their AGTID's. If ACDGRP is entered, all agents belonging to that group will be displayed by their positions.

The display can be filtered to the agent type.

**Procedure Overview**

| Command Code  | Parameter                                             |
|---------------|-------------------------------------------------------|
| DISPLAY-AGENT | [AGTID=<number>],[ACDGRP=<number>],[AGTTYPE=<param>]; |

**Examples:**

- 1. Display all the agents in the ACD system.

Input:

DISPLAY-AGENT:;

Output:

|                                                        |         |         |         |         |
|--------------------------------------------------------|---------|---------|---------|---------|

| AGTID                                                  | ACDGRP  | AGTPOS  | AUTOWK  | AUTOEXT |
| +-----+                                                | +-----+ | +-----+ | +-----+ | +-----+ |

|              |                |       |     |      |
|--------------|----------------|-------|-----|------|
| 008897       | 1              | 1     | 120 | 7768 |
| TYPE: NORMAL | PEN:           | BC:   |     |      |
| 009876       | 2              | 1     | 90  | 7555 |
| TYPE: NORMAL | PEN:           | BC:   |     |      |
| 200000       | 1              | 4     | 0   |      |
| TYPE: NORMAL | PEN:           | BC:   |     |      |
| 500001       | 5              | 1     |     |      |
| TYPE: PM     | PEN: 1-2-103-0 | BC: 1 |     |      |

## 2. Display agents with AGTID=200000 and AGTID=500001

Input:

DISPLAY-AGENT:AGTID=200000&500001;

|                              |                |        |        |         |
|------------------------------|----------------|--------|--------|---------|
| ACD AGENT'S DATA INFORMATION |                |        |        |         |
| AGTID                        | ACDGRP         | AGTPOS | AUTOWK | AUTOEXT |
| 200000                       | 1              | 4      | 0      |         |
| TYPE: NORMAL                 | PEN:           | BC:    |        |         |
| 500001                       | 5              | 1      |        |         |
| TYPE: PM                     | PEN: 1-2-103-0 | BC: 1  |        |         |

## 3. Display all agents in the range 009876and 500001

Input:

DISPLAY-AGENT:AGTID=008897&&200000;

Output:

|                              |                |       |    |      |
|------------------------------|----------------|-------|----|------|
| ACD AGENT'S DATA INFORMATION |                |       |    |      |
| 009876                       | 2              | 1     | 90 | 7555 |

## AGENT - ACD Agents

### Functions of the AMO

#### 4. Display all agents in the ACD group number "1".

Input:

DISPLAY-AGENT:ACDGRP=1;

| ACD AGENT'S DATA INFORMATION |        |        |        |         |
|------------------------------|--------|--------|--------|---------|
| AGTID                        | ACDGRP | AGTPOS | AUTOWK | AUTOEXT |
| 008897                       | 1      | 1      | 120    | 7768    |
| TYPE: NORMAL                 |        | PEN:   |        | BC:     |
| 200000                       | 1      | 4      | 0      |         |
| TYPE: NORMAL                 |        | PEN:   |        | BC:     |

#### 5. Display flexible agents.

Input:

DISPLAY-AGENT:ACDGRP=0;

Output:

| ACD AGENT'S DATA INFORMATION |        |        |        |         |
|------------------------------|--------|--------|--------|---------|
| AGTID                        | ACDGRP | AGTPOS | AUTOWK | AUTOEXT |
| 187000                       | 0      |        | 300    |         |
| TYPE: NORMAL                 |        | PEN:   |        | BC:     |

#### 6. Display PM agents.

Input:

DISPLAY-AGENT:AGTTYPE=PM;

Output:

| ACD AGENT'S DATA INFORMATION |        |                |        |         |
|------------------------------|--------|----------------|--------|---------|
| AGTID                        | ACDGRP | AGTPOS         | AUTOWK | AUTOEXT |
| 500001                       | 5      | 1              |        |         |
| TYPE: PM                     |        | PEN: 1-2-103-0 |        | BC: 1   |

## 10.2.5 REGENERATE-AGENT

The Regenerate action enables the regeneration of the ADD-AGENT commands. The output format is set up so that it can be used directly as an input command for the function ADD. REGENERATE-AGENT is used for regeneration of all agents in ACD, or by ACDGRP's (single, chained, or range).

### Procedure Overview

| Command Code     | Parameter                            |
|------------------|--------------------------------------|
| REGENERATE-AGENT | [AGTID=<number>], [ACDGRP=<number>]; |

#### Examples:

1. Regenerate all the agents in the ACD system.

Input:

```
REGENERATE-AGENT;
```

Output:

```
ADD-AGENT:187000,0,,NORMAL,300,;
ADD-AGENT:008897,1,1,NORMAL,120,7768;
ADD-AGENT:200001,1,2,NORMAL,60,;
ADD-AGENT:500001,5,1,PM,1-2-103-0,1;
```

2. Regenerate all the ACDGRP=1 and ACDGRP=2.

Input:

```
REGENERATE-AGENT:ACDGRP=1&2;
```

Output:

```
ADD-AGENT: 008897,1,1,NORMAL,120,7768;
ADD-AGENT: 200001,1,2,NORMAL,60,;
ADD-AGENT: 200002,1,3,NORMAL,120,;
ADD-AGENT: 200000,1,4,NORMAL,0,;
ADD-AGENT: 009876,2,1,NORMAL,90,7555;
```

3. Regenerate all the agents in the ACDGRP=0 through ACDGRP=3.

Input:

```
REGENERATE-AGENT:ACDGRP=0&&3;
```

Output:

```
ADD-AGENT: 187000,0,,NORMAL,300,;
ADD-AGENT: 008897,1,1,NORMAL,120,7768;
ADD-AGENT: 200001,1,2,NORMAL,60,;
ADD-AGENT: 200002,1,3,NORMAL,120,;
ADD-AGENT: 200000,1,4,NORMAL,0,;
ADD-AGENT: 009876,2,1,NORMAL,90,7555;
ADD-AGENT: 187654,3,1,NORMAL,300,;
```

4. Regenerate agents 187000 and 500001

Input:

REGENERATE-AGENT:AGTID=187000&500001;

Output:

ADD-AGENT: 187000,0,,NORMAL,300;  
ADD-AGENT: 500001,5,1,PM,1-2-103-0,1;

**10.3 Parameter Description**

|                 |                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 10.4 Error Messages and Advisories

**Note:**

AMO AGENT communicates with the Call Processing subsystem when performing various commands. Some of the error and advisory messages reflect a negative response from call processing during requests from the AMO to log off, log in, or block an agent's device. For some types of commands, AMO AGENT sends a message to Call Processing (request to block an agent's device) prior to changing the static database. If the request fails (negative response from Call Processing), the static database is not changed. Error messages F24 and F26 reflect this. For some types of commands, AMO AGENT sends a message to Call Processing (request to logoff or logon an agent's device) after changing the static database. The AMO changed the static database, but the agent's device was not logged off or in. Advisory messages H13-H18 reflect this.

### 10.4.1 Error Messages

- F01: THE INPUT FOR PARAMETER 'AGTID'  
MUST BE EXACTLY @ DIGITS LONG.  
(DISP-ACDSD:TYPE=SYS; PARAMETER 'AGTIDLEN').
- F02: AGENT IDENTIFICATION NUMBER  
AGTID=@@@@@ IS ALREADY IN USE.
- F03: NO ACD GROUP WITH ACDGRP=@@@ CONFIGURED.  
(DISP-ACDGP:ACDGRP;)
- F04: NO MORE AGENTS CAN BE ASSIGNED TO ACD GROUP ACDGRP=@@@.  
THE MAXIMUM NUMBER OF AGENTS HAS ALREADY BEEN ATTAINED.
- F05: INSTEAD OF AUTOWK=@@@@ ENTER ANY VALUE BETWEEN 1 TO 9, OR A MULTIPLE OF 5  
BETWEEN 10 TO 300 FOR THE LENGTH OF THE SYSTEM CONTROLLED WORK PERIOD.
- F06: THE SUBSCRIBER CAN NOT BE CONFIGURED AS AN AGENT HAVING  
'AUTOMATIC LOGON' FEATURE (AUTOEXT=@@@@@) BECAUSE THE  
STATION NUMBER HAS BEEN CONFIGURED AS A FLOATING STATION.  
(SEE AMO SCSU, INS=FLOAT)
- F08: STATION NUMBER AUTOEXT=@@@@@ MUST FIRST BE  
CLASSMARKED FOR THE AUTOMATIC LOGON FEATURE.  
SET REQUESTED CLASSMARK WITH THE FOLLOWING COMMAND:  
CHANGE-SDAT:STNO=@@@@@,TYPE=ATTRIBUT,AATTR=AUTOLOG;
- F09: FOR A FLEXIBLE AGENT THE OPTIONAL PARAMETERS  
'AGTPOS' AND 'AUTOEXT' MAY NOT BE SPECIFIED.
- F10: NO EXTENSION (AUTOEXT) FOR THE 'AUTOMATIC LOGON' FEATURE  
HAS YET BEEN ASSIGNED TO AGENT AGTID=@@@@@
- F11: NO AGENT CONFIGURED WITH AGTID=@@@@@.
- F12: THE NUMBER @@@@@ ENTERED FOR 'NEWID'  
(NEW AGENT IDENTIFICATION NUMBER) IS ALREADY IN USE.
- F13: THE STATION NUMBER @@@@@ ENTERED FOR 'AUTOEXT'  
IS ALREADY ASSIGNED TO AN OTHER AGENT.
- F15: SETTING AUTOWORK FOR PM AGENTS IS NOT POSSIBLE

- F16: ACD FEATURE IS BLOCKED.  
ACTIVATE IT WITH THE FOLLOWING COMMAND:  
CHANGE-ZAND:TYPE=ACD,ACDALLOW=YES;
- F18: AGENT AGENT=@@@@@@ IS STILL  
REFERENCED BY ACD ROUTING TABLES.  
ENTER COMMAND 'DISP-ACDRT;' AND SEARCH FOR ENTRIES  
HAVING THE WORD 'AGTID' IN THE OUTPUT COLUMN  
MARKED BY HEADER 'PARAMETER'. (ACTION=RTAGT)
- F19: MEMORY RESERVED FOR AGENTS IS INSUFFICIENT.  
ALLOCATE ADDITIONAL MEMORY WITH THE FOLLOWING COMMAND:  
ADD-DIMSU:ACDAGT=<?>;
- F20: THE NUMBER @@@@@@ ENTERED FOR 'AUTOEXT'  
IS NOT YET CONFIGURED AS A STATION NUMBER.  
(SEE AMO SBSCU,STNO)
- F22: STATION NUMBER AUTOEXT=@@@@@@ MUST FIRST BE  
CLASSMARKED AS AN AGENT. SET REQUESTED  
CLASSMARK WITH THE FOLLOWING COMMAND:"  
CHANGE-SDAT:STNO=@@@@@@,TYPE=ATTRIBUT,AATTR=AGENT;
- F24: AGENT AGTID=@@@@@@ HAS NOT BEEN DELETED BECAUSE  
THE APPROPRIATE DEVICE COULD NOT BE DEACTIVATED.  
(NEGATIVE ACKNOWLEDGEMENT FROM CALL PROCESSING)
- F26: AGENT AGTID=@@@@@@ HAS NOT BEEN CHANGED BECAUSE  
THE APPROPRIATE DEVICE COULD NOT BE DEACTIVATED.  
(NEGATIVE ACKNOWLEDGEMENT FROM CALL PROCESSING)
- F28: AGENT AGTID=@@@@@@ MAY NOT BE MOVED TO GROUP  
ACDGRP=^acdgrp^ BECAUSE BOTH PARAMETERS ARE  
REFERENCED IN THE SAME ACD ROUTING TABLE (ART).  
(THIS RESTRICTION CAN BE RELIEVED A LITTLE,  
SEE AMO ACDRT, TYPE=ARTSTEP, ACT=RTAGT/RTGRP/COND)
- F29: AN AGENT ENDOWED WITH THE 'AUTOMATIC LOGON'  
FEATURE (WHOSE 'AUTOEXT' HAS BEEN CONFIGURED)  
MAY NOT BE MOVED TO THE FLEXIBLE ACD GROUP.
- F30: MEMORY RESERVED FOR AUTOMATIC LOGON AGENTS IS INSUFFICIENT.  
ALLOCATE ADDITIONAL MEMORY WITH THE FOLLOWING COMMAND:  
ADD-DIMSU:ACDLOGON=<?>;
- F31: A PM AGENT MUST JOIN A PM GROUP
- F32: A NORMAL AGENT MUST NOT JOIN A PM GROUP
- F33: DEL AUTOEXT IS ONLY ALLOWED FOR A NORMAL AGENT
- F34: INSUFFICIENT MEMORY SPACE (SEE AMO DIMSU, ACDAGT AND ACDPRIM)
- F35: TRUNK GROUP OF ACDPMGRP DOES NOT EQUAL TO INPUT ACDGRP
- F36: INPUT B-CHANNEL NOT AVAILABLE
- F37: B-CHANNEL @@ IS NOT OUT-OF-SERVICE.  
PLEASE USE LONG TERM DEACTIVATION WITH THE FOLLOWING COMMAND:  
DEACTIVATE-DSSU:OFFTYPE=L,TYPE=BCHAN,PEN1=<pen>,BCHL=<number>;
- F38: AUDIBLE SOURCE ID PERSANN=@@@ HAS YET TO BE CREATED (ADD-  
RCSU:OPMODE=CONT,OPTYPE=RANDOM, RECAPL=ACDR,RECNUM=@@@;).
- F39: THE APPLICATION TYPE ASSIGNED FOR RECORDER 'AUDSRCID' BY AMO RCSU MUST BE  
RECAPL=ACDR.
- F40: RECORDER 'AUDSRCID' MUST BE CONFIGURED WITH CONTINUOUS OPERATIONS MODE AND  
RANDOM START (CHANGE-RCSU,OPMODE=CONT,OPTYPE=RANDOM,RECNUM=;).
- F41: RECORDER 'AUDSRCID' MUST BE CONFIGURED WITH CONTINUOUS OPERATIONS MODE AND  
RANDOM START (CHANGE-RCSU,OPMODE=CONT,OPTYPE=RANDOM,RECNUM=;).
- F42: PARAMETER PERSANN IS NOT VALID FOR PHONEMAIL AGENTS.
- F43: THE SPECIFIED PEN IS NOT MEMBER OF A PM TRUNK GROUP (AMO BUEND,TDCSU).

## AGENT - ACD Agents

### Error Messages and Advisories

#### 10.4.2 Advisories

H01: AGENT AGTID=@@@@@ HAS BEEN ADDED.  
H02: AGENT AGTID=@@@@@ HAS BEEN CHANGED.  
H03: AGENT AGTID=@@@@@ HAS BEEN DELETED.  
H04: AGENT POSITIONS WITHIN A GROUP MUST BUILD AN UNINTERRUPTED SEQUENCE. THE NEW POSITION AGTPOS=@@@@ HAS THEREFORE BEEN ASSIGNED TO THE AGENT SPECIFIED IN THE COMMAND.  
H05: THIS COMMAND CAUSED A CHANGE IN THE AGENT POSITIONS WITHIN ACD GROUP ACDGRP=@@@.  
H06: AGENT AGTID=@@@@@ HAS BEEN ADDED TO THE FLEXIBLE ACD GROUP.  
H07: THE AGENT AGTID=@@@@@ HAS BEEN MOVED TO FLEXIBLE GROUP.  
H08: THERE ARE NO AGENTS HAVING 'AGTID' WITHIN THE REQUIRED RANGE.  
H09: THERE ARE NO AGENTS HAVING 'ACDGRP' WITHIN THE REQUIRED RANGE.  
H10: THERE ARE NO AGENTS ASSIGNED YET TO ACD GROUP ACDGRP=@@@.  
H11: NO AGENT WITH AGTID=@@@@@ CONFIGURED  
H12: THERE IS NO ACD GROUP WITH ACDGRP=@@@ CONFIGURED.  
(SEE AMO ACDGP,ACDGRP)  
H13: LOGON OF AGENT AGTID=@@@@@ NOT POSSIBLE.  
(NEGATIVE ACKNOWLEDGEMENT FROM CALL PROCESSING)  
H14: COULD NOT LOG ON AGENT AGTID=@@@@@ BECAUSE THE APPROPRIATE DEVICE (AUTOEXT) IS NOT IDLE OR IS UNAVAILABLE. IN ORDER TO LOG ON DEACTIVATE AND ACTIVATE THE DEVICE THE FOLLOWING COMMANDS:  
DEACT-DSSU:OFFTYPE=DC,TYPE=STNO,STNO=<AUTOEXT>;  
ACT-DSSU:ONTYPE=ANL,TYPE=STNO,STNO=<AUTOEXT>;  
OR USE FUNCTION RESTART-DSSU.  
H15: LOGON OF AGENT AGTID=@@@@@ NOT POSSIBLE  
BECAUSE THE DEVICE (AUTOEXT) IS NOT IN SERVICE.  
ACTIVATE DEVICE WITH THE FOLLOWING COMMAND:  
ACT-DSSU:ONTYPE=ANL,TYPE=STNO,STNO=<AUTOEXT>;  
H16: AGENT AGTID=@@@@@ COULD NOT BE RELOGGED BY CALL PROCESSING DUE TO THE LACK OF LOGON POSITIONS.  
ALLOCATE ADDITIONAL MEMORY WITH THE FOLLOWING COMMAND:  
ADD-DIMSU:ACDLOGON=<?>;  
H17: LOGOFF OF AGENT AGTID=@@@@@ NOT POSSIBLE.  
(NEGATIVE ACKNOWLEDGEMENT FROM CALL PROCESSING)  
H18: NEGATIVE RESPONSE FROM CALL PROCESSING.  
H19: THE 'AUTOMATIC LOGON' FEATURE HAS BEEN WITHDRAWN FROM AGENT AGTID=@@@@@.  
H20: THERE ARE NO AGENTS CONFIGURED.

Error Messages and Advisories

# 11 ANSU - Enter System Number into SWU Data Base

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

AMO ANSU has the task of entering the system numbers in the SWU database and displaying or regenerating the entered system numbers and APS code numbers from the database.

## 11.1 Restrictions

This description is valid from SP300-V3.1

## 11.2 Interrelationships

none

## 11.3 Functions of the AMO

- [ADD-ANSU](#) : Enter the system number in the database
- [DISPLAY-ANSU](#) : Interrogate and output the system number and the APS code numbers
- [REGENERATE-ANSU](#) : Regenerate the system number

### 11.3.1 ADD-ANSU

The system number is only entered in those database subsystems which can contain customer-specific data. Since the SWU database consists of several subsystems, the system number can also be selectively entered in certain DB subsystems only. Existing entries are overwritten. If individual values are entered for parameter SUSY, i.e. a system number is not to be entered in all DB subsystems, the system numbers of DB subsystems not to be processed are compared with the newly entered system number. If deviations are detected, Advisory H01 is output. An empty database is initialized with

**ANSU - Enter System Number into SWU Data Base**

Functions of the AMO

"EMPTY\_DB\_ZDBxxxxx". In addition, by entering parameter SP the system program number entered in the DIR file for the specified APS on the hard disk can be changed.

**Note**

The system program number in the APS (SP) is defined during SP production, and subsequent alteration (by means of ADD) is not permitted.

**Procedure Overview**

| Command Code | Parameter                                                                                 |
|--------------|-------------------------------------------------------------------------------------------|
| ADD-ANSU     | TYPE=SYSNO, SYSNO=<string>, [SUSY=<string>];<br><br>  TYPE=SP, APS=<string>, SP=<string>; |

**Note**

If the parameter SUSY is not specified, the system number is entered in all SWU subsystems.

**Examples**

The system number is entered in the SWU database subsystem DB\_SUSY\_ZDBCCDD1.

Input:

ADD-ANSU:SYSNO,"L31617S0001X", "ZDBCCDD1";

In APS S6-E50, the system program number is replaced by the number P30252X5521A10101.

Input:

ADD-ANSU:SP,"S6-E50SC", "P30252X5521A10101";

**11.3.2 DISPLAY-ANSU**

This function provides an overview, in the form of a table, of system program numbers contained in the 3rd set of the APS-DIR files of the SWU, and of the system numbers entered in the DB subsystems.

**Procedure Overview**

| Command Code | Parameter |
|--------------|-----------|
| DISPLAY-ANSU | ;         |

**Example**

Input:

DISPLAY-ANSU;

Output:

| APS TYPE     | NAME     | SP REFERENCE NO.  |
|--------------|----------|-------------------|
| SWU RES-CODE | S3-E50SC | P30252X55211A1011 |
| SWU RES-TEXT | S3-E51ST | P30252X55212A1011 |
| SWU AMO-CODE | B3-E50BC | P30252X55213A1011 |
| SWU AMO-TEXT | B3-E51BT | P30252X55214A1011 |

| SYSTEM NUMBER | DB SUBSYSTEM NAME |
|---------------|-------------------|
| L31617S0001X  | DB_SUSY_ZDBCCDD1  |
| L31617S0001X  | DB_SUSY_ZDBCCDD2  |
| L31617S0001X  | DB_SUSY_ZDBCCDD3  |

**11.3.3 REGENERATE-ANSU**

With this function, the ADD command or, if there are different system numbers, the ADD commands, are regenerated.

**Note**

The branch TYPE = SP cannot be regenerated.

**Procedure Overview**

| Command Code    |
|-----------------|
| REGENERATE-ANSU |

| Parameter |
|-----------|
| ;         |

**Example**

Input:

REGENERATE-ANSU;

Output:

|                              |         |    |
|------------------------------|---------|----|
| ADD-ANSU:SYSNO,"L31617S0001X | ", "DD1 | "; |
| ADD-ANSU:SYSNO,"L31617S0001X | ", "DD2 | "; |
| ADD-ANSU:SYSNO,"L31617S0002X | ", "DD3 | "; |

**11.4 Parameter Description**

|     |                                                        |
|-----|--------------------------------------------------------|
| APS | APS NAME<br>(for which the SP number is to be changed) |
|-----|--------------------------------------------------------|

**ANSU - Enter System Number into SWU Data Base**

Parameter Description

|       |                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO ANUM has the task of entering the system number in the database of the HW module ADS and of displaying or regenerating the entered system number and APS code numbers from the database.

### 12.1 Restrictions

This description is valid from Hicom 300 E V3.0

### 12.2 Interrelationships

none

### 12.3 Functions of the AMO

- [ADD-ANUM](#) : Entry of the system number into the database
- [DISPLAY-ANUM](#) : Interrogation and output of the system number and the APS code numbers
- [REGENERATE-ANUM](#) : Regeneration of the system number

#### 12.3.1 ADD-ANUM

The system number is entered only in those database subsystems that can contain customer-specific data. Already existing entries are overwritten. If single values are entered for the parameter SUSY, i.e., a system number is not to be entered in all DB subsystems; thus the system numbers of the DB subsystems not to be processed are compared with the newly entered number and the advisory H01 is issued in case of discrepancies. An empty database is initialized with "EMPTY DB ZDBxxxxx". In addition, the SP code number entered in the DIR file on hard disk for the corresponding APS can be changed by specifying the parameter SP.

**ANUM - Enter System Number into Data Base**

Functions of the AMO

**Note**

The system number (SYSNO) is defined during the SP production; a subsequent change (via ADD) is not permitted.

**Procedure Overview**

**Command Code**

ADD-ANUM

**Parameter**

TYPE=SYSNO, [UNIT=<param>], SYSNO=<string>;  
  
| TYPE=SP, APS=<string>, SP=<string>;

**Examples**

The system number is to be entered into the database of the ADS.

Input:

ADD-ANUM:SYSNO,A1,"L31617S0001X";

The SP number P30252B1111A00101 is to be entered in the DIR file of the APS A6-E50AC.

Input:

ADD-ANUM:SP,"A0-EJ0AC","P30252B4100A50401";

**12.3.2 DISPLAY-ANUM**

This action provides an overview in table format of the system numbers entered in the DB subsystems and of the APS code numbers contained in the 3rd record of the APS DIR file. A check is made to determine whether all entered system numbers are the same.

**Procedure Overview**

**Command Code**

DISPLAY-ANUM

**Parameter**

[UNIT=<param>], [LIST=<param>;

**Example**

Interrogating the system numbers in the Voice Mail Server

Input:

DISPLAY-ANUM:A1;

Output:

ANUM - Output for SWU  
-----  
  
APS-TYPE        | NAME        | SP-CODE NUMBER

```

-----+-----+-----
ADS AMO-TEXT | A0-TJ0AF | P30252B4100B50401
ADS RES-CODE | A0-EJ0AC | P30252B4100A00178

```

```

-----+-----
SYSTEM NUMBER | HW MODULE
-----+-----
L31617S0001X | ZDAVMM01
-----+-----

```

### 12.3.3 REGENERATE-ANUM

This action regenerates the ADD command.

#### Note

Branch TYPE=SP cannot be regenerated.

#### Procedure Overview

| Command Code    |
|-----------------|
| REGENERATE-ANUM |

| Parameter      |
|----------------|
| [UNIT=<param>; |

#### Example

Regenerate the system numbers from the database of the SWU.

Input:

REGENERATE-ANUM:A1;

Output:

ADD-ANUM:SYSNO,A1,"L31617S0001X";

## 12.4 Parameter Description

|                 |                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------|
| SYSNO           | System number to be entered (System number, correct number of positions, without hyphens) |
| Type of Input   | : Single value, mandatory                                                                 |
| Possible Values | : 17-digit system number                                                                  |
| APS             | Name of the APS for which the SP number is to be changed                                  |
| Type of Input   | : Single value, mandatory                                                                 |

**ANUM - Enter System Number into Data Base**

Parameter Description

|       |                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 13 APC - Application Configuration

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO "Application Configuration" (APC) serves to manage the applications of the integrated HICOM server. Each application consists of one or more subsystems, a subsystem may occur in several applications, and an application may be active in one or more servers, but the subsystem itself exists only once in the program library (PGLIB).

An application update for a certain server only ever takes effect at the next RELOAD of the server concerned.

The PGLIB-loading tables will be overwritten while UPDAT. An UPDAT- if any- should be done before any changes of applications with APC. Otherwise, while an UPDAT, the changed loading tables with AMO APC will be overwritten with the unchanged loading tables from memory.

### 13.1 Restrictions

This description is valid from SP300 - E V3.0 WP2

### 13.2 Interrelationships

- AMO DBC : Database Configuration
- AMO APS : Application program system transfer to hard disk
- AMO UCSSM : Unit configuration of service modules
- AMO UPDAT : Update Control
- AMO USSM : Unit switch of service modules
- AMO SWS : Software supply

### 13.3 Functions of the AMO

- [ACTIVATE-APC](#) : Activating applications in one or more servers with the possibility of naming a loading place

APC - Application Configuration

Functions of the AMO

- DEACTIVATE-APC : Deactivating applications in one or more servers
- DISPLAY-APC : Displaying the applications, the servers and individual subsystems
- REGENERATE-APC : Regenerating all applications in all servers
- EXEC-APC : Automatical generating of Loading Tables

13.3.1 ACTIVATE-APC

The specified application for the specified loading place in the specified server is transferred to the PGL loading tables.

The AMO ensures that a subsystem is entered only once in a loading table; that is, only subsystems not yet entered for the server are applied to the specified loading place.

It is not possible to activate applications in servers IHS and ISU at the same time.

If the loading place is not named, BP (local MEM) will be taken instead of it.

The information saying which directory contains the subsystem that is to be entered is obtained by the AMO straight from the PGLIB by reading the RMX directory files.

The AMO does not ensure whether the specified subsystem configuration really has enough space in the server's existing memories.

The PGLIB loading tables are overwritten at every change.

The following points are valid only for IHS applications.

If the subsystem name ZDAIHS00 is identified, it will be converted, prior to entry in the loading table, to the subsystem name of the database of the specified server.

If the subsystem name ZMDAMCJ0 is identified, it will be converted (in the case of server ADS) to the subsystem name ZMDAMCJA.

When "SERVER=ADS" is specified, "ZDAIHS00" ==> "ZDAADS00" and "ZMDAMCJ0" ==> "ZMDAMCJA".

Procedure Overview

| Command Code | Parameters                                       |
|--------------|--------------------------------------------------|
| ACTIVATE-APC | APPL=<string>, SERVER=<param>, [MEMORY=<param>]; |

**Example**

Activating the application "TFS-AS" in server ADS with loading place CM as the only change

Input:

```
ACTIVATE-APC:"TFS-AS",ADS,CM;
```

**13.3.2 DEACTIVATE-APC**

The specified application is removed from the loading tables of the specified server.

It is not possible to deactivate applications in servers IHS and ISU at the same time.

The AMO ensures that only those subsystems are removed that are not needed for any other application in this server.

The PGLIB loading tables are overwritten at every change.

**Procedure Overview**

| Command Code   | Parameters                     |
|----------------|--------------------------------|
| DEACTIVATE-APC | APPL=<string>, SERVER=<param>; |

**Example**

Deactivating the application "TFS-AS" in server ADS as the only change

Input:

```
DEACTIVATE-APC:"TFS-AS",ADS;
```

**13.3.3 DISPLAY-APC**

The display shows the applications with their subsystems and the servers with their activated applications, or a subsystem and its loading places.

It is possible to display applications in servers IHS and ISU at the same time.

The display can be confined to a server, an application or an application in a server. If only a subsystem is specified, only the subsystem and its loading places will be displayed.

With the parameter MODE can be defined which applications will be examined:

- only installed applications (default value)
- possible (defined in applicaton tables but not activated)
- both (installed and possible)

Procedure Overview

| Command Code | Parameters                                                            |
|--------------|-----------------------------------------------------------------------|
| DISPLAY-APC  | [APPL=<string>], [SERVER=<string>], [SUSY=<string>], [MODE=<string>]; |

Examples

1. Displaying the application TFS-AS in server ADS

Input:

DISPLAY-APC:"TFS-AS",ADS;

Output:

```
DISPLAY-APC:"TFS-AS",ADS;

RELATING-TABLE FOR IHS
=====

CLASSIFICATION:  APPLICATION - SUBSYSTEMS

### 13.3.4 REGENERATE-APC

The applications activated in all servers are output.

The output for server SWU is done as "EXEC-APC" , followed by an advisory H16 for each active application.

#### Procedure Overview

| Command Code   | Parameters |
|----------------|------------|
| REGENERATE-APC | ;          |

#### Example

Regenerating the PGL loading tables

Input:

REGENERATE-APC;

Output:

```
ACTIVATE-APC:"TFS-AS",ADS,BP;  
  
EXEC-APC;  
H16: ACTIVATE-APC: "B370      ",SWU,BP;
```

13.3.5 EXEC-APC

The loading tables for the specified servers are generated and activated automatically.

When the server is not specified, the SWU will be assumed and the AMO APC reads from the database the values for ARCHITECTURE and ARCHITECTURE-TYPE which have been configured with the AMO DBC. The AMO APC investigates the applications which have to be loaded using the HW architecture tables. The AMO APC activates the new SWU loading tables. The already existing SWU loading tables will be deleted and exchanged to the new generated ones.

The HW architecture tables can be checked by invoking

```
STA-LIST:" :PDS:APSU/HWARCH?" , , M,N;
```

Because of overwriting an existing loading table, the AMO DBC has to be executed before the execution of AMO APC.

Changes by AMO DBC or AMO APS will be taken over in the SWU/L00 loading tables only after an execution of "EXEC-APC;".

When the server is specified, the AMO-APC reads the old loading and application tables, investigates which applications have to be loaded for the specified server, deletes the old loading tables and configures new ones. Although "EXEC-APC:server;" is needed in very few cases, it should not be forgotten if whatever change occur in application tables (example: new subsystem by the automatic takeover of the new software version).

If SWS is started with parameter UPDATE=Y, the UPDATE task (at the end of its work) automatically executes EXEC-APC for all configured servers.

Procedure Overview

| Command Code | Parameters        |
|--------------|-------------------|
| EXEC-APC     | [SERVER=<string>; |

## 13.4 Parameter Description

|        |                                         |                                                                                                                         |
|--------|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------|

This function makes it possible for the user to append a file to another file.

The name of the destination file and the contents of the appended file remain unchanged.

# 17 APRT - Access Point Routing Table

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">General</a>            | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

## 17.1 General

The AMO APRT performs the following functions for APs in NBCS:

- Configuration of the IP addresses for the AP net  
The AP IP address, the Netmask and the TA IP address can be maintained per AP.
- Configuration of the IP routing tables  
The IP routing tables are a part of the board configuration data for the NCUI and the STMI boards. They consist of 8 entries each with a destination IP address, a destination mask and router IP address. For the NCUI boards the IP routing tables are configured per board, for the STMI boards the same values in the IP routing tables are valid for all STMI boards configured in the system.  
The configuration data will be loaded to the corresponding board either by plugging the board in or by means of the AMOs BSSU/ USSU after successful configuration with the AMO STMIB.
- Configuration of the survivability path (if allowed by PFS)  
Survivability can be configured per AP. It is a purchasable feature and can only be configured by AMO APRT if the remote survivability PFS counter in the system is greater than the number of APs already configured for survivability.
- Configuration of the alternate routing table  
The entries in the alternate routing table are configured per source group index. For each particular source group index the entries in the alternate routing table are sorted by the position parameter that can be shown e.g. with a display command.  
An entry in the alternate routing table consists of
  - an alternate routing number
  - an access code
  - an artificial calling number

In order to make the administration of the alternate routing table easier a further parameter is provided to enter a range of artificial calling numbers. If an artificial calling number is entered together with a artificial calling number range it means

## APRT - Access Point Routing Table

### Interrelationships

that a there are as many artificial calling numbers configured as specified in the artificial calling number range, starting with the artificial calling number entered and incremented by one.

- Configuration of source group related "Alternate Routing on Error" table:

For the cases of OOS (Out of Service) and AP emergency, AMO-APRT administers the source group related Alternate Routing Numbers

Entries of the table consist of

- An Alternate Routing Number
- An Extension number : Number of digits to supplement the alternate routing number
- A Gateway IP address of the alternate logon switch

Administration of the table depends on the type of the alternate routing.( OOS or APE). For the type APE, Gateway IP address is not needed.

## 17.2 Interrelationships

- AMO DIMSU : Configuration of features, switching unit
- AMO SIPCO : Configuration of basic IP addresses
- AMO UCSU : Configuration of LTU and NCUI boards
- AMO BCSU : Configuration of STMI boards
- AMO STMIB : Configuration of board data for STMI and NCUI boards

## 17.3 Functions of the AMO

- [ADD-APRT](#) : password class 2
- [CHANGE-APRT](#) : password class 2
- [DELETE-APRT](#) : password class 2
- [DISPLAY-APRT](#) : password class 2
- [REGENERATE-APRT](#) : password class 2

### 17.3.1 ADD-APRT

- TYPE=APNET

The values for APIPADDR, NETMASK and TAIPADDR are optional and will be generated by DB if not filled in. The following restrictions apply:

- The APIPADDR is mandatory in the case of the AP connected via an IP network.
- If the TAIPADDR is entered the APIPADDR has to be entered, too.

- TYPE=SURV

CONF=ROUTER: assigns the address of a SL100 router and the address of a survivability router to a particular router number. It is neither necessary to enter a value for the routernr number nor to fill in values for the addresses, they will both be generated if not entered.

CONF=AP: configures APs for survivability by assigning them to a particular router that has been configured before with the branch CONF=ROUTER.

An AP can only be configured for survivability if the PFS counter for remote survivability is greater than the number of configured shelves for survivability.

- TYPE=ALTROUT

Only in the case of ALRTYPE=ALR the further parameters can be used for the configuration of an alternate routing path.

The combination of alternate routing number, access code and artificial calling number has to be unique. If an artificial calling number range is entered all resulting artificial calling numbers will be checked against the already configured artificial calling numbers for the particular source group.

- TYPE=ALTERR

ALRTYPE =OOS :

Configures the Out Of Service (by AMO) part of the Alternate Routing on Error table for the given Source Group. The combination of ALTRTNR and EXTNO is saved into the table together with the GWIPADR value.

ALRTYPE =APE :

Configures the Access Point Emergency part of the Alternate Routing on Error table for the given Source Group. The combination of ALTRTNR and EXTNO is saved. GWIPADR is not needed for the type APE.

## APRT - Access Point Routing Table

Functions of the AMO

The EXTNO is set to ZERO if the entered ALTRTNR is a Station Number.

### Procedure overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| ADD-APRT     | <pre>TYPE=APNET,LTU=&lt;number&gt;, [APIPADDR=&lt;number&gt;],<br/>[NETMASK=&lt;number&gt;], [TAIPADDR=&lt;number&gt;];<br/>  TYPE=SURV,<br/>    CONF=ROUTER,[ROUTERNR=&lt;number&gt;], [LSADDR=&lt;number&gt;];<br/>  CONF=AP,LTU=&lt;number&gt;, ROUTERNO=&lt;number&gt;;<br/>      SURVTYPE=MODEM;<br/>      SURVTYPE=SURVLAN,SURVIP=&lt;number&gt;,<br/>    SURVNETM=&lt;number&gt;, SURVRT=&lt;number&gt;,<br/>    [VLANTAG=&lt;param&gt;], [VLANID=&lt;number&gt;]<br/>  TYPE=ALTROUT,SRGGRP=&lt;number&gt;, [POS=&lt;number&gt;],<br/>    ALRTYPE=&lt;param&gt;, [ALTRTNR=&lt;key-num&gt;],<br/>    [ACCODE=&lt;key-num&gt;],<br/>    [ARTCNR=&lt;key-num&gt;], [ARTCNRNG=&lt;number&gt;];<br/>  TYPE=ALTERR, SRGGRP=&lt;number&gt;,<br/>      ALRTYPE=OOS, [ALTRTNR=&lt;key-num&gt;],<br/>    [GWIPADR=&lt;number&gt;], [EXTNO=&lt;number&gt;];<br/>      ALRTYPE=APE, ALTRTNR=&lt;key-num&gt;,<br/>    [EXTNO=&lt;number&gt;];</pre> |

## 17.3.2 CHANGE-APRT

- TYPE=APNET

The values for APIPADDR, NETMASK and TAIPADDR are optional and will be generated by DB if not filled in. The following restrictions apply:

- The APIPADDR is mandatory in the case of the AP connected via an IP network.
- If the TAIPADDR is entered the APIPADDR has to be entered, too.

- TYPE=ROUTTBL

Both, the entries in the IP routing tables for NCUI and STMI boards can be changed with AMO APRT. The entries in the IP routing tables for STMI boards are the same for all STMI boards, no specific STMI board can therefore be addressed in the MTYP=STMI branch. After changing the IP routing tables the board data has to be loaded to the corresponding board by means of the AMOs BSSU/USSU.

- TYPE=ALTROUT

The entry in the alternate routing table for a particular source group index and position can be modified.

Although the parameter ARTCNR is defined as a key-numeral number, it can contain only numeric characters, except for one condition:

When the combination ARTCNR=\*\*\* ARTCNRRNG=0 is fulfilled the parameters of the corresponding record are reset to their initial values (ARTCNR is deleted and ARTCNRRNG is set to 0).

If ARTCNR contains non-numeric characters but is not equal to "\*\*\*\*", the AMO breaks with error message F18.

If ARTCNR is equal to "\*\*\*\*" but ARTCNRRNG is not equal to zero, ARTCNR and ARTCNRRNG are ignored (advisory message H14 is given) but all other entered parameters will take effect.

TYPE=ALTERR

The entries of the Alternate Routing numbers on Error for both types OOS and APE can be modified per source group.

### Procedure overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## APRT - Access Point Routing Table

Functions of the AMO

| Command Code | Parameter                                                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | TYPE=ALTROUT, SRCGRP=<number>, POS=<number>,<br>  [ALTRTNR=<key-num>], [ACCODE=<key-num>],<br>  [ARTCNR=<key-num>], [ARTCNRNG=<number>];<br>  TYPE=ALTERR, SRCGRP=<number>,<br>  ALRTYPE=OOS, [ALTRTNR=<key-num>], [GWIPADR=<number>]<br>  [EXTNO=<number>];<br>  ALRTYPE=APE, [ALTRTNR=<key-num>], [EXTNO=<number>]; |

### 17.3.3 DELETE-APRT

- TYPE=APNET

The complete data for an APNET will be deleted by specifying the LTU number.

- TYPE=ROUTTBL

The IP routing tables can only be deleted by the AMOs that are deleting the corresponding boards - this is the AMO UCSU for NCUI boards and the AMO BCSU for STMI boards.

Applying the DELETE-APRT on a particular entry in the IP routing tables will reset the destination IP address, the destination mask and the router IP address to 0.0.0.0. If no value is entered for INDEX all fields of the corresponding IP routing table will be reset.

- TYPE=SURV

CONF=ROUTER: removes a router configuration addressed by the router number. This is only possible if all APs assigned to the router are removed before.

CONF=AP: Removes the configuration of the specified AP for survivability from a particular router.

The counter indicating the number of APs configured for survivability is decremented by one.

- TYPE=ALTROUT

The alternate routing path for a particular source group index and position is deleted. If no value is entered for the position parameter all entries in the alternate routing table for the particular source group are deleted.

- TYPE=ALTERR

The alternate routing number (on Error) entry for a particular source group index is deleted. If no values are entered for the parameters SRCGRP and ALRTYPE then all entries in the alternate routing table are deleted.

### Procedure overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DELETE-APRT  | TYPE=APNET, LTU=<number>;<br>  TYPE=ROUTTBL,<br>[MTYPE=STMI], [INDEX=<number>];<br>  [MTYPE=NCUI], [LTU=<number>], [INDEX=<number>];<br>  TYPE=SURV,<br>CONF=ROUTER, ROUTERNO=<number>;<br>  CONF=AP, LTU=<number>;<br>  TYPE=ALTROUT, SRCGRP=<number>, [POS=<number>];<br>  TYPE=ALTERR, [SRCGRP=<number>], [ALRTYPE=<param>]; |

## 17.3.4 DISPLAY-APRT

- TYPE=APNET  
Displays the configured AP net tables sorted by LTU
- TYPE=ROUTTBL  
The IP routing table data can be displayed for either the STMI or the NCUI boards by using the parameter MTYPE.  
For the STMI boards the routing table will be displayed only once followed by the information on which LTU/SLOT the STMI boards are configured.  
If the parameter MTYPE is not entered the IP routing tables will be displayed for all STMI and NCUI boards, starting with the STMI boards.
- TYPE=SURV  
CONF=ROUTER: displays for all configured routers the router number, the address of the SL100 router and the address of the survivability router.  
CONF=AP: Displays which AP is configured for survivability on which particular router.
- TYPE ALTROUT:  
Displays the alternate routing table data for a particular source group index or for all source group indices if no value is entered for the source group parameter.
- TYPE ALTERR:  
Displays the alternate routing on error table data for a particular source group index or for all source groups if no value is entered for the source group parameter.

| DISPLAY-APRT | [TYPE=APNET], [LTU=<number>];<br>  [TYPE=ROUTTBL],<br>[MTYPE=STMI];<br>  [MTYPE=NCUI], [LTU=<number>];<br>  [TYPE=SURV],<br>CONF=ROUTER, [ROUTERNO=<number>];<br>  CONF=AP, [LTU=<number>];<br>  [TYPE=ALTROUT], [SRCGRP=<number>];<br>  [TYPE=ALTERR], [SRCGRP=<number>]; |

### 17.3.5 REGENERATE-APRT

- TYPE=APNET  
Regenerates the configured AP net table sorted by LTU
- TYPE=ROUTTBL  
The IP routing table data can be regenerated for either the STMI or the NCUI boards by using the parameter MTYPE. If parameter MTYPE is not entered the IP routing tables will be regenerated for all STMI and NCUI boards, starting with the STMI boards.  
For the STMI boards a change command of AMO APRT will be generated, because the actual configuration of those boards is done by AMO BCSU. Although the AMO will not generate commands for IP routing tables that do contain only default values can force the AMO to regenerate those by entering a value for the LTU parameter.
- TYPE=SURV  
If the CONF parameter is not entered the data for all configured routers followed by the the commands for configuring the APs for survivability are generated, otherwise only the specified commands are generated.
- TYPE=ALTROUT:  
Regenerates the alternate routing table data for a particular source group index or for all source group indices if no value is entered for the source group parameter.
- TYPE ALTERR:  
Regenerates the alternate routing on error table data for a particular source group index or for all source groups if no value is entered for the source group parameter.

## Overview of Procedures

| Command Code    | Parameter                                                                                                                                                                                                                                                                                                           |

Error Messages and Advisories

## 18 APS - Software Load Upgrade

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The AMO APS has the task of transferring program systems (PS) in the program library (PGLIB) onto the hard disk area ":PDS:".

The program systems may be supplied on cartridge or on Digital Audio Tape (DAT), or may already have been copied by remote administration and maintenance onto a hard disk area by means of file transfer.

If the supplied subsystems (SUSY) are already on the HD, all required files (SUSY and DIR) are stored under a uniform prefix (e.g. ":AMD:FBT/FCOR/L10/.....").

Since the PGLIB must be handled with special care, the AMO APS first runs a series of test functions before the actual copy procedure takes place.

The AMO APS also provides information on the status of the PS and individual subsystems (SUSY) in the PGLIB.

The supplied customer program system contains two or more DIR files, which are on a single data carrier. The actual subsystems (SUSY) may be contained on two or more data carriers.

There is no follow-up-tape-processing in the sense of relevant standards for cartridge respectively DAT. Only the individual filenames of the subsystems indicate whether the proper DAT or cartridge is applied. By comparing the supplied DIR files with the DIR files on the HD, a compatibility check is made to determine whether copying is worthwhile or at all possible.

In addition, the SUSY supplied on one or more data carriers and named in the DIR files are copied onto the HD.

The accesses to the Program Library must be coordinated, to guarantee the consistency and the correctness of the informations about the PGLIB.

This coordination is managed by an entry into the system catalog. Does this entry already exist the AMO APS will interrupt with the following message:

```
PROGRAMM LIBRARY IS AT THE MOMENT IN USE.
PARALLEL ACCESS NOT POSSIBLE.
```

Furthermore the AMO APS can handle program systems, which are on a HD-area with a logical name unequal :PDS:.

The wanted logical name can be named by the parameter 'DESTDEV'.  
If there is no value for 'DESTDEV' given then the default value is  
:PDS:.

## 18.1 Restrictions

This description is valid from SP300-V3.3

## 18.2 Interrelationships

- AMO BACK : Automatic backup of program system
- AMO CMP : Comparison of Files
- AMO DLSP : Device Logical Area, Server Modules
- AMO RTAPE : DAT and Cartridge Reservation
- AMO XAPC : Xenix Applikations Verwaltung
- AMO-complex FIDES : File and device service  
(see System AMO Section 'ISY startup system')

## 18.3 Functions of the AMO

- [TEST-APS](#) : Test the supplied DIR files against the PGLIB status
- [COPY-APS](#) : Copy the subsystems in the program library onto the HD
- [DISPLAY-APS](#) : Display the contents of the program library
- [OUTPUT-APS](#) : Output the DIR file without editing
- [DUMP-APS](#) : Dump the PGLIB on the data carrier

### 18.3.1 TEST-APS

Tests whether the status of the supplied PS match the status on the HD.  
However, this test does not change the :PDS: area in any way.  
The test can be carried out as often as desired, unless a COPY-APS has  
not successfully been completed beforehand.

Depending on input, there are various test options:

- If a DIR file is not specified (parameter DIRNAME), the NORMAL test  
is run.

The test ascertains which PS have been supplied and which are already present. In the event that the version number and corrected version number of the supplied PS are greater than those of the PS already present, the supplied PS are copied. This means that only those SUSY are copied whose version or corrected version in the supplied PS has been altered in comparison to the PS already present.

If the DIR file corresponds to the DIR file specified on the data carrier (e.g. "DIRDC0.20.001"), the specified PS in the PGLIB is copied.

If the DIR file corresponds to the DIR file specified in the PGLIB (e.g. "D0-EF0DC"), the specified PS is deleted from the PGLIB.

Duplicate entries will be detected and rejected by the AMO APS.

The specified PS are copied without testing of their version or corrected version, even if they were not yet present in the PGLIB. If a complete delivery is being made, all SUSY of the specified PS are copied.

If a partial delivery is being made, all SUSY are copied which have been altered with respect to the PGLIB status. If PS are found which have been altered but were not specified, the NORMAL test is then run for these PS.

If an additional DIR file exists on the data carrier, it is tested regardless of input.

Only those PS are copied for which the DIR files have been specified. For each SUSY a query is made as to whether it is to be copied, and, if it is not to be copied, whether the present status is to be deleted.

- If two or more DIR files of the same type are on a data carrier, the user is queried as to whether the DIR file is to be copied. DIR files of the same type are, for example, DIRD11.20.001 (Server texts in German) and DIRD22.20.001 (Server texts in English).

All system programs of PGLIB and data carrier will be tested normal.

If DIRNAME is declared as a DIR file of data carrier, the system program will be tested forced. The other one will be tested normal.

If DIRNAME is declared as a DIR file of PGLIB, the system program will be deleted on PGLIB.

The kind of assumption can be directed by the parameter MODE.

## APS - Software Load Upgrade

### Functions of the AMO

- If MODE is declared as (NALL/FALL/NGEN/FGEN), the declaration of DIRNAME and SELE will be rejected. If MODE is declared as DELETE and system programs have been declared, the system programs have to be declared as system programs of PGLIB. (e.g.: data carrier DIRDC0.20.001 in PGLIB D0-EF0DC).
- If in addition to the parameter value NORMAL the name of a DIR-file is specified, this program system will be tested regardless of a predecessor.

By declaration of SELE you will get an assortment of selections. Without the parameter SELE you will get either selections depending on parameter MODE or no selections.

- Repeated testing means that a tested status of a system program will be tested any more.

The sense of using repeated testing is that additional selections can be added or deleted without a run of COPY-APS between two runs of TEST-APS.

Repeated testing is only possible by the MODES of NORMAL, FORCE, DBNORM, DBONLY and DELETE.

### Procedure Overview

| Command Code | Parameter                                                                                                                               |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| TEST-APS     | [FILENAME=<string>], [DIRNAME=<string>], [MODE=<param>]<br>, [SELE=<string>], [DESTDEV=<string>]<br>, [LANAME=<string>], [ANS=<param>]; |

### Examples

1. DIR file DIRSC0.20.001 will be tested forced. Other DIR files on the source device will be tested normal.

Input:

```
TEST-APS:,"DIRSC0.20.001",;
```

2. DIR file DIRSC0.20.001 will be tested forced. A cartridge is used as source device and has been reserved by the AMO RTAPE with the logical name "C". Other DIR files on the source device will be tested normal.

Input:

```
TEST-APS:":C:", "DIRSC0.20.001",;
```

3. All program system of data carrier will be tested. The subsystems of all present selections will be tested whether the subsystem has changed.

Input:

TEST-APS:":C:";

4. All program systems of PGLIB will be tested. The subsystems of all present selections will be tested whether the subsystem has changed.

All subsystems of DIR files DIRBC0 and DIRB22 will be assumed forced.

Input:

TEST-APS:":C:", "DIRBC0.20.001"&"DIRB22.20.001";

5. All program systems of specified data carrier will be tested with all selections and all subsystems of these selections (Generation system).

Input:

TEST-APS:":C:", , FALL;

6. All changed subsystems of all system programs and selections will be tested.

Input:

TEST-APS:":C:", , NALL;

7. The specified program systems and their actuall selections will be tested. The changed subsystems will be assumed by COPY-APS.

Input:

TEST-APS:":C:", "DIRDC0.20.001"&"DIRSC0.20.001", NORMAL;

8. The specified program systems and their actuall selections will be tested. The changed subsystems and DB subsystems will be assumed by COPY-APS.

Input:

TEST-APS:":C:", "DIRDC0.20.001"&"DIRSC0.20.001", DBNORM;

(\*1) Valid for SP300-V3.1

9. The specified program systems and their actuall selections will be tested. The changed subsystems will be assumed by COPY-APS.

Input:

TEST-APS:":C:", "DIRDC0.20.001"&"DIRSC0.20.001", FORCE;

10. The specified program systems will be tested, their actuall selections have to be deleted by the following run of COPY-APS. All subsystems will be deleted by the following run of COPY-APS. The name of program systems have to be the name in PGLIB.

Input:

## APS - Software Load Upgrade

### Functions of the AMO

TEST-APS:,"S0-EF0DC"&"B0-EF0BC",DELETE;

11. The specified program systems and their actual selections will be tested. Only DB subsystems will be assumed by the following run of COPY-APS. The program systems have to be specified with their actual correct version on PGLIB.

Input:

TEST-APS:":C:", "DIRDC0.20.001"&"DIRSC0.20.001", DBONLY;

12. The specified program systems of data carrier and PGLIB will be tested. All changed subsystems will be assumed by the following run of COPY-APS.

Input:

TEST-APS:":C:", , NORMAL, SELEK001&SELEK002&&SELEK003;

13. The specified program systems of data carrier and PGLIB will be tested. All subsystems will be assumed by the following run of COPY-APS.

Input:

TEST-APS:":C:", , FORCE, SELEK001&SELEK002&SELEK003;

14. The specified selections, which have to be deleted, of all program systems in PGLIB will be tested. All subsystems which are not contained in any selection and the subsystems of the specified selections will be tested. All subsystems, which will not be used any more, will be deleted by the following run of COPY-APS.

Input:

TEST-APS:":C:", , DELETE, SELEK001&SELEK002&SELEK003;

15. The specified selections of the specified program systems will be tested. The subsystems with changed status will be assumed by the following run of COPY-APS.

Input:

TEST-APS:":C:", "DIRDC0.20.001", NORMAL, SELEK001&SELEK002&SELEK003;

16. The specified selections of the specified program systems will be tested. All subsystems will be assumed by the following run of COPY-APS.

Input:

TEST-APS:":C:", "DIRDC0.20.001", FORCE, SELEK001&SELEK002&SELEK003;

17. All actual active and all specified selections of the specified program systems will be tested. The changed subsystems will be assumed by the following run of COPY-APS.

Input:

```
TEST-APS:":C:", "DIRDC0.20.001"&"DIRSC0.20.001", NORMAL,  
SELEK001&SELEK002&SELEK003;
```

18. All actually active and all specified selections of the specified program systems will be tested. The changed subsystems and the DB subsystems will be assumed by the following run of COPY-APS.

Input:

```
TEST-APS:":C:", "DIRDC0.20.001"&"DIRSC0.20.001", DBNORM,  
SELEK001&SELEK002&SELEK003;
```

19. The specified selections of specified program systems will be tested. Only the DB subsystems will be assumed by the following run of COPY-APS.

Input:

```
TEST-APS:":C:", "DIRDC0.20.001"&"DIRSC0.20.001", DBONLY,  
SELEK001&SELEK002&SELEK003;
```

20. In the specified program systems all selections, which have been specified as to delete, will be tested. All subsystems which are not contained in any selection and all subsystems of the specified selections will be tested. The subsystems which are not required any more will be deleted by the following run of COPY-APS. The program systems have to be specified with their name of PGLIB.

Input:

```
TEST-APS:":C:", "D0-EF0DC", DELETE, SELEK001&SELEK002&SELEK003;
```

21. The added selection SIMPLEX has to be deleted from PGLIB, the not added selection DUPLEX has to be added.

Input:

```
TEST-APS: ", "S0-EF0SC", DELETE, SIMPLEX;
```

```
TEST-APS: ", "DIRSC0.20.030", FORCE, DUPLEX;
```

22. Testin of a program system. The program system will be copied by a following COPY-APS into the area :PDS2":. The area with the name :PDS: must be changed with CHANGE-TINIT:A1,A1H2E," :PDS:" to ":PDS2:"

Input:

```
T-APS:":C:", "DIRDC0.20.001",,, ":PDS2:";
```

## **18.3.2 COPY-APS**

Copies all those subsystems which are marked in the DIR file by TEST-APS as 'to be copied', into PDS.

Copies all those subsystems which are marked in the DIR file by TEST-APS as 'to be copied', in this HD-area, which is specified by the parameter DESTDEV.

Generates the file structure required by the loader (PGLIBM) (e.g. 'TAB' files) in the PGLIB. The PGLIB does not return to a consistent status until after successful completion, and only then can the next TEST action take place.

Procedure Overview

| Command Code | Parameter     |
|--------------|---------------|
| COPY-APS     | [ANS=<param>; |

Example

Copy all subsystems marked 'to be copied'.

Input:

COPY-APS;

18.3.3 DISPLAY-APS

This action supplies information on the output status of:

- 1. all system programs and subsystems
- 2. all system programs
- 3. an individual system program
- 4. an individual subsystem
- 5. a DIR file in comparison with the OMF header
- 6. Selections

The declaration of TYPE=SELE doesn't put out tables of values for Xenix system programs.

Procedure Overview

| Command Code | Parameter                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-APS  | [ANS=<param><br> , [TYPE=ALL], [DESTDEV=<string>; (1)<br><br> , [TYPE=PSALL], [SP=<string>], [DESTDEV=<string>; (2)<br><br> , [TYPE=PSGL], SP=<string>, [DESTDEV=<string>; (3) |

| Command Code | Parameter                                                                                    |
|--------------|----------------------------------------------------------------------------------------------|
|              | , [TYPE=SUSY], SUSY=<string>, SP=<string> (4)<br> , [DESTDEV=<string>];                      |
|              | , [TYPE=DIR], FILENAME=<string> (5)<br> , [DESTDEV=<string>];                                |
|              | , [TYPE=SELE], [SP=<string>], [SELE=<string>] (6)<br> , [SUSY=<string>], [DESTDEV=<string>]; |

### Example

1. Interrogate the supplied DIR file DIRSC0.02.023.

Eingabe:

```
DISP-APS: , DIR, ":C:DIRSC0.02.023";
```

Ausgabe:

```
DIR-FILE: :C:DIRSC0.02.023
COMPLETE READ-IN
PROGRAM SYSTEM: S6-S00SC
VERSION NUMBER: 02
UPDATE VERSION NUMBER: 023
ITEM CODE NUMBER: P12345-X12343-A123-00-9999
PROGRAM SYSTEM WITH CODE SUBSYSTEMS
INTERFACE VERSION:
PROGRAMMSYSTEM: S6-S00ST      NUMBER: A01
PROGRAMMSYSTEM: D6-S00DC      NUMBER: B31

SUBSYSTEM DIR                | | SUBSYSTEM OMF
-----+-----
ZONCANN.S6-S00.02.022 | |
ZONPRIDS.S6-S00.02.023 | |
```

2. Display the subsystems "ZGGDEB0A".

Input:

```
DISPLAY-APS: , SUSY, ZGGDEB0A, "D0-EF0DC";
```

Output:

```
PROGRAM SYSTEM      : D0-EF0DC
VERSION NUMBER      : 20
UPDATE VERSION NUMBER : 014
ITEM CODE NUMBER    : P30252B0011A60301
PROGRAM SYSTEM WITH CODE SUBSYSTEMS
INTERFACE VERSION:
PROGRAM SYSTEM| NUMBER
-----+-----
D0-TF1D0      | 000
S0-TF1S0      | 000

-----+-----
ZGGDEB0A.D0-EF0.20.013 | | ZGGDEB0A.D0-EF0.20.013
```

3. Display all selections of system program "D0-EF0DC".

Input:

DISPLAY-APS: ,SELE, "D0-EF0DC";

Output:

```
PROGRAM SYSTEM: D0-EF0DC

SELECTION  | | SUBSYSTEMS
-----+-----+-----+-----+-----+-----+
D0-EF0DC   |*| <all subsystems which are not included in any selection>
SELEK002   | | ZDBVM100 ZBPTAB00 ZCATAB00 ZCMTAB00
SELEK001   |*| ZODBKUP NBATABD0 NBATABE0

SELECTION  | | PDS (KB) | MEMORY | MEM MIN | MEM MAX |
-----+-----+-----+-----+-----+-----+
D0-EF0DC   |*| 123456789 | 123456789 | 123456789 | 123456789 |
SELEK002   | | 123456789 | 123456789 | 123456789 | 123456789 |
SELEK001   |*| 123456789 | 123456789 | 123456789 | 123456789 |

SUMMARY    | | 123456789 | 123456789 | 123456789 | 123456789 |
```

All selections signed with '\*' are contained in PGLIB.

The value <PDS (KB)> is investigated for all subsystems of a selection by calling the DMS function GET\_FILE\_STATUS. The summary of all selections includes each subsystem of these selections only for one times.

The value <MEMORY> is investigated by evaluating the OMF structure in PGLIB as the summary of all lenght of segments. The summary of all selections includes each subsystem of these selections only for one times.

The value <MEM MIN> is investigated by evaluating the Config Information as the summary of all subsystems of a selection. The summary of all selections includes each subsystem of these selections only for one times.

The value <MEM MAX> is investigated by evaluating the Config Information as the summary of all subsystems of a selection. The summary of all selections includes each subsystem of these selections only for one times. If the value <MEM MAX> exceeds H'FFFF of a Config Information, the value of MEM MIN will be taken for evaluation.

4. Display all selections of "SELEK001".

Input:

DISPLAY-APS: ,SELE, ,SELEK001;

Output:

```
PROGRAM SYSTEM: D0-EF0DC

SELECTION  | | SUBSYSTEMS
```

```

-----+-----

ZONPRIDS.S0-EF0.02.001 | |
```

18.3.4 OUTPUT-APS

Output one or more DIR file(s) without editing.
The contents of the specified DIR file(s) are output record by record.

Procedure Overview

| Command Code | Parameter                         |
|--------------|-----------------------------------|
| OUTPUT-APS   | FILENAME=<string>, [ANS=<param>]; |

Example

- 1. Output of the DIR file "D6-S00DC" on the hard disk.

Eingabe:

```
OUTPUT-APS:":PDS:APSI/PS/D6-S00DC",;
```

Ausgabe:

```
-- FILE CONTENTS < :PDS:APSI/PS/D6-S00DC > --
|| |APSI/PS/D6-S00DC      |D6-S00.02.025|D6-S00.02.024|T|C02500

|B|X/END
```

18.3.5 DUMP-APS

Dump one or all DIR file(s) on the data carrier.  
The contents of the PGLIB are copied to the data carrier and can be copied again using TEST APS and COPY APS. All subsystems, or just the DATABASE subsystems, may be dumped.  
Individual server databases can be accessed by declaring the parameter SUSY.  
It is not possible to dump individual SWU databases.  
If the parameter SUSY is declared as "ZAPLTABD" or "ZAPLTABS", then the load tables of the according module (D = Server, S = SWU) are dumped.  
If the parameter TYPE is declared as "PS", ALL subsystems are dumped. An additional declaration of "SUSY" is ineffective.

**Note:**  
The value of the parameter DIRNAME must be entered exactly as specified when the volume was reserved with AMO RTAPE.  
It is also possible to dump the difference between the actually DIR files and the DIR files specified by the parameter OLDDIR.  
The parameter 'DESTDEV' indicates that virtuell device from which the named program systems have to be copied.

Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DUMP-APS     | FILENAME=<string>, [ANS=<param>]<br> , [TYPE=GEN], [DESTDEV=<string>;<br><br> , [TYPE=PS], [DIRNAME=<string>], [DESTDEV=<string>;<br><br> , [TYPE=DB], [DIRNAME=<string>], [SUSY=<string>]<br> , [DESTDEV=<string>;<br><br> , [TYPE=DELTA], OLDDIR=<string>, [DESTDEV=<string>; |

**Examples**  
1. Dump all subsystems on Cartridge.  
Input:  
DUMP-APS:":C:";  
2. Dump the SWU program system on cartridge.  
Input:  
DUMP-APS:":C:", PS, "S0-EF0SC";

3. Dump the VMS database on cartridge.

Input:

DUMP-APS:":C:",DB,"S0-TFGSG","ZDBTXTGC";

4. The delta between the old DIR file and the specified DIR file has to be dumped onto the data carrier, which has been reserved by the name "C".

Input:

DUMP-APS:":C:",,DELTA,"DBDA:OLDDIRS/DIRDC0.20.068";

5. Dump all subsystems on DAT.

Input:

DUMP-APS:":D:";

## 18.4 Parameter Description

|                 |                                                             |

## 19 ASPIK - Change System Program Number in MML Command File on Hard Disk

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

AMO ASPIK overwrites the old SP number with a new number to be entered by the user. This function is required because generation with an MML batch in which the SP number differs from the SP number in the DIR file is rejected by GENDB.

### 19.1 Restrictions

This description is valid from Hicom 300 E V3.0

### 19.2 Interrelationships

- AMO GENDB : Generate Data Base with MML Command File

### 19.3 Functions of the AMO

- [CHANGE-ASPIK](#) : Change system program number in the MML command file

#### 19.3.1 CHANGE-ASPIK

##### Procedure Overview

##### Command Code

CHANGE-ASPIK

##### Parameter

FILE=<string>,UNIT=<param>  
,APSTYP=<param>  
,SP=<string>;

##### Example

Changing SP number P30252B1111A00101 in file :PAS:TESTFILE to P30252B1111A00412

**ASPIK - Change System Program Number in MML Command File on Hard Disk**  
Parameter Description

Input:  
CHANGE-ASPIK: TESTFILE,BP,RESCODE,P30252B1111A00412;  
Output:  
H01 : OLD SP NUMBER P30252B1111A00101 WAS OVERWRITTEN

**19.4 Parameter Description**

|        |                                                                                                                                                                                                                                              |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APSTYP | Denotes the APS for which the SP number is to be changed.<br>Type of Input : Single value, mandatory<br>Possible Values : AMOCODE, AMOTEXT, RESCODE                                                                                          |
| FILE   | Name of MML command file<br>The AMO checks whether the file is on the hard disk.<br>If this is not the case, parameter FILE is prompted.<br>Type of Input : Single value, mandatory<br>Possible Values : Syntactically correct DMS file name |

Error Messages and Advisories

## 20 ASSGN - Device Assignment

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | AMO Functions         | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The APS of the Hicom system has 3 tables in each of which real output devices are assigned to the symbolic output devices used by the AMOs to output results. These tables are listed below:

- standard device assignment table for external connections (SATEC) (Logon extern).  
This table contains the device assignments to be used generally if AMOs are called via terminals or data lines.
- standard device assignment table for internal connections (SATIC) (Logon intern).  
This table contains the device assignments to be used generally if APS's that are not AMOs send outputs to a device.
- a session-specific device assignment table (SCT).  
The assignments from the SATEC or from the SATIC are transferred to this table when a session is opened, depending on whether the session was opened by a terminal, or via data link, or by an APS.

The AMO ASSGN can display or change the device assignments of all three tables.

A change in a standard assignment table effects all subsequent sessions, while a change in the session-specific assignment table is effective only for the duration of the session.

### 20.1 Restrictions

This description is valid from SP300-V3.4

### 20.2 Interrelationships

- AMO ATCSM : Asynchronous Terminal Configuration Service Module
- AMO SIGNL : Error Signaling Control

## 20.3 AMO Functions

- **CHANGE-ASSGN** : Change of the device assignments
- **DISPLAY-ASSGN** : Display of the device assignments
- **REGENERATE-ASSGN** : Regeneration of the device assignments

### 20.3.1 CHANGE-ASSGN

Change of the device assignments for the following:

1. Current, session-specific device assignment table
2. Standard device assignment table for external connections (SATEC)

One of the logical devices (parameter LDEV) can be assigned to the symbolic devices (parameter SDEV). It is also possible to assign a specific logical device to several symbolic devices.

#### **Logical Device FILE/CFILE (expandable/cyclic file on hard disk)**

If the logical device FILE or CFILE is assigned, the AMO also waits for the input of a file name. The file is created by AMO if it does not yet exist. This file is always a BYTE FILE.

The file name NULL or a file name starting with NULL has a special status. It is provided for the controlled suppression of outputs, and no file is created for it. This file name is allowed only with the logical device FILE. The standard prefix of the file name for the logical device CFILE must be C- .

For the logical device CFILE, the AMO waits for the specification of the file length in addition to the file name. The file is then created with the requested length and retains this length during its life. A standard file (FILE) is set up with a length of 0 and is then continuously expanded during writing.

#### **Assignment Test Matrix**

The AMO checks the validity of the assignment on the basis of an assignment test matrix that the AMO has for each assignment table. The permitted, prohibited and permanently-assigned logical devices are entered in this matrix for all symbolic devices.

For permanent assignments, only the permanently assigned logicaldevice may be specified during the change, e.g., to reconstruct the assignment.

If the requested assignment is prohibited, the AMO enters a dialog status in which it asks the user whether the assignment test matrix is to be output.

This dialog status is initiated by an input request with the verb 'DIALOG01'. The name of the only parameter in this action, which can only be called down by the AMO, is 'ANS', the possible values are 'Y' or 'N'.

Example of a dialog :

Input:

CHANGE-ASSGN:SCT,DIALOG,C01;

Output:

F03 : LOGIC DEVICE C01 MUST NOT BE ALLOCATED IN SCT  
TO SYMBOLIC DEVICE DIALOG.

IS THE MATRIX TO BE OUTPUTTED WITH THE ADMISSIBLE,  
INADMISSIBLE AND FIXED  
ASSIGNMENT SCHEMES FOR THE SCT ?

<DIALOG01-assgn:

Input:

Y

Output:

```
TBL = SCT      L | D
                D | E
                E | F
                V | A
                | U C C C C C C P P P P I I A T S
                | L O O O O O O R R R R L L F N E
SDEV           | T 1 2 3 4 5 6 1 2 3 4 E E R D R
-----+-----

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                           |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <pre> ,LDEV=&lt;remaining values&gt;;    [TBL=SATEC],SDEV=&lt;param&gt;   ,LDEV=FILE,FILE=&lt;string&gt;;   ,LDEV=CFILE,FILE=&lt;string&gt;,LEN=&lt;number&gt;;   ,LDEV=&lt;remaining values&gt;;    [TBL=SATIC],SDEV=&lt;param&gt;   ,LDEV=FILE,FILE=&lt;string&gt;;   ,LDEV=CFILE,FILE=&lt;string&gt;,LEN=&lt;number&gt;;   ,LDEV=&lt;remaining values&gt;;</pre> |

**Example**

Assign the expandable hard disk file REGEN-STAPEL to the symbolic device RESULT in the standard device assignment table for external connections.

Input:

```
CHANGE-ASSGN:SATEC,RESULT,FILE,"REGEN-STAPEL";
```

Output:

```
CHANGE-ASSGN:SATEC,RESULT,FILE,"REGEN-STAPEL";

H500: AMO ASSGN STARTET
AMO-ASSGN-...      INPUT/OUTPUT DEVICE ASSIGNMENT
CHANGE COMPLETED;
```

**20.3.2 DISPLAY-ASSGN**

Display of the device assignments for the following:

- The current, session-specific device assignment table (portion of the session control table)
- The standard device assignment table for external connections (SATEC)
- The standard device assignment table for internal connections (SATIC)

In general, the table with the specifications of the symbolic device and the logical device is used for the output. For the logical device FILE or CFILE, the file name is also output and for CFILE, the length of the file is added.

Since the length of the file is stored in the file itself and may not be capable of being read in the event of a file access error, "???" is output to identify the read error instead of the file length.

### Procedure Overview

| Command Code  | Parameter      |
|---------------|----------------|
| DISPLAY-ASSGN | [TBL=<param>]; |

### Example

Display the standard device assignment table for external connections.

Input:

```
DISPLAY-ASSGN:SATEC;
```

Output:

```
DISPLAY-ASSGN:SATEC;
H500: AMO ASSGN STARTET
```

```
TABLE: SATEC
```

| SYMBOLIC<br>DEVICE | LOGICAL<br>DEVICE | FILE NAME    | FILE LENGTH<br>( IN BYTE ) |
|--------------------|-------------------|--------------|----------------------------|
| RESULT             | FILE              | REGEN-STAPEL |                            |
| ERR                | DEFAULT           |              |                            |
| DIALOG             | DEFAULT           |              |                            |
| PR                 | PR1               |              |                            |
| CON                | DEFAULT           |              |                            |
| DPT1               | CO2               |              |                            |
| DPT2               | CO2               |              |                            |
| DPT3               | CO2               |              |                            |
| DPT4               | CO2               |              |                            |
| ATND               | ATND              |              |                            |
| AFR                | AFR               |              |                            |

```
AMO-ASSGN-... INPUT/OUTPUT DEVICE ASSIGNMENT
DISPLAY COMPLETED;
```

## 20.3.3 REGENERATE-ASSGN

Remark: For parameter

Regenerate the device assignments for the following:

- Standard device assignment table for external connections (SATEC)
- Standard device assignment table for internal connections (SATIC)

The regeneration of the session-specific device assignment table (SCT) is not practical, because the SCT is a temporary table which is deleted after the session is ended.

**Notes**

Contrary to the function DISPLAY, the symbolic device DIALOG is output only for the SATIC during REGENERATE because the assignment of a logical device to the symbolic device DIALOG in the function CHANGE is permitted only for SATIC.  
If the length of a CFILE cannot be determined for the REGENERATE action, then the value "64000" is output (not "???" as for DISPLAY) for this file. In addition, the advisory message H6 is output in order to show that the standard value has been substituted for the real value.

**Procedure Overview**

| Command Code     | Parameter        |
|------------------|------------------|
| REGENERATE-ASSGN | TBL=SATEC\SATIC; |

**Example**

Regenerate the standard assignment table for external connections.

Input:

REG-ASSGN:SATEC;

Output :

```
H500: AMO ASSGN STARTED
CHANGE-ASSGN:SATEC,RESULT,FILE      ,"REGEN-BATCH";
CHANGE-ASSGN:SATEC,ERR      ,DEFAULT;
CHANGE-ASSGN:SATEC,PR      ,PR1;
CHANGE-ASSGN:SATEC,CON      ,DEFAULT;
CHANGE-ASSGN:SATEC,DPT1     ,CO2;
CHANGE-ASSGN:SATEC,DPT2     ,CO2;
CHANGE-ASSGN:SATEC,DPT3     ,CO2;
CHANGE-ASSGN:SATEC,DPT4     ,CO2;
CHANGE-ASSGN:SATEC,ATND     ,ATND;
CHANGE-ASSGN:SATEC,AFR      ,AFR;
AMO-ASSGN-...              INPUT/OUTPUT DEVICE ASSIGNMENT
REGENERATE COMPLETED;
```

## 20.4 Parameter Description

---

**NOTE:** Remark: The parameter LDEV can additionally have the value USER. This assigns the logical device 'TELNET TASK OVER USER TASK'. In the table below this parameter value is not mentioned because the TELNET TASK is not officially released.

---

|                 |                                                                                                                                                       |

## **20.5 Error Messages and Advisories**

### **20.5.1 Error Messages**

F01: FILE NAME IS INCORRECT.  
ONLY SPECIAL CHARACTERS "-" "\_" "#" "|" "%" "&" ARE PERMITTED.

F02: IT WAS NOT POSSIBLE TO SET UP FILE @@@@@@@@@@@@@@.

F03: LOGIC DEVICE @@@@@@@@ MUST NOT BE ALLOCATED IN @@@@@@ TO SYMBOLIC DEVICE @@@@@@@.

F04: LOGIC DEVICE @@@@@@@@ DOES NOT HAVE DIALOG CAPABILITIES AND THEREFORE MUST NOT BE ASSIGNED TO THE SYMBOLIC DEVICE DIALOG.

F05: LOGIC DEVICE @@@@@@@@ IS NOT CONFIGURED.

F07: THERE IS INSUFFICIENT MEMORY FOR A FILE OF THE REQUIRED SIZE ON THE DISK.

F08: NO SPACE ON THE DISK FOR A NEW FILE.

F09: ERR IN COMPILATION OF FILE HEADER.  
IT WAS NOT POSSIBLE TO SET UP FILE @@@@@@@@@@@@@@.

F10: ERROR DURING CLOSURE OF FILE @@@@@@@@@@@@@@.  
NOTE: THE FILE IS NOW OPEN ON THE DISK.

F11: ERROR IN COMPILATION OF FILE HEADER.  
FILE @@@@@@@@@@@@@@ IS ERRONEOUS, BUT COULD NOT BE DELETED AGAIN.

F13: FILE NAME MUST START WITH A LETTER.

F14: AT LDEV=CFILE, THE FILE NAME MUST START WITH "C-".

F15: ERROR IN CHECKING FILE HEADER.  
FILE IS NOT A CFILE OR FILE HEADER HAS BEEN DESTROYED.

F16: AT LDEV=FILE THE FILE NAME MUST NOT START WITH A "C-".

F17: AT LDEV OR SDEV = "???" THE TEXT MASK FOR THE READ SET VALUE WAS NOT FOUND.  
-> CONVERSION TABLE OF AMO DESTROYED OR  
-> DIFFERENT VERSIONS OF AMO AND DB.

F18: FILE <FILE> WAS ALREADY SET UP. THE FILE LENGTH VALUE CAN ONLY BE APPLIED TO NON-EXISTENT FILES. CURRENT FILE LENGTH IS <FLENGTH> . IF NECESSARY, DELETE FILE OR USE A DIFFERENT FILE NAME.

### **20.5.2 Advisories**

H01: THE ALLOCATED LOGIC DEVICE @@@@@@@@ WAS STILL RESERVED.  
THE RESERVATION HAS BEEN CANCELLED.

H02: FILE @@@@@@@@@@@@@@ HAS BEEN SET UP.

H03: FILE @@@@@@@@@@@@@@ WAS ALREADY SET UP.

H04: FILE @@@@@@@@@@@@@@ WAS ALREADY SET UP.  
ENTERED FILE LENGTH IS DISREGARDED.  
THE FILE LENGTH VALUE CAN ONLY BE APPLIED TO NON-EXISTENT FILES.  
IF NECESSARY, DELET FILE OR USE A DIFFERENT FILE NAME.

## 21 ATCSM - Asynchronous Terminal Configuration, Service Module

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO ATCSM processes the descriptions of *asynchronous devices* and device types as well as the allocation of these devices and device types to physical lines and enables the activation of a device or a line.

The AMO ATCSM does not process the description of device 1, the device type allocated to device 1 and the allocations to line 8, because this description, together with the allocations, forms the configuration of the standard administration and maintenance terminal.

### 21.1 Restrictions

This description is valid for SP300-Rel6.3.

In case of a Hipath 4000 v2.0 there don't exist synchrone or asynchrone V24 - Lines.

### 21.2 Interrelationships

- AMO UCSM : Unit Configuration of Server Devices
- AMO LCSM : Line Configuration, Service Module
- AMO BCSM : Board Configuration, Service Modules
- AMO TCSM : Terminal Configuration of Server
- AMO LSSM : Line Switch, Service Modules

### 21.3 Functions of the AMO

- [ADD-ATCSM](#) : Create asynchronous devices and device types
- [CHANGE-ATCSM](#) : Change asynchronous devices and device types
- [DELETE-ATCSM](#) : Cancel asynchronous devices and device types
- [DISPLAY-ATCSM](#) : Display asynchronous devices and device types

- **REGENERATE-ATCSM** : Regenerate asynchronous devices and device types

**21.3.1 ADD-ATCSM**

Restriction:

In case of a Hipath 4000 v2.0 there don't exist synchrone or asynchrone V24 - Lines.

- Create a device type (DEVTYPE) in the device-profile
- Create a device (TYPENO) in the device table
- Create an allocation of a device (TYPENO), logical device (IDEVNAME) or device type (DEVTYPE)
- Create an allocation of a device (TYPENO) and line (LN) with optional startup (OPMODE)

**Prerequisites**

- Existing server configuration (via AMO UCSM)
- A device can be reconfigured only if the old configuration was cancelled in the database.
- For the allocation of a device type to a device, the corresponding device and the device type as well as the logical line characteristics associated with the device must be configured.
- A device type must be allocated to the device before a line is allocated to a device.

**Notes**

- If the device type is already created, it will be overwritten and an advisory (H14) will be displayed.
- The device types RSV1 til RSV3 are for reserve and so they have no default values. Creating these device types without input of valid control character sequences will be rejected (F45).

**Procedure Overview**

| Command Code | Parameter                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------|
| ADD-ATCSM    | [UNIT=<param><br>, TYPE=CFIG, CFIG=TYPE, DEVTYPE=<param>, [CRLF=<hex>]<br>, [FF=<hex>], [USERGD=<hex>], [STATXBLK=<hex>] |

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Example

A system with an AMT (administration and maintenance terminal) which is connected to line 8 of module A1 (ADS) is specified.

A standard service terminal with a connected PT88 is provided. This hardware configuration is to be connected to line 9 of module A1 of the ADS. Output on this device must be program-controlled, with the option of output on the screen only, on the printer only, or on both the screen and the printer.

In the first three calls, the control character sequences of the required device types are defined by default values. The type-specific data is then created. Prior to allocating a device, the AMO LCSM (line configuration service module) must be used to create the line-specific data. Since the device data is allocated to the index 2 (TYPENO = 2), the line data must also be assigned to the same index.

In the 3 subsequent calls, one device type each is allocated to the type-specific and line-specific data and to the logical device name used by the LDU.

In the last call, the device data is allocated to a line which is subsequently activated.

## ATCSM - Asynchronous Terminal Configuration, Service Module

### Functions of the AMO

#### 1. Create device types

Input:

```
AD-ATCSM : UNIT=A1,TYPE=CFIG,CFIG=TYPE,DEVTYPE=QUOSC;
```

```
AD-ATCSM : UNIT=A1,TYPE=CFIG,CFIG=TYPE,DEVTYPE=QUOPT;
```

```
AD-ATCSM :A1,CFIG,TYPE,PT88,0D0A,0C,,,,,,,,62,80;
```

#### 2. Create device

Input:

```
AD-ATCSM : UNIT=A1,TYPE=CFIG,CFIG=DEV,TYPENO=2,TERMDISC=PRTYPCO,  
           ECHOCHAR=C1&F3&EF,CNTRLND=EF,TFOUT=BB&FF&FF&35,  
           TFIN=4C&89,DAINT=20,PASSEXCL=A1A2A3A4,PASSRES=B1B2B3B4;
```

#### 3. Create logic devices

Input:

```
AD-ATCSM : UNIT=A1,TYPE=ADD,ALSEL=TYPE,LDEVNAME=CON1,DIAIND=Y,  
           DEVTYPE=QUOSC,TYPENO=2;
```

```
AD-ATCSM : UNIT=A1,TYPE=ADD,ALSEL=TYPE,LDEVNAME=CON2,DIAIND=N,  
           DEVTYPE=QUOPT,TYPENO=2;
```

```
AD-ATCSM : UNIT=A1,TYPE=ADD,ALSEL=TYPE,LDEVNAME=CON3,DIAIND=Y,  
           DEVTYPE=QUCSAPT,TYPENO=2;
```

#### 4. Allocate device to a line

Input:

```
AD-ATCSM : UNIT=A1,TYPE=ADD,ALSEL=TYPE,TYPENO=2,LN=9,OPMODE=Y;
```

## 21.3.2 CHANGE-ATCSM

Restriction:

In case of a Hipath 4000 v2.0 there don't exist synchrone or asynchrone V24 - Lines.

- An allocation can be changed by means of the functions 'delete' and 'add'.
- The specified device or the devices allocated to a device type can also be activated.
- When the action 'change' is executed, any existing line allocations of the corresponding device or device type are cancelled.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-ATCSM | <pre>[UNIT=&lt;param&gt;] ,CFG=TYPE,DEVTYPE=&lt;param&gt;,[CRLF=&lt;hex&gt;] ,[FF=&lt;hex&gt;],[USERGD=&lt;hex&gt;],[STATXBLK=&lt;hex&gt;] ,[STOTXTBL=&lt;hex&gt;],[VATRNORM=&lt;hex&gt;] ,[VATRDARK=&lt;hex&gt;],[CRCHAR=&lt;hex1&gt;] ,[LNPERSCR=&lt;decimal&gt;],[CHPERLN=&lt;decimal&gt;];   ,CFG=DEV,TYPENO=&lt;decimal&gt;,[TERMDESC=&lt;param&gt;] ,[CHPERLN=&lt;decimal&gt;],[CNTRLNA=&lt;hex&gt;] ,[T=&lt;decimal&gt;],[ANSLNT=&lt;hex&gt;],[ANSLN=&lt;hex&gt;] ,[ECHOCHAR=&lt;hex&gt;],[FILLWTPR=&lt;hex&gt;] ,[FILLCNT=&lt;decimal&gt;],[CNTRLND=&lt;hex&gt;] ,[TFOUT=&lt;hex&gt;],[TFIN=&lt;hex&gt;],[DISDELN=&lt;hex&gt;] ,[FRAMEFL=&lt;hex&gt;],[PARERR=&lt;hex&gt;] ,[OVERFL=&lt;hex&gt;],[DAOUTT=&lt;decimal&gt;] ,[DAINT=&lt;decimal&gt;],[RSVT=&lt;decimal&gt;] ,[INTOUTT=&lt;decimal&gt;],[DIALT=&lt;decimal&gt;] ,[PASSEXCL=&lt;hex&gt;],[PASSRES=&lt;hex&gt;];</pre> |

### Example

1. Change the device type.

Input:

```
CHA-ATCSM:UNIT=A1,CFG=TYPE,DEVTYPE=PT88,CRLF=0D0A;
```

## 21.3.3 DELETE-ATCSM

### Note

During the cancellation of an allocation or configuration, the corresponding lines can also be deactivated.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                    |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DELETE-ATCSM | <pre>[UNIT=&lt;param&gt;] ,TYPE=CFG,CFG=DEV,TYPENO=&lt;decimal&gt;;   ,TYPE=CFG,CFG=TYPE,DEVTYPE=&lt;param&gt;;   ,TYPE=ADD,ALSEL=TYPE,CFG=DEV,TYPENO=&lt;decimal&gt;;</pre> |

## ATCSM - Asynchronous Terminal Configuration, Service Module

### Functions of the AMO

| Command Code | Parameter                                                                                 |
|--------------|-------------------------------------------------------------------------------------------|
|              | ,TYPE=ADD,ALSEL=TYPE,CFIG=TYPE,DEVTYPE=<param>;<br><br>  ,TYPE=ADD,ALSEL=LN,LN=<decimal>; |

#### Example

1. Cancel the configuration of the device with the number 2 in module A1.

Input:

```
DEL-ATCSM:UNIT=A1,TYPE=CFIG,CFIG=DEV,TYPENO=2;
```

## 21.3.4 DISPLAY-ATCSM

### Procedure Overview

| Command Code  | Parameter                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-ATCSM | [UNIT=<param>],<br>[TYPE=CFIG],[CFIG=DEV],[TYPENO=<decimal>];<br><br>  [TYPE=CFIG],[CFIG=TYPE],[DEVTYPE=<param>];<br><br>  [TYPE=ADD]; |

#### Examples

1. Display the configuration data of one device

Input:

```
DIS-ATCSM:UNIT=A1,TYPE=CFIG,CFIG=DEV,TYPENO=1;
```

2. Display the configuration data of all devices

Input:

```
DIS-ATCSM:UNIT=A1,TYPE=CFIG,CFIG=DEV;
```

3. Display the configuration data of one device type

Input:

```
DIS-ATCSM:UNIT=A1,TYPE=CFIG,CFIG=TYPE,DEVTYPE=PT88;
```

4. Display the configuration data of all device types

Input:

```
DIS-ATCSM:UNIT=A1,TYPE=CFIG,CFIG=TYPE;
```

5. Display the configuration data of all devices and device types

Input:

DIS-ATCSM:UNIT=A1,TYPE=CFG;

6. Display the configuration data of all allocations

Input:

DIS-ATCSM:UNIT=A1,TYPE=ADD;

7. Display the configuration data of all devices, device types and allocations

Input:

DIS-ATCSM:UNIT=A1;

## 21.3.5 REGENERATE-ATCSM

### Procedure Overview

| Command Code     | Parameter      |
|------------------|----------------|
| REGENERATE-ATCSM | [UNIT=<param>; |

### Example

1. Regenerate all devices in module A1.

Input:

REG-ATCSM:A1;

Output:

ADD-ATCSM:A1,DEV,TYPE,QUOSC,274A,27822784,,,,,1D84,1DC4,,,,;

ADD-ATCSM:A1,DEV,DEV,2,,,CD,3,0A,0D,C1&F3&EF,,,EF,20  
BB&FF&FF&35,4C&89,BA&DF,,20,,,,,xy37,1248;

ADD-ATCSM:A1,DEV,CON1,TT,Y,QUOSC,,2,17,,;

## 21.4 Parameter Description

ALSEL            Allocation selection (device type or line)  
                  Branching parameter  
Type of Input    : Single value, mandatory

## ATCSM - Asynchronous Terminal Configuration, Service Module

### Parameter Description

|         |                                                              |                                                                                     |             |
|---------|--------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------|
|         | Possible Values                                              | : TYPE                                                                              | Device type |
|         |                                                              | LN                                                                                  | Line        |
| ANSLN   | State of "answer" line after activation                      |                                                                                     |             |
|         | Type of Input                                                | : Single value, optional                                                            |             |
|         | Possible Values                                              | : 00 - FF                                                                           |             |
|         | Default Value                                                | : 00                                                                                |             |

| FILLCNT  | <p>Input of how often fill characters are to be sent</p>                                                                                                                                                                                                                                                                                                                                                                                                      |

## ATCSM - Asynchronous Terminal Configuration, Service Module

### Parameter Description

|          |                                                            |
|----------|------------------------------------------------------------|
|          | Type of Input : Single value, optional                     |
|          | Possible Values : 0 - 99                                   |
|          | Default Value : 0                                          |
| FILLWTPR | Fill character, waiting for printer                        |
|          | Type of Input : Single value, optional                     |
|          | Possible Values : 00 - FF                                  |
|          | Default Value : 00                                         |
| FRAMEFL  | Start or stop step fault threshold (frame flutter)         |
|          | Type of Input : Single value, optional                     |
|          | Possible Values : 0 - 65535                                |
|          | Default Value : 65535                                      |
| INOUTT   | Supervision time for interruption to data output           |
|          | Type of Input : Single value, optional                     |
|          | Possible Values : 0 - 1310 seconds                         |
|          | (0 = no supervision)                                       |
|          | Default Value : 600                                        |
| LDEVNAME | Logical device name                                        |
|          | Type of Input : Single value, mandatory                    |
|          | Possible Values : CON1 - CON6 Console                      |
|          | PR1 - PR4 Lineprinter                                      |
| LN       | Physical line number                                       |
|          | Type of Input : Single value, mandatory                    |
|          | Possible Values : 8, 9, 16, 17, 24, 25                     |
|          | 8 - 63                                                     |
|          | (Line 8 of module A1 cannot be allocated by means of AMOs) |
| LNPERSCR | Number of lines per screen or page                         |
|          | Type of Input : Single value, optional                     |
|          | Possible Values : 0 - 64                                   |

Default Value : 24

|          |                                                                                                                                                                                                                                                                                                                                       |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPMODE   | <p>Operating mode for power supply on switch on</p> <p>Type of Input : Single value, optional</p> <p>Possible Values : Y, N</p> <p>Default Value : N</p>                                                                                                                                                                              |
| OVERFL   | <p>Threshold value for reporting the loss of characters</p> <p>Type of Input : Single value, optional</p> <p>Possible Values : 0 - 65535</p> <p>Default Value : 65535</p>                                                                                                                                                             |
| PARERR   | <p>Threshold value for reporting parity errors</p> <p>Type of Input : Single value, optional</p> <p>Possible Values : 0 - 65535</p> <p>Default Value : 65535</p>                                                                                                                                                                      |
| PASSEXCL | <p>Password exclusion class - so that protected data outputs are not aborted</p> <p>Type of Input : Single value (ADD)<br/>2 combined single values (CHANGE)<br/>1st single value old password<br/>2nd single value new password<br/>optional</p> <p>Possible Values : 00000000 , ... , FFFFFFFF</p> <p>Default Value : Available</p> |
| PASSRES  | <p>Password for the reservation of a TTY device</p> <p>Type of Input : Single value (ADD)<br/>2 combined single values (CHANGE)<br/>1st single value old password<br/>2nd single value new password<br/>optional</p> <p>Possible Values : 00000000 , ... , FFFFFFFF</p> <p>Default Value : Available</p>                              |

## ATCSM - Asynchronous Terminal Configuration, Service Module

### Parameter Description

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RSVT     | Reservation supervision time<br>Type of Input : Single value, optional<br>Possible Values : 0 - 1310 seconds<br>(0 stands for no monitoring)<br>Default Value : 300                                                                                                                                                                                                                                                                       |
| STATXBLK | Start text block (control character sequence)<br>Type of Input : Single value, optional<br>Possible Values : Even number of hexadecimal digits or 0<br>(0 stands for no control character sequence)<br>Default values, depending on the device type<br>PT880<br>QUME-ONLY-SCREEN0<br>QUME-ONLY-PT881B60<br>QUME-SCRE-AND-PT881B40<br>PC-D-ONLY-SCREEN0<br>PC-D-ONLY-PT881B60<br>PC-D-SCRE-AND-PT881B40<br>ASCII-TRANSP0<br>EBCDIC-TRANSP0 |
| STATXBLK | Start text block (control character sequence)<br>Type of Input : Single value, optional<br>Possible Values : Even number of hexadecimal digits or 0<br>(0 stands for no control character sequence)<br>Default values, depending on the device type<br>PT880<br>QUME-ONLY-SCREEN0<br>QUME-ONLY-PT881B61<br>QUME-SCRE-AND-PT881B41<br>PC-D-ONLY-SCREEN0<br>PC-D-ONLY-PT881B61<br>PC-D-SCRE-AND-PT881B41<br>ASCII-TRANSP0<br>EBCDIC-TRANSP0 |

**T** Indicates the permissible time period during which the message  
'activated' must be identified

Type of Input : Single value, optional

Possible Values : 1 - 1310 seconds

Default Value : 1

**TERMDESC** Terminal description

Type of Input : Single value, maximum of 4 linked single values,  
optional

Possible Values : **SIMPLEX** (SIMPLEX-TERM)

**ECHO** (ECHOING-MODE)

**ACOL** (ACT-CONTR-LEAD)

**DEACOL** (DEACT-CONTR-LEAD)

**ARCVCO** (ACT-WITH-RCV-CONTR)

**PRTYPCO** (PRINT-TYPE-CONTR)

**RXBUFTR** (RX-BUF-TREAT)

Default Value : ECHO&ARCVCO

The value RXBUFTR ( End Device with Receive Buffer Control ) is relevant only in the case that a terminal with parallel printer has been configured or the mounted printer has not been configured on XON/XOFF-protocol.

**TFIN** Type face control for input

Type of Input : Maximum of 4 linked single values, optional

Possible Values : 00 - FF

Default Value : 0D  
(definition: no control)

**TFOUT** Type face control for output

Type of Input : Maximum of 4 linked single values, optional

Possible Values : 00 - FF

Default Value : 0D  
(definition: no control)

**TYPE** Choice of configuration or allocation

Branching parameter

## ATCSM - Asynchronous Terminal Configuration, Service Module

### Error Messages and Advisories

## **22 AUN - Call Pickup Groups**

The description of this AMO is only available in html format!

## 23 AUTH - Administration of Exec Permissions

|                    |                        |                             |
|--------------------|------------------------|-----------------------------|
| Restrictions       | Functions of the AMO   | Advisory and Error Messages |
| Interrelationships | Parameter Descriptions |                             |

AMO AUTH can be used to change, display and regenerate the *exec permission* necessary for the execution of an AMO action.

An AMO action is the combination of an AMO name (noun, e. g. *AMO*=APS, AUTH, SCSU, WABE) and of an action verb (e. g. *ACTION*=ADD, CHANGE, DEACTIVATE, DELETE, DISPLAY), such as DISPLAY-APS, CHANGE-AUTH, DELETE-SCSU, ADD-WABE<sup>1</sup>. The *exec permission* itself is an integer number (called class) between 0 and 15<sup>2</sup>.

On the one hand every AMO action has assigned to it a standard value for the *exec permission* which has proven itself more or less adequate in the course of Hicom evolution. In general lower permission classes are assigned to simple harmless actions and higher ones to more complex actions. In order to approach customer specific needs these permissions may now be changed by the new AMO AUTH.

On the other hand every user gets from the system administrator a certain combination of permission classes. The user is then authorized to call up any AMO action whose permission class is present in his or her class combination.

Action CHANGE-AUTH manages a single AMO action whereas actions DISPLAY-AUTH and REGENERATE-AUTH can render information about more than one AMO action in case the AMO name (AMO) and/or the action verb (ACTION) is not specified in the command call. For DISPLAY-AUTH and REGENERATE-AUTH it is also possible to restrict the output to those AMO actions whose permission class differs from their standard setting (TYPE=DELTA). Moreover, instead of the current settings one can let the standard class assignments appear here (TYPE=STD). This should make the resetting of the usual class assignments easier.

The use of AMO AUTH is also helped by letting the action verb (ACTION) be abbreviated to its first 2-4 letters, provided that it can still be uniquely identified within the set of all possible action verbs<sup>3</sup>.

- 
1. the call syntax requires the verb placed before the noun and a hyphen between them
  2. classes 11-15 are reserved
  3. The program takes the first verb found if the abbreviation is too short for unique identification.

23.1 Restrictions

This description is valid from SP300-E V3.0.

23.2 Interrelationships

(none)

23.3 Functions of the AMO

- [CHANGE-AUTH](#) : Changing the exec permission assigned to an AMO action. Class: 10
- [DISPLAY-AUTH](#) : Displaying exec permissions in form of a table. Class: 0
- [REGENERATE-AUTH](#) : Reproducing exec permissions in form of CHANGE-AUTH commands. Class: 2

23.3.1 CHANGE-AUTH

Action CHANGE-AUTH can be used to change the exec permission of an AMO action.

Basically the class assigned to an AMO action may be anywhere between 0 and 15<sup>1</sup> but the change can only be carried out if the user issuing the command is in possession of the class in question (besides of course possessing class 10 which is required anyhow for being able to call up the command CHANGE-AUTH ).

By the way the usual (standard) class can be restored by the appropriate CHANGE-AUTH command after obtaining its value with the command DISPLAY-AUTH: <amo>,<aktion>,<STD>;.

Remark: The exec permissions of the actions CHANGE-AUTH, DISPLAY-AUTH, REGENERATE-AUTH of this AMO can equally be changed.

Procedure Overview

| Command Code | Parameter                                    |
|--------------|----------------------------------------------|
| CHANGE-AUTH  | AMO=<string>,ACTION=<string>,CLASS=<number>; |

1. as mentioned, classes 11-15 are reserved

**Example:**

Setting the exec permission for action CHANGE-USER to class 5:

CHANGE-AUTH:USER,CHANGE,5; or simply CH-AUTH:USER,CH,5;

**23.3.2 DISPLAY-AUTH**

Action DISPLAY-AUTH can be used to display the permission classes assigned to various AMO actions. The output takes the form of a table with the following three columns: AMO name, action verb and permission class.

To control the kind of output produced one has the optional parameter called *TYPE* whose default setting lets the current class assignments be shown on the screen (TYPE=ALL), without restricting the set of AMO actions listed. One can also let the standard class assignments be displayed instead of the current settings (TYPE=STD), without restricting the set of AMO actions listed.

Moreover, the output can be restricted to those AMO actions whose permission class differs from its standard value (TYPE=DELTA). One should not be surprised if no output line appears here — it only means that all affected AMO actions are currently set to their default permission class.

The parameters *AMO* and *ACTION* are also optional. If parameter *AMO* is not specified, all AMOs will be processed and listed with their affected actions. If parameter *ACTION* is not specified, all actions of the affected AMOs will be listed. If both parameters are entered however, one gets exactly one<sup>1</sup> line of output with the AMO name, the action verb and the with the corresponding permission class.

**Attention:** The reading of hard disk data and their subsequent processing may take up to two minutes.

**Procedure Overview**

| Command Code | Parameter                                          |
|--------------|----------------------------------------------------|
| DISPLAY-AUTH | [AMO=<string>], [ACTION=<string>], [TYPE=<param>]; |

**Examples:**

1. Displaying the current permission class for AMO action ADD-USER:

Input:

DISP-AUTH:USER,ADD;

---

1. with TYPE=DELTA *at most* one

## AUTH - Administration of Exec Permissions

### Functions of the AMO

or

```
DISP-AUTH:USER,ADD,ALL;
```

2. Displaying the standard permission class for AMO action ADD-USER:

```
DISP-AUTH:USER,ADD,STD;
```

3. Displaying the current permission classes for all actions of AMO USER:

```
DISP-AUTH:USER;1
```

4. Listing those actions of AMO USER whose current permission class differs from the action's standard permission class:

```
DISP-AUTH:USER,,DELTA;
```

5. Displaying the current permission classes for the ADD actions of all AMOs that possess such an action:

```
DISP-AUTH:,ADD;2
```

6. Listing those ADD actions of all possible AMOs, whose current permission class differs from the action's standard permission class:

```
DISP-AUTH:,ADD,DELTA;
```

7. Displaying the standard permission class of the ADD actions of all possible AMOs that possess such an action:

```
DISP-AUTH:,ADD,STD;
```

8. Displaying the permission classes of all possible AMO actions:

```
DISP-AUTH;3
```

9. Listing those actions of all possible AMOs whose current permission class differs from the action's standard permission class:

```
DISP-AUTH:,,DELTA;
```

10. Displaying all standard permission classes:

```
DISP-AUTH:,,STD;
```

### 23.3.3 REGENERATE-AUTH

Action REGENERATE-AUTH can be used to reproduce in reusable form the permission classes assigned to various AMO actions. The output consists of CHANGE-AUTH commands for the AMO actions affected.

---

1. or    DISP-AUTH:USER,,ALL;  
2. or    DISP-AUTH:,ADD,ALL;  
3. or    DISP-AUTH:,,ALL;

To control the kind of output produced one has an optional parameter called *TYPE* whose default setting for action REGENERATE-AUTH restricts output to those AMO actions whose permission class differs from its standard value (*TYPE=DELTA*). This is because it is in general sufficient for restoring a previous state after an upgrade or a software transport to regenerate only the permissions which have been changed with respect to their standard value. One should not be surprised if no output line appears here — it only means that all affected AMO actions are currently set to their default permission class.

Here too the symbols ALL and STD are available for parameter *TYPE*: entering *TYPE=ALL* lets the current permission class assignments be reproduced without restrictions, whereas *TYPE=STD* lets the standard permission class settings be reproduced without any consideration for their current state.

The parameters *AMO* and *ACTION* are also optional. If parameter *AMO* is not specified, all AMOs will be processed and the affected actions reproduced. If parameter *ACTION* is not specified, all actions of the affected AMOs will be reproduced. If both parameters are entered however, exactly one<sup>1</sup> line of output is generated in form of a CHANGE-AUTH command containing the AMO name, the action verb and the with the corresponding permission class.

**Attention:** The reading of hard disk data and their subsequent processing may take up to two minutes.

### Procedure Overview

| Command Code     | Parameter                                          |
|------------------|----------------------------------------------------|
| REGENERATE-AUTH; | [AMO=<string>], [ACTION=<string>], [TYPE=<param>]; |

### Examples

The examples given for DISPLAY-AUTH could well be repeated here. The only difference is that for REGEN-AUTH the default assignment is *TYPE=DELTA* instead of *TYPE=ALL*.

1. Reproducing the current permission class for AMO action ADD-USER:

```
REGEN-AUTH:USER,ADD,ALL;
```

2. Reproducing the permission classes for exactly those actions of AMO USER whose permission class differs from the respective standard permission class:

```
REGEN-AUTH:USER;
```

---

1. with *TYPE=DELTA* at most one

**AUTH - Administration of Exec Permissions**

Parameter Descriptions

- 3. Reproducing the CHANGE-AUTH commands necessary to set the permission classes to their default settings for the ADD actions of all AMOs that possess such an action:

REGEN-AUTH: , ADD, STD;

- 4. Reproducing all permission class assignments for all AMO actions for which these permissions have been changed with respect to their standard setting:

REGEN-AUTH;

**23.4 Parameter Descriptions**

|                 |                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AMO             | noun: selection of an AMO                                                                                                                                                                                                                                                                                                                                                             |
| Type of Input   | single value, mandatory (CHANGE)<br>single value, optional (DISPLAY, REGENERATE)                                                                                                                                                                                                                                                                                                      |
| Possible Values | : 2 to 5 characters                                                                                                                                                                                                                                                                                                                                                                   |
| Default Value   | if not specified, the affected actions of all AMOs are to be reproduced                                                                                                                                                                                                                                                                                                               |
| ACTION          | verb: selection of an action within the AMO                                                                                                                                                                                                                                                                                                                                           |
| Type of Input   | single value, mandatory (CHANGE)<br>single value, optional (DISPLAY, REGENERATE)                                                                                                                                                                                                                                                                                                      |
| Possible Values | : 2 to 16 characters                                                                                                                                                                                                                                                                                                                                                                  |
| Default Value   | if not specified, all actions of the affected AMOs are to be reproduced                                                                                                                                                                                                                                                                                                               |
| CLASS           | new exec permission class                                                                                                                                                                                                                                                                                                                                                             |
| Type of Input   | : single value, mandatory (CHANGE)                                                                                                                                                                                                                                                                                                                                                    |

## 24 AUTHO - Display Stations with Trunk Access

|                                    |                                               |
|------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>          |
| <a href="#">Interrelationships</a> | <a href="#">Error Messages and Advisories</a> |

The AMO AUTHO (authorization for CO calls) is used to provide the user with a simple display option for

- the total number of stations with full or restricted trunk access
- the total number of stations without trunk access

Each station has 2 classes-of-service (COSs): the main class-of-service COS1 and an alternative class-of-service COS2 to which the station user can switch over (e.g. to prevent unauthorized use of special features).

A station is displayed as having full or partial trunk access even if only one COS contains one of the following classmarks:

- Partial toll access\_1
- Partial toll access\_2
- Partial toll access\_3
- Partial toll access\_4
- Partial toll access\_5
- Partial toll access\_6
- Full toll access
- Outward restricted trunk access
- Full trunk access

Otherwise, the station is listed as having no trunk access.

The number of stations with trunk access and without trunk access are displayed in separate columns in the output table, grouped according to the type of device concerned (VCE, FAX, TTX, VTX and DTE).

### 24.1 Restrictions

This description is valid for SP300-V3.1

**24.2 Interrelationships**

- AMO COSSU : Classes of Service, Switching Unit

**24.3 Functions of the AMO**

- **DISPLAY-AUTHO** : Interrogate the number of stations with/without trunk access per communication service

**24.3.1 DISPLAY-AUTHO**

The number of stations with trunk access (EXT) and without trunk access (INT) are displayed according to the type of device concerned.

Each station has two classes of service defined with the AMO COSSU. A station is listed as having trunk access even if only one COS contains an appropriate classmark, and even if the other one is active at the time.

**Procedure Overview**

|                     |                  |
|---------------------|------------------|
| <b>Command Code</b> | <b>Parameter</b> |
| DISPLAY-AUTHO       | ;                |

**Example**

Display stations with/without trunk access.

Input:

DISP-AUTHO;

Output:

| SERVICE | EXT | INT |
|---------|-----|-----|
| VCE     | 151 | 382 |
| TTX     | 2   | 7   |
| VTX     | 6   | 13  |
| FAX     | 3   | 12  |
| DTE     | 1   | 3   |

## **24.4 Error Messages and Advisories**

None

## **AUTHO - Display Stations with Trunk Access**

Error Messages and Advisories

## 25 BACK - Automatic Backup of Program Library

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The AMO BACK is used to determine the parameters for executing automatic save runs for the program library.

With AMO BACK, the operator determines which programs are to be saved, specifies files outside the program library which are to be included and sets the intervals between each backup run.

The backup data can be stored on hard disk or on a magneto optical disk (MO).

The AMO can also be used to start immediate backup runs.

---

**NOTE:** When writing program systems to backup for the first time, use empty directories only.  
When updating program systems, only those program systems may be updated which were originally copied onto the cartridge

---

### 25.1 Restrictions

This description is valid from HiPath 4000 V6.0.

### 25.2 Interrelationships

- AMO APS : Software Load Upgrade
- AMO DLSP : Hard Disc Area Allocation Logical

---

**NOTE:** The name "BACKUP" will be used internally by the AMO BACK. Therefore it is not allowed to add the name "BACKUP" by the AMO DLSP.

---

**25.3 Functions of the AMO**

- **ADD-BACK** : Add (create) backup parameters
- **CHANGE-BACK** : Change backup parameters
- **DELETE-BACK** : Delete backup parameters
- **ACTIVATE-BACK** : Activate the automatic backup run
- **DEACTIVATE-BACK** : Deactivate the automatic backup run
- **START-BACK** : Start an immediate backup run
- **COPY-BACK** : Copy back all extra files included in the backup run
- **DISPLAY-BACK** : Interrogate the backup parameters
- **REGENERATE-BACK** : Regenerate the backup parameters

**25.3.1 ADD-BACK**

This action creates the operational parameters for the resident backup task and stores them on hard disk.

The backup parameters can be added (created) even if a specified backup medium or program system is not present at the time. However, the operator must ensure that the missing unit is present when the automatic backup run is carried out.

Date and/or time parameters for the start time of the backup run need only be declared if the values to be specified differ from the current date and/or time.

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-BACK     | <div>  TYPE=GEN, FILENAME=&lt;string&gt;, [DBNO=&lt;number&gt;]<br/>  , [YEAR=&lt;number&gt;], [MONTH=&lt;number&gt;], [DAY=&lt;number&gt;<br/>  , HOUR=&lt;number&gt;, MINUTE=&lt;number&gt;<br/>  , RTYPE=&lt;param&gt;, RNO=&lt;number&gt;, [TEST=&lt;param&gt;]<br/>  , [ASD=&lt;param&gt;], [AROUND =&lt;param&gt;];<br/><br/>  TYPE=PS, SP=&lt;string&gt;;<br/><br/>  TYPE=FILE, FILE=&lt;string&gt;;</div> |

### Examples

1. Create an automatic daily backup to cartridge for the IHS and SWU.

Input:

```
ADD-BACK:PS,"S0-EL0SC"&"D0-EL0DC"&"A0-EL0DC";
```

2. Create automatic backup daily

Input:

```
ADD-BACK:GEN,":SCR:BACKUP/001",2,2001,6,14,23,00,DAYS,1;
```

3. Create automatic backup at 8-hourly intervals

Input:

```
ADD-BACK:GEN,":SCR:BACKUP/001",2,2001,6,14,23,00,HOURS,8;
```

4. Create backup for patch administration

Input:

```
ADD-BACK:FILE,":PDS:PATCH100/";
```

## 25.3.2 CHANGE-BACK

Change one or more backup parameters.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-BACK  | FILENAME=<string>,DBNO=<number><br>, YEAR=<number>,MONTH=<number>,DAY=<number><br>, HOUR=<number>,MINUTE=<number>,RTYPE=<param><br>, RNO=<number>,TEST=<param>,ASD=<param><br>, AROUND=<param>; |

### Examples

1. Change the backup to cartridge to a backup to hard disk.

Input:

```
CHANGE-BACK:":SCR:BACKUP/002";
```

2. Change the backup interval to every 30 days.

Input:

```
CHANGE-BACK:,,,,,,DAYS,30;
```

## 25.3.3 DELETE-BACK

Delete backup parameters.

### Procedure Overview

| Command Code | Parameter                                                                                |
|--------------|------------------------------------------------------------------------------------------|
| DELETE-BACK  | [TYPE=GEN] ;<br><br>  [TYPE=PS], [SP=<string>] ;<br><br>  [TYPE=FILE], [FILE=<string>] ; |

### Examples

1. Delete all backup entries

Input:

```
DELETE-BACK;
```

2. Delete all file entries

Input:

```
DELETE-BACK:FILE;
```

3. Delete the the program system IHS from the backup parameters.

Input:

```
DELETE-BACK:PS,D0-EL0DC;
```

## 25.3.4 ACTIVATE-BACK

### Procedure Overview

| Command Code  | Parameter |
|---------------|-----------|
| ACTIVATE-BACK | ;         |

### Example

Input:

```
ACTIVATE-BACK;
```

## 25.3.5 DEACTIVATE-BACK

### Procedure Overview

| Command Code    | Parameter |
|-----------------|-----------|
| DEACTIVATE-BACK | ;         |

### Example

Input:

```
DEACTIVATE-BACK;
```

## 25.3.6 START-BACK

Start an immediate backup run.

The immediate backup run uses the parameters defined in ADD-BACK, but ignores the start time parameters.

### Procedure Overview

| Command Code | Parameter                                                                                                   |
|--------------|-------------------------------------------------------------------------------------------------------------|
| START-BACK   | [FILENAME=<string>], [DBNO=<number>]<br>, [SP=<string>], [FILE=<string>]<br>, [TEST=<param>], [ASD=<param>; |

### Examples

1. Start des Backup

Input:

```
START-BACK;
```

2. Start an immediate backup run for several (specified) program systems

Input:

```
START-BACK:,, "S0-EL0SC"&"B0-EL0BC";
```

## 25.3.7 COPY-BACK

Copy the files saved in addition to the program library back onto the hard disk.

The program system should be restored by means of AMO APS.

BACK - Automatic Backup of Program Library

Functions of the AMO

If no ein FILENAME is specified, the FILENAME used for ADD-BACK is used.

If the data storage medium is not available, an error message is output.

Procedure Overview

| Command Code | Parameter           |
|--------------|---------------------|
| COPY-BACK    | [FILENAME=<string>; |

Example

Fetch all additional saved files

Input:

COPY-BACK:":SCR:BACKUP/002";

25.3.8 DISPLAY-BACK

Output the backup parameters at the terminal.

If the backup medium is accessible, then the contents of the data medium are also displayed.

Procedure Overview

| Command Code | Parameter                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-BACK | [TYPE=GEN];<br><br>  [TYPE=PS], [SP=<string>;<br><br>  [TYPE=FILE], [FILE=<string>;<br><br>  [TYPE=DM], [FILENAME=<string>; |

Examples

- 1. Interrogate the general backup parameters

Input:

DISPLAY-BACK:GEN;

Output:

```
BACKUP-DATA FROM DATABASE:
-----
DATAMEDIUM                : <:SCR:BACKUP/001/>
BACKUP - DATE              : 12.08.1988
```

```

BACKUP - TIME                : 23:00:00
BACKUP-REPETITION            : EVERY 2 MONTHS
NUMBER OF DATABASE-GENERATIONS : 2
ACTUAL SYMBOLIC OUTPUT-DEVICE : DPT1
COMPARE HD AND BACKUP-STATE   : YES
BACKUP ACTIVATED              : NO

```

**2. Interrogate all backup parameters****Input:**

```
DISPLAY-BACK;
```

**Output:**

```

BACKUP-DATA FROM DATABASE:
-----
DATAMEDMUM                : <:SCR:BACKUP/001/>
BACKUP - DATE              : 12.08.2001
BACKUP - TIME              : 23:00:00
BACKUP-REPETITION          : EVERY 2 MONTHS
NUMBER OF DATABASE-GENERATIONS : 2
ACTUAL SYMBOLIC OUTPUT-DEVICE : DPT1
COMPARE HD AND BACKUP-STATE : YES
BACKUP ACTIVATED           : NO

FILES                      : <:PDS:PATCH100/>
PROGRAM-SYSTEMS : S0-EL0SC
                  L0-EL0LC
                  D0-EL0DC

BACKUP-DATA FROM DATAMEDMUM: <:SCR:BACKUP/001/>
-----
LAST BACKUP-DATE          : 12.10.2001
LAST BACKUP-TIME          : 23:00:00
NUMBER OF DATABASE-GENERATIONS : 2

FILES                      : <:PDS:PATCH100/>
PROGRAM-SYSTEMS : S0-EL0SC
                  L0-EL0LC
                  D0-EL0DC

```

**3. Interrogate the backup program systems****Input:**

```
DISPLAY-BACK:PS;
```

**Output:**

```

PROGRAM-SYSTEMS : S0-EL0SC
                  L0-EL0LC
                  D0-EL0DC

```

**4. Interrogate a specific backup program system****Input:**

```
DISPLAY-BACK:PS,D6-E60DC;
```

**Output:**

```
PROGRAM-SYSTEM D6-E60DC IS INSTALLED
```

## BACK - Automatic Backup of Program Library

### Functions of the AMO

#### 5. Interrogate the backup files

Input:

```
DISPLAY-BACK:FILE;
```

Output:

```
FILES                : <:PDS:PATCH100/>
```

#### 6. Interrogate a specific data medium

Input:

```
DISPLAY-BACK:DM," :CT1:BACKUP/001";
```

Output:

```
BACKUP-DATA FROM DATAMEDium: <:SCR:BACKUP/001/>
-----
LAST BACKUP-DATE           : 12.10.2001
LAST BACKUP-TIME           : 23:00:00
NUMBER OF DATABASE-GENERATIONS : 2

FILES                : <:PDS:PATCH100/>
PROGRAM-SYSTEMS : S0-E60SC
                  L0-EL0LC
                  D0-EL0DC
```

## 25.3.9 REGENERATE-BACK

Interrogate the backup data with output in the form of a position-oriented command listing for the "ADD" action.

### Procedure Overview

| Command Code    | Parameter |
|-----------------|-----------|
| REGENERATE-BACK | ;         |

### Example

Regenerate the backup data

Input:

```
REGENERATE-BACK;
```

Output:

```
ADD-BACK:GEN," :SCR:BACKUP/001/",2,2001,6,14,23,00,DAYS,1;
ADD-BACK:PS,"S0-EL0SC";
ADD-BACK:PS,"L0-EL0LC";
ADD-BACK:PS,"D0-EL0DC";
ADD-BACK:FILE," :PDS:PATCH100/";
```

## 25.4 Parameter Description

|                 |                                                                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| AROUND          | When DAT tape is full, new initialisation *) DAT not longer supported                                                                                |
| Type of Input   | : Single value<br>optional                                                                                                                           |
| Possible Values | : Y ... yes<br>N ... no                                                                                                                              |
| Default Value   | N                                                                                                                                                    |
| ASD             | Actual symbolic device                                                                                                                               |
| Type of Input   | : Single value<br>optional                                                                                                                           |
| Possible Values | : DPT1 ... Dependability terminal<br>AC ... Attendant console<br>AFR ... Automatic Fault Report                                                      |
| Default Value   | DPT1                                                                                                                                                 |
| DAY             | Date - day                                                                                                                                           |
| Type of Input   | : Single value<br>optional                                                                                                                           |
| Possible Values | : 1-31                                                                                                                                               |
| Default Value   | current day                                                                                                                                          |
| DBNO            | Number of database generations to backup                                                                                                             |
| Type of Input   | : Single value<br>optional                                                                                                                           |
| Possible Values | : 0-3                                                                                                                                                |
| Default Value   | 1                                                                                                                                                    |
| FILE            | Name of file or file hierarchy                                                                                                                       |
| Type of Input   | : Single value (DISPLAY)<br>Max. 10 chained (with '&') single values<br>(ADD, START, DELETE)<br>mandatory (ADD)<br>optional (DISPLAY, DELETE, START) |

## BACK - Automatic Backup of Program Library

### Parameter Description

|          |                                                   |                                                                              |
|----------|---------------------------------------------------|------------------------------------------------------------------------------|
|          | Possible Values                                   | : Name (max. 32 chars.)                                                      |
| FILENAME | Name of cartridge or name of HD directory         |                                                                              |
|          | Type of Input                                     | : Single value<br>mandatory (ADD)<br>optional (CHANGE, COPY, START, DISPLAY) |
|          | Possible Values                                   | : Name (max. 24 chars.)                                                      |
| HOUR     | Time - hour                                       |                                                                              |
|          | Type of Input                                     | : Single value, mandatory                                                    |
|          | Possible Values                                   | : 0-23                                                                       |
| MINUTE   | Time - minute                                     |                                                                              |
|          | Type of Input                                     | : Single value<br>mandatory                                                  |
|          | Possible Values                                   | : 0-59                                                                       |
| MONTH    | Date - month                                      |                                                                              |
|          | Possible Values                                   | : 1-12                                                                       |
|          | Type of Input                                     | : Single value<br>optional                                                   |

Error Messages and Advisories

## 26 BCSM - Board Configuration, Service Modules

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO BCSM (Board Configuration of Service Modules) is used for allocating the LCXs to the various loadware subsystems, and thus ultimately determines the appropriate buffer requirements for each server. In addition, after checking against existing configurations, the AMO BCSM enters the currently plugged line modules of a server into the database as the current configuration.

Due to the abolishment of line busses in newer hardware platforms the parameter RCONF is not evaluated any longer. Therefore the parameter RCONF has to have the value WITHOUT for "implementation technical reasons" respectively if the parameter is not specified the AMO chooses automatically the value WITHOUT (e.g. in case of CC80F "B5391-X").

### 26.1 Restrictions

This description is valid from HiPath 4000 - V2.0

### 26.2 Interrelationships

- AMO UCSM : Unit Configuration of Server Devices
- AMO BSSM : Board Switch, Service Modules
- AMO LCSM : Line Configuration, Service Module
- AMO TCSM : Terminal Configuration, Service Modules
- AMO ATCSM : Asynchronus Terminal Configuration, Service Modules
- AMO LCS0 : S0 Interface Configuration, Service Modules
- AMO BCSU : Board Configuration, Switching Unit

### 26.3 Functions of the AMO

- [ACT-BCSM](#) : Activate the Start Up of UNIX
- [DEACT-BCSM](#) : Deactivate the Start Up of UNIX
- [ADD-BCSM](#) : Create all line modules in a server or add new loadware

**BCSM - Board Configuration, Service Modules**

Functions of the AMO

- **DELETE-BCSM** : Delete all line modules from a server or delete redundant loadware
- **DISPLAY-BCSM** : Interrogate all existing line modules of a server or loadware installed  
Display of status of Start Up of UNIX
- **REGENERATE-BCSM** : Regenerate the database for the line modules or the loadware

**26.3.1 ACT-BCSM**

The following command activates the Start Up of UNIX. ( A flag of the data base is set to TRUE. The UNIX loader polls this flag and activates the Start Up of UNIX. )

Restriction: According to the Unix Loader Specification,

ACT-BCSM:A1,UNIX;

works **ONLY** on DSCXL. In other cases

ADD-BCSM:A1,DPP,11,YES;

has to be executed.

| Kommandocode | Parameter                      |
|--------------|--------------------------------|
| ACT-BCSM     | [UNIT=<param><br>,SYSTEM=UNIX; |

Example:

ACT-BCSM:A1,UNIX;

**26.3.2 DEACT-BCSM**

The following command deactivates the Start Up of UNIX. ( A flag of the data base is set to FALSE. The UNIX loader polls this flag and the Start Up of UNIX is blocked. )

Restriction: According to the Unix Loader Specification,

DEACT-BCSM:A1,UNIX;

works **ONLY** on DSCXL. In other cases

ADD-BCSM:A1,DPP,11,NO;

has to be executed.

**Kommandocode**

ACT-BCSM

**Parameter**

[UNIT=<param>]  
 ,SYSTEM=UNIX;

Example:

DEACT-BCSM:A1,UNIX;

**26.3.3 ADD-BCSM**

Depending on the value specified for the parameter TYPE, the operator can

1. install in the BC depending on the parameter CONF the type of server shelf, a new loadware or the line modules for a server by declaring the slot and part numbers. Only complete line module configurations can be declared.
2. install in the EC depending on the parameter CONF the type of server shelf, a new loadware or the line modules for a server by declaring the slot and part numbers. Only complete line module configurations can be declared.
3. install in the SWU depending on the parameter CONF a new loadware or the line modules for a server.  
 The board has to be configured by AMO BSCU in the same HW position (LTG, LTU, SLOT).  
 An automatic check by the AMO can not be provided.
4. From the version HiPath 4000 V2.0 the hardware and loadware of PSIO board cannot be added any longer ( i.e. the PSIO board is not marketed any longer.
5. reserve or block the Data-Processor-Ports for RMX.  
 A reservation or block of Data-Processor-Ports for RMX is not any longer possible in a cPCI - Shelf all Data-Processor-Ports being reserved permanently for UNIX.

|  | <pre>,TYPE=SWU ,[CONF=SW,LCXNO=&lt;number&gt;,LW=&lt;param&gt; ,[APPL=&lt;string&gt;];  ,CONF=HW,[INS=&lt;param&gt;] ,[LTG=&lt;number&gt;,LTU=&lt;number&gt; ,[SLOT=&lt;number&gt;,LCXNO=&lt;number&gt; ,[PARTNO=&lt;number&gt;;</pre>                                                                                                                                                                                                 | (3) |
|  | <pre>,TYPE=DPP ,[LINE=&lt;number&gt;,RMX=&lt;param&gt;;</pre>                                                                                                                                                                                                                                                                                                                                                                          | (4) |

**Examples**

1. Install type of server shelf

Input:

```
ADD-BCSM:A1,BC,STYPE,"B5301-X  ";
```

2. Create (add) loadware

Input:

```
ADD-BCSM:A1,BC,SW,1,TTYBSC;
```

3. Block the Line 10 for RMX

Input:

```
ADD-BCSM:A1,DPP,10,NO;
```

Remark:

A reservation or block of Data-Processor-Ports for RMX is not any longer possible in a cPCI - Shelf all Data-Processor-Ports being reserved permanently for UNIX.

**26.3.4 DELETE-BCSM**

Depending on the value specified for the parameter TYPE, the operator can

1. erase the existing loadware in the BC or cancel the line module entries of a server in the database (first line module in the ADS cannot be canceled).
2. erase the existing loadware in the EC or cancel the line module entries of a server in the database (first line module in the ADS cannot be canceled).
3. erase the existing loadware in the SWU or cancel the line module entries of a server in the database (first line module in the ADS cannot be canceled).

**Procedure Overview**

| Command Code | Parameter                                                                                      |     |
|--------------|------------------------------------------------------------------------------------------------|-----|
| DELETE-BCSM  | [UNIT=<param><br>,TYPE=BC<br>,CONF=SW,SLOT=<number>,LW=<param>;<br><br>,CONF=HW,SLOT=<number>; | (1) |

|  |                                                                                                                                                                                              |                                                    |
|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
|  | <pre>,TYPE=EC ,CONF=SW,SLOT=&lt;number&gt;,LW=&lt;param&gt;;  ,CONF=HW,SLOT=&lt;number&gt;;  ,TYPE=SWU ,CONF=SW,LCXNO=&lt;number&gt;,LW=&lt;param&gt;;  ,CONF=HW,LCXNO=&lt;number&gt;;</pre> | (2)<br><br><br><br><br><br><br><br><br><br><br>(3) |
|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|

Examples

- 1. Cancel the line module at slot 13

Input:

```
DELETE-BCSM:A1,BC,HW,13;
```

- 2. Erase the loadware at slot 13

Input:

```
DELETE-BCSM:A1,BC,SW,13,TTYBSC;
```

26.3.5 DISPLAY-BCSM

Depending on the value specified for the parameter CONF, the operator can

- 1. output a list of the loadware installed in a server
- 2. interrogate the line modules of a server in the database.
- 3. output the present relation of the Data-Processor-Ports.

Procedure Overview

| Command Code | Parameter                                 |     |
|--------------|-------------------------------------------|-----|
| DISPLAY-BCSM | <pre>[UNIT=&lt;param&gt;] ,CONF=SW;</pre> | (1) |
|              | <pre>,CONF=HW</pre>                       | (2) |
|              | <pre>,CONF=DPP;</pre>                     | (3) |

```
| ,CONF=UNIX;
```

### Examples

1. Display all the line modules of a server <Format 1>.

Input:

```
DISPLAY-BCSM:A1,HW;
```

Output:

```
      OUTPUT OF SLOTS AND CODE NUMBERS FOR BC B5331-X      AND EC
B5337-X
```

| ADDRESS | NOM. MOD. | HW ABB. | ACTUAL MOD. | STATE | FIRMWARE | MOD.STATUS |
|---------|-----------|---------|-------------|-------|----------|------------|
| A1. 38  | Q2090-x   | LBC     | Q2090-X     | 0     | -----    | INS        |
| A1. 1   | Q2011-x 1 | LCU     | Q2011-x 1   | 0     | B064-D   | INS        |

|| |  
 || +- SLOT  
 |+----- HW module number  
 +----- HW module designation

2. Display all services of a server

Input:

```
DISPLAY-BCSM:A1,SW;
```

Output:

| LCX-NO. | SERVICE | APPLICATION |
|---------|---------|-------------|
| 1       | TTYBSC  | TTYBSC      |

3. Display the present relation of the lines 9, 10 and 11.

Input:

```
DISPLAY-BCSM:A1,DPP;
```

Output:

```
DATA-PROCESSOR-PORTS
```

| LINE | RMX |
|------|-----|
| 9    | Y   |
| 10   | N   |
| 11   | N   |

Remark:

A reservation or block of Data-Processor-Ports for RMX and consequently also a display of the present relation of the lines 9, 10 and 11 is not any longer possible in a cPCI - Shelf all Data-Processor-Ports being reserved permanently for UNIX.

4. Display the Status of Start Up of UNIX

Eingabe:

DISPLAY-BCSM:A1,UNIX;

Ausgabe:

```
+=====+
| DISPLAY UNIX: STATE                                     |
+-----+
|                                                         |
|                               UNIX IST ACTIVATED         |
|                                                         |
+-----+
```

26.3.6 REGENERATE-BCSM

Regenerate the database entries for the loadware and the line modules of a server.

In case TYPE=DPP the commands will be regenerated only when the Data-Base-Value for the actual line is not equal to the Init-Value.

Procedure Overview

| Command Code    | Parameter      |
|-----------------|----------------|
| REGENERATE-BCSM | [UNIT=<param>] |

Example

Regenerate the line module entries for the Voice Mail Server A1.

Input:

REGENERATE-BCSM:A1;

Output:

```
ADD-BCSM:A1,BC,STYPE,"B5316-X",WITHOUT;
ADD-BCSM:A1,EC,STYPE,"B5318-X";
ADD-BCSM:A1,BC,SW,13,TTYBSC;
ADD-BCSM:A1,BC,HW,N,13,"Q2011-X 1";
ADD-BCSM:A1,DPP,9,N;
ADD-BCSM:A1,DPP,10,Y;
ADD-BCSM:A1,DPP,11,Y;
```

## 26.4 Parameter Description

|       |                                              |
|-------|----------------------------------------------|
| APPL  | Application name                             |
|       | Type of Input : Single value, optional       |
|       | Possible Values : Valid name (8 chars.)      |
|       | Default values, depending on loadware:       |
|       | TTYBSC, IBM, VMRTCO01, TTX01,                |
|       | FAX01                                        |
|       | ISOV24, S0D, UTC,                            |
|       | XLWV24, XLWU*                                |
|       | PSIODAT                                      |
| CONF  | Type of configuration                        |
|       | Type of Input : Single value, mandatory      |
|       | Possible Values : SW: Software configuration |
|       | HW: Hardware configuration                   |
|       | STYPE = shelf configuration                  |
|       | DPP = Data-Processor-Ports                   |
| INS   | Board to be activated                        |
|       | Type of Input : Single value, optional       |
|       | Possible Values : Y,N                        |
|       | Default Value : N                            |
| LCXNO | LCX-Number                                   |
|       | Type of Input : Single value, mandatory      |
|       | Possible Values : 1 to 7                     |
| LINE  | physical Line                                |
|       | Type of Input : Single value, mandatory      |
|       | Possible Values : 9 to 11                    |
| LTG   | Line Trunk Group                             |
|       | Type of Input : Single value, mandatory      |
|       | Possible Values : 1 to 32                    |

## BCSM - Board Configuration, Service Modules

### Parameter Description

|                            |                                                                                                                                                                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LTU                        | Line Trunk Unit<br>Type of Input : Single value, mandatory<br>Possible Values : 1 to 15                                                                                                                                                                                          |
| LW                         | Loadware<br>Type of Input : Single value, mandatory<br>Possible Values : TTYBSC, IBM, VOICE, TTX, FAX,<br>ISOV24,UTC,<br>SOD,<br>XLWV24, XLWU*                                                                                                                                   |
| PARTNO                     | Part number for a SWU line module<br>(this is marked on the front panel of each module<br>and can thus also be read if the module is already plugged in).<br>Type of Input : Single value, mandatory<br>Possible Values : Valid part number (10 chars.)                          |
| PARTNO01                   | The part number must be entered for each line module and slot (this is marked on the<br>front panel of each module and can thus also be read if the module is already plugged in).<br>Type of Input : Single value, mandatory<br>Possible Values : Valid part number (10 chars.) |
| PARTNO02<br>to<br>PARTNO05 | The part number must be entered for each line module and slot (this is marked on the<br>front panel of each module and can thus also be read if the module is already plugged in).<br>Type of Input : Single value, optional<br>Possible Values : Valid part number (10 chars.)  |
| RMX                        | Port assignment for RMX<br>Type of Input : Single value, mandatory<br>Possible Values : Y = Port is for RMC/CMS reserved<br>N = Port is for RMX blocked                                                                                                                          |
| SLOT                       | The slot must be specified for each line module in the SWU shelf.<br>Type of Input : Type of Input<br>Possible Values : 1 to 121                                                                                                                                                 |

|        |                                                                                                                                                   |                                                         |  |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|--|
| SLOT01 | The slot must be specified for each line module of the specified server. The maximum hardware configuration allows for 5 line modules per server. |                                                         |  |
|        | Type of Input                                                                                                                                     | : Single value, mandatory                               |  |
|        | Possible Values                                                                                                                                   | : 1 to 127                                              |  |
| SLOT02 | The slot must be specified for each line module of the specified server. The maximum hardware configuration allows for 5 line modules per server. |                                                         |  |
| SLOT05 |                                                                                                                                                   |                                                         |  |
|        | Type of Input                                                                                                                                     | : Single value, optional                                |  |
|        | Possible Values                                                                                                                                   | : 1 to 127                                              |  |
| SCONF  | shelf configuration                                                                                                                               |                                                         |  |

## BCSM - Board Configuration, Service Modules

### Error Messages and Advisories

"Q5382-X "

MULTI : "B5350-X "

: "B5384-X "

MONO : "X7659-X "

MULTI : "X7659-X "

In EC there is the same default value as in BC.

SPARTNO Part number of basic or extension shelf (depending on parameter TYPE)  
Type of Input : Single value, mandatory  
Possible Values : Valid part number (10 chars.)

TYPE Shelf type  
Type of Input : Single value, mandatory  
Possible Values : BC : Basic shelf  
EC : Extension shelf  
SWU : Line Board in the SWU  
DPP : Data-Processor-Ports

UNIT Functional system unit, i.e. server code  
Type of Input : Single value, optional  
Possible Values : A1 = Administration and Data Server (ADS)

## 26.5 Error Messages and Advisories

### 26.5.1 Error Messages

F01: CONFIGURATION NOT FOUND  
F02: MOUNTING SLOT <slot> NOT VALID IN <unit> SERVER  
F03: PART NUMBER <partno> NOT VALID IN <unit> SERVER  
F04: THE ENTERED ASSIGNMENT (PART NUMBER - MOUNTING SLOT) IS NOT  
POSSIBLE FOR <unit> SERVER  
F05: NO CONFIGURATION FOUND TO DELETE  
F06: NO CONFIGURATION ASSIGNED  
F07: SPECIFIED MOUNTING SLOT <slot> NOT IN CONFIGURATION  
F08: CONFIGURATION WAS NOT ACTIVATED  
F09: CONFIGURATION WAS NOT DEACTIVATED  
F10: SPECIFIED MOUNTING SLOT <slot> ALREADY ASSIGNED  
F11: ERROR IN LSCR DIALOG (TIME OUT)  
F12: HARDWARE STILL ASSIGNED AT SLOT <slot>

F13: BOARDS IN ADS MAY NOT BE DELETED  
F14: MOUNTING SLOT <slot> IS NOT ASSIGNED  
F15: NO LCU SPECIFIED  
F16: NO LBC SPECIFIED  
F17: SLOT <slot> SPECIFIED TWICE  
F18: NO PART NUMBER WAS SPECIFIED FOR SLOT <slot>  
F19: NO SLOT WAS SPECIFIED FOR PART NUMBER <partno>  
F20: LINES STILL ASSIGNED (DELETE THEM USING TCSM, ATCSM OR LCS0)  
F21: NO SUITABLE LOADWARE ASSIGNED  
F22: NOT POSSIBLE TO ASSIGN SINCE OTHER CONFIGURATION ALREADY ASSIGNED  
F23: THE LCX NUMBER DERIVED FROM SLOT <slot> IS NOT IN THE ADMISSIBLE RANGE  
F24: SERVICE <lw> IS NOT ALLOWED  
F25: SERVICE <lw> IS MARKED AS NOT AVAILABLE  
F26: SERVICE <lw> CANNOT BE ASSIGNED ON ACCOUNT OF THE KEY VALUE  
F27: SERVICE <lw> IS NOT ALLOWED IN <unit> SERVER AT THE  
LCX NUMBER DERIVED FROM SLOT <slot> IN SERVER  
F28: SLOT <slot> IS NOT SPECIFIED OR NOT VALID  
F29: SERVICE <lw> IS NOT SPECIFIED OR NOT VALID  
F30: AT SLOT <slot> NO SERVICE <lw> ASSIGNED  
F31: NO EXTENSION SHELF POSSIBLE  
F32: NO LOADWARE FOUND  
F33: THE SPECIFIED LOADWARE DOES NOT EXIST  
F34: SHELF PART NUMBER/SHELF CONFIGURATION NOT ALLOWED  
F35: SHELF PART NUMBER/SHELF CONFIGURATION NOT VALID  
F36: SHELF PART NUMBER/SHELF CONFIGURATION NOT ALLOWED FOR <unit> SERVER  
F37: NOT POSSIBLE TO CREATE SINCE BOARDS ARE ALREADY CREATED  
F38: NO LOADWARE CREATED FOR THIS SLOT  
F39: TYPE=SWU IS ONLY FOR UNIT=A1 POSSIBLE  
F40: A LOADWARE IS ALREADY INSTALLED FOR LCXNO <lcxno>  
F41: THE SPECIFIED PARTNO IS NOT VALID FOR TYPE=SWU  
F42: HARDWARE STILL ASSIGNED ON LCXNO <lcxno>  
F43: LINES STILL ASSIGNED, DELETE THEM USING TCSM OR ATCSM  
F44: TYPE=DPP IS ONLY FOR UNIT=A1 POSSIBLE  
F45: PLEASE DEACTIVATE UNIX BEFORE CONFIGURING LINE 11 FOR RMX  
F46: LINE <8> IS RESERVED FOR THE CONSOLE  
F47: A RESERVATION OF A LINE FOR RMX IS NOT POSSIBLE IN A CPCI SHELF

## **26.5.2 Advisories**

H01: CONFIGURATION COMPLETED  
H02: BOARD ACTIVATION WILL BE ATTEMPTED  
H03: NO CONFIGURATION EXISTS  
H04: CONFIGURATION WAS ACTIVATED  
H05: CONFIGURATION WAS DEACTIVATED  
H06: CONFIGURATION WAS NOT ACTIVATED  
H07: BOARD DEACTIVATION WILL BE ATTEMPTED  
H08: RESTART NECESSARY BEFORE ACTIVATION OF HW  
H09: CONFIGURATION NOT ACTIVATED SINCE LBC IS LOCKED

## **BCSM - Board Configuration, Service Modules**

### **Error Messages and Advisories**

H10: CONFIGURATION NOT ACTIVATED SINCE TEST FAILED  
H11: CONFIGURATION NOT ACTIVATED SINCE LOAD ERROR OCCURED  
H12: CONFIGURATION REJECTED SINCE ANOTHER CONFIGURATION IN PROGRESS  
H13: CONFIGURATION NOT ACTIVATED SINCE HW NOT ASSIGNED  
H14: CONFIGURATION NOT DEACTIVATED SINCE LBC IS LOCKED  
H15: CONFIGURATION REJECTED SINCE ANOTHER DEACTIVATION IN PROGRESS  
H16: SWU NOT AVAILABLE  
H17: UNIX-REBOOT NECESSARY FOR ACTIVATION OF THE LINE  
H18: WARNING! LINE 11 MUST BE SET TO 'RMX=NO' FOR PROPER UNIX FUNCTIONALITY

## 27 BCSU - Configuring Mounting Locations for Modules in the SWU

This AMO is used to configure peripheral modules, ringing current generator modules, and SIUs in the LTU.

The module is entered in the SWU database (reference configuration) and, if the correct module is plugged in, loaded and put into service.

### 27.1 Interrelationships

- AMO CONSY : Administration of System Configuration Data
- AMO BFDAT : Configuration of Functional Blocks for CGW boards
- AMO UCSU : Unit configuration of switching unit
- AMO BSSU : Board switch, switching unit
- AMO DIMSU : Dimensioning of features, switching unit
- AMO TACSU : Configuration of analog trunk circuits in the SWU
- AMO TDCSU : Configuration of digital trunk circuits in the SWU
- AMO REFTA : Reference clock pulse table
- AMO VOICO : Administration of voice compression connections
- AMO LWPAR : Configuration of LW parameter blocks
- AMO ZAND / -ZANDE : System Data
- AMO SIPCO : System IP address configuration
- AMO APRT : Access Point Routing Table
- AMO CGWB : Configuration of HG3550 boards

### 27.2 Functions of the AMO

- [ADD-BCSU](#) : Equip modules in the reference configuration
- [CHANGE-BCSU](#) : Change modules in the reference configuration
- [DELETE-BCSU](#) : Remove modules from the reference configuration
- [DISPLAY-BCSU](#) : Interrogate the modules
- [REGENERATE-BCSU](#) : Regenerate the modules

### 27.2.1 ADD-BCSU

Assign the desired module type.

The LTU in which the module is to be configured must already be assigned. (AMO UCSU).

Caused by feature IPDA there are two different kind of LTUs from now on. The range for traditional LTUs in HHS (Hicom Host System) are from 1 to HW max. value which depends on the particular platform - and AP shelves (Access Points). The range for these AP shelves starts generally from 17 and goes up to 99.

During the load of a HHS shelf (Shelf Broadcast) no module can be configured in that shelf.

The AMO is canceled, producing an error message in case a configuration is attempted in that state.

#### **Assigning a SIU:**

Assigning a SIU requires the actions as follows:

- a) Manually blocking of LTU shelf (AMO USSU)
- b) assigning a SIU
- c) Putting the LTU shelf in service

In "compact" shelves (C, EC, ECX, cPCI) one SIU board per LTU quarter will be able to be assigned.

This rule will not be checked by AMO. Generally a advisory message about this rule will be printed if a SIU board has to be assigned.

One SIU is not taken into operation during installation. Because of time slot allocation, the SIU is taken into operation by means of a hard restart. To prevent a loss of the preinitialized SIU data in those cases where a hard restart escalates into a RELOAD, the data should be written to the hard disk using AMO UPDAT before initiating the hard restart.

Advisory: If a SIUX board is added as peripheral SIU the parameter FCTID will have to be specified. Via this parameter the right function of the board - as SIU type 2 (MFV), SIU type 3 (MFC), type 4 (TDS), SIU type 5 (ANI) , SIU type 6 (MFS) or SIU Type 7 (Line Testing) - will be selected.

Note for SIU type 4:

If such a SIU is added, a TDS port will be configured by the AMO. For the amount of TDS ports (SIU type 4) in the system the following rule exists:

- Only one TDS port may be configured in the whole HHS shelf range (1 - 15). This means, that in this whole range only one SIU type 4 can be configured with AMO BCSU. On some system platforms it is furthermore possible, to configure a central SIU (DSCX/SIUCO) with AMO UCSU. In this case a TDS port will be configured by AMO UCSU for this central SIU. If such a DSCX/SIUCO is configured as central SIU, it is not possible to configure a peripheral SIU type 4.
- In the AP shelf range (17 - 99) one TDS port may be configured per LTU. This Port will be configured by AMO UCSU, when the NCUI board is added. That means: it is not possible, to configured a SIU type 4 in an AP shelf.

The timeslots, which are usually reserved for SIU boards, can be used by a voice compression (VC) connection. In this case a SIU board can only be assigned if the VC connections have been deactivated by AMO-VOICO first. All affected VC connections will be displayed in a corresponding error message.

### **Assigning a Ringing/Dialing AC Generator:**

Any desired number of ringing AC generator or dialing AC generator can be assigned.

However, only one ringing AC generator and one dialing AC generator may be put into service per backup unit (e.g. platform 600ECX: LTU 1-3, LTU 4-6, etc.)

Advisory: For CC80 shelf the wiring connections on back plan must be connected like described in service manual. If this advisory is ignored the ringing AC generator will be destroyed.

For feature message waiting Thailand the US ringing AC generator is used for all hardware platforms. The OPMODE has to be UN20H85V. If an other OPMODE is specified by user for the US ringing AC generator (Q2468-X) the AMO will overwrite the OPMODE with the right value. If the user specifies an other ringing AC generator for OPMODE UN20H85V the AMO will prompt the right value for part number.

### **Assigning a DIU (digital interface unit):**

A DIUC may only be configured for an LTU-half.

When configuring a DIUC in a compact shelf, it should be borne in mind that the slot immediately next to the DIUC remains free, and that the slot immediately following this free slot will be allocated. The free slot next to the DIUC may be freely-assigned, e.g. to another DIUC. In shelves with old HW the DIUC requires 4 adjacent slots.

When configuring a DIUC64 with the loadware variant 6, the feature "line alarm handling for DIUC-France" is activated.

#### **Assigning BOS, MOS or CVN mode for T1 board (TMDN or DIU2U):**

The T1 board (TMDN or DIU2U) can be configured in three different working modes:

- In work mode BOS the board works similar to the already existing DIUC board.
  - Trunks on this kind of board can be configured by means of AMO TACSU.
  - If certain loadwareparameters are desired for this BOS board, the user has the possibility, to preconfigure a loadware block with AMO LWPAR as desired, and enter the number of this configured loadware block during the board configuration (ADD-BCSU: parameter = LWPAR ). If no value is entered for parameter LWPAR, a default loadware block will be assigned.
- In work mode MOS mode the board works similar to the already existing DIUS2 board.
  - Circuits on this kind of board can be configured by means of AMO TDCSU.
  - The LW parameter block for MOS boards is assigned during the trunk configuration by means of AMO-TDCSU.
- In work mode CVN mode (CorNet VN) the board works similar to the already existing TMDN board.
  - Circuits on this kind of board can be configured by means of AMO TDCSU.
  - The LW parameter block for MOS boards is assigned during the trunk configuration by means of AMO-TDCSU.

#### **Assigning an IP gateway (HG3500 board for IPDA, HFA, SIP, WAML usage):**

The IP gateway HG3500 can either cover just one or multiple functions at the same time on one single board. Therefore the information which functions should be covered by the configured board has to be defined before the configuration itself starts.

This information is provided via so called function blocks which have been configured by means of AMO-BFDAT as a prerequisite.

The number of assigned b-channels per configured function (Multiple Feature Support - MFS) can be reduced manually as usual via a bunch of parameters per configurable function.

Furthermore a number of trunk circuits respectively a number of b-channels for subscribers can be pre-reserved in the function blocks and assigned to usable trunks/subscribers later when needed. For this function an own parameter is located in the IPGW branch.

A special handling is needed for configuring the IP address because basically it is configured together with the global by means of AMO-CGWB but when the HG3570 function is used, it is needed to configure it already by means of AMO-BCSU. The address must fit into the LAN segment of SL net table which is configured by means of AMO-SIPCO.

For configuring an IP gateway, the following parameters are used:

- **Parameter FCTBLK:**  
Number of function block which is a pre-requisit configuration by means of AMO-BFDAT.
- **Parameter IPADDR:**  
Address from the SL net table. This table must previously have been configured by means of AMO-SIPCO and is only configurable by means of AMO-BCSU if the IPDA function is used.
- **Parameter BCHL3530, BCHLSIP, BCHL3550, BCHLWAML, BCHL3570 (number of b-channels per desired function):**  
Number of usable b-channels per desired function for each HG3500 board.

The features DMC and/or Signalling & Payload Encryption need to reduce the configured b-channels automatically for some functions to prevent an overload of the board. This calculation is done automatically and is displayed in the configuration output in display table format

### **Following shelf types require special treatment:**

- For feature IPDA a new shelf type "INCH 19" has been introduced. The HW of this 19" shelf consists of one 19" base box and one 19" expansion box.  
  
The 19" base box allows the configuration of three boards and one NCUI board instead of LTUC (AMO-UCSU). The slot numbers are 1 to 3 for peripheral boards and 4 for the NCUI board. The 19" base box can be considered as left shelf half.

## BCSU - Configuring Mounting Locations for Modules in the SWU

### Functions of the AMO

The 19" expansion box allows the configuration of four peripheral boards. The slot numbers are 9 to 12. The 19" expansion box can be considered as right shelf half.

- Also if the 19" expansion box is not mounted, AMO-BCSU can configure boards in the according slots. The AMO-BCSU considers the 19" base box and 19" expansion box as one shelf unit.
- It is not possible to configure some special boards (e.g. Ringing AC generators or Dialing AC generators, VCM board) on this 19" shelf. AMO-BCSU will check this against restrictions contained in the UBGDAT.
- The 19" shelf is only possible for usage in the AP shelf range.

#### **Following slots require special treatment:**

- In compact shelves, slot 19 is usually reserved for configuring an RG, an ACGEN, or a SIU.

#### **Adding signed off PENs for feat. "autoset relocate":**

For feat. "autoset relocate" (see also service manual) it is necessary to prepare PENs (Port equipment numbers) (Circuits on boards) in that way, that added and signed off devices on this PEN would be able to signed on by a key number or by AMO-DSSU.

This will be done in two steps:

- Adding the board as before
- Change the PEN with the command `CHANGE-BCSU:TYPE=SIGNOFF,...` to this state

At a signed off PEN can only devices but no line circuits or switch boards be added !

At signing off circuits, a parameter OPS enables the user, to mark circuits on SLMA boards for off premises usage (OPS=YES). If OPS=YES is entered for circuits on other boards than SLMAs, an advisory message will be displayed, that the parameter will be ignored.

With the command `CHANGE-BCSU:TYPE=RELEASE,...` a signed off PEN will be switched to state "free". At this PEN a line circuit can be added.

Sign off is only valid for following board types:

SLMA, SLMB, STMD, SLMO, SLMQ, SLMS, SLMU, SLMQ16 and WAML2 (=SLMPX)

PENs at a WAML2-board are subordinated a PFS-check (Telecommuting). Only as many PENs can be signed off as the PFS-counter allows, depending on the contracted respectively the already assigned value. If the counter is exceeded this is announced by the AMO producing an error message.

At all other boards, the signed off circuits are subordinated a PFS-check too (TEILNEHMER/SUBSCRIBER). In this case, the signed off B-Channels are counted.

For analog boards one signed off circuit represents one B-channel, for digital boards the signed off subscribers on a circuit ( up to 8 sign offs possible ) will be counted as maximal 2 signed off B-channels. If the counter is exceeded this is announced by the AMO producing an error message.

**Adding of base stations:**

Via branch PERHW a base station for a SLMC board can be assigned. A base station doesn't have a physical address in the system so it can only be assigned but not deleted.

**Special treatments for assigning peripheral boards:**

For certain boards the number of circuits, which have to be configured, can be reduced from the UBGDAT value because in a 80CM system the number of available lines is quite low. The parameter CIRCNT will be ignored with a corresponding advisory for all boards with a fixed number of circuits.

Peripheral boards can have more functions like SIUX boards (e.g. WAML, STMA, SLMO24). These functions can be specified by parameter FCTID.

The first used line (Begin Line = circuit 0) of the STMA-board is added to the reference clock - table. The REFTA-entry can therefore only be changed in AMO-REFTA.

Only one Unix-processor-board (DMP5L) can be assigned for each PBX. Two slots are needed. An exception is the PBC 10 (slot 61) in the 80CMX - base-frame. Due to the physical order only one single slot is used. The DMP5L board may be configured in following LTUs (depending on the HICOM type):

| SYSTEM    | PERMITTED LTU         |
|-----------|-----------------------|
| 600ECX    | 1, 5, 6, 10, 11, 12   |
| 600ECS    | 1, 4, 5, 8, 9, 12, 13 |
| 80CMX     | 1, 2                  |
| 80CMX-DSC | 1, 2                  |

## BCSU - Configuring Mounting Locations for Modules in the SWU

### Functions of the AMO

| SYSTEM | PERMITTED LTU |
|--------|---------------|
| 80CXE  | 1, 2          |

#### NOTE:

for HICOM600:

Because the AMO can not distinguish between platform 600ECX and 600ECS the possible user input for parameter LTU are values between 1 and 15. The systemadministrator must ensure that, depending on the HW type, the DMP5L will be configured only in the LTUs described above.

If a 80CMX-DSC is used with the small version power supply (PSDSC), only 4 boards can be configured in LTU 1. The AMO can not check, if the configuration was done with a strong version power supply (PSAFE) and a small power supply is used during the full action. This case can lead up to destruction of the switch.

#### Feature "Wireless Server":

If the Feature "Wireless Server" is activated, adding of boards is limited to:

| Boardtype | Configurable amount |
|-----------|---------------------|
| SLMA      | 1                   |
| DIUS2     | 2                   |
| STMD      | 2                   |
| SLMC      | 2                   |
| WAML      | 1                   |
| CDG       | 2                   |

The attempt, to configure other boards than described above, will be rejected with an error message.

If the amount of configureable boards of a certain type is already reached and the user tries to add such a board, the ADD-command will be rejected with an error-message.

#### Procedure Overview

### Command Code

### Parameter

```
|MTYPE=PERHW, PARTNO=<string>, [FCTID=<number>]  
|, [LWVAR=<string>];
```

### Example

1. Assign the ringing current generator with LTG=1, LTU=1, SLOT=19, part number=Q2258-X and mode of operation=UN50H65V.

Input:

```
ADD-BCSU:RG,1,1,19,"Q2258-X",UN50H65V;
```

## 27.2.2 CHANGE-BCSU

### Modification of module data.

- It is only possible to change code numbers of modules within the same module-line-type (e.g. SLMA).

Exception: The change of some boards with newer HW modules is possible even though the module-line-type is different and is handled AMO internally (e.g. STMD<->STMD2, SLMS<->SLMS2, DIUS2<->DIUN2,...).

If the module is not already blocked, the AMO blocks it. After the change is carried out, the module is put back into service.

- In the case of a DIUC, the parameters FIDX1/2 and LWPAR1/2 of the associated PCM paths can be modified.
- With the new branch "HWYBDL" the access to the upper (F) or lower (A) highwaybundle of a board can be set, to use a previously by AMO UCSU configured overlay configuration. At the moment, bundle "F" can only be used for STMI, DIUN2- and DIUN4 boards.
- With the new branch "HWYBDL" the number of usable b-channels can be reduced and also reset to the original value for each configured function on the HG3500 board, respectively the pre-reserved amount of circuits (for trunks) and/or b-channels (for subscribers) can be re-configured to usable circuits/b-channels.

The calculation of values for automatic b-channel reduction is always done if a value is specified for the according parameter - but it is not possible to configure more than the maximum possible values.

## Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Examples

1. Change the SLMA module with the code number Q2041-X and the parameters LTG=1, LTU=1, SLOT=31 to an SLMA module with the code number Q2057-X100.

Input:

```
CHANGE-BCSU:PARTNO,1,1,31,, "Q2057-X100";
```

2. Change all SLMA modules of LTG 1 with the code number Q2041-X to SLMA modules with the code number Q2057-X100.

Input:

```
CHANGE-BCSU:PARTNO,1,,, "Q2041-X", "Q2057-X100";
```

Output:

```
H01: BG 1.1. 25 CHANGED - IN SERVICE
H01: BG 1.1. 31 CHANGED - OUT OF SERVICE (NPR)
: : : : : : : : : : : : : : : :
: : : : : : : : : : : : : : : :
```

3. Change the highwaybundle of a DIUN2 to bundle "F":

```
CHANGE-BCSU:HWYBDL,1,1,37,Q2196-X,1,F;
```

4. Change pre-reserved trunk circuits to configurable HG3550 circuits for IP gateway by means of parameter CHNGRSL.

Prerequisites are pre-reserved HG3550 circuits:

| ADDRESS :                                                           |            | LTG 1    | LTU 3 | SOURCE GROUP 1 |                                 |     | ALARMNO-LTU 0 |               |            |

- Input:

Output:

H31: THE AMOUNT OF AVAILABLE B-CHANNELS ON CGW BOARD HAS BEEN CHANGED !  
PLEASE CHECK THE RESOURCE MANAGER CONFIGURATION (ALSO AMO-CGWB)

H32: IF THE B-CHANNEL PARAMETER IS SPECIFIED, THE AVAILABLE B-CHANNELS ON CGW  
FUNCTIONS IS SMALLER/EQUAL AS THE CONFIGURED VALUES FOR CGW FUNCTIONS !  
THE RESOURCE MANAGEMENT IS ALSO AFFECTED BY SPECIFYING THIS  
PARAMETER, THEREFORE FEWER B-CHANNELS WILL BE CONFIGURED IN TOTAL.

H39: THE PARAMETERS FOR CHANGING THE NUMBER OF B-CHANNELS WILL BE IGNORED IF  
THE ACCORDING FUNCTION IS NOT CONFIGURED.

H35: THE PROCESSED CHANGES HAVE NEEDED A DEACTIVATED STMI BOARD.  
THE BOARD IS INITIATED TO BE TAKEN IN SERVICE AGAIN RIGHT NOW.

### 27.2.3 DELETE-BCSU

An exception is only the WAML1 board, which can only be deleted if the corresponding data have explicitly been deleted before.

## Procedure Overview

### Example

- Input:

```
DELETE-BCSU:RG,1,1,19;
```

## 27.2.4 DISPLAY-BCSU

The type of output is controlled exclusively by parameter TYPE.

- Interrogate the configuration of an LTU with modules in the following format:
  - a statistics
  - a table
  - a table of modules with variable modes
- Interrogate the operating mode RG, ACGEN, SIU- and DIUC-modules.
- Interrogate the connection status of pens.
- Interrogate base stations.
- Interrogate source groups (see also AMO-UCSU).

### Procedure Overview

#### Command Code

DISPLAY-BCSU

#### Parameter

```
[TYPE=STAT], [LTG=<number>], [LTU=<number>]
, [CFG=<number>], [SACHNR<string>];

| [TYPE=TBL], [LTG=<number>], [LTU=<number>]
, [SLOT=<number>];

| [TYPE=MODE], [LTG=<number>], [LTU=<number>]
, [SLOT=<number>];

| [TYPE=PEN], [LTG=<number>], [LTU=<number>]
, [SLOT=<number>], [CCT=<number>];

| [TYPE=PERHW];

| [TYPE]=FLOWCTRL, [LTG=<number>], [LTU=<number>]
, [SLOT=<number>];

| [TYPE=SRCGRP], [SRCGRP=<number>];
```

### Functions of the AMO

#### Examples

1. Generate statistics of the reference configuration of the entire system. Parameters (LTG, LTU, SLOT,CFIG and PARTNO) are assigned default values.

Input:

```
DISPLAY-BCSU:STAT;
```

Output:

TOTAL OF THE REFERENCE CONFIGURATION

| PARTNO     | FID | TYPE  | NUMBER |                          |
|------------|-----|-------|--------|--------------------------|
| Q2057-X    |     | SLMA  | 6 =>   | 96 LINE CIRCUITS / PORTS |
| Q2058-X    |     | RG    | 1 =>   | 0 LINE CIRCUITS / PORTS  |
| Q2052-X    |     | SLMB  | 5 =>   | 40 LINE CIRCUITS / PORTS |
| Q2027-X    |     | TMX21 | 6 =>   | 12 LINE CIRCUITS / PORTS |
| Q2032-X    |     | TMBP  | 2 =>   | 8 LINE CIRCUITS / PORTS  |
| Q2033-X    |     | TMBC  | 2 =>   | 8 LINE CIRCUITS / PORTS  |
| Q2025-X200 |     | TMBD  | 11 =>  | 44 LINE CIRCUITS / PORTS |
| Q2248-X    |     | LTUCE | 6      |                          |
| Q2014-X    |     | TMOM  | 4 =>   | 8 LINE CIRCUITS / PORTS  |
| Q2013-X    |     | TMBM  | 2 =>   | 4 LINE CIRCUITS / PORTS  |
| Q2233-X    | 2   | SIUX  | 1 =>   | 8 LINE CIRCUITS / PORTS  |
| Q2065-X1   |     | TMAG  | 1 =>   | 2 LINE CIRCUITS / PORTS  |
| Q2066-X1   |     | TMAU  | 4 =>   | 12 LINE CIRCUITS / PORTS |
| Q2064-X    |     | TLMR  | 2 =>   | 4 LINE CIRCUITS / PORTS  |
| Q2233-X    | 7   | SIUX  | 1 =>   | 8 LINE CIRCUITS / PORTS  |
| Q2233-X    | 4   | SIUX  | 1 =>   | 8 LINE CIRCUITS / PORTS  |
| Q2067-X100 |     | TMASF | 1 =>   | 4 LINE CIRCUITS / PORTS  |
| Q2064-X100 |     | TMLR  | 2 =>   | 4 LINE CIRCUITS / PORTS  |

2. List the data for all modules in LTG 1 / LTU 1.

Input:

```
DISPLAY-BCSU:TBL,1,1;
```

Output:

LTG 1 LTU 1 SRCGRP 1 ALARMNO-LTU 0

| ASSIGNED     |         | MODULE |    | FCT E W ARM P |   | INSERTED                     |         | HW-          |              |

### 27.2.5 REGENERATE-BCSU

For program technical reasons configured base stations will be regenerated before all regular boards.

## Procedure Overview

| Command Code    |
|-----------------|
| REGENERATE-BCSU |

| Parameter                                        |
|--------------------------------------------------|
| [LTG=<number>], [LTU=<number>], [SLOT=<number>]; |

### Example

1. Regenerate all modules in the system.

Input:

```
REGENERATE-BCSU:;
```

Output:

```
ADD-BCSU:PER,1,1,61,"Q2144-X",0,0,NO,300,700,300,A;
ADD-BCSU:PER,1,1,67,"Q2158-X",1,0,NO,300,700,300,A;
ADD-BCSU:PER,1,1,73,"Q2115-X",0,0,NO,,,,A;
ADD-BCSU:PER,1,1,79&85,"Q2150-X",0,0,,,,,A;
ADD-BCSU:PER,1,1,91,"Q2141-X",0,0,,,,,A;
ADD-BCSU:PER,1,1,97,"Q2025-X300",0,0,,,,,A;
ADD-BCSU:PER,1,1,103,"Q2121-X",0,0,,,,,A;
```

BCSU - Configuring Mounting Locations for Modules in the SWU

Parameter Description

```
ADD-BCSU:PER,1,2,31,"Q2117-X",0,0,,,,,A;  
ADD-BCSU:PER,1,2,55,"Q2214-X",0,0,,,,,A;  
ADD-BCSU:PER,1,2,61,"Q2208-X100",0,0,,,,,A;  
ADD-BCSU:DIU,1,2,79,"Q2096-X200",0,,,,0,,,,A;  
ADD-BCSU:DIU,1,2,85,"Q2096-X200",0,,,,0,,,,A;  
ADD-BCSU:DIU,1,2,91,"Q2096-X200",0,,,,0,,,,A;  
ADD-BCSU:DIU,1,2,97,"Q2096-X200",0,,,,0,,,,A;  
ADD-BCSU:PER,1,2,103,"Q2235-X",0,0,,,,,A;  
ADD-BCSU:PER,1,2,109,"Q2235-X100",0,0,,,,,A;  
ADD-BCSU:DIU,1,2,115,"Q2096-X200",0,,,,0,,,,A;  
ADD-BCSU:PER,1,2,121,"Q2174-X",0,0,,,,,A;
```

|        | Default Value                                                                                                                                                                                                                                                                                                                                                                      | 0 | boards without function identification number |
| FIDX   | File index of DEP LOCK TBL (1st PCM highway). This contains error code combinations for initiating soft locking/no action/special action treatment of errors on PCM highways of a TMD-BOS.<br>The error code combinations are defined with the ZAND AMO, parameter TYPE=DIUSL<br>Type of Input : Single value, optional<br>Possible : 1 - 10<br>Values<br>Default Value : 1        |   |                                               |
| FIDX1  | File index of DEP LOCK TBL (1st PCM highway). This contains error code combinations for initiating soft locking/no action/special action treatment of errors on PCM highways of a DIUC or DIUC64.<br>The error code combinations are defined with the ZAND AMO, parameter TYPE=DIUSL<br>Type of Input : Single value, optional<br>Possible : 1 - 10<br>Values<br>Default Value : 1 |   |                                               |
| FIDX2  | File index of DEP LOCK TBL (2nd PCM highway). This contains error code combinations for initiating soft locking/no action/special action treatment of errors on PCM highways of a DIUC64.<br>The error code combinations are defined with the ZAND AMO, parameter TYPE=DIUSL<br>Type of Input : Single value, optional<br>Possible : 1 - 10<br>Values<br>Default Value : 1         |   |                                               |
| HWYBDL | Highwaybundle<br>Type of Input : Single value, optional (ADD/CHANGE)<br>Possible : A Highwaybundle I A<br>Values : F Highwaybundle I F: for overlayconfiguration<br>Default Value : A                                                                                                                                                                                              |   |                                               |
| IPADDR | IP gateway address (i.e 198.16.16.78) for payload connections from IP net to HHS<br>Type of Input : 1 to 4 single values, concatenated with ". "<br>: mandatory (ADD)<br>: mandatory ( CHANGE)<br>Possible : 0 to 255<br>Values                                                                                                                                                    |   |                                               |

## BCSU - Configuring Mounting Locations for Modules in the SWU

### Parameter Description

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LTERM | Threshold value long<br>Type of Input : Single value, optional<br>Possible Values : 100 to 5000<br>Default Value : see UBGDAT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LTG   | Line trunk group specifications<br>Type of Input : Single value, mandatory (ADD, DELETE, CHANGE)<br>Single value, range, optional (DISPLAY, REGENERATE)<br>Type of Input : optional<br>(CHANGE) TYPE=FLOWCTRL :1 single value or 1 value range may be specified.<br>(DISPLAY) TYPE=FLOWCTRL :Up to 2 single values or 1 value range may be specified.<br>Possible Values : 1 to 1<br>Default Value : 1                                                                                                                                                                                                                                                                                                                                                                 |
| LTU   | Specification of the LTU of an LTG. The LTU shelves in the cabinet are consecutively numbered from top to bottom.<br>Type of Input : mandatory<br>1 single values or a range (TYPE=PER)<br>1 single values or a range,<br>optional (CHANGE)<br>Single value or a range, optional (DISPLAY, REGENERATE)<br>Type of Input : optional<br>(CHANGE) TYPE=FLOWCTRL :1 single value or 1 value range may be specified.<br>(DISPLAY) TYPE=FLOWCTRL :1 single values or 1 value range may be specified.<br>Possible Values : 1 - 15 in HHS (Host Shelf)<br>16 not defined<br>17 - 99 in AP (Access Point Shelf)<br>Default Value : 1 && max value of HW platform for shelves in HHS<br>: 17 to 99 for AP shelves (gap between LTU number max and 17 depends on the HW platform) |
| LWPAR | Index to LW parameter block for TMDN board<br>Type of Input : Single value, optional<br>Possible Values : 1 - 200<br>Default Value : 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LWPAR1  | <p>Loadware parameterization of DIUC or DIUC64 (1st PCM highway)</p> <p>This parameter assigns a specific parameter block defined by means of the LWPAR AMO, parameter TYPE=DIUC.</p> <p>Type of Input : Single value, optional</p> <p>Possible Values : 1 - 6</p> <p>Default Value : 1</p>                                                                                                                                                                                                                           |
| LWPAR2  | <p>Loadware parameterization of DIUC64 (2nd PCM highway)</p> <p>This parameter assigns a specific parameter block defined by means of the LWPAR AMO, parameter TYPE=DIUC.</p> <p>Type of Input : Single value, optional</p> <p>Possible Values : 1 - 6</p> <p>Default Value : 1</p>                                                                                                                                                                                                                                   |
| LWVAR   | <p>Loadware Variant</p> <p>Type of Input : Single value, optional</p> <p>Possible Values : 0-9, A-Z</p> <p>Default Value : 0</p> <p>Remark : The parameter LWVAR can only be declared in the initial configuration command for a board type (e.g. SLMA1), if the LWVAR is known to be greater than 0. In subsequent configuration commands for boards of the same type the parameter LWVAR will be ignored. Later changes to the loadware variant must be carried out with the ZAND AMO, TYPE=LOADWARE</p>            |
| MACADDR | <p>MAC address of board</p> <p>Type of Input : 6 single values,concatenated with -, optional</p> <p>Possible Values : hexadecimal, 0-FF</p> <p>Remark : The parameter LWVAR can only be declared in the initial configuration command for a board type (e.g. SLMA1), if the LWVAR is known to be greater than 0. In subsequent configuration commands for boards of the same type the parameter LWVAR will be ignored. Later changes to the loadware variant must be carried out with the ZAND AMO, TYPE=LOADWARE</p> |
| MFCTYPE | <p>Specification of the working mode for SIU type 3, type 5, type 6</p> <p>Type of Input : mandatory for SIU type 3, type 5, type 6<br/>8 single values</p>                                                                                                                                                                                                                                                                                                                                                           |

## BCSU - Configuring Mounting Locations for Modules in the SWU

### Parameter Description

|                 |                                                                  |                                                                                                                                                        |                                                                       |
|-----------------|------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
|                 |                                                                  | If fewer values are entered, the last entered value is used to complete the set. If SIU is not type 3, type 5 or type 6 the parameter is not permitted |                                                                       |
| Possible Values | :                                                                | R2F                                                                                                                                                    | CCITT R2 forward                                                      |
|                 |                                                                  | R2B                                                                                                                                                    | CCITT R2 backward                                                     |
|                 |                                                                  | R1                                                                                                                                                     | CCITT R1                                                              |

| TSI    | Terminal selection identifier  |                                                        |                                                                                |
|        | Type of Input                  | : 1 to 4 Single values or a value range (CHANGE)       |                                                                                |
|        | Possible Values                | : 1 to 8                                               |                                                                                |
|        | Default Value                  | : 1                                                    |                                                                                |
| TYPE   | Type of output (CHANGE)        |                                                        |                                                                                |
|        | Type of Input                  | : Single value, mandatory                              |                                                                                |
|        | Possible Values                | : PARTNO                                               | Code number                                                                    |
|        |                                | DIU                                                    | DIU configuration                                                              |
|        |                                | SIGNOFF                                                | Set circuit or tsi to signed off (feat. "autoset relocate")                    |
|        |                                | RELEASE                                                | Set circuit or tsi from signed off to not connected (feat. "autoset relocate") |
|        |                                | FLOWCTRL                                               | Threshold values for flow control boards                                       |
|        |                                | HWYBDL                                                 | Highwaybundlel for overlayconfiguration.                                       |
|        |                                | TMD                                                    | TMDN board                                                                     |

|                            | IPGW     | IP gateway                                                                                        |
|----------------------------|----------|---------------------------------------------------------------------------------------------------|
| Type of Output :           |          |                                                                                                   |
| (DISPLAY)                  |          |                                                                                                   |
| Possible output types are: |          |                                                                                                   |
| Table Output               | :        | The reference and actual configurations with the peripheral modules are output in table format.   |
| Statistics                 | :        | For the reference or actual configuration of an LTG, the sum of the peripheral modules is output. |
| Mode                       | :        | For modules with work modes (RG, WGEN, SIU type 3), the work modes are output.                    |
| Type of Input              | :        | single value, optional                                                                            |
|                            | TBL      | table output                                                                                      |
|                            | STAT     | output of system statistics                                                                       |
|                            | MODE     | output of work modes                                                                              |
|                            | PEN      | port equipment number                                                                             |
|                            | PERHW    | display base stations                                                                             |
|                            | FLOWCTRL | Threshold values for flow control boards                                                          |
|                            | SRCGRP   | Source group index                                                                                |

## 27.4 Error Messages and Advisories

### 27.4.1 Error Messages

F01: LTG HAS NOT BEEN ASSIGNED  
F02: LTU HAS NOT BEEN ASSIGNED  
F03: MODULE CODE NUMBER OR FUNCTION ID INVALID !  
FOR BOARDS WITH MORE FUNCTIONS THE AMO HAS TO INVESTIGATE THE BOARD DATA BY THE COMBINATION OF PARTNO AND FCTID. IF THE FCTID IS NOT SPECIFIED THE DEFAULT VALUE 0 FOR THIS PARAMETER MIGHT NOT LEAD TO VALID BOARD DATA. PROBABLY THE WRONG CONFIGURATION/DECONFIGURATION BRANCH IS USED !  
F04: MOUNTING SLOT n INVALID  
F05: MOUNTING SLOT ASSIGNED  
F06: MODULE AT THIS MOUNTING SLOT INVALID  
F07: ERROR AT ADD/DELETE WAML1 BOARD  
A WAML1 BOARD HAS ALREADY BEEN ADDED or  
FOR FURTHER WAML1 THE FLEXAMA MEMORY HAS TO BE INCREASED (AMO-DIMSU) or  
THE MEMORY FOR WAML1 BOARD HAS TO BE ASSIGNED BY AMO-DIMSU FIRST or  
AT SPECIFIED PEN NO DATA FOR WAML1 COULD BE FOUND or  
CONFIGURATION ON WAML1 BOARD STILL EXISTS ==> DELETE WITH AMO-LANC  
F08: MOUNTING SLOT NOT ASSIGNED  
F09: NO DIUC CONNECTED AT SPECIFIED PEN (aa, bb, ccc)  
F10: MODULE LINE CIRCUITS NOT DELETED

F11: LOADING SUBSYSTEM "UBGDAT00" NOT POSSIBLE

F12: MOUNTING SLOT INVALID -  
MODULE REQUIRES @ FREE MOUNTING LOCATIONS

F13: FOR LTU n (shelftype - SHELF) THE SPECIFIED BOARD IS NOT ALLOWED  
TO BE CONFIGURED  
shelftype = NORMAL, COMPACT, EXT\_COMP\_X, 80CM\_BASE, CC80X, CC80F,  
40CMX\_BASE, INCH19, AP37009 or AP370013

F14: IN THIS LTU SHELF NO SIUP BOARD IS ALLOWED TO BE ADDED

F15: DATA BASE INCONSISTENT (NO LOADFILES ENTERED)

F16: IN A MODULAR CABINET SYSTEM SHELF, ONLY RG, ACGEN AND SIUP  
MODULES MAY BE CONFIGURED AT SLOT 19

F17: ANOTHER MODULE HAS BEEN ASSIGNED AT THE MOUNTING SLOT

F18: PART NUMBER DOES NOT LEAD TO A PERIPHERAL SIU BOARD

F19: MOUNTING SLOT n WILL NOT BE PROCESSED

F20: MODULE TYPE AT THIS MOUNTING SLOT WILL NOT BE PROCESSED

F21: NOT POSSIBLE TO ASSIGN A SIUP IN THE SPECIFIED LTU QUARTER BECAUSE  
THERE IS ALREADY A PERIPHERAL SIU BOARD ASSIGNED.

F22: not applicable anymore

F23: VALUE OUT OF RANGE

F24: IN THIS CASE PARAMETER MUST BE ANSWERED

F25: AMO IS ALREADY RUNNING - FURTHER START NOT PERMITTED

F26: THE PERMITTED NUMBER OF MODULE TYPES HAS ALREADY BEEN ASSIGNED

F27: THE DESIRED BOARD CHANGE IS NOT ALLOWED !  
POSSIBLE REASONS :  
- BOARD TYPES DON'T MATCH  
- BOARD CHANGE EXPLICITELY RESTRICTED (E.G. LAYOUT DIFFERS)  
- COMBINATION OF SACHNR1/FCTID1 DOESN'T MATCH CONFIGURED BOARD  
- COMBINATION OF SACHNR/FCTID (DEFAULT=0) NOT FOUND IN UBGDAT  
- COMBINATION OF SACHNR1/FCTID1 NOT CHANGEABLE AGAINST SACHNR2/FCTID2  
(LINE-TYPE DOESN'T MATCH)  
- LINE RANGE OF BOTH BOARDS DON'T MATCH  
(STMIX DOES NOT SUPPORT WAML FUNCTION)

F28: not applicable anymore

F29: REQUIRED TIMESLOTS FOR SIUP ARE USED BY FOLLOWING ACTIVE  
VOICE COMPRESSION CONNECTIONS :  
PEN : ltg-ltu-slot VCSU n (message is displayed n times)  
DEACTIVATE THESE VC CONNECTIONS WITH AMO-VOICO FIRST

F30: MODULE LINE CIRCUIT IS ENTERED IN THE REFERENCE CLOCK LIST -  
DELETE ENTRY WITH AMO "REFTA"

F31: THE BOARD CANNOT BE DELETED BECAUSE IT IS STILL MEMBER OF  
HFA BOARD RECONFIGURATION POOL @@@@.  
PLEASE REMOVE IT FROM THE POOL BY MEANS OF AMO-BPOOL FIRST.

F32: THE BOARD CHANGE CAUSES ALSO A REDUCTION OF AVAILABLE LINE CIRCUITS.  
SOME MODULE LINE CIRCUITS ARE NOT DELETED IN THE OBSOLETE RANGE - THOSE  
LINE CIRCUITS HAVE TO BE DELETED FIRST.

F33: LOADWARE WITH SPECIFIED VARIANT NOT PRESENT ON HARDDISK

F34: FOR SIUX BOARD THE PARAMETER FCTID IS MANDATORY  
POSSIBLE VALUES ARE : 2 ... SIU\_TYPE\_2  
3 ... SIU\_TYPE\_3  
4 ... SIU WITH TDS FUNCTIONALITY  
5 ... ANI SIGNALLING CIS  
6 ... CIS MULTIFREQUENCY

## BCSU - Configuring Mounting Locations for Modules in the SWU

### Error Messages and Advisories

7 ... LINE TESTING RURAL

F35: not applicable anymore  
F36: FOR SLC24 BOARDS ONLY LWVAR 7 IS VALID.  
F37: INSUFFICIENT MEMORY (AMO DIMSU: PARAMETER <param>)  
F38: TSI'S ON PEN <ltg.ltu.slot.cct> COULD NOT BE SET TO SIGNED OFF  
F39: A DEVICE IS CONFIGURED ON PEN <ltg.ltu.slot.cct> -  
SIGNING OFF ONLY POSSIBLE WITH AMO DSSU  
F40: NO FREE LINES ARE AVAILABLE IN THE SPECIFIED LTG  
F41: NO SIUP MODULES ALLOWED ON RMS  
F42: FOR SPECIFIED BOARD THE PARAMETER CIRCNT HAS TO BE WITHIN  
THE RANGE <satz> TO <maxsatz>.  
F43: OPMODE UN20H85V IS ONLY VALID FOR US RING GENERATOR  
F44: CIRCUIT 0 FOR SPECIFIED BOARD MUST NOT BE SIGNED OFF OR RELEASED  
BY AMO-BCSU  
THIS CIRCUIT WILL BE USED FROM TELECOMMUTING SERVER FOR  
ADMINISTRATE PURPOSES (AMO-SBCSU)  
F45: NO MORE THAN FOUR TSI'S PER CIRCUIT CAN BE SET TO SIGNED OFF  
OR CONNECTED FOR VOICE SERVICE  
F46: FOR THE SLMQ MODULE WITH DEVTYPE=OPTISET ONLY ONE TSI PER  
CIRCUIT CAN BE SET TO SIGNED OFF OR CONNECTED FOR VOICE SERVICE  
F47: not applicable anymore  
F48: NO MORE THAN TWO TSI'S PER SLMO CIRCUIT WITH DEVTYPE=OPTISET  
CAN BE SET TO SIGNED OFF OR CONNECTED FOR VOICE SERVICE  
F49: NO MORE THAN THREE TSI'S PER SLMO/SLMQ CIRCUIT CAN BE SET  
TO SIGNED OFF OR CONNECTED FOR VOICE SERVICE  
F50: BEFORE SETTING ANY TSI TO SIGNED OFF ON SLMO CIRCUITS ALWAYS  
A TSI HAS TO BE SET TO SIGNED OFF FIRST WITH DEVTYPE=OPTISET  
F51: SIGNOFF OR RELEASE OF CIRCUITS OR TSI'S IS NOT POSSIBLE ON THE  
RESPECTIVE BOARD  
F52: PEN <ltg.ltu.slot.cct tsi> IS NOT SET TO SIGNED OFF -  
SETTING TO NOT CONNECTED NOT POSSIBLE  
F53: INVALID CIRCUIT NUMBER n FOR SPECIFIED BOARD  
SPECIFIED BOARD HAS n CIRCUITS, STARTING AT ZERO  
F54: CONFIGURATIONS CONCERNING LTUC/NCUI BOARDS MUST BE DONE WITH AMO-UCSU  
F55: OPTISET MASTER MUST ALWAYS BE CONFIGURED AT TSI=1  
F56: OPTISET MASTER MUST BE THE LAST TSI TO BE RELEASED  
F57: THE TELEWORKING STATION CANNOT BE ADDED. THE CONTRACTED NUMBER OF  
<contrnr> TELEWORKING STATIONS IS REACHED.  
PLEASE USE THE DISP-CODEW FOR DISPLAY OF THE CONTRACTED FEATURE PACKAGES  
PLEASE CONTACT YOUR SERVICE CENTER IF YOU WISH TO USE  
ONE OF THESE FEATURES  
F58: NO CONFIGURATIONS CAN BE DONE DURING SHELF BROADCAST  
F59: THE SPECIFIED BOARD COULD NOT BE ENTERED INTO REFERENCE CLOCK TABLE  
F60: FOR SPECIFIED BOARD THE SPECIFIED MFCTYPE  
<mfcerr> IS NOT VALID  
F61: FOR SPECIFIED BOARD NO RANGE OF PENS IS PERMITTED  
F62: THE SPECIFIED BOARD IS ONLY ALLOWED IN LTU 1 TO <ltu>  
F63: IF THE SMALL VERSION OF POWER SUPPLY IS USED (PSDSC) ONLY  
@@ BOARDS CAN BE ADDED IN LTU @@  
FOR MORE BOARDS USE STRONGER VERSION (PSAFE) OF POWER SUPPLY  
F64: FOR BOARD @@-@@@-@@@ IT IS NOT ALLOWED TO CONFIGURE  
FLOW CONTROL VALUES

- F65: THE LONG TERM VALUE (LTERM) FOR FLOW CONTROL MUST NOT BE SMALLER THAN THE SHORT TERM VALUE (STERM)
- F66: SPECIFIED HIGHWAY BUNDLE NOT VALID FOR THIS BOARD.
- F67: HIGHWAY BUNDLE @ CAN NOT BE ASSIGNED, BECAUSE STANDARD LTU @@ IS NOT CONFIGURED WITH AN OVERLAY LTU.
- F68: THE BOARD ON @@-@@-@@@ CAN NOT BE CHANGED, BECAUSE THE ASSIGNED HIGHWAY BUNDLE @ IS NOT ALLOWED FOR THE NEW BOARD.  
PLEASE DELETE BOARD FIRST AND THEN ADD THE NEW BOARD, OR CHANGE THE ASSIGNED HIGHWAY BUNDLE WITH CHANGE-BCSU:HWYBDL
- F69: BOARDS OF THE ENTERED TYPE MAY NOT BE CONFIGURED
- F70: THE MAXIMUM AMOUNT OF CONFIGURABLE BOARDS OF THE ENTERED TYPE IS ALREADY REACHED.  
ANOTHER BOARD MAY NOT BE CONFIGURED.
- F71: NO MORE SUBSCRIBER CAN BE SIGNED OFF, BECAUSE THE CONTRACTED NUMBER OF @@@@ FLEX+TDM LICENSES ARE REACHED.  
PLEASE USE DISP-CODEW FOR DISPLAY OF THE CONTRACTED FEATURE PACKAGES.  
PLEASE CONTACT YOUR SERVICE CENTER IF YOU WISH TO USE ONE OF THESE FEATURES.
- F72: ENTERED MODULE CODE NUMBER IS INVALID
- F73: DEVTYPE=OPTISET IS ONLY ALLOWED FOR SLMO CIRCUITS
- F74: DEVTYPE=API NOT ALLOWED, IF THERE ARE ALREADY CONFIGURED DEVICES FOR SERVICE DATA
- F75: not applicable anymore
- F76: PARAMETER LWPARG (LOADWARE BLOCK INDEX) MAY BE CHANGED WITH AMO BCSU ONLY FOR TMDN-BOS/DIU2U-BOS BOARDS. PLEASE USE AMO TDCSU TO CHANGE THIS PARAMETER FOR THE CONFIGURED BOARD
- F77: THE TDS PORT UPDATE TO THE DATABASE WAS UNSUCCESSFUL
- F78: ON THIS BOARD ONLY THE FOLLOWING TSIS MAY BE SIGNED OFF:  
- IF THE ENTERED DEVICETYPE IS OPTISET OR API:  
    TSI 1: AS OPTISET  
    TSI 2: AS API  
- IF NO, OR A DIFFERENT DEVICETYPE THAN OPTISET OR API WAS ENTERED:  
    TSI 1: IN THIS CASE THE DEVICETYPE WILL BE IGNORED.
- F79: INSUFFICIENT MEMORY FOR STMI BOARDS. PLEASE INCREASE MEMORY WITH AMO DIMSU (PARAMETER: STMI).
- F80: NO LS NET CONFIGURED  
PLEASE CONFIGURE LS NET BY MEANS OF ADD-SIPCO
- F81: ENTERED IP ADDRESS IS INVALID.  
POSSIBLE REASONS:  
- IP ADDRESS IS NOT WITHIN THE VALID RANGE.  
  THE VALID RANGE WITHIN LS NET IS BETWEEN:  
    @@@.@@@.@@@.@@@ AND @@@.@@@.@@@.@@@
- F82: BOARDS MAY ONLY BE CONFIGURED IN CERTAIN TYPES OF LTUS. THE VALID LTU TYPES FOR THE ENTERED BOARD DO NOT MATCH THE LTU TYPE OF LTU n.  
BOARD MAY NOT BE CONFIGURED.
- F83: ON A SLMQ3 BOARD ONLY TSI 1 MAY BE SIGNED OFF.  
POSSIBLE ERROR REASONS:  
- YOU DID NOT ENTER A VALUE FOR PARAMETER TSI  
- YOU ENTERED A TSI HIGHER THAN 1 OR A TSI RANGE  
- TSI 1 IS ALREADY SIGNED OFF OR CONFIGURED
- F84: NO IPGW BOARD (STMI) CONFIGURED ON ENTERED PEN.  
ONLY IPGW BOARDS CAN BE CHANGED WITH ENTERED AMO BRANCH.

## BCSU - Configuring Mounting Locations for Modules in the SWU

### Error Messages and Advisories

F85: A TMD-MOS/DIU2U-BOS BOARD IS CONFIGURED AT ENTERED PEN. WITH CHANGE-BCSU PARAMETERS MAY ONLY BE CHANGED FOR TMD-BOS/DIU2U-MOS BOARDS.

F86: ENTERED SIU BOARD CAN NOT BE CONFIGURED.  
REASON:  
- ONLY ONE TDS PORT MAY BE CONFIGURED IN THE WHOLE HHS LTU RANGE  
- ONLY ONE TDS PORT MAY BE CONFIGURED IN EACH AP LTU  
THIS TDS PORT IS ALREADY CONFIGURED:  
- IF YOU ENTERED A LTU WITHIN THE HHS RANGE, EITHER THE CENTRAL SIU HAS TDS FUNCTIONALITY (CONFIGURED WITH AMO UCSU), OR A PERIPHERAL SIU WITH TDS FUNCTIONALITY WAS ALREADY ADDED.  
- IF YOU ENTERED A LTU WITHIN THE AP RANGE, THIS TDS PORT WAS CONFIGURED, WHEN THE NCUI BOARD (AMO UCSU) WAS ADDED.

F87: GIVEN IP ADDRESS IS ALREADY CONFIGURED IN THE SYSTEM AND CANNOT BE USED

F88: THE DESIRED CONFIGURATION CANNOT BE DONE BECAUSE IN TOTAL THE CONFIGURED VIRTUAL GATEWAYS NEED MORE PORTS THAN THE ACTUAL SOFTGATE TYPE ALLOWS.

F89: THE GIVEN FUNCTION BLOCK IS NOT COMPLETELY CONFIGURED. PLEASE FINISH CONFIGURATION BY MEANS OF AMO-BFDAT FIRST.

F90: THE GIVEN FUNCTION BLOCK IS NOT USABLE FOR THE GIVEN CGW BOARD.  
POSSIBLE REASONS ARE :  
- THE POSSIBLE FUNCTION BLOCK TYPES DO NOT MATCH  
- IN TOTAL LESS B-CHANNELS ARE AVAILABLE ON CGW THAN CONFIGURED  
- SOFTGATE CONFIGURATIONS NEED OWN FUNCTION BLOCKS WITH ATTR SOCO  
- CGW CONFIGURATIONS NEED OWN FUNCTION BLOCKS WITHOUT ATTR SOCO  
- STMIX DOES NOT SUPPORT WAML FUNCTION

F91: THE GIVEN BOARD TYPE IS NOT ALLOWED ON RG8300.

F92: IPV6 AND DHCP FUNCTIONALITY IS SUPPORTED ONLY FOR SOFTGATES.

F93: PARAMETER IPMODE CAN BE CHANGED TO IPV6 OR DUALSTCK FOR SOFTGATE BOARDS CONFIGURED FOR SIP TRUNKING AND SIP SUBSCRIBER.

F94: SAME MAC ADDRESS CANNOT BE USED TWICE. MAC ADDRESS SHOULD BE UNIQUE.

F95: TDMLAW PARAMETER CAN ONLY BE USED FOR HIPATH ACCESS TRUNK BOARDS.

F96: CMIV30 HAS TO BE SET BY MEANS OF CHA-ZANDE:TYPE=ALLDATA,CMIV30=YES;

F97: MAC ADDRESS NOT ALLOWED FOR THIS BOARD TYPE.

F98: SG VIRTUAL BOARDS CANNOT BE CHANGED TO CLASSIC.

F99: ALARM NUMBER CAN BE CHANGED ONLY ON DEACTIVATED BOARDS.  
(DEA-BSSU:OFFTYPE=DI,LTG=@@,LTU=@@, SLOT=@@@;)

## 27.4.2 Advisories

Sample advisories which are output after an ADD, DELETE or CHANGE has been performed:

H01: BD aa.bb. ccc dddddd eeeeeee (ffffff gggggg)  
aa : LTG (1 (HiPath4000)  
bb : LTU (1 to 99 (HiPath4000)  
ccc : SLOT (1 to 121)  
ddddd : ASSIGNED  
NOT ASSIGNED  
DELETED  
NOT DELETED

```

CHANGED
NOT CHANGED
eeeeeee : if dddddd = ASSIGNED OR CHANGED:
          - IN SERVICE
          - OUT OF SERVICE
ffffff : possible additional information
         if dddddd = NOT ASSIGNED
         ORDER ERROR:order error with assing
         MAX. MOD. TYPES: max. no. of mod. types already assigned
         if dddddd = NOT CHANGED
         NOT BLOCKED: Error with blocking of the module
         MAX. MOD. TYPES: max. no. of mod. types already assigned
         - INCREASE PERMDL IN AMO DIMSU
         - NO FREE LINES IN LTG
ffffff : if eeeee = OUT OF SERVICE:
         Combinations of up to 3 states and a load error can be
         output.
         DEFModule defective

         UAModule blocked because of interrelationships
         UHModule hierarchically blocked
         WBTIncorrect module inserted
         ORDER ERROR:Order error with activation following change
         LOADERROR: Load error
ggggggg : if fffffff with LOADERROR:
         HARDWARE load error: Error in module hardware
         FILE load error: no load files for this code
         TRANSFER load error: error with data transmission
    
```

If an LTU is not assigned within a certain LTU range, the following message is output:

```

H02: LTU aa.bb IS NOT ASSIGNED
      aa      : LTG (1 (HiPath4000)
      bb      : LTU (1 to 99 (HiPath4000)
    
```

```

H03: LTG aa IS NOT ASSIGNED
      aa      : LTG (1 (HiPath4000)
    
```

When CHANGE is performed, if there is difference in the number of line circuits for the old and new module, the following message is output:

```

H04: NUMBER OF LINE CIRCUITS CHANGED - CHECK LINE CIRCUIT CONFIGURATION
    
```

If no corresponding module is found when the module modes are interrogated, the following message is output:

## BCSU - Configuring Mounting Locations for Modules in the SWU

### Error Messages and Advisories

H05: NO MODULE WITH MODES WAS FOUND WITHIN THE PROCESSED ADDRESS RANGE

H06: PARAMETER LWVAR WILL BE IGNORED, SIMILAR MODULE TYPE ALREADY ASSIGNED.  
VARIANT CAN BE CHANGED USING AMO ZAND.

H07: FOR THE SLMA1, THE PARAMETERS FOR SOME OF THE TIMERS FOR THE TERMINALS  
MUST BE SET WITH THE AMO-SCSU, PARAMETER=CCTIDX (SEE AMO-PTIME, TYPE=SLMA1)  
ATTENTION: IF DEVICES ARE CONFIGURED WITH DIALING TYPE = VARIABLE ON THE add  
SLMA1, THE SLMA BOARD WILL NOT GO IN SERVICE (TYPE VARIABLE NOT on  
ALLOWED FOR SLMA) .

H08: PARAMETERS FIDX1/2 AND LWPAR1/2 ONLY APPLY TO DIUC, THE INPUT WILL BE IGNORED

H09: PARAMETER TSI WILL BE IGNORED FOR THE CORRESPONDING  
MODULE TYPE

H10: PARAMETER DEVTYPE WILL BE IGNORED FOR THE CORRESPONDING  
MODULE TYPE

H11: PARAMETER FCTID IS ONLY ALLOWED FOR SIUX BOARDS  
PARAMETER FCTID IGNORED

H12: !!! ATTENTION !!!  
CONNECTION BRIDGES ON BACK PLAN WIRING MUST BE SWITCHED AS  
DESCRIBED IN SERVICE MANUAL TO PREVENT DESTRUCTION OF RG !!

H13: FOR SPECIFIED RG (US-RG) ONLY OPMODE UN20H85V VALID  
INPUT HAS BEEN CORRECTED BY AMO

H14: - IF THE SIUP WAS ADDED IN THE HHS, A HARDRESTART IS NECESSARY, TO GET  
THE BOARD IN SERVICE  
- IF THE SIUP WAS ADDED IN THE AP, A RESTART OF THE AP LTU IS NECESSARY  
(AMO USSU) .

NUMBER OF POSSIBLE SIUP-BOARDS: ONE PER LTU QUARTER

H15: THE PARAMETER CIRCNT IS NOT ALLOWED FOR THIS BOARD  
THE INPUT WILL BE IGNORED

H16: FOR SPECIFIED BOARD ONLY TSI=1 IS ALLOWED TO BE SIGNED OFF OR  
RELEASED. TSI GREATER THAN 1 WILL BE IGNORED.

H17: FOR SPECIFIED BOARD THE CIRCUIT 0 HAS TO BE CONFIGURED  
(AMO-SSCSU: OPT=TC, DVCFIG=TCLOG)

H18: FLEX LICENSE EXCEEDED.  
SIGNED OFF TSIS ARE MARKED AS TRIAL ENTITY.  
THEY WILL BE BLOCKED, IF TRIAL MODE EXPIRES WITHOUT SUFFICIENT LICENSES.

H19: FOR SPECIFIED BOARD IT IS NOT ALLOWED TO CONFIGURE  
FLOW CONTROL VALUES  
THE AMO IGNORES THE INPUT

H20: LTU @@ IS AN OVERLAY LTU FOR LTU @@

H21: THE ALREADY SIGNED OFF TSI(S) WAS (WERE) NOT REPROCESSED.

IF YOU DID NOT ENTER A VALUE FOR PARAMETER TSI, DEFAULT VALUE TSI = 1  
WAS USED.

H22: PARAMETER LWPAR WILL BE IGNORED FOR TMD/DIU2U BOARDS IN MOS MODE

H23: YOU DID NOT ENTER A VALID IP ADDRESS.  
IP-ADDRESS aaa-bbb-ccc-ddd WAS AUTOMATICALLY RESERVED.

H24: PARAMETER OPS IS ONLY RELEVANT FOR CIRCUITS ON SLMA BOARDS.  
BOARD IS NO SLMA, PARAMETER WILL BE IGNORED.

H25: THE DEVICETYPE OF A SIGNED OFF TSI ON A SLMQ3 BOARD CAN ONLY BE OPTISET  
(PARAMETER DEVTYPE). YOUR INPUT WAS CORRECTED TO DEVTYPE=OPTISET.

H26: NO DATA CONFIGURED FOR ENTERED PARAMETER VALUES OR DEFAULT VALUES.

H27: IP-ADDRESS @@@.@@@.@@@.@@@ WAS CONFIGURED.

H28: PARAMETER FIDX WILL BE IGNORED FOR TMD/DIU2U BOARDS IN MOS MODE

H29: ENTERED BOARD IS A MIXED LINE CARD (WITH SLMO AND STMD CIRCUITS).  
PARAMETER DEVTYPE IS MANDATORY FOR THIS BOARD, BUT WILL BE EVALUATED ONLY FOR SLMO CIRCUITS.  
FOR STMD CIRCUITS, THE ENTERED DEVTYPE WILL BE IGNORED AND THE CIRCUIT WILL BE SIGNED OFF

H30: THE (POSSIBLY) ALREADY RELEASED TSI(S) WAS (WERE) NOT REPROCESSED.

H31: THE AMOUNT OF AVAILABLE B-CHANNELS ON CGW BOARD HAS BEEN CHANGED !  
PLEASE CHECK THE RESOURCE MANAGER CONFIGURATION (ALSO AMO-CGWB)

H32: IF THE PARAMETER BCHLCNT IS SPECIFIED, THE AMOUNT OF AVAILABLE B-CHANNELS ON CGW BOARD IS SMALLER AS THE DEFAULT VALUE OF THE BOARD !  
THE RESOURCE MANAGEMENT IS ALSO AFFECTED BY SPECIFYING THIS PARAMETER, THEREFORE ONLY ^anzbkan^ B-CHANNELS WILL BE CONFIGURED.

H33: THE FLAG TO FORCE BOARD LOADING IS SET.  
IF YOU WANT TO PREVENT REPEATEDLY BOARD LOADING PROCESSES; THE FLAG SHOULD BE RESET AFTER THE FIRST LOADING OF THE BOARD BY MEANS OF :  
CHANGE-FUNSU:FLASH,,,RESET;

H34: DUE TO ACTIVATED FEATURE SIGNALLING & PAYLOAD ENCRYPTION AND/OR ACTIVATED DMC THE NUMBER OF CONFIGURED B-CHANNELS FOR <function> HAVE BEEN REDUCED BY @@@ B-CHANNELS.  
ACTUAL AVAILABLE <function> B-CHANNELS: @@@

H35: THE PROCESSED CHANGES HAVE NEEDED A DEACTIVATED STMI BOARD.  
THE BOARD IS INITIATED TO BE TAKEN IN SERVICE AGAIN RIGHT NOW.

H36: THE SETTING OF PARAMETER BITRATE HAS BEEN CHANGED TO 100MBFD BECAUSE OF HW RELATED RESTRICTIONS. CHANGE POSSIBLE WITH AMO-CGWB.

H37: NO (FURTHER) RESERVED LINES AVAILABLE, PARAMETER CHNGRSLN IGNORED.

H38: LESS RESERVED LINES ARE AVAILABLE AS SPECIFIED VIA PARAMETER CHNGRSLN.  
THE MAXIMUM POSSIBLE CONFIGURATION WILL BE APPLIED.

H39: THE PARAMETERS FOR CHANGING THE NUMBER OF B-CHANNELS WILL BE IGNORED IF THE ACCORDING FUNCTION IS NOT CONFIGURED.

H40: THE DESIRED CONFIGURATION HAS TO BE CUT BECAUSE IN TOTAL THE CONFIGURED VIRTUAL GATEWAYS NEED MORE PORTS THAN THE ACTUAL SOFTGATE TYPE ALLOWS.

H41: FOR SUBSCRIBER CONFIGURATIONS ON THIS BOARD, NO ENTRIES ARE VALID IN THE REFERENCE CLOCK TABLE. FURTHERMORE LEAD REFERENCE CLOCK ENTRIES WHICH ARE NOT FOLLOWED BY TRUNK CONFIGURATIONS TO HEAVY SYSTEM MALFUNCTIONS.

H42: UBGDAT ENTRY HAS BEEN MODIFIED INTERNALLY BEFORE FIRST USAGE.

H43: BOARD DATA HAVE TO BE CONFIGURED WITH AMO CGWB.

H44: DHCP IS ACTIVATED. LEGK CONFIGURATIONS (AMO-GKREG) ARE SUSPENDED FOR THIS GATEWAY.

H45: FOR IPMODE SET TO DUAL STACK OR IPV6 MODE, A PROFILE FOR SIPQ TRUNKS HAS TO BE CONFIGURED VIA WBM.

H46: THE PARAMETERS IPMODE, DHCPV4 UND DHCPV6 ARE NOT RELEVANT FOR TRADITIONAL HG3500 BOARDS AND WILL BE IGNORED.

H47: DHCP IS ACTIVATED BUT AT LEAST ONE CONFIGURED IP ADDRESS IS NOT VALID ! THE GATEWAY CANNOT BE TAKEN INTO SERVICE.

H48: Please note that DHCP functionality is not fully supported yet (in Release 0).

H49: TO COMPLETE THE DELETION OF BOARD RELATED DATA, A MANUAL RESTART OF THE SOFTGATE IS NEEDED: RES-USSU:RESTYPE=LTU,LTU=<LTU>;

H50: PARAMETER LWVAR WILL BE IGNORED, FOR SLC24 BOARDS ONLY LWVAR 7 IS VALID.

H51: CLASSICAL BOARD IS CONVERTED TO VIRTUAL, AS THE LTU IS A SOFTGATE.

H52: PARAMETER LWVAR WILL BE IGNORED, FOR SIMC BOARDS ONLY LWVAR 4 IS VALID.  
H53: G723 IS NOT SUPPORTED BY STMIX BOARD. IT HAS TO BE DEACTIVATED BY MEANS OF AMO  
CGWB: CHA-CGWB:MTYPE=CGW,LTU=<xx>,SLOT=<xxx>,TYPE=ASC,PRIO=PRIO<xxx>,CODEC=NO  
H54: G723 HAS BEEN DECTIVATED ON STMIX BOARD. IF NEEDED IT CAN BE ACTIVATED FOR THE  
NEW BOARD BY MEANS OF AMO CGWB.  
H55: THE BOARD FROM PEN @@-@@-@@@ WILL BE ACTIVATED

## 28 BDAT - Administration of Module Data

|                      |                        |                               |
|----------------------|------------------------|-------------------------------|
| Validity of Variants | Configuration Sequence | Parameter Description         |
| Cross-References     | Functions of the AMO   | Error messages and advisories |

At present the AMO BDAT can be used to administer the data of the STMA<sup>1</sup> and the WAML2<sup>2</sup> modules. The AMO BDAT is used for adding as well as for modifying, deleting, displaying and regenerating module data and for loading of the data.

The module data are entered in the SWU database and loaded into the module if the correct module is inserted and has been started up.

In scope of feature IPDA (IP Distributed Architecture) the STMA and WAML2 boards can be configured in the Access Points which have the LTU range from 17 to 99 (added by AMO UCSU and BCSU). The Source Group Index (SRCGRP) assigned to the LTU is issued in the header mask at command DISP-LANC.

### STMA module

The operating mode of the module to be added is set by means of the parameter FCTID of the AMO BCSU. The FCTID is assigned as follows:

| FCTID | Operating mode       |
|-------|----------------------|
| 4     | PSW: Port Switching  |
| 5     | NW20: Networking 2.0 |

The operating mode of the STMA module cannot be changed while it is in operation. In order to change the operating mode it is necessary first to deactivate the module (AMO BSSU) and then reconfigure it (delete then add with AMO BCSU).

In operating mode PSW there are global module data that have to be added in branch TYPE=STMA, OPMODE=GLOBAL. The users connected to the STMA module have to be administered by AMO SBCSU.

In operating mode NW20 the global module data and the operating mode related data are configured in the common parameter branch OPMODE=NW20. The circuits of the STMA module have to be administered by AMO TDCSU.

### WAML2 module

The WAML2 module is added with the AMO BCSU. It is necessary to specify FCTID=2 .

---

1. Subscriber Trunk Module for ATM  
2. WAML2 = WAML Module with Loadware for Telecommuting

The module-specific configuration data for a LAN communication via the WAML2 module can be administered with the AMO BDAT. The AMO BDAT is also used to initiate loading of the data to the WAML2 module.

The following tables are edited:

- **Global Parameter Table**  
All generally valid properties for every WAML2 module and the parameters for communication with the TC server (Telecommuting Server) are contained in this table.
- **Network Interface Table**  
This table describes the network interface of the WAML2 module. The network mask describes the network connected to the interface.
- **IP Routing Table**  
This table contains routing information for the destination IP address of the data package. The next router needed in the network is ascertained on the basis of this table. Entries can be made for an entire network as well as for individual hosts. The table is IP address- oriented and up to 8 different entries can be created. An entry in the IP routing table is only necessary if the TC server can be reached via a router.
- **Firewall MAC Address Table**  
This table contains the assignment of permitted source MAC address to source IP address for packages that are received from the WAML2. The assignment of source IP address to MAC address is IP address-oriented and 4 different entries can be created. If routers are inserted between the WAML2 and the external server, as source MAC address the MAC address of the last router has to be added into the Firewall MAC Address Table.  
The MAC address is a worldwide unique hardware address of the Ethernet interface that is permanently encoded on every LAN module during production. The MAC address of the WAML2 can be determined with the verb DISPLAY.

The WAML2 module is not ready for operation with the basic initialization of the tables.

Criteria deciding whether a data transfer is made are the source IP address and the destination IP address of a data package. The MAC firewall function on the WAML2 module is a protection mechanism to prevent the transfer of data packages of unauthorized users and to generate a firewall alarm. The entries in the firewall MAC address table are used for this. The firewall check and the WAML2 network interface are switched on in the Global Parameter Table.

Only one LAN interface can be operated simultaneously at the external LAN. The setting of the desired LAN-HW interface is made in the Global Parameter Table.

The AMO BDAT is not able to check the created tables with the topology of an existing network (e.g. IP addresses) for consistency.

## 28.1 Validity of Variants

This description applies for HiPath 4000 V1.0. The STMA and WAML2 modules can only be used in system types 80CMX and 600ECX.

## 28.2 Cross-References

|             |                                            |
|-------------|--------------------------------------------|

| • AMO BUEND | Adding of trunk groups                     |
| • AMO DIMSU | Adding of memory                           |
| • AMO SBUSU | Adding of user terminals                   |
| • AMO TDCSU | Adding of digital circuits                 |

## 28.3 Configuration Sequence

AMO DIMSU -> AMO BCSU -> AMO BDAT

## 28.4 Functions of the AMO

- [ADD-BDAT](#) : Adds the data of a module
- [CHANGE-BDAT](#) : Changes the data of a module
- [EXEC-BDAT](#) : Loads the data to the module
- [DELETE-BDAT](#) : Deletes specific module data
- [DISPLAY-BDAT](#) : Displays the module data
- [REGENERATE-BDAT](#) : Regenerates the module data

### 28.4.1 ADD-BDAT

#### 28.4.1.1 STMA Module Data

This function (branch TYPE=STMA) is used to add the data of the specified STMA module to the SWU database.

The addition of an STMA module requires the following procedure:

- Sufficient memory space for the STMA to be added must be reserved in the CC Flexama memory with the AMO DIMSU (Parameter STMA und STMACIR).
- An STMA module must be added with the AMO BCSU at the specified position (LTG, LTU, SLOT) on the basis of the UBGDAT data.

The global data of the operating mode PSW can be administered in the joint parameter branch OPMODE=GLOBAL.

The global and the networking related data in operating mode NW20 can be administered only in the common parameter branch OPMODE=NW20.

In **operating mode NW20** (parameter branch OPMODE=NW20) the following checks are performed:

- The ATM address must be unique i.e. the ATM address must not be already assigned to another STMA module having the operating mode NW20.
- all VPCI values (par. VPCI0 .. VPCI7) on one STMA module must be different

The optional parameters that are not entered are assigned a default value. As a consequence the VCIOFS values are in this case set as zero.

After executing the function ADD

- the added VCI offsets and their VCI values are output for every VPI in tabular form within an advisory message and
- the module data are automatically loaded to the PIT (or the module) by calling the EXEC function. If loading is not successful an advisory message to this effect is output.

#### 28.4.1.2 WAML2 module data

The addition of an WAML2 module requires the following procedure:

- Sufficient memory space for the WAML2 to be added must be reserved in the CC Flexama memory with the AMO DIMSU (Parameter WAML2).
- A WAML2 module must be added with the AMO BCSU at the specified position (LTG, LTU, SLOT). It is necessary for FCTID=2 to be specified.

No particular sequence is prescribed for the configuration of the tables. However, the following cross-references exist when adding the Global Parameter Table:

- to the Network Interface Table:  
A check is made in this case to ascertain whether the network interface to be activated (parameter ACTNETIF) is added. If it is not added message H13 is output and the command is executed properly.
- to the IP Routing Table:  
No network mask is to be entered for host IP addresses because the network mask has no significance in this case. Even if the network mask has been entered the value 255.255.255.255 is written into the database and message H18 is output. If on the other hand the network mask 255.255.255.255 is specified with network IP addresses the input is rejected with message F34.
- to the firewall check:  
The entries in the firewall MAC address table are used for this depending on the FIREWALL parameter. If the firewall test is activated but there are no valid entries in the associated table then no data packages are transferred.

In order to ensure that IP addresses are unique an IP address may occur only once in all IP address-oriented tables.

After execution of the function ADD the WAML2 configuration data are not loaded to the module. Loading can only be initiated with the EXEC command.

### Procedure overview

| Command  | Parameter                                                                                                                                                                                                                                                                                                                  |              |

**Examples**

**STMA module data**

1. Adding of an STMA module at position 1-2-37 with the ATM protocol UNI3.1 and the VCI offset value 15 for VPI1.

Input:

ADD-BDAT:1,2,37,STMA,GLOBAL,, ,UNI31,,15;

Output:

H01: THE VPI'S HAVE BEEN CONFIGURED AS FOLLOWS:

|                                                                           |     |  |        |  |          |  |        |  |        |  |             |

2. Adding another STMA module at position 1-2-43 with the ATM protocol UNI3.1 and the ATM interface SONET. VCI-offsets are zero.

Input:

ADD-BDAT:1,2,43,STMA,GLOBAL,SONET,,UNI31;

Output:

H01: THE VPI'S HAVE BEEN CONFIGURED AS FOLLOWS:

| VPI |        |           |  | VPI |        |           |  |
|-----|--------|-----------|--|-----|--------|-----------|--|
| VPI | VCIOFS | VCI RANGE |  | VPI | VCIOFS | VCI RANGE |  |
| 0   | 0      | 32 - 511  |  | 1   | 0      | 32 - 511  |  |
| 2   | 0      | 32 - 511  |  | 3   | 0      | 32 - 511  |  |
| 4   | 0      | 32 - 511  |  | 5   | 0      | 32 - 511  |  |
| 6   | 0      | 32 - 511  |  | 7   | 0      | 32 - 511  |  |

- Adding an STMA module on position 1-2-31 in operating mode NW20. Default values are configured except the ATM address.

Input:

ADD-BDAT:1,2,31,STMA,NW20,089712654244;

### WAML2 module data

- Adding of the Global Parameter Table with TC server IP address 128.1.2.0, TC server port number 1000 and WAML2 port number 1010.

Input:

ADD-BDAT:1,2,25,WAML2,GLOBAL,COAX,EXTLAN1,NONE,,128.1.2.0,1000,1010;

- Adding of the network interface to the external LAN in the table of network interfaces with IP address 192.168.1.4, network mask 255.255.255.0 and a package size of 512 Byte.

Input:

ADD-BDAT:1,2,25,WAML2,NETWORK,192.168.1.4,255.255.255.0,512;

- Creation of an entry in the IP routing table for network IP address 198.1.108.3, network mask 255.255.255.0 and IP address of the next router (192.21.2.1).

Input:

ADD-BDAT:1,2,25,WAML2,IPROUTE,198.1.108.3,NET,255.255.255.0,192.21.2.1;

- Adding an entry in the IP routing table for host IP address 192.1.108.103, IP address of the next router (192.21.22.11).

Input:

```
ADD-  
BDAT:1,2,25,WAML2,IPROUTE,198.1.108.103,HOST,,192.21.22.11;
```

8. Adding an entry in the firewall MAC address table for IP address 192.168.5.1 and MAC address CC.00.A0.45.D0.7F.

Input:

```
ADD-BDAT:1,2,25,WAML2,FIREMAC,192.168.5.1,CC.00.A0.45.D0.7F;
```

## 28.4.2 CHANGE-BDAT

This function can be used to modify the previously added module data.

### STMA module data

Only the module data that have been entered as parameters are changed (overwritten) in the DB. Unentered module data remains unchanged.

- The following points apply when changing global module data:
  - The global parameters (L1MODE, ATMPROT, REASBUF and VCIOFS0-7) cannot be changed while the STMA module is activated because this can result in errors in the loadware. The module can be activated and deactivated by means of AMO BSSU.
  - If the circuits of the STMA module have been created earlier a check is made whether the new VCI offsets to be entered match the VCI values of the added circuits<sup>1</sup>. In the event of an error an error message is output indicating possible remedial action.
  - When the VCI offsets are changed a check is also made against the VCI values of a PSW user. This means specifically:  
  
In the PSW mode the VPI on which the VCI offset is based must not be assigned to a user. If it is, the VCI offset must not be changed.
- Checks similar to that performed by the action ADD are carried out for operating mode NW20. Moreover, the following rules should be kept in mind:
  - For entries with device type PVC the VPI/VCI values configured by ADD-TDCSU must remain consistent with the (eventually modified) VCI offsets.

---

1. Formula: VCI value = (VCI Offset \* 512) + (32..511)

- The user must be aware that the modification of either the ATM source address or of the numbering plan identifier will effect the whole network configuration. Especially:
  - partner nodes who refer to the given ATM address as a target address must also change their settings;
  - the network administrator may also be concerned.
- The ATM address must be unique within all STMA boards in operating mode NW20

After execution of the CHANGE function

- the added VCI offsets and the associated VCI values for each VPI are output in tabular form within an advisory message and
- the module data are automatically loaded to the PIT (or to the module) by calling the EXEC function. If loading is unsuccessful an advisory message to this effect is output.

### WAML2 module data

The same cross-references exist as for the action ADD. In addition, only added table elements may be changed.

Data for entire networks can be changed uniformly by entering a network mask.

The parameter IPADDR (TC server IP address) of the Global Parameter Table cannot be changed while the WAML2 is activated.

The IP address (parameter IPADDR) of an entry is itself changed by specifying the parameter IPADRNEW.

After the CHANGE function has been executed the WAML2 configuration data are not loaded to the module. Loading can be initiated with the EXEC command.

### Procedure overview

| Command     | Parameter                                                                                                                                                                                                                                                                                                                     |                                           |

|         | <pre>,{[IPADDR=&lt;string&gt;],[IPNMASK=&lt;string&gt;],[MAXTU=&lt;nummer&gt;]};</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |
|         | <pre>,TABTYPE=IPROUTE</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | (2.3) |
|         | <pre>,IPADDR=&lt;string&gt;,{[IPADRNEW=&lt;param&gt;],[DESTTYPE=&lt;param&gt;], [IPNMASK=&lt;string&gt;],[NEXTROUT=&lt;string&gt;]};</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |
|         | <pre>,TABTYPE=FIREMAC</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | (2.4) |
|         | <pre>,IPADDR=&lt;string&gt;,{[IPADRNEW=&lt;param&gt;],[MACADDR=&lt;string&gt;]};</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |

Examples

STMA module data

1. Changing the STMA module data at position 1-2-43: VPI0 offset from 0 to 20, VPI1 offset from 15 to 31.  
Requirement: the VCI values of VPI0 and VPI1 must match the associated offsets.

Input:

CHANGE-BDAT:1,2,43,STMA,GLOBAL,,,,20,31;

Output:

H01: THE VPI'S HAVE BEEN CONFIGURED AS FOLLOWS:

| +-----+-----+-----+-----+-----+-----+ |        |               |  |     |        |               |  |  |  |  |  |
|---------------------------------------|--------|---------------|--|-----|--------|---------------|--|--|--|--|--|
| VPI                                   | VCIOFS | VCI RANGE     |  | VPI | VCIOFS | VCI RANGE     |  |  |  |  |  |
| +-----+-----+-----+-----+-----+-----+ |        |               |  |     |        |               |  |  |  |  |  |
| 0                                     | 20     | 10272 - 10751 |  | 1   | 31     | 15904 - 16383 |  |  |  |  |  |
| 2                                     | 0      | 32 - 511      |  | 3   | 0      | 32 - 511      |  |  |  |  |  |
| 4                                     | 0      | 32 - 511      |  | 5   | 0      | 32 - 511      |  |  |  |  |  |
| 6                                     | 0      | 32 - 511      |  | 7   | 0      | 32 - 511      |  |  |  |  |  |

2. Changing the following NW20 data at position 1-2-31: ATM address, numbering plan identifier, ATM protocol and VCIOFS0.

Input:

```
CHANGE-BDAT:1,2,31,STMA,NW20,0614604128,ISDN,,,UNITEST,,,10;
```

Output:

H24: THE PARAMETER 'ATMADDR' OR 'ATMNPI' HAS BEEN CHANGED.  
THE WHOLE NETWORK

CONFIGURATION MIGHT BE AFFECTED. SEE AMO DESCRIPTION.

H23: AFTER CHANGING THE MODULE DATA, REMEMBER TO ACTIVATE THE  
MODULE WITH AMO BSSU  
AGAIN.

H01: THE VPI'S HAVE BEEN CONFIGURED AS FOLLOWS:

| VPI   VCIOFS   VCI RANGE |    |             |  | VPI   VCIOFS   VCI RANGE |   |          |  |
|--------------------------|----|-------------|--|--------------------------|---|----------|--|
| 0                        | 10 | 5152 - 5631 |  | 1                        | 0 | 32 - 511 |  |
| 2                        | 0  | 32 - 511    |  | 3                        | 0 | 32 - 511 |  |
| 4                        | 0  | 32 - 511    |  | 5                        | 0 | 32 - 511 |  |
| 6                        | 0  | 32 - 511    |  | 7                        | 0 | 32 - 511 |  |

### WAML2 module data

3. Changing HW interface and the TC server IP address in the Global Parameter Table.

Input:

```
CHANGE-BDAT:,2,25,WAML2,GLOBAL,AUI,,,,128.1.2.64;
```

4. Changing IP address and package size for the network interface to the external LAN.

Input:

```
CHANGE-BDAT:,2,25,WAML2,NETWORK,192.168.17.4,,1024;
```

5. A new IP address (198.1.108.0) is to be issued in the IP Routing Table for the entry with IP address 198.1.108.3.

Input:

```
CHANGE-BDAT:,2,25,WAML2,IPROUTE,198.1.108.3,198.1.108.0;
```

6. The entry with the IP address 192.168.5.1 is to be changed in the firewall MAC address table.

Input:

```
CHANGE-BDAT:,2,25,WAML2,FIREMAC,192.168.5.1,140.1.0.10;
```

### 28.4.3 EXEC-BDAT

This command initiates dynamic reloading of the entire configuration data during operation. The configuration data are also loaded to the module:

- when adding with AMO BCSU
- on insertion in the LTU shelf
- when activating with AMO BSSU

The WAML2 does not use the configured data until successful loading.

The timing of the response from PIT is monitored using a timer. If loading of the module data is unsuccessful the corresponding error message is output and the AMO is aborted. Loading may not be successful for the following reasons:

- no module data has been added
- the module is not present
- an acknowledgment was not received from PIT within the 2-minute waiting time
- the dynamic module identifier is not present
- the module is not in the 'ready' state

If the ADD and CHANGE functions are transmitted, the *STMA module data* are automatically loaded if this is possible. If loading is not yet possible at the time of adding/changing of the module data (e.g. module not inserted), they must be loaded later with this command.

Attention: the STMA module data can not be loaded with the EXEC command in operating mode NW20. To do this, the module has to be first deactivated and then activated again (with AMO BSSU).

#### Procedure overview

| Command Code | Parameter                                    |
|--------------|----------------------------------------------|
| EXEC-BDAT    | [LTG=<number>], LTU=<number>, SLOT=<number>; |

## 28.4.4 DELETE-BDAT

### STMA module data

Note: the global module data of the STMA module cannot be deleted with this function. In order to delete these data or to change the operating mode the module must first be deactivated (AMO BSSU) and then reconfigured (AMO BCSU).

### WAML2 module data

The cross-references between the Global Parameter Table and subsequent tables can result in inconsistencies in the WAML2-specific tables. Deactivation of the corresponding function in the Global Parameter Table is recommended before deleting entire tables.

- **Network Interface Table:**  
The AMO checks whether the network interface to be deleted is deactivated. If it is still active message H14 is output although the command is executed as required.
- **Firewall check:**  
The entries in the firewall MAC address table are used for this purpose depending on the desired scope (FIREWALL parameter). If the firewall check is activated and the entries are deleted in the associated table then no data packages are transferred.

Individual table elements can be deleted as well as the contents of entire tables. Individual tables can only be deleted if entries have been previously added in the table.

With TABTYPE=ALL all tables are deleted without checking whether they contain added entries!

After the DELETE function has been executed the WAML2 configuration data are not loaded to the module. Loading can be initiated with the EXEC command.

### Procedure overview

| Command     | Parameter                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DELETE-BDAT | [LTG=<number>], LTU=<number>, SLOT=<number><br>, TYPE=WAML2<br>, TABTYPE=GLOBAL;<br>, TABTYPE=NETWORK;<br>, TABTYPE=IPROUTE, [IPADDR=<string>];<br>, TABTYPE=FIREMAC, [IPADDR=<string>];<br>, TABTYPE=ALL; |

#### Examples

##### WAML2 module data

1. Deletion of the Global Parameter Table.

Input:

```
DEL-BDAT: , 2, 25, WAML2, GLOBAL;
```

2. Deletion of network interfaces.

Input:

```
DEL-BDAT: 1, 2, 25, WAML2, NETWORK;
```

3. Deletion of the entire IP Routing Table.

Input:

```
DEL-BDAT: 1, 2, 25, WAML2, IPROUTE;
```

4. Deletion of the table element with the IP address 93.181.25.47 in the firewall MAC address table.

Input:

```
DEL-BDAT: 1, 2, 25, WAML2, FIREMAC, 93.181.25.47;
```

5. Deletion of all WAML2 configuration tables.

Input:

```
DEL-BDAT: , 2, 25, WAML2, ALL;
```

## 28.4.5 DISPLAY-BDAT

This function is used to output the module data in tabular form according to the specific position. The module data can be displayed as follows:

- for an addressed position
- per LTU if a SLOT has not been entered
- all positions if neither a SLOT nor an LTU has been entered

##### STMA module data

Only the Global Parameter Table can be displayed in the PSW operating modes.

In operating mode NW20 the global module data and the network related data are always displayed together.

##### WAML2 module data

Configured entries can be output individually for each table or jointly for all tables. By default all configured entries are output.

The WAML2 module has an Ethernet interface for which reason there is also a MAC address that can be output (TABTYPE=MACADDR).

If TABTYPE=ALL is specified, all tables including the MAC address are output.

If a table is empty message H16 is output.

Message H12 explicitly draws the user's attention to the fact that WAML2 configuration data have been changed since the last loading job and that reloading of the WAML2 is required in order to make the changes effective.

### Procedure overview

| Command      | Parameter                                                                                                                                               |     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| DISPLAY-BDAT | [LTG=<number>], [LTU=<number>], [SLOT=<number>]<br>, TYPE=STMA<br>, [OPMODE=GLOBAL];<br>, [OPMODE=NW20];                                                | (1) |
|              | , TYPE=WAML2<br>, [TABTYPE=GLOBAL];<br>, [TABTYPE=NETWORK];<br>, [TABTYPE=IPROUTE];<br>, [TABTYPE=FIREMAC];<br>, [TABTYPE=MACADDR];<br>, [TABTYPE=ALL]; | (2) |

### Examples

#### STMA module data

1. Output of the global STMA module data at position 1-2-43.

Input:

```
DISP-BDAT: , 2, 43, STMA, GLOBAL;
```

Output:

```
+-----+
|
|
|          STMA GLOBAL PARAMETERS
|          =====
|
|
+-----+-----+
| STMA:   LTG = 1   LTU = 2   SLOT = 43   FCTID: 4   | SRCGRP: 1 |
+-----+-----+

|
+-----+

```

## 8. Output of all entries in the WAML2 configuration tables.

Input:

DISP-BDAT:,2,25,WAML2;

Output:

The table contents are output in the following order:

|         |   |                            |
|---------|---|----------------------------|
| GLOBAL  | - | Global Parameter Table     |
| NETWORK | - | Network Interface Table    |
| IPROUTE | - | IP Routing Table           |
| FIREMAC | - | Firewall MAC Address Table |

MACADDR        -    MAC Address of the WAML2 Module

**28.4.6 REGENERATE-BDAT**

The action REGENERATE outputs the module data in the form of one or more position-oriented "ADD" commands.

With the command REG-BDAT; (without parameter TYPE) all STMA and WAML2 module data configured in the switch can be regenerated.

**Procedure overview**

| Command         | Parameter                                                                                                     |     |
|-----------------|---------------------------------------------------------------------------------------------------------------|-----|
| REGENERATE-BDAT | [LTG=<number>], [LTU=<number>], [SLOT=<number>]<br>, [TYPE=STMA];                                             | (1) |
|                 | , [TYPE=WAML2]<br>, [TABTYPE=GLOBAL];<br>, [TABTYPE=NETWORK];<br>, [TABTYPE=IPROUTE];<br>, [TABTYPE=FIREMAC]; | (2) |

**Examples**

1. Regeneration of all STMA module data.

Input:

REGEN-BDAT: , 2, 43, STMA;

Output:

ADD-  
BDAT: 1, 2, 31, STMA, NW20, 0614604128, ISDN, SDH, 16, UNITEST, 213, 0,  
      10, , , , , , , , ,  
      0, 1, 2, 3, 4, 5, 6, 7;  
ADD-BDAT: 1, 2, 43, STMA, GLOBAL, SDH, 16, UNI31, 20, 31, , , , , , ;

2. Regeneration of all added WAML2 configuration tables.

Input:

REGEN-BDAT: TYPE=WAML2;

Output:

ADD-BDAT: 1, 2, 25, WAML2, GLOBAL, AUI, EXTLAN1, NONE, 3, 128.1.2.64,  
          1000, 1010;  
  
ADD-  
BDAT: 1, 2, 25, WAML2, NETWORK, 192.168.17.4, 255.255.255.0, 1024;  
ADD-BDAT: 1, 2, 25, WAML2, IPROUTE, 198.1.108.0, NET, 255.255.255.0,  
          192.21.2.1;

ADD-

BDAT:1,2,25,WAML2,IPROUTE,198.1.108.103,HOST,,192.21.22.11;

ADD-BDAT:1,2,25,WAML2,FIREMAC,140.1.0.10,CC.00.A0.45.D0.7F;

## 28.5 Parameter Description

|                 |                                                                                                                                                          |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACTNETIF        | Activate network interface                                                                                                                               |
| Type of input   | : Single value,<br>mandatory (ADD)<br>optional (CHANGE)                                                                                                  |
| Possible values | : EXTLAN1            External LAN<br>NONE            None                                                                                                |
| Default value   | : -                                                                                                                                                      |

|         | Reassembly Buffer Size defines the total size of a buffer for reassembly of the data stream. The first byte of a new incoming data stream will be processed after the buffer is half full. Thus the Cell Delay Variation Tolerance based on the first incoming cell is $0.5 * \text{Reassembly Buffer Size}$ . The worst case CDVT, assuming that the first cell comes with maximum CDV is $0.25 * \text{Reassembly Buffer size}$ . |                                                                  |                                                      |

## BDAT - Administration of Module Data

### Parameter Description

|         |                                                                    |
|---------|--------------------------------------------------------------------|
|         | Type of input : Single value, optional<br>Group parameter (CHANGE) |
|         | Possible values : 0 - 127                                          |
|         | Default value : 0                                                  |
| VCIOFS2 | VCI offset for VPI2                                                |
|         | Type of input : Single value, optional<br>Group parameter (CHANGE) |
|         | Possible values : 0 - 127                                          |
|         | Default value : 0                                                  |
| VCIOFS3 | VCI offset for VPI3                                                |
|         | Type of input : Single value, optional<br>Group parameter (CHANGE) |
|         | Possible values : 0 - 127                                          |
|         | Default value : 0                                                  |
| VCIOFS4 | VCI offset for VPI4                                                |
|         | Type of input : Single value, optional<br>Group parameter (CHANGE) |
|         | Possible values : 0 - 127                                          |
|         | Default value : 0                                                  |
| VCIOFS5 | VCI offset for VPI5                                                |
|         | Type of input : Single value, optional<br>Group parameter (CHANGE) |
|         | Possible values : 0 - 127                                          |
|         | Default value : 0                                                  |
| VCIOFS6 | VCI offset for VPI6                                                |
|         | Type of input : Single value, optional<br>Group parameter (CHANGE) |
|         | Possible values : 0 - 127                                          |
|         | Default value : 0                                                  |
| VCIOFS7 | VCI offset for VPI7                                                |
|         | Type of input : Single value, optional<br>Group parameter (CHANGE) |
|         | Possible values : 0 - 127                                          |
|         | Default value : 0                                                  |

| Default Value   | 0..7                        | Default value is always the VPI number. |

## 28.6 Error messages and advisories

### Explanation of the Error Messages and Advisories:

Fields which output text variables are indicated by two <pointed brackets> in which the possible text variables are entered, separated by diagonal strokes (separatrices).

<xxx>, <yyy>, <zzz> denote number values.

### 28.6.1 Error messages

- F01: ltu is out of range. allowed range from <xxx> to <yyy>  
<xxx> and <yyy> = 1 to 15
- F02: slot does not exist
- F03: global <stma/waml2> module data have <not/already> been configured
- F04: ltu has not been configured
- F05: atmprot=uni31 can not be used in operating mode 'interworking'
- F06: no <stma/waml2> module is configured in this slot
- F07: the circuit <x>-<xx>-<xxx>-<xxx> configured in the module uses vpi/vci values, which are not consistent to vciofs<y>=<zzz>.  
help: delete circuit then call amo bdat and configure the circuit again.  
<x>-<xx>-<xxx>-<xxx> = ltg-ltu-slot-circuit; <y> = 0 to 7; <zzz> = 0 to 255
- F08: the stma module is not with the required operating mode configured.  
(see amo bcsu, parameter fctid)
- F09: slot without ltu, an ltu number must be entered
- F10: data have not been loaded: module is not in state 'ready'
- F11: module data could not be loaded
- F12: the load of module data was not acknowledged
- F13: the dynamic module-id is not available
- F22: the vpi<x> based on vciofs<x> is already assigned to a psw subscriber. vci offset can not be changed.  
<x> = 0 to 7
- F24: there are formal errors in the ip-address <nnn.nnn.nnn.nnn>  
<nnn> = 0 to 255
- F25: the ip-address 255.255.255.255 in parameter <ipaddr/ipadrnew/nextroute> is not allowed
- F26: the entered network interface has <not/already> been configured
- F27: the entered ip-address has <not/already> been configured

## BDAT - Administration of Module Data

### Error messages and advisories

F28: table '<iproute/firemac>' is full, no entry possible  
F29: there are formal errors in the mac-address <nn.nn.nn.nn.nn>  
    <nn> = 00 to FF (hexadecimal)  
F30: the ip-address of parameter <ipaddr/ipadrnew> has <not/already> been configured  
F31: no data have been configured  
F32: to change the global parameters, the stma module has to be deactivated (amo bssu).  
F33: to change parameter <fuellgrd/ipaddr>, the <stma/waml2> module has to be deactivated  
    (amo bssu).  
F34: the entered network mask can not be used if destination=net  
F37: the stma module data for 'nw20' have <not/already> been configured  
F39: all vpci values have to be different  
F40: the entered atm address is already used by the stma module 1-<ltu>-<slot>  
    in operating mode 'nw20'.  
    attention: the atm address must be unique networkwide!  
F41: atmprot=unittest can be set only in operating mode 'nw20'.  
F42: in operating mode 'nw20' the module data can not be loaded with exec-bdat.  
    to load these module data, the stma module has to be first deactivated  
    and then activated again (amo bssu).

## 28.6.2 Advisories

H01: the vpi's have been configured as follows:  
H02: data have not been loaded: module is not in state 'ready'  
H03: module data could not be loaded  
H04: the load of module data was not acknowledged  
H05: the dynamic module-id is not available  
H06: the stma module is not with the required operating mode configured. (see amo bcsu,  
    parameter fctid)  
H07: global <stma/waml2> module data have <not/already> been configured  
H08: no corresponding entry found  
H09: no <stma/waml2> module is configured in this slot  
H12: changed configuration data available - load waml2 module with command  
    'exec-bdat' required.  
H13: the network interface extlan1 (parameter 'actnetif') is not configured in the  
    network interface table.  
H14: the network interface extlan1 (parameter 'actnetif') is still active in the global  
    table.  
H15: user advisory: this action may result in an inconsistent configuration of the lan.  
    for more information read the amo description.  
H16: there are no data configured in table '<global/netzwerk/iproute/firemac>'  
H18: the ip-address is configured as host, so the network mask (ipnmask)  
    is not effective.  
H19: it is not possible to read the waml2 mac address, module is not in  
    state 'ready'.  
H20: it is not possible to read the waml2 mac address, no plausible event from pit.  
H21: it is not possible to read the waml2 mac address, no answer from pit.  
H22: the stma module data for 'nw20' have <not/already> been configured  
H23: after changing the module data, remember to activate the module with amo bssu again.  
H24: the parameter 'atmaddr' or 'atmnp' has been changed. the whole network  
    configuration might be affected. see amo description.

H25: module data have been loaded successfully to the module

H26: reasbuf values less than 4 may only be used in stma 'back to back' configurations without an atm switch.

Error messages and advisories

## 29 BERUM - Class of Service Switchover

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

Stations are allocated two classes of service (COS1 and COS2) in (COS1 = normal or day COS COS2 = alternative or night COS) in their line tables.

The class of service are maintained by AMO COSSU and assigned to stations with the AMOs SCSU and SBCSU.

An identifier (COS pointer) in the line tables indicates which COS is active.

AMO SCSU and AMO SBCSU subdivides the stations into COS switchover groups (COSX groups). This is performed in order to group stations so that a certain COS can be switched active for all of them. If no specific allocation has been made, a station belongs to COSX group 00. Stations with an active key switch (KEYSTN) are not changed over, but they are still assigned to a COSX group. The COSX groups are independent of other station groups formed on the basis of other features.

Switchover between the two classes of service can be performed from a station, from an attendant console, centrally using the AMO, via data channel and/or by means of a timed switchover.

### a) COS Switchover from the Station

A station authorized for this type of switchover can switch over between the COSs using the personal ID number (PIN) and a code for switchover using an active key switch (KEYSTN).

As long as the alternative COS (COS2) is active, the user hears the special dial tone when he lifts the receiver.

The station is assigned the authorization COSXCD (COS switchover by code) by AMO COSSU in order to be able to perform a switchover using the PIN.

The PIN (maximum of 12 digits) is defined by the AMO PERSI.

### b) COS Switchover from the Attendant Console (ATND)

Switchover of the normal COS of the COSX groups to an alternative COS can be performed from every attendant console, including the night attendant console (performed with the task BEZUM).

### c) COS Switchover by AMO

COS switchover for COSX groups of stations can be performed using the AMO BERUM.

## **BERUM - Class of Service Switchover**

### **Restrictions**

d) COS switchover using a data processing system (DVA) is implemented via a data channel.

e) Automatic COS Switchover

The COS switchover for COSX groups can be carried out automatically at a specific, definable time. This time is defined using the AMO BERUZ (time table for times at which class of service switchover is to occur). Switchover is carried out by the task BEZUM.

### **Priorities for COS Switchover**

The last COS switchover performed for a station is always in effect, regardless of where this change was carried out (from the station, from the attendant console or automatically).

## **29.1 Restrictions**

This description is valid from SP300-V3.4 and R6.3 Atlantic

## **29.2 Interrelationships**

- AMO COSSU : Classes of service, switching unit  
Allocation of the classes of service to a COS
- AMO SCSU : Subscriber configuration of switching unit  
Configuration of stations and assignment of COSX groups and COS to the stations
- AMO SBCSU : Station and S0-Bus Configuration of SWU  
Configuration of stations and assignment of COSX groups and COS to the stations

## **29.3 Functions of the AMO**

- [CHANGE-BERUM](#) : Enter the code indicating which COS is active in the line table.
- [DISPLAY-BERUM](#) : Interrogate the code indicating which COS is active.

## 29.3.1 CHANGE-BERUM

Enter the code indicating which COS is active.

1. For stations (TYPE=STN)  
Activate a selected or alternative COS.
2. for COSX groups (TYPE=COSX)  
Activate a selected COS.

For stations associated with a DCI, the code (COS pointer) is also changed in the line tables of the DCI.

If the active state of at least one COSX group is changed, the AMO initiates updating of the instant display buffers of all attendant consoles.

### Note

Switchover is not possible for stations with key-lock (COS KEYSTN).

### Procedure Overview

| Command Code | Parameter                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------|
| CHANGE-BERUM | TYPE=STN, STNO=<number>, [COSACT=<param>];<br><br>  TYPE=COSX, COSX=<number>, COSACT=<param>; |

### Examples

1. Switch COS2 to active for stations 2100, 2106, and 2121-2139.

Input:

```
CHANGE-BERUM:TYPE=STN,STNO=2100&2106&2121&&2139,COSACT=2;
```

Output:

```
F02 : 2123    IS NOT A STATION NUMBER  
CHANGE PARTIALLY COMPLETED;
```

2. Switch COS2 to active for COSX group 1-2

Input:

```
CHANGE-BERUM:BUM,1&2,2;
```

3. Change the active state for station 2109 to the alternative COS

Input:

```
CHANGE-BERUM:STN,2109;
```

**29.3.2 DISPLAY-BERUM**

Interrogate the active COS state, output the code (COS pointer) indicating which COS is active

- 1. For specific stations (TYPE=STN)
- 2. For specific COS switchover groups (TYPE=COSX)
- 3. For all stations (TYPE=ALLSTN)
- 4. For all COS switchover groups (TYPE=ALLCOSX)

**Procedure Overview**

| Command Code  | Parameter                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------|
| DISPLAY-BERUM | TYPE=STN,STNO=<number>;<br><br>  TYPE=COSX,COSX=<number>;<br><br>  TYPE=ALLSTN;<br><br>  TYPE=ALLCOSX; |

**Example**

- 1. Interrogate the active states of stations 2100, 2105, and 2121 through 2140.

Input:

DISPLAY-BERUM:TYPE=STN,STNO=2100&2105&2121&&2140;

Output:

|                                                               |  |  |  |  |  |  |  |  |  |  |  |

## 30 BERUZ - Times at which Class of Service Switchover is to occur

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

Stations (configured by AMO SCSU and AMO SBCSU) are allocated two classes of service COS1 and COS2) in their line tables. A class of service contains the authorizations of a station. An identifier (COS pointer) in the line tables indicates which COS is active, i.e. which of the station's authorizations are currently activated; this is usually COS1.

AMO SCSU and AMO SBCSU subdivides stations into COS switchover groups. This is performed in order to group stations so that a certain COS can be switched active for all of them. The COSX groups are independant of other station groups formed by other features.

If no specific allocation has been made, a station belongs to COSX group 0. Stations with an active key switch (KEYSTN) are not switched over, but they are still assigned to a COSX group.

The classes of service can be switched over from a station, from an attendant console, y means of AMO BERUM, via data channel, and/or by means of a timed switchover.

Switchover at a fixed Time (timed Switchover)

A table is created in the database, in which the following data is entered for each day of the week and for each COS switchover group:

- A time at which COS1 is switched to active (COS1T),
- A time at which COS2 is switched to active (COS2T),
- A program switch indicating whether the displayed switchover to COS1 is to be carried out on that day (COS1),
- A program switch indicating whether the displayed switchover to COS2 is to be carried out on that day (COS2).

AMO BERUZ administrates this table. (The switchover is carried out with the task BEZUM.)

(COSX = Class of service switchover group)

Table 3                      Layout of the time table

This table is implemented as a static FIXAMA table.

## 30.1 Restrictions

This description is valid from SP300-V3.4, R6.3.

## 30.2 Interrelationships

- AMO COSSU                      : Classes of service, switching unit  
                                         Allocation of the classes of service to a COS
- AMO FEASU                      : Customer features list

## 30.3 Functions of the AMO

- [ADD-BERUZ](#)                      : Enter times and switch settings for each COS switchover group (COSX) and day of the week (DAY). Existing entries are overwritten without a check.
- [DISPLAY-BERUZ](#)                      : Interrogate the entries for specific COSXs or all COSXs.
- [REGENERATE-BERUZ](#)                      : Interrogate the entries for specific COSXs or all COSXs in order to regenerate the table

### 30.3.1 ADD-BERUZ

Assign switchover times

The following is entered in the table:

- Two time entries which determine the switchover time (COS1T, COS2T).
- A pair of program switches (COS1, COS2).
- One or more COS switchover groups and one or more days of the week.

Values already contained in the table are overwritten.

### Procedure Overview

| Command Code | Parameter                                                                                   |
|--------------|---------------------------------------------------------------------------------------------|
| ADD-BERUZ    | COSX=<number>, DAY=<number>, {COS1T=<hh-mm><br>, COS1=<param>, COS2T=<hh-mm>, COS2=<param>; |

### Examples

1. For COS switchover groups 0 to 2, entries are to be made for Monday to Friday and the times 6:55 each day for switchover to COS1 and 15:40 each day for switchover to COS2. The switchovers are to be carried out.

Input:

```
ADD-BERUZ: COSX=0&2, DAY=1&5, COS1T=06-55, COS1=ON, COS2T=15-40, COS2=ON;
```

2. No switchover is to be made for groups 0 and 1 on the weekend, and the times 00.00 and 12.00 are to be entered for group 2, where switchover is to be carried initially only on Saturday.

a) Input:

```
ADD-BERUZ: COSX=0&1, DAY=6&7, COS1=OFF, COS2=OFF;
```

b) Input:

```
ADD-BERUZ: COSX=2, DAY=6&7, COS1T=00-00, COS1=ON, COS2T=12-00, COS2=ON;
```

c) Input:

```
ADD-BERUZ: COSX=2, DAY=7, COS1=OFF, COS2=OFF;
```

## 30.3.2 DISPLAY-BERUZ

Interrogate the entries for one, several, or all of the COS switchover groups. The output is generated in a tabular form.

**Procedure Overview**

| Command Code  | Parameter        |
|---------------|------------------|
| DISPLAY-BERUZ | [COSX=<number>]; |

**Example**

Interrogate all COSX groups

Input:

DISPLAY-BERUZ:0&&2;

Output:

|             |                                                              |   |         |         |         |         |         |         |         |  |

**30.3.3 REGENERATE-BERUZ**

Interrogate the entries for one, several, or all COS switchover groups. The output is generated as a command listing for the ADD action of the AMO.

**Procedure Overview**

| Command Code     | Parameter        |
|------------------|------------------|
| REGENERATE-BERUZ | [COSX=<number>]; |

### Example

Regenerate COSX groups 0-2.

Input:

REGENERATE-BERUZ: COSX=0&&2;

Output:

```
ADD-BERUZ: 0, 7, 0-00, OFF, 0-00, OFF;
ADD-BERUZ: 0, 1, 6-55, OFF, 15-40, ON;
ADD-BERUZ: 0, 2, 6-55, ON, 15-40, OFF;
ADD-BERUZ: 0, 3, 6-55, ON, 15-40, ON;
ADD-BERUZ: 0, 4, 6-55, ON, 15-40, ON;
ADD-BERUZ: 0, 5, 6-55, ON, 15-40, ON;
ADD-BERUZ: 0, 6, 0-00, ON, 0-00, OFF;
ADD-BERUZ: 1, 7, 0-00, OFF, 0-00, ON;
ADD-BERUZ: 1, 1, 6-55, ON, 15-40, ON;
ADD-BERUZ: 1, 2, 6-55, ON, 15-40, ON;
ADD-BERUZ: 1, 3, 6-55, ON, 15-40, ON;

AMO BSSM ( *Board Switch of Service Module* ) is used to activate or deactivate the module specified.

### Messages:

The messages from dependability that are the results of a check are output via AMO BSSM and appear directly on the dependability output device.

### 34.1 Restrictions

This description is valid from SP300-Rel6.3.

### 34.2 Interrelationships

- AMO UCSM : Configure Server
- AMO BCSM : Configure Mounting Location for Module in the Server

### 34.3 Functions of the AMO

- [ACTIVATE-BSSM](#) : Activate modules, either with or without a prior test.
- [DEACTIVATE-BSSM](#) : Deactivate modules, either with or without prior blocking.
- [TEST-BSSM](#) : Check modules (module must be deactivated)

#### 34.3.1 ACTIVATE-BSSM

Before it is activated, the status of the module is determined. If the module is in a state that does not permit activation, no activate job is assigned and the AMO is terminated with a corresponding message to the operator.

The following can be activated:

## BSSM - Board Switch of Service Module

### Functions of the AMO

- basic shelf of IS
- extension shelf of IS
- SWU shelf (PSIO)

#### Procedure Overview

| Command Code  | Parameter                                   |
|---------------|---------------------------------------------|
| ACTIVATE-BSSM | [UNIT=<param>]                              |
|               | , TYPE=BC, SLOT=<number>, [KIND=<param>]    |
|               |                                             |
|               | , TYPE=EC, SLOT=<number>, [KIND=<param>];   |
|               |                                             |
|               | , TYPE=SWU, LCXNO=<number>, [KIND=<param>]; |

#### Example

Activate the LBC module without test

Input:

```
ACTIVATE-BSSM:A1,BC,38,ANT;
```

### 34.3.2 DEACTIVATE-BSSM

Individual modules are deactivated. When a module is deactivated, all hierarchically subordinate units are also deactivated.

The following can be deactivated:

- basic shelf of IS
- extension shelf of IS
- SWU shelf (PSIO)

#### Procedure Overview

| Command Code    | Parameter                                   |
|-----------------|---------------------------------------------|
| DEACTIVATE-BSSM | [UNIT=<param>]                              |
|                 | , TYPE=BC, SLOT=<number>, [KIND=<param>];   |
|                 |                                             |
|                 | , TYPE=EC, SLOT=<number>, [KIND=<param>];   |
|                 |                                             |
|                 | , TYPE=SWU, LCXNO=<number>, [KIND=<param>]; |

**Example**

Deactivate the LBC module without prior blocking.

Input:

```
DEACT-BSSM:A1,BC,38,DI;
```

**34.3.3 TEST-BSSM****Procedure Overview**

| Command Code | Parameter                 |
|--------------|---------------------------|
| TEST-BSSM    | [UNIT=<param>]            |
|              | ,TYPE=BC,SLOT=<number>;   |
|              |                           |
|              | ,TYPE=EC,SLOT=<number>;   |
|              |                           |
|              | ,TYPE=SWU,LCXNO=<number>; |

**Example**

Check the LBC module.

Input:

```
TEST-BSSM:A1,BC,38;
```

**34.4 Parameter Description**

|                 |                                        |
|-----------------|----------------------------------------|
| KIND            | Service change type                    |
|                 | Type of activate/deactivate order      |
| Type of Input   | : Single value, optional               |
| Possible Values | : AT (Activate test)                   |
|                 | ANT (Activate without test)            |
|                 | DC (Deactivate with prior blocking)    |
|                 | DI (Deactivate without prior blocking) |
| Default Value   | : AT (ACTIVATE) (activate)             |
|                 | DC (DEACTIVATE) (deactivate)           |
| LCXNO           | LCX-number                             |

## **BSSM - Board Switch of Service Module**

### Error Messages and Advisories

## **35 BSSU - Board Switch, Switching Unit**

This AMO is used to process modules of the switching unit (SWU).

- **Activate:**  
Modules can be activated either with conditional or with unconditional loading.
- **Deactivate:**  
It is possible to deactivate the module with or without being pre-blocked.
- **Restart:** Deactivate without pre-blocking and Activate with unconditional loading has been combined in one action.
- **Display:**  
The statistic counters of the specified module(s) can be displayed and reset.

### **35.1 Interrelationships**

None

### **35.2 Functions of the AMO**

- [ACTIVATE-BSSU](#) : Activate modules
- [DEACTIVATE-BSSU](#) : Deactivate modules
- [RESTART-BSSU](#) : Reset (Deactivate/activate) modules
- [DISPLAY-BSSU](#) : Display module statistic counters

#### **35.2.1 ACTIVATE-BSSU**

Individual modules are activated, i.e. any 'manual blocking' status is removed. Hierarchically subordinate trunks and terminals are also activated.

Before a module is activated, its status is checked. If it is manually blocked, the block is removed.

If a pre-blocking is in effect for the module to be activated, the activate job removes the pre-blocking.

## BSSU - Board Switch, Switching Unit

### Functions of the AMO

Activation can be carried out:

- with conditional loading
- with unconditional loading
- without loading

In the case of an activate job with conditional loading, the trunk circuit data is only loaded when necessary.

After the activate job is executed, a message is output supplying information regarding the switching state achieved. The message does not specify whether or not the deactivated module had been manually blocked before the deactivate job.

### Voice Compression

If the board to be activated is partner of a voice compression connection, the according VCM board will be activated automatically and the message H30 will be displayed.

### STMI2-HFA boards

The AMO performs the activation (bring-into-service) action of a STMI2-HFA board from which IP terminals have been automatically switched from. Because of a board error, either

- without switching back the IP terminals
- with switching back the IP terminals

This command is called after the defective board has been replaced by a board which is expected to be O.K.

**HFASW = IPSTNBCK :** AMO switchs (reconfigures) back the IP terminals which had been originally configured at the specified board and activates the specified board. The DC state of the specified (standby) board must be MAN\_AMO/DEF, where the destination board ( from which the IP terminals are switched from ) must be DEF or READY.

**HFASW = STBYRDY :** AMO activates the specified board and changes its Standby Mode from ...STDBY\_DEF to ...STDBY\_READY.

**HFASW = NONE :** AMO just activates the STMI2-HFA board .

HFASW parameter is only valid for STMI2-HFA board, for the rest of the boards this parameter is ignored.

## Procedure Overview

| Command Code  | Parameter                                                                           |
|---------------|-------------------------------------------------------------------------------------|
| ACTIVATE-BSSU | [ONTYPE=<param>], [LTG=<number>], LTU=<number><br>, SLOT=<number>, [HFASW=<param>]; |

### The following system responses to ACTIVATE-BSSU are possible

- State 'OPERATIONAL'

H2: MODULE <pen> ACTIVATED

- State 'NOT OPERATIONAL'

Hnn: MODULE <pen> ACTIVATED - NOT OPERATIONAL  
<state>:<loaderror>

- State remains unchanged

F11: MODULE <pen> NOT ACTIVATED (JOB ERROR)

### Description <pen>:

| UNACH | Module                 | hierarchically blocked (superordinate unit blocked)  |
| UA/UH | Module                 | blocked hierarchically and due to interrelationships |
| WBT   | Wrong board type found |                                                      |

### Description of <loaderror>:

|   |                                         |
|---|-----------------------------------------|
| 1 | No load files for this module           |
| 2 | Error occurred during data transmission |
| 3 | Fault in module hardware                |

### Example

The module at LTG 1, LTU 2, SLOT 25 is to be activated with conditional loading.

Input:

ACTIVATE-BSSU:AT,1,2,25;

Output:

H02: MODULE 1.2.25 ACTIVATED

or

H12: MODULE 1.2.25 ACTIVATED - NOT OPERATIONAL (UNACH-NPR)

(The module is not operational since it is hierarchically blocked (UNACH) and not present (NPR). Any existing manual block was removed.)

## 35.2.2 DEACTIVATE-BSSU

Individual modules are deactivated, i.e., the status 'manual blocking' or 'pre-blocking' is set.

When a module is deactivated, all the hierarchical blocks for subordinate units are also set.

Before a module is deactivated, its status is checked. If the module is in a state that does not permit deactivation, a deactivate job is not issued and, after a corresponding message is sent to the operator, the AMO is terminated.

Two types of deactivate jobs are possible:

Deactivate jobs with pre-blocking, i.e. existing connections are not released.

Deactivate jobs without pre-blocking, i.e., without regard for existing connections.

The operator receives an advisory message to say that the switching job is executed. The message does not specify whether or not the deactivated module had been manually blocked.

If the current reference clock generator is on the module(s) to be deactivated, and there are other reference clock generators available outside the specified range, the optional parameter REFOFF is prompted with the advisory H26.

The advisory H27 is prompted if the job affects all reference clock generators. In this case, a prompt is also given if the value YES was specified when the AMO was started.

The operator can determine what the AMO is supposed to do using the values YES or NO for the new parameter REFOFF.

The value YES means that if applicable, the module with the current reference clock generator should also be deactivated.

The value NO means that the module with the current reference clock generator should not be deactivated. In this case, the AMO responds with the advisory H28.

The value PROMPT (default value) means that the parameter should be prompted if the current reference clock generator is within the specified range.

### Voice Compression

If the board to be deactivated with OFFTYPE=DC is partner of a voice compression connection, the according VCM board will be deactivated automatically and the message H30 will be displayed.

### Procedure Overview

| Command Code    | Parameter                                                                             |
|-----------------|---------------------------------------------------------------------------------------|
| DEACTIVATE-BSSU | [OFFTYPE=<param>], [LTG=<number>], LTU=<number><br>, SLOT=<number>[, REFOFF=<param>]; |

The following system responses to DEACTIVATE-BSSU are possible:

- State 'Manual block'

H23: MODULE <pen> DEACTIVATED

- State 'Pre-blocking'

H24: MODULE <pen> PRE-BLOCKED

- State remains unchanged

F14: MODULE <pen> NOT DEACTIVATED (JOB ERROR)

### Description <pen>:

<pen> = <LTG number>.<LTU number>.<Slot>

## 35.2.3 RESTART-BSSU

This function resets boards; that means the commands DEACTIVATE and ACTIVATE are combined in one order. For ranges all devices will be deactivated first and activated afterwards. All deactivations will be done with OFFTYPE= DI, all activations will be done with ONTYPE=AUL. The last reference clock generator can not be reset by means of this function, the message H28 will be displayed.

WTIME parameter is used to have a pause time between activation and deactivation process.

HFA SW parameter is only valid for STM12-HFA board, for the rest of the boards this parameter is ignored.

## BSSU - Board Switch, Switching Unit

### Functions of the AMO

#### STMI2-HFA boards

HFASW parameter is ignored for the boards different from STMI2-HFA . Possible values and the functionalities behind are as follows :

**HFASW = IPSTNBCK :** After deactivation of the STMI2-HFA , AMO switchs (reconfigures) back the IP terminals which had been originally configured at the specified board and activates the specified board. The DC state of the specified (standby) board must be MAN\_AMO/DEF, where the destination board ( from which the IP terminals are switchced from ) must be DEF or READY.

**HFASW = STBYRDY :** After deactivation of the board, AMO activates the specified board and changes its Standby Mode from ...STDBY\_DEF to ...STDBY\_READY.

**HFASW = NONE :** AMO just deactivates and activates the STMI2-HFA board .

HFASW parameter is only valid for STMI2-HFA board, for the rest of the boards this parameter is ignored.

**HFASW = SWITCH:** Manually switches the IP terminals from the specified board ( LTG-LTU-SLOT) to the destination board (LTG2-LTU2-SLOT2). If the destination board is not entered by the user then AMO searches for an appropriate standby board ( Standby Ready Mode) in the reconfiguration pool which the specified board is a member of.

Standby Mode of the destination board must be STBYRDY,

#### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESTART-BSSU | <pre>ADDRTYPE=ALL,WTIME=&lt;number&gt;;   ADDRTYPE=PARTNO,PARTNO=&lt;string&gt;,[FCTID=&lt;number&gt;], WTIME=&lt;number&gt;;   ADDRTYPE=PEN,[LTG=&lt;number&gt;],LTU=&lt;number&gt;,SLOT=&lt;number&gt;,   [WTIME=&lt;number&gt;],     [HFASW=NONE];   [HFASW=IPSTNBCK];   [HFASW=STBYRDY];   [HFASW=SWITCH],[LTG2=&lt;number&gt;],   [LTU2=&lt;number&gt;],[SLOT2=&lt;number&gt;;</pre> |

**Example**

The module at LTG 1, LTU 2, SLOT 25 is to be activated with conditional loading.

Input:

```
RESTART-BSSU:1,2,25;
```

Output:

```
H23: MODULE 1.2.25 DEACTIVATED  
H02: MODULE 1.2.25 ACTIVATED
```

## **35.2.4 DISPLAY-BSSU**

Display and reset the statistic counters of modules in the LTU.

Only modules with statistic counter (see table below) can be interrogated.

For the specified module(s), a job is sent to PP (preprocessing) for each module to interrogate and to reset the statistic counters. For the modules STMD, SLMU, SLMU16, SLMQ and SLMS one job is sent to PP for each trunk circuit.

In the case of STMD modules, the circuits without S0 bus are processed first, followed by those with S0 bus.

In the case of STMA modules, depending on the operating mode the statistic counters will be displayed per board (IW Interworking / TFA Telephone Feature Access) or per port (PBB PBX Backboning / PSW Port Switching).

In the case of SLMAR modules, no statistic counters will be displayed but rather the feeding voltage modes for each port of the module.

If the specified module has the status "not equipped" or "not present" or an incorrect module type, no statistic counters are available. The AMO outputs error message F33.

If PP is processing a different job at the time, or if the expected statistic do not arrive within a certain time period (10 seconds), the AMO issues a corresponding error message. If there is another module to be processed, the AMO continues. Otherwise, the AMO terminates at this point.

Parameters DISTYPE and RESET are only valid for TMDN 64 board. If any of these parameters is entered for a different board, then advisory message H39 is displayed. Because all statistical board data is displayed for TMDN 64 board, if the parameter CIR is entered, then advisory message H40 is displayed. (CIR value ignored.)

**BSSU - Board Switch, Switching Unit**  
Functions of the AMO

|             |
|-------------|
| Module Type |
| STMD        |
| STMA        |

| TMDN        |

Table 4                      List of Module Types with Statistic Counter

**Procedure Overview**

| Command Code | Parameter                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------|
| DISPLAY-BSSU | [LTG=<number>], LTU=<number>, SLOT=<number><br>[, CIR=<number>], [DISTYPE=<param>], [RESET=<param>]; |

**Examples**

1. The statistic counters of the DIUS2 module for LTG 1, LTU 4 and SLOT 103 are to be displayed.

Input:

DISPLAY-BSSU:1,4,103;

Output:

F28: MODULE 1.4.103 DISPLAY OF STATISTICAL DATA CURRENTLY NOT POSSIBLE

(Preprocessing (PP) is processing a different job at this time)

or

F29: MODULE 1.4.103 TIME EXPIRED FOR DISPLAY OF STATISTICAL DATA

or

F33: MODULE 1.4.103 DISPLAY NOT POSSIBLE

(The module has the status NOGEN, NPR or WBT)

or output of the statistic counter data

| STATISTICAL DATA FOR MODULE DIUS2 PEN 1- 4-103 |                |                   |         |           |               |              |              |
|------------------------------------------------|----------------|-------------------|---------|-----------|---------------|--------------|--------------|
| CIR NO.                                        | TOTAL MESSAGES | PARTNER NOT READY | REPEATS | CHECK SUM | DATA OVERFLOW | DATA MISSING | ADAPTER LINE |
| 0                                              | 1100           | 4                 | 20      | 11        | 5             | 25           |              |
| 1                                              | 4433           | 7                 | 12      | 11        | 5             | 35           |              |

2. The statistic counters for a SLMU module for LTG 1, LTU 4, SLOT 79 and CIR 5 are to be displayed.

Input:

DISPLAY-BSSU:1,4,79,5;

Output:

F28: MODULE 1-4-79-5 DISPLAY OF STATISTICAL DATA CURRENTLY NOT POSSIBLE

(Preprocessing (PP) is processing a different job at this time)

or

F29: MODULE 1-4-79-5 TIME EXPIRED FOR DISPLAY OF STATISTICAL DATA

or output of the statistic counter data

| STATISTICAL DATA FOR MODULE SLMU |     |         |                |                   |         |           | PEN           | 1-           | 4- | 79- | 5 |

| 11                                               | 11                    | 5            | 3                | 0                    | 0               | 0                        |  |

SARE-Quality-Data:

ATM-CELLS SENT: Number of all ATM Cells sent,inclusive empty cells  
ATM-CELLS RECEIVED: Number of all ATM Cells received,inclusive empty cells  
DATA SENT: Number of all ATM Cells sent with data  
DATA RECEIVED: Number of all ATM Cells received with data  
HEADER CORRECTION: Number of "Header Error Correction" was not successful  
CYCLIC CHECK: Number of Cyclic Redundancy check-32 errors  
TIME STAMP ADJUSTABLE: SARE time stamp

4. The statistic counters for a SLMU module (PSW) for LTG 1, LTU 4, SLOT 79 and CIR 1 are to be displayed.

Input:

DISPLAY-BSSU:1,4,79,1;

Output:

| STATISTICAL DATA FOR MODULE STMA-PSW PEN 1- 4- 79 |                |              |      |     |     |     |     |                 |                 |                 |                 |
|---------------------------------------------------|----------------|--------------|------|-----|-----|-----|-----|-----------------|-----------------|-----------------|-----------------|
| CIR                                               | RES-I<br>FRAME | CHECK<br>SUM | PRNR | REJ | RDO | XDU | XMR | DELETE<br>CELLS | INSERT<br>CELLS | SEQ-NO<br>ERROR | STRUCT<br>TRANS |
| 1                                                 | 1              | 0            | 0    | 0   | 0   | 0   | 0   | 0               | 0               | 0               | 0               |

CIR: Circuit number

LAPD-Quality-Data:

RES-I FRAME: Number of received I-Frames  
CHECKSUM: Number of CRC errors (checksum comparison)  
PRNR: Partner could not receive (NOT READY)  
REJ: Data block could not recorded  
(partner had to repeat)  
RDO: Receive Data Overflow  
XDU: Transmit Data Underflow, board circuit was too slow

XMR: - No value supported -

PADACK-Quality-Data:

DELETE CELLS: Number of deleted cells due to depacketising buffer overflow  
 INSERT CELLS: Number of inserted cells due to depacketising buffer overflow  
 SEQ-NO ERROR: Number of cells that are in any way erroneous in context with sequence number checking  
 STRUCT TRANS: Number of times something has gone wrong in context with structure data transfer

### 5. The feeding voltage for a SLMAR module for LTG 1, LTU 5, SLOT 79 are to be displayed.

Input:

DISPLAY-BSSU:1,5,79;

Output:

| FEEDING VOLTAGE DATA FOR MODULE SLMAR PEN 1- 5- 79 |                                          |
|----------------------------------------------------|------------------------------------------|
| CIR NO.                                            | EXTENDED SUBSCRIBER LOOP (BATTERY BOOST) |
| 0                                                  | YES                                      |
| 1                                                  | NO                                       |
| 2                                                  | YES                                      |
| 3                                                  | UNDEF                                    |
| 4                                                  | YES                                      |
| 5                                                  | YES                                      |
| 6                                                  | YES                                      |
| 7                                                  | YES                                      |

YES = Battery boost

NO = No battery boost

UNDEF = Loadware with initialized value, there is no knowledge what battery boost has to be used.

### 6. Statistical Data of TMDN Board

#### 1. 24 Hours total statistics

| 24 HOURS TOTAL STATISTICS FOR TMDN |        |         |        | LTG.LTU.EBT : 1- 4- 79 |
|------------------------------------|--------|---------|--------|------------------------|
| ESF                                | xxxxxx | FS      | xxxxxx |                        |
| ES                                 | xxxxxx | OES     | xxxxxx |                        |
| BES                                | xxxxxx | FS      | xxxxxx |                        |

## BSSU - Board Switch, Switching Unit

### Parameter Description

|         |                                       |                           |                                         |
|---------|---------------------------------------|---------------------------|-----------------------------------------|
| HFASW   | HFA switching activities.             |                           |                                         |
|         | Type of input                         | single value,optional     |                                         |
|         | Possible Values                       | NONE                      | No HFA specific activities.             |
|         |                                       | IPSTNBCK                  | Switch IP stations back.                |
|         |                                       | STBYRDY                   | Act as HFA standby board.               |
|         |                                       | SWITCH                    | Switchover ip stations to another board |
| LTG     | Specification of the line trunk group |                           |                                         |
|         | Type of input                         | : Single value, optional  |                                         |
|         | Possible value                        | : 1-32                    |                                         |
|         | Default value                         | : 1                       |                                         |
| LTU     | Specification of the line trunk unit  |                           |                                         |
|         | Type of input                         | : Single value, mandatory |                                         |
|         | Possible values                       | : numeric, 1-15, 17-99    |                                         |
| OFFTYPE | Specifies the type of deactivate job  |                           |                                         |
|         | Type of Input                         | : Single value, optional  |                                         |
|         | Possible Values                       | DC                        | Deactivate Conditionally                |
|         |                                       | DI                        | Deactivate immediately                  |
|         | Default Value                         | : DC                      |                                         |
| ONTYPE  | Specifies type of activate job        |                           |                                         |
|         | Type of input                         | : Single value, optional  |                                         |
|         | Possible Values                       | ACL                       | Activation with conditional loading     |
|         |                                       | AUL                       | Activation with unconditional loading   |
|         |                                       | ANL                       | Activation with no loading              |
|         | Default value                         | : ACL                     |                                         |
| PARTNO  | Part Number                           |                           |                                         |
|         | Type of input                         | single value, mandatory   |                                         |
|         | Possible Values                       | text, up to 10 characters |                                         |
| REFOFF  | Switch reference clock generator      |                           |                                         |
|         | Type of input                         | : Single value            |                                         |

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                        |                                                                                |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|--------------------------------------------------------------------------------|

## 35.4 Error Messages and Advisories

### Note:

'<pen>' stands for '<LTG number>.<LTU number>.<SLOT-number>'. or '<LTG number>.<LTU number>.<SLOT number>.<CIR number>'.

#### 35.4.1 Error Messages

F01: LOADING OF MODULE DIRECTORY FILE (UBGDAT) IS NOT POSSIBLE

F02: LTG NOT ASSIGNED

F03: LTU NOT ASSIGNED

F04: LTU NOT PRESENT

F05: MODULE NOT ASSIGNED

F11: MODULE <pen> NOT ACTIVATED (JOB ERROR)  
(Activate not executed since an activate or deactivate job is currently being processed.)

F12: MODULE <pen> NOT DEACTIVATED (NEQ)  
(The module has not been deactivated since it is not assigned.)

F13: MODULE <pen> NOT DEACTIVATED (WBT)  
(The module has not been deactivated, since an incorrect module type is plugged.)

F14: MODULE <pen> NOT DEACTIVATED (JOB ERROR)  
(Deactivate not executed since an activate or deactivate job is currently being processed.)

F15: MODULE <pen> IMPLAUSIBLE STATE  
(GENNR,TRS,DEFIL AND/OR SIGNED\_OFF)  
(The module is in a state that cannot be evaluated.)

F16: LTG NUMBER DOES NOT HAVE ADMISSIBLE VALUE  
(The LTG with the specified LTG number does not exist.)

F17: LTU NUMBER DOES NOT HAVE ADMISSIBLE VALUE  
(The LG with the specified LTG number does not exist.)

F18: INVALID SLOT NUMBER SPECIFIED FOR PARAMETER SLOT  
(Invalid SLOT number specified. A mounting location is made up of six SLOTS; thus, valid SLOTS are 1, 7, 13 etc. except SLOT 65. this SLOT contains the LTUC and is not switchable!)

F20: LTG NOT PRESENT

F21: MODULE <pen> NOT ACTIVATED - MODULE TYPE IS RG  
THE MODULE CAN BE HANDLED WITH BCSU ONLY.

F22: MODULE <pen> NOT ACTIVATED - MODULE TYPE IS ACGEN  
THE MODULE CAN BE HANDLED WITH BCSU ONLY.

F23: MODULE <pen> NOT DEACTIVATED - MODULE TYPE IS RG  
THE MODULE CAN BE HANDLED WITH BCSU ONLY.

F24: MODULE <pen> NOT DEACTIVATED - MODULE TYPE IS ACGEN  
THE MODULE CAN BE HANDLED WITH BCSU ONLY.

F26: MODULE <pen> IF LTC MODULE SWITCH ASSOCIATED MODULE  
(The LTC module is switched along with the associated module.)

F27: MODULE <pen> MODULE HAS NO STATISTICAL DATA  
(Display not executed because this module has no statistic counter.)

F28: MODULE <pen> DISPLAY OF STATISTICAL DATA CURRENTLY NOT POSSIBLE  
(Display not executed since PP (pre-processing) is processing a different job at this time.)

F29: MODULE <pen> TIME EXPIRED FOR DISPLAY OF STATISTICAL DATA

F33: MODULE <pen> DISPLAY NOT POSSIBLE  
(Display not executed since the module is in the state 'not present' or 'not equipped' or has an incorrect module type.)

- F34: MODULE <lage> NOT SWITCHED - MODULE TYPE IS PSIO  
BOARD CAN BE SWITCHED ONLY BY MEANS OF AMO BSSM. CHECK LCXNO:  
DISP-BCSM:A1,SW; THEN SWITCH: ACT/DEACT-BSSM:UNIT=A1,TYPE=SWU,LCXNO=<?>;
- F35: OFFTYPE=DC NOT POSSIBLE FOR MODULE SLC16.  
SWITCH OFF BY MEANS OF:  
DEACT-BSSU:DI,^ltg^,^ltu^,^ebt^;
- F36: MODULE PART NUMBER OR FUNCTION IDENTIFICATION IS INVALID.  
VALID VALUES CAN BE INVESTIGATED WITH THE DATA OF A CORRESPONDING BOARD BY  
USING AMO BCSU:  
DISP-BCSU:TYPE=TBL,LTG=,LTU=,SLOT=;
- F37: MODULE ^ltg^,^ltu^,^ebt^ NOT ACTIVATED.

## 36 BST - Background Signalling Task

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO BST can be used to start and to stop the Background Signalling Task. Moreover at any point of time the state of the BST can be examined.

The BST is a Backgroundtask, which will take over the display function of the Signalling Task (SIT) in HICOM 3x3. In HICOM 3x3 there is no longer an administration terminal, therefore the system messages are written to a cyclic file by SIT.

The BST reads the messages from the cyclic file block by block and sends them block by block to the Terminal Task (TT).

The AMO BST can be used to start explicitly the BST. The user has to specify, which symbolic device the cyclic file is assigned. The logical output device the messages will be sent can also be specified. Further the user has the possibility to insert a framemark (the framemark can be used for additional processing on MF300 side.).

### 36.1 Restrictions

This description is valid from SP300-R6.3

### 36.2 Interrelationships

None

### 36.3 Functions of the AMO

- [ACTIVATE-BST](#) : Activate the BST
- [DEACTIVATE-BST](#) : Deactivate the BST.
- [DISPLAY-BST](#) : Display the state and the working parameter of the BST.

### 36.3.1 ACTIVATE-BST

The function ACTIVATE starts the BST. The parameter SOURCE specifies the symbolic input device the cyclic file will be found.

If the parameter DEST is not supplied, the output will be displayed on the logical output device the BST was started from. If parameter MARK is supplied with N, no framemark for further processing of the messages will be added. In the other case (the default value for the parameter MARK is Y.) a framemark will be added to every message. The AMO expects a response from BST, therefore time delays can occur.

If there are any problems, starting BST (e.g. gets no logon, file access error, .....), the AMO gets a negative response with additional information about the error reason.

#### Procedure Overview

| Command Code | Parameter                                       |
|--------------|-------------------------------------------------|
| ACTIVATE-BST | SOURCE=<param>, [DEST=<param>], [MARK=<param>]; |

#### Examples

1. Activate the Background Signalling Task with output device different the device, the AMO was started from and without framemark.

Input:

```
ACTIVATE-BST:SOURCE=DPT4,DEST=LP1,MARK=N;
```

Output:

```
H01: BST SWITCHED ON.  
SOURCE-FILE IS C-HIST1.
```

2. Activate the Background Signalling Task with the same output device, as used to start the AMO and with framemark.

Input:

```
ACTIVATE-BST:SOURCE=DPT3;
```

Output:

```
H01: BST SWITCHED ON.  
SOURCE-FILE IS C-HIST2.
```

### 36.3.2 DEACTIVATE-BST

This function causes the deactivation of the BST. First BST finishes its running process, then it will get inactive. Time delays between the end of the AMO and the real end of the BST can occur, because of this running process from BST.

#### Procedure Overview

| Command Code   | Parameter |
|----------------|-----------|
| DEACTIVATE-BST | ;         |

#### Examples

Deactivation of the BST.

Input:

DEACTIVATE-BST;

Output:

H02: SWITCH OFF OF BST INITIATED.

### 36.3.3 DISPLAY-BST

This function displays the Input-/Output devices for BST, the flag if framemark is switched on/off and the state of the BST. If the BST is deactivated, this function will display the deactivation reason too.

#### Procedure Overview

| Command Code | Parameter |
|--------------|-----------|
| DISPLAY-BST  | ;         |

#### Examples

1. Display of the BST.

Input:

DISPLAY-BST;

Output:

```

+----- BACKGROUND SIGNALLING TASK -----+
|
| SOURCE      : ---- FILENAME: -----
|
| OUTPUT DEVICE : ----
|
| FRAMEMARKER : ----
|

```

## BST - Background Signalling Task

### Functions of the AMO

```
|
|
| STATE: DEACTIVATED - BECAUSE OF RELOAD OR POWER ON
|
+-----+
|
```

After every RELOAD or POWER ON the BST is deactivated and doesn't know anything about the devices or the framemark.

#### 2. Display of the BST.

Input:

```
DISPLAY-BST;
```

Output:

```
+----- BACKGROUND SIGNALLING TASK -----+
|
| SOURCE          : DPT4                      FILENAME : C-HIST1
|
| OUTPUT DEVICE   : CON1
|
| FRAMEMARKER     : NO
|
|
| STATE : DEACTIVATED - BECAUSE OF FILE ACCESS ERROR
|
| ACCESS : OPEN OF THE FILE                      EXCEPTION-CODE : H'21
|
+-----+
|
```

BST is deactivated.

The BST did read the cyclic file (C-HIST1), currently assigned to the Dependability Terminal 4 (DPT4). The output messages were sent to the Output Terminal 1 (CON1). The messages weren't signed with a framemark.

Due to a file access error the BST was deactivated. An error occurred while opening the file. The DMS Exception Code was H'21 (the file didn't exist.).

#### 3. Display of the BST.

Input:

```
DISPLAY-BST;
```

Output:

```
+----- BACKGROUND SIGNALLING TASK -----+
|
| SOURCE          : DPT3                      FILENAME : C-HIST2
|
| OUTPUT DEVICE   : CON1
|
| FRAMEMARKER     : YES
|
|
|
```

```
| STATE : ACTIVATED |
|                   |
+-----+-----+
```

BST is activated.

The BST reads from the cyclic file (C-HIST2), currently assigned to the Dependability Terminal 3 (DPT3). The output messages are sent to the Output Terminal 1 (CON1). The messages are signed with a framemark.

### Output overview for activated BST

```
+-----+-----+
|                   |
| STATE : ACTIVATED |
|                   |
+-----+-----+
```

### Output overview for deactivated BST

```
+-----+-----+
|                   |
| STATE : DEACTIVATED - BECAUSE OF RELOAD OR POWER ON |
|                   |
+-----+-----+
|                   |
| STATE : DEACTIVATED - BECAUSE OF STOP-ORDER FROM AMO |
|                   |
+-----+-----+
|                   |
| STATE : DEACTIVATED - BECAUSE BST DIDN'T GET A SESSION FOR |
|                   OUTPUT OF THE SYSTEM MESSAGES |
|                   |
+-----+-----+
|                   |
| STATE : DEACTIVATED - BECAUSE THE DISPLAYED SYSTEM MESSAGES |
|                   WERE NOT ACKNOWLEDGED |
|                   |
+-----+-----+
|                   |
| STATE : DEACTIVATED - BECAUSE BST DIDN'T FIND A SYSTEM MESSAGE |
|                   |
+-----+-----+
|                   |
| STATE : DEACTIVATED - BECAUSE BST DIDN'T SEND A SYSTEM MESSAGE |
|                   |
+-----+-----+
|                   |
| STATE : DEACTIVATED - BECAUSE TOO MANY NEGATIVE RESPONSES |
|                   WERE RECEIVED |
|                   |
+-----+-----+
|                   |
| STATE : DEACTIVATED - BECAUSE THE SOURCE DEVICE HAS BEEN CHANGED |
|                   WITHOUT STOP-ORDER |
|                   |
+-----+-----+
|                   |
| STATE : DEACTIVATED - BECAUSE THE FILE HAS BEEN DELETED AND |
|                   |
+-----+-----+
```

## 37 BUEND - Trunk Groups

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

A trunk group consists of a variable number of equivalent trunks and is unambiguously identified in the system by means of a trunk group number.

### 37.1 Interrelationships

- AMO TACSU : Analog trunk circuits
- AMO TDCSU : Digital trunk circuits
- AMO TSCSU : Special trunk circuits
- AMO RICHT : Routes
- AMO LDAT : LCR Routes

#### Relationship to Trunks

Trunks are allocated to trunk groups by means of AMO TACSU, TDCSU or TSCSU. A trunk can be allocated to exactly one trunk group.

#### Relationship to Routes

Trunk groups are allocated to routes and LCR routes by means of AMO RICHT respectively AMO LDAT. A trunk group can be allocated to many routes and LCR routes.

#### Priority Classes

When a trunk is assigned to a trunk group with priority class 0, the priority class of the trunk group is changed to a device specific default value (1 for CO, 2 any other trunk). The value may be changed later on, but priority class 0 is allowed for empty trunk groups only.

#### Generation Sequence

```

BUEND --> TACSU --> RICHT --> LDAT -->
      |           |
      +--> TDCSU --+
      |           |
      +--> TSCSU --+

```

**37.2 Functions of the AMO**

- [ADD-BUEND](#) : Create new trunk group
- [CHANGE-BUEND](#) : Change trunk group characteristics
- [DELETE-BUEND](#) : Delete trunk groups
- [DISPLAY-BUEND](#) : Interrogate trunk groups
- [REGENERATE-BUEND](#) : Regenerate trunk groups

**37.2.1 ADD-BUEND**

This action creates a new empty trunk group, that means makes memory available and initializes this memory.

Procedure Overview

| Command Code | Parameter                                                                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-BUEND    | [TGRP=<number>] , [NAME=<string><br>, NO=<number><br>, [TRACENO=<number>] , [ACDTHRH=<number> or *]<br>, [PRIONUM=<number>] , [GDTRRULE=<number>]<br>, [TDDRFLAG=<param>] , [ACDPMGRP=<number>]; |

If no number is entered for TGRP, the new trunk group is assigned to the first free trunk group number (the number of possible trunk groups is limited to 512).

The size of the memory for a trunk group is determined by parameter NO, which specifies the maximum number of trunks that can be allocated to the trunk group.

During creation, the name associated with the trunk group (parameter NAME) is entered into the name table and also the maximum number of trunks in a trunk group that can be call traced (parameter TRACENO), the number of trunks that can handle ACD calls (parameter ACDTHRH) the priority class (PRIONUM) , general digit translation rule (GDTRRULE), traffic dependent dynamic routing (TDDRFLAG) and the ACD phone mail group number are set.

Existence of the entered GDTRRULE is checked before assigning it to the trunk group. GDTRRULE is added by means of AMO-DNIT.

Validity of ACDPMGRP is also checked before assigning it to the trunk group.

### Example

Create a new trunk group for two DIU-S2 trunks (60 B-channels) with the name "CO". The next available free trunk group has to be searched by AMO.

Input:

```
ADD-BUEND:NAME="CO",NO=60;
```

Output:

```
H01: ADD TGRP 47 COMPLETED
```

## 37.2.2 CHANGE-BUEND

This action changes one or more attributes of an existing trunk group.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-BUEND | TGRP=<number>, { NAME=<string><br>, NO=<number><br>, TRACENO=<number>, ACSTHRH=<number> or *<br>, PRIONUM=<number>, TDDRFLAG=<param><br>, GDTRRULE=<number>; |

The attributes that can be changed are the trunk group name (NAME), the maximum number of trunks to be allocated (NO), the maximum number of trunks in a trunk group that can be call traced (TRACENO), the number of trunks that can handle ACD calls (parameter ACDTHRH), the priority class (PRIONUM), traffic dependent dynamic routing flag (TDDRFLAG) and the general digit translation rule(GDTRRULE). At least one the parameters must be entered for a change to be performed.

There are no restrictions for changing the name . However, if only blanks are specified in a NAME, the AMO enters NULL for the number of specified characters into the name table, deleting the name. When changing the maximum number of trunks to be allocated (parameter NO):

- If the change will result in an increase in the memory allocation, then sufficient memory must be available.
- If the change will result in a reduction in the memory allocation, then the number of trunks that are already allocated must not exceed the newly entered number.

## BUEND - Trunk Groups

### Functions of the AMO

The value entered for TRACENO should be less than the total number of trunks assigned to the trunk group. The value entered for ACDTHRH should not be greater than the value of parameter NO.

There is another restriction on changing GDTRRULE value. Existence of the entered value of GDTRRULE and number of trunks in the group are checked before changing it. (AMO-DNIT adds this rule number.) If the trunk group is not empty then it is not allowed to change the GDTRRULE value.

#### Example

Change the name of trunk group 47 to "ISDN CO".

Input:

```
CHANGE-BUEND:TGRP=47,NAME="ISDN CO";
```

Output:

```
H01: CHANGE TGRP 47 COMPLETED
```

### 37.2.3 DELETE-BUEND

This action deletes an existing trunk group.

#### Procedure Overview

| Command Code | Parameter      |
|--------------|----------------|
| DELETE-BUEND | TGRP=<number>; |

Trunk groups to be deleted must no longer be allocated to a route (trunk group are removed from a route by means of AMO RICHT). Trunk groups with allocated trunks can be deleted, in this case, the allocations of the trunks are released.

An exception is given by S2 and modem pool trunks, who have to be first deleted or put into an other trunk group by means of AMO TDCSU.

### 37.2.4 DISPLAY-BUEND

This action displays information about one or more existing trunk groups.

#### Procedure Overview

| Command Code  | Parameter                          |
|---------------|------------------------------------|
| DISPLAY-BUEND | [TGRP=<number>], [FORMAT=<param>]; |

If no number or range of numbers is entered for TGRP, all existing trunk groups will be displayed.

For each trunk group, the trunk group number, trunk group name, maximum number of allocated trunks, device type, subgroup index, the number of trunks to be traced without blocking the trunk group, the number of trunks that can handle ACD calls and the allocated port locations will be displayed.

If identical ports appear in the display for a trunk group, i.e. the same trunk appears more than once, then a corresponding number of devices is connected to the trunk.

By means of FORMAT parameter (B) , the B-channel status of a trunk group can be interrogated.

### Examples

Input:

DISPLAY-BUEND:42,B;

Output:

| NO. | MAX | ACT | BUSY | FREE | OTHER |
|-----|-----|-----|------|------|-------|
| 42  | 20  | 0   | 0    | 0    | 0     |

Interrogate trunk group 47.

Input:

DISPLAY-BUEND:47,L;

Output:

```

+-----+
| TRUNK GROUP NO.: 47   TRUNK GROUP NAME: ISDN CO           MAX.NO.: 60 |
| SUBGROUP NO.: 52    DEVICE TYPE: S2COD                   TRACENO: 0 |
| SEARCH MODE : CIRCULAR                               ACD THRESHOLD : * |
| ASSIGNED TO AT LEAST ONE ROUTE                       PRIORITY: 1 |
| TDDRFLAG : ON    TDDRTHRESHOLD:                          SOURCEGROUPIDX : 1 |
| GDTRRULE : 140   ACDPMGRP : 20                           |
| THE FOLLOWING TRUNKS (LTG-LTU-SLOT-CCT) HAVE BEEN ALLOCATED: |
+-----+

```

**37.2.5 REGENERATE-BUEND**

This action outputs existing trunk groups in the form of ADD commands.

**Procedure Overview**

| Command Code     | Parameter        |
|------------------|------------------|
| REGENERATE-BUEND | [TGRP=<number>]; |

If no number or range of numbers is entered for TGRP, all existing trunk groups will be regenerated.

**Example**

Regenerate all trunk groups.

Input:

REGENERATE-BUEND;

Output:

```
ADD-BUEND: 1 , "SATELLITE      ", 20 , N, 0 , * , 1 , OFF, 138, 20;
ADD-BUEND: 2 , "SATELLITE      ", 60 , N, 0 , * , 1 , ON , 38, 0 ;
ADD-BUEND: 3 , "SATELLITE      ", 20 , N, 0 , * , 1 , OFF, 230, 2 ;
ADD-BUEND: 4 , "MAINLP         ", 20 , N, 0 , * , 1 , ON , 14 , 140;
ADD-BUEND: 5 , "XX             ", 12 , Y, 0 , * , 8 , ON , 22 , 21;
ADD-BUEND: 6 , "XX             ", 12 , Y, 0 , * , 16, OFF, 140, 20;
ADD-BUEND: 7 , "TSAC           ", 20 , N, 0 , * , 1 , OFF, 0 , 225;
ADD-BUEND: 8 , "TSSIM          ", 30 , N, 0 , * , 1 , ON , 0 , 0;
ADD-BUEND: 9 , "TCOM-DICT      ", 20 , N, 0 , * , 2 , OFF, 0 , 0;
ADD-BUEND: 10, "TCOM-CCE       ", 20 , N, 0 , * , 2 , OFF, 0 , 0;
ADD-BUEND: 11, "VOICEMAIL      ", 20 , N, 0 , * , 2 , ON , 1 , 0;
ADD-BUEND: 12, "TCOM-NWS       ", 5 , N, 0 , * , 1 , ON , 0 , 0;
ADD-BUEND: 13, "TCOM-RA        ", 20 , N, 0 , * , 1 , OFF, 0 , 0;
```

**37.3 Parameter Description**

|         |                                                                                                                                                                                     |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|          | Default Value : 0                                                                                                                                                 |
|          | The AMO does not check, whether the inserted value causes a blocking of the trunk group.                                                                          |
| TGRP     | Trunk group number                                                                                                                                                |
|          | Type of Input : single value or range,<br>mandatory resp. optional                                                                                                |
|          | Possible Values : 1 to 512                                                                                                                                        |
|          | If no trunk group number is entered, the AMO tries to find a free trunk group number (CREATE) or outputs all trunk groups of the system (DISPLAY and REGENERATE). |

## 37.4 Error Messages and Advisories

### 37.4.1 Error Messages

F01: TGRP <xxx> ALREADY EXISTS  
F02: NO MORE FREE TRUNK GROUPS ARE AVAILABLE

F03: NO MORE FREE SUBGROUPS ARE AVAILABLE  
 F04: NO MEMORY IS AVAILABLE FOR CREATING THE TRUNK GROUP  
 F06: CANNOT DELETE TGRP <xxx> SINCE IT IS ALLOCATED TO AT LEAST ONE ROUTE  
 F07: TGRP <xxx> DOES NOT EXIST  
 F08: CANNOT CHANGE TGRP <xxx> SINCE NOT ENOUGH MEMORY IS AVAILABLE TO EXTENT NUMBER OF TRUNKS (PARAMETER NO)  
 F09: CANNOT CHANGE TGRP <xxx> SINCE IT IS ALLOCATED TO MORE TRUNKS THAN THE NUMBER ENTERED FOR PARAMETER NO  
 F10: NO TRUNK GROUP FOUND  
 F11: CANNOT DELETE TGRP <xxx> SINCE IT IS ALLOCATED TO S2-TRUNKS (REMOVE THE ALLOCATED S2-TRUNKS WITH AMO TDCSU)  
 F13: CANNOT ADD/CHANGE TGRP <xxx> SINCE PARAMETER NO CAN NOT BE GREATER THAN MAXIMUM ALLOWED LODEN (AMO DIMSU)  
 F14: not used  
 F15: CANNOT ADD/CHANGE TGRP <xxx> SINCE NO MEMORY IS AVAILABLE FOR CC-DB  
 F17: ACDTHRH <xxx> INVALID (NOT A NUMBER OR \*)  
 F18: ACDTHRH <xxx> NOT IN PERMISSIBLE RANGE FROM <xxx> TO <xxx>  
 F19: CHANGING PRIONUM TO 0 IS ALLOWED FOR EMPTY TRUNK GROUPS ONLY  
 F20: TRUNK NOT CONTAINED IN @@@@ @@@  
 F21: CANNOT @@@@@@@@@@ A PRIMARY RATE ACCESS TRUNK FROM @@@@@ @@@  
 F23: CANNOT @@@@@@@@@@ LAST TRUNK FROM @@@@@ @@@, SINCE THE TRUNK GROUP IS ALLOCATED TO AT LEAST ONE ROUTE  
 F30: TRUNK DOES NOT EXIST  
 F31: TRUNK IS ALREADY IN A TRUNK GROUP  
 F32: @@@@@ @@@ IS NOT EMPTY, PLEASE USE TRUNK AMO  
 F33: GDTRRULE DOES NOT EXIST.(AMO-DNIT)  
 F34: CAN NOT CHANGE GDTRRULE, SINCE TRUNK EXIST IN THE TRUNK GROUP.  
       (AMO-TACSU/TDCSU)  
 F35: ACD PHONE MAIL GROUP NUMBER IS NOT VALID. CONFIGURED BY AMO-ACDGP  
 F36: CAN NOT DELETE TRUNK GROUP , SINCE IT IS STILL REFERENCED BY AMO-DNIT. REMOVE THE ALLOCATED TRUNKS WITH AMO TACSU/TDCSU.

## 37.4.2 Advisories

H01: <action> TGRP <xxx> COMPLETED  
 H02: PARAMETER NAME HAS MORE THAN 15 CHARACTERS.  
       THE LAST CHARACTER WILL BE IGNORED FOR USAGE OF PARAMETER CHARCON.

## 39 CABA - Callback-Function of LDU FAMOS

|                       |                       |                               |
|-----------------------|-----------------------|-------------------------------|
| Validity for Variants | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships    | Parameter Description |                               |

The AMO CABA controls the *callback function of the LDU FAMOS* with the help of the CABA table.

This table contains passwords, symbolic processor names (description of the connection path) and the parameter CABA\_ALLOWED. The AMO CABA is used to add, change, delete and display this CABA table. Input of the data is carried using the parameters:

- CABAPSW :  
This password is used by the LDU FAMOS to ascertain the partner which desires a callback. It must be transferred to the LDU FAMOS upon request. FAMOS requests a CABA password from all connections initiated via a dial circuit as soon as there is at least one valid entry in the CABA table.
- PROCID :  
PROCID contains a symbolic processor name which must be added to the CMS database. This symbolic processor name is used for the callback from Hicom to the SZ.
- CABA :  
This parameter specifies whether the added partner may access the CABA table to write in it.

### 39.1 Validity for Variants

This AMO description is valid from ATLANTIC-R6.3

### 39.2 Interrelationships

AMO CPSM

The symbolic processor name set with the AMO CABA should be known in the CMS database (add using the AMO CPSM).

39.3 Functions of the AMO

- ADD-CABA : Add the CABA table
- CHANGE-CABA : Change single entries in the CABA table
- DELETE-CABA : Delete single entries or the entire CABA table
- DISPLAY-CABA : Display the CABA table
- REGENERATE-CABA : Regenerate the CABA table

39.3.1 ADD-CABA

CABAPSW, PROCID and CABA must be given. Following this, an entry is set up in the CABA table. If the specified password (CABAPSW) already exists in the CABA table, an error message is output. An error message also results when the maximum number of entries in the CABA table has been exceeded.

Procedure Overview

| Command Code | Parameter                                        |
|--------------|--------------------------------------------------|
| ADD-CABA     | CABAPSW=<string>, PROCID=<string>, CABA=<param>; |

Example

Add an entry in the CABA table with the password SZMCH and the symbolic processor name DVAPROC1 and callback class of service.

Input:

ADD-CABA:SZMCH,DVAPROC1,Y;

Output:

ADD-CABA:SZMCH,DVAPROC1,Y;  
H500: AMO CABA STARTED  
AMO CABA -... CALL - BACK  
ADD COMPLETED;

39.3.2 CHANGE-CABA

Changes entries in the CABA table. At least the password and one other paramater must be given.

### Procedure Overview

| Command Code | Parameter                                         |
|--------------|---------------------------------------------------|
| CHANGE-CABA  | CABAPSW=<string>, {PROCID=<string>, CABA=<param>} |

#### Examples

1. Deactivate callback class of service for an entry in the CABA table with the password SZMCH.

Input:

```
CHANGE-CABA:SZMCH,,N;
```

Output:

```
CHANGE-CABA:SZMCH,,N;
H500: AMO CABA STARTED
AMO CABA -... CALL - BACK
CHANGE COMPLETED;
```

2. Change the symbolic process name to DVAPROC2 for an entry in the CABA table with the password SZMCH.

Input:

```
CHANGE-CABA:SZMCH,DVAPROC2;
```

Output:

```
CHANGE-CABA:SZMCH,DVAPROC2;
H500: AMO CABA STARTED
AMO CABA -... CALL - BACK
CHANGE COMPLETED;
```

## 39.3.3 DELETE-CABA

Deletes an entry in the CABA table or deletes the entire table.

### Procedure Overview

| Command Code | Parameter                    |
|--------------|------------------------------|
| DELETE-CABA  | TYPE=PSWD, CABAPSW=<string>; |
|              | TYPE=ALL;                    |

#### Examples

1. Delete the entry with the password SZMCH from the CABA table.

Input:

```
DELETE-CABA:PSWD, SZMCH;
```

Output:

CABA - Callback-Function of LDU FAMOS

Functions of the AMO

```
DELETE-CABA:PSWD,SZMCH;
H500: AMO CABA STARTED
AMO CABA -... CALL - BACK
DELETE COMPLETED;
```

2. Delete the entire CABA table.

Input:

```
DELETE-CABA:ALL;
```

Output:

```
DELETE-CABA:ALL;
H500: AMO CABA STARTED
AMO CABA -... CALL - BACK
DELETE COMPLETED;
```

39.3.4 DISPLAY-CABA

Display is used to output the entire contents of the current CABA table.

Procedure Overview

| Command Code | Parameter |
|--------------|-----------|
| DISPLAY-CABA | ;         |

Example

Output all entries from the current CABA table.

Input:

```
DISPLAY-CABA;
```

Output:

```
DISPLAY-CABA;
H500: AMO CABA STARTED

CALL-BACK-TABLE FOR REMOTE-AMO-START ( LDU FAMOS )
=====
+=====+=====+=====+
| CABAPSW | PROCID | CABA |
| (CABAPASSWORD) | (PARTNERPROC.) | (AMO CALLUP ALLOWED) |
+=====+=====+=====+
| SZMCH | DVAPROC2 | N |
+-----+-----+-----+
| SZZUE | DVAPROC1 | Y |
+-----+-----+-----+

AMO CABA -... CALL - BACK
DISPLAY COMPLETED;
```

### 39.3.5 REGENERATE-CABA

Displays the entire contents of the current CABA table with output in command form for regeneration. Output is in the form of position-oriented commands. The first command is a delete command which deletes the entire CABA table.

#### Procedure Overview

| Command Code    | Parameter |
|-----------------|-----------|
| REGENERATE-CABA | ;         |

#### Example

Regenerate the entire CABA table

Input:

```
REGENERATE-CABA;
```

Output:

```
REGENERATE-CABA;
H500: AMO CABA STARTED
DELETE-CABA:ALL ;
ADD-CABA: "SZMCH" , "DVAPROC2" , N ;
ADD-CABA: "SZZUE" , "DVAPROC1" , Y ;
AMO CABA -... CALL - BACK
DISPLAY COMPLETED;
```

## 39.4 Parameter Description

|                 |                                                               |
|-----------------|---------------------------------------------------------------|
| CABA            | AMO CABA callup allowed                                       |
| Type of Input   | : Single value<br>mandatory (ADD)<br>group parameter (CHANGE) |
| Possible Values | : Y, N                                                        |
| PROCID          | identification of EDP processor                               |
| Type of Input   | : Single value<br>mandatory (ADD)<br>group parameter (CHANGE) |
| Possible Values | : alphanumeric ( max. 8 characters)                           |
| TYPE            | delete/display option                                         |

## 40 CDBR - Customer Data Backup and Restore

|                |                       |                               |
|----------------|-----------------------|-------------------------------|
| Restrictions   | Functions of the AMO  | Error Messages and Advisories |
| Interrelations | Parameter Description |                               |

The function of AMO CDBR is to save the configured customer data to a Hicom storage device, like hard disk, cartridge (CT), digital audio tape (DAT) or flash memory (FM). The BS2000 magnetic tape (MT) is not supported. This backup can be done periodically (routine backup) or with an explicit AMO order.

The internal function of the AMO is in that way, that it starts AMO REGEN to save the configuration data to the harddisk. In the next step this resultfile is compressed (when compression type is not none) and copied to the desired device by using AMO COPY. In case of device :NULL: only AMO REGEN will be executed.

The function of parameter 'restore' is to regain the saved data out of the compressed backup file back to the REGEN resultfile. To generate a new customer database, you have to use AMO GENDB.

Following items can be changed using AMO CDBR:

- Filename including directory path
- Data compression type
- Date/time and repetition intervall for routine backup
- Routine backup activated or deactivated

After first time installation of a Hicom APS the routine backup is deactivated and must be configured with the CHANGE command of AMO CDBR.

Because of the internal execution of AMO-VEGAS during a CDBR backup, all processors must be configured with an identical and valid system number.

For explicit backup you have the option to select a specific Hicom module, while at routine backup always the complete system is saved.

An explicit backup or restore can be cancelled via system logon by using the BREAK command.

In case of a restart during routine backup the routine backup is started again after restart is finished. A explicit backup is not started again in case of a restart.

**Examples**

1. Backup of SWU customer data in uncompressed format.

Input:

```
EXEC-CDBR:BACKUP,SWU,NONE;
```

< Output messages of AMO VEGAS, AMO REGEN und AMO COPY >

2. Restore of the saved customer data

Input:

```
EXEC-CDBR:RESTORE," :PAS:TESTFILE";
```

```
H01: INPUTFILE FOR AMO-GENDB: " :PAS:CDBR/R/RESULT"
```

**40.3.2 CHANGE-CDBR**

Configuration or change of the CDBR parameters. This is activation or deactivation of the routine backup, backupfile, compression type, date and time for routine backup and repetition interval.

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-CDBR  | ACTIVE=<param>, DFILE=<param>, COMP=<param><br>, YEAR=<param>, MONTH=<param>, DAY=<param><br>, HOUR=<param>, MIN=<param><br>, REPTYPE=<param>, REPINT=<param>; |

**Examples**

1. Configuration and activation of a weekly routine backup.

Input:

```
CHANGE-CDBR:Y," :PAS:TESTFILE",BINARY,1992,11,1,17,30,DAY,7;
```

2. Deactivation of the routine backup

Input:

```
CHANGE-CDBR:N;
```

**40.3.3 DISPLAY-CDBR**

Display of the current CDBR status.

Procedure Overview

| Command Code | Parameter |
|--------------|-----------|
| DISPLAY-CDBR | ;         |

Example

Display of the configured CDBR parameters

Input:

DISPLAY-CDBR;

Output:

```
+----- Customer Data Backup & Restore -----+
|
| ROUTINE BACKUP      :  DEACTIVATED - BY STATISTIC-ORDER
|
| DESTINATION-FILE    :  :AMD:TESTFILE
|
| COMPRESSION         :  BINARY
|
| DATE: 11/01/1992   TIME: 17-30-00  REP-TYPE: DAY    REP-INTERVAL: 7
|
| CURRENT PHASE       :  EXPLICIT RESTORE          - DECOMPRESSION PHASE
|
+-----+
|
| LAST ACTION         :  CDBR_EXPLICIT_BACKUP
| LAST PHASE          :  CDBR_COMPRESS_PHASE
| DATE & TIME         :  1997-05-22 17:24:34
|
+-----+
```

Overview Over Outputtexts

|               |   |                  |                       |
|---------------|---|------------------|-----------------------|
| STATE         | : | ACTIVATED        |                       |
|               |   | DEACTIVATED      | - AFTER INSTALLATION  |
|               |   |                  | - BY AMO-ORDER        |
|               |   |                  | - BY STATISTIC-ORDER  |
| CURRENT PHASE | : | NONE             |                       |
|               |   | EXPLICIT BACKUP  | - REGENERATION PHASE  |
|               |   |                  | - COMPRESSION PHASE   |
|               |   |                  | - BACKUP PHASE        |
|               |   | ROUTINE BACKUP   | - REGENERATION PHASE  |
|               |   |                  | - COMPRESSION PHASE   |
|               |   |                  | - BACKUP PHASE        |
|               |   | EXPLICIT RESTORE | - RESTORE PHASE       |
|               |   |                  | - DECOMPRESSION PHASE |

## 40.3.4 REGENERATE-CDBR

Regeneration of the AMO command out of the configured CDBR parameters.

The configuration of the routine backup is displayed in form of an CHANGE-CDBR command with the current parameters.

These configuration data are read from the CDBR table.

### Procedure Overview

| Command Code    | Parameter |
|-----------------|-----------|
| REGENERATE-CDBR | ;         |

### Example

Regeneration of the CDBR data

Input:

```
REGENERATE-CDBR;
```

Output:

```
CHANGE-CDBR:Y," :PAS:TESTFILE",BINARY,1992,11,1,17,30,DAY,7;
```

## 40.4 Parameter Description

|        |                                      |                           |                                       |
|--------|--------------------------------------|---------------------------|---------------------------------------|
| ACTION | CDBR-action to be executed           |                           |                                       |
|        | Type of input                        | : Single value, mandatory |                                       |
|        | Possible values                      | : BACKUP                  | = Customer-data backup                |
|        |                                      | RESTORE                   | = Customer-data restore               |
| ACTIVE | Activation-switch for routine backup |                           |                                       |
|        | Type of input                        | : Single value, optional  |                                       |
|        | Possible values                      | : Y                       | = Yes, activate routine backup        |
|        |                                      | N                         | = No, do not activate routine backup  |
| COMP   | Type of data compression             |                           |                                       |
|        | Type of input                        | : Single value, optional  |                                       |
|        | Possible values                      | : NONE                    | = Data-compression off                |
|        |                                      | ASCII                     | = Data-compression of character level |
|        |                                      | BINARY                    | = Data-compression binary             |

## CDBR - Customer Data Backup and Restore

### Parameter Description

|        |                                           |                                                                                     |
|--------|-------------------------------------------|-------------------------------------------------------------------------------------|
|        | Default value                             | : Value of CDBR table                                                               |
| DAY    | Date-day                                  |                                                                                     |
|        | Type of input                             | : Single value, optional                                                            |
|        | Possible values                           | : 1-31                                                                              |
|        | Default value                             | : Current day                                                                       |
| DFILE  | Destination-file including directory-path |                                                                                     |
|        | Type of input                             | : Single value, optional                                                            |
|        | Possible values                           | : Valid DMS filename                                                                |
|        | Default value                             | : Filename configured in CDBR table                                                 |
| HOUR   | Time-hour                                 |                                                                                     |
|        | Type of input                             | : Single value, optional                                                            |
|        | Possible values                           | : 0-23                                                                              |
|        | Default value                             | : 2                                                                                 |
| MIN    | Time-minute                               |                                                                                     |
|        | Type of input                             | : Single value, optional                                                            |
|        | Possible values                           | : 0-59                                                                              |
|        | Default value                             | : 0                                                                                 |
| MODULE | System Unit                               |                                                                                     |
|        | Type of input                             | : Single value, optional                                                            |
|        | Possible values                           | : ADS = Administration and data server<br>SWU = Switching unit<br>ALL = All modules |
|        | Default value                             | : ALL                                                                               |
| MONTH  | Date-month                                |                                                                                     |
|        | Type of input                             | : Single value, optional                                                            |
|        | Possible values                           | : 1-12                                                                              |
|        | Default value                             | : Current month                                                                     |
| REPINT | Repetition interval                       |                                                                                     |
|        | Type of input                             | : Single value, optional                                                            |
|        | Possible values                           | : 1-99                                                                              |
|        | Default value                             | : 1                                                                                 |

|                 |                                            |
|-----------------|--------------------------------------------|
| REPTYPE         | Unit of repetition                         |
| Type of input   | : Single value, optional                   |
| Possible values | : HOUR = Repetition-unit hour              |
|                 | DAY = Repetition-unit day                  |
|                 | MONTH = Repetition-unit month              |
| Default value   | : DAY                                      |
| SFILE           | Source-file including directory-path       |
| Type of input   | : Single value, optional                   |
| Possible values | : Valid DMS filename, max. of 32 positions |
| Default value   | : Filename configured in CDBR table        |
| YEAR            | Date-year                                  |
| Type of input   | : Single value, optional                   |
| Possible values | : 1992-2099                                |
| Default value   | : Current year                             |

## 40.5 Error Messages and Advisories

### 40.5.1 Error Messages

F01: OVERLAY IS IN USE  
 F02: OVERLAY LOAD ERROR  
 F03: OVERLAY INIT ERROR  
 F04: USER-TASK LOGON FAILURE  
 F05: AMC LOGON FAILURE  
 F06: START OF AMO-VEGAS NOT SUCCESSFUL  
 F07: ERROR AT DATA REGENERATION  
 F08: ERROR AT DATA COMPRESSION  
 F09: ERROR AT DATA DECOMPRESSION  
 F10: RESERVE TAPE ERROR  
 F11: RELEASE TAPE ERROR  
 F12: DMS ERROR  
 F13: ERROR WHILE COPYING DATA  
 F14: DEVICE <device> DOES NOT EXIST  
 F15: NAME <device> IS SYNTACTICALLY NOT CORRECT  
 F16: INVALID FILENAME  
 F17: INVALID SYSTEM-NO  
 F18: INVALID SET-VALUE

**Explanations:**

<device>    Devicename of the parameter DFILE or SFILE

**40.5.2    Advisories**

H01: INPUTFILE FOR AMO-GENDB: ":PAS:CDBR/R/RESULT"  
H02: CDBR BREAK-ORDER PENDING  
H03: CDBR-FUNCTION ABORTED  
H04: CDBR-FUNCTION NOT ABORTED

## 41 CDSM - Cabinet Configuration Display of System Server

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

This AMO is used to output the cabinet configuration of a system - cabinet data, module frame data, and data of the server modules in the form of a table.

The cabinet is addressed by means of its cabinet address.

### Description of the cabinet address:

Figure 1 Cabinet Address

### Output form

```

CABINET ADDRESS : aaaa
CABINET TYPE    : bbbbbbbb
CODE NUMBER     : ccccccccc

SHELF           : d
FRAME TYPE      : eeeeeeee ff
CODE NUMBER     : gggggggggg
  
```

## 41.1 Restrictions

This description is valid from SP300-V3.4

## 41.2 Interrelationships

- AMO BCSM : Configuration of server modules
- AMO CDSU : Interrogate cabinet conf. and CC conf.

## CDSM - Cabinet Configuration Display of System Server

Functions of the AMO

- AMO CONSY : Cabinet and Frame Configuration of System

### 41.3 Functions of the AMO

- **DISPLAY-CDSM** : Interrogate the cabinet configuration

#### 41.3.1 DISPLAY-CDSM

Interrogate cabinet configuration and module configuration of the servers

Output is done in form of a table

##### Note

The AMO CDSM has the function DISPLAY-CDSU only.

##### Procedure Overview

| Command Code | Parameter                         |
|--------------|-----------------------------------|
| DISPLAY-CDSM | [ADR=<string>], [SHELF=<number>]; |

##### Examples

1. Interrogate shelf 2 in cabinet P205

Input:

```
DISPLAY-CDSM:P205,2;
```

Output:

```
CABINET ADDRESS: P205
CABINET TYPE    : CABB
CODE NUMBER     : G5208-X

SHELF           : 2
FRAME TYPE      : LTU      1
CODE NUMBER     : B5307-X
```

2. Display shelf 7 in cabinet P205

Input:

```
DISPLAY-CDSM:P205,7;
```

Output:

## CDSM - Cabinet Configuration Display of System Server

| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

This AMO is used to output the cabinet configuration of a system - cabinet data, module frame data, and data of the SWU-CC modules - in the form of a table or position-oriented commands for compiling a diagram by means of a PC program.  
The cabinet is addressed by means of its cabinet address.

## Description of the Cabinet Address

Figure 3 Cabinet Address

## 42.1 Restrictions

This description is valid from SP300-V3.1

## 42.2 Interrelationships

- AMO BCSU : Board Configuration, Switching Unit
- AMO CDSM : Cabinet Configuration Display of System Server
- AMO CONSY : Cabinet and Frame Configuration of System

42.3 Functions of the AMO

- **DISPLAY-CDSU** : Interrogate the cabinet configuration

42.3.1 DISPLAY-CDSU

Interrogate the cabinet configuration and module configuration of the CC

Output is done in form of a table

Note

- The AMO CDSU has the function DISPLAY-CDSU only.

Procedure Overview

| Command Code | Parameter                         |
|--------------|-----------------------------------|
| DISPLAY-CDSU | [ADR=<string>], [SHELF=<number>]; |

Examples

1. Interrogate shelf 2 in cabinet P205

Input:

DISPLAY-CDSU:P205,2;

Output:

```
DISPLAY-CDSU:P205,2;
H500: AMO CDSU  STARTED

CABINET ADDRESS: P205
CABINET TYPE    : CABB
CODE NUMBER     : G5208-X

## 43 CGWB - Configuration of HG 3500 (CGW) Board

The description of this AMO is only available in html format!

## 44 CHESE - Executive/Secretary Arrangements (Integrated arrangements)

|                      |                               |
|----------------------|-------------------------------|
| Interrelationships   | Parameter Description         |
| Functions of the AMO | Error Messages and Advisories |

The integrated executive/secretary arrangement is a special group configuration of system stations as executive, secretary stations and maybe some more representative stations. In one integrated arrangement are 4 executive, 2 secretary and for each secretary two more stations allowed. Only digital terminals e.g. Optiset E can be users of an integrated arrangement. Executive and secretary stations must not be configured as "DIGITE with no display" (\*1).

Every integrated arrangement has a special group code, which can be 1 to 1000. The level will be fixed by AMO DIMSU.

Each executive and secretary station can only belong to one group. The stations with representative function can belong to more than one group. Secretary stations can also be used as representative stations. Secretary stations can also belong to one group without relation to an executive.

Secretary stations have to be signed as such by AMO SBCSU (SECR = Y).

Executive and secretary stations have to have special function key:

- Executive station
  - PU (call pickup) key for each executive
  - DSS (direct station select) key for the secretary
  - (and possibly for representative stations)
- Secretary station
  - PU key for each executive
  - DSS key for each executive
  - RNGXFER key (deactivation of secretarial intercept)
  - REP (secretarial transfer) key for each executive

In the database there are some standard key functions for executive and secretary stations for different terminals specified. With AMO SBCSU these function keys are configured for the terminals.

The standard function keys can be changed with AMO TAPRO and also can some new function keys be created.

The special function keys for integrated arrangements can not be programmed by the terminals.

### **Tone Ringing**

The Hicom terminal (DIGITE) usually has a single tone ringing (one frequency). Ring discrimination for calls between the executive and the secretary is implemented by means of special ring cadences which are administerable. (parameter MULTN)

### **Delayed Notification Ringing**

Where calls are signalled simultaneously e.g. to executive and secretary, an acoustic notification is normally applied after a predetermined (AMO parameter) delay. The notification to be applied can be a single or multiple burst, the burst being applied either only when the station is in the idle state, in all states, or not at all.

### **Additional Features**

Additional special features are created by means of other AMOs:

- An executive station has a secrete directcall phonenummer. Calls on these second number, will not be transfered to the secretary station. This is managed by AMO SA with a code, which is the same as the secrete phonenummer.
- Secondary stations are possible. AMO AUN defines these secondary telephones for executive and secretary stations.
- Call Forwarding (FWD) and Ring No Answer (RNA): The call is routed to a Voice Mailbox specified by AMO CHESE. Possible values are:
  - NONE: The call for the appropriate executive is not routed for FWD and RNA to any mailbox.
  - EXEC: The call for the appropriate executive is routed for FWD and RNA into the executive's mailbox.
  - SECR: The call for the appropriate executive is routed for FWD and RNA into the secretary's mailbox.

The setting is assigned to a specific executive and becomes effective if

- the intercept key is not activated (executive is not intercept destination) and
- the Voice Mailbox is activated as FWD/RNA-destination for the executive

An activated deputy secretary does not affect this feature. An activated FWD-All-Calls is given preference.

## 44.1 Interrelationships

- AMO DIMSU : Dimensioning of features, Switching Unit
- AMO TAPRO : Key programming
- AMO SA : Hunting arrangements
- AMO AUN : Call pickup groups
- AMO ZIEL : Destinations for various station features
- AMO SBCSU : Creation of stations. Secretary stations have to be marked separately.
- AMO SSCSU : Creation of special subscribers
- AMO KCSU : Creation of keyset subscribers
- AMO SDAT : Subscriber data and attributes

## 44.2 Functions of the AMO

- **ADD-CHESE** : Create an integrated executive/secretary arrangement
- **CHANGE-CHESE** : Change an integrated executive/secretary arrangement
- **DELETE-CHESE** : Cancel an integrated executive/secretary arrangement
- **DISPLAY-CHESE** : Interrogate an integrated executive/secretary arrangement
- **REGENERATE-CHESE** : Regenerate an integrated executive/secretary arrangement

### 44.2.1 ADD-CHESE

This function allows to create a complete integrated arrangement consisting 1 to 4 executive, 2 secretary and 2 more stations with representative function.

The sequence of executive and secretary station phonenumbers and the parameter ALLOC fixes the relations between executive and secretary stations.

For all station numbers (executive, secretary, representative) dummy numbers (000000) may be entered. The meaning of these numbers is to reserve space, i.e. the affected spot in the integrated arrangement remains free. So any configuration can be generated by one ADD command.

## CHESE - Executive/Secretary Arrangements (Integrated arrangements)

### Functions of the AMO

The sequence of the numbers of representative stations is important to find the relations to the first and second secretary phonenumbers. If it is necessary to give the second secretary a representative station, then one must enter a dummy-number (000000) for the first representative station.

It is rejected, if a number of a hunting group master is entered as executive or representative station number.

Radio connected stations (CMI, AMO SBCSU)) and special subscribers configured by AMO SSCSU, are rejected as members of executive/secretary arrangements.

Keyset subscribers are rejected as executive or secretary but allowed as representative.

Subscribers with "Automatic Call Distribution" attribute AGENT are rejected as executive. Subscribers with at least one of the ACD attributes AGENT, SUPER, AUTOLOG or CAF are rejected as secretary.

The parameters MBOX1 to MBOX4 are correlated to the executive station numbers defined in parameter EXEC.

Subscribers that are ONS members can not be assigned as a CHESE member.

### Procedure Overview

| Command Code | Parameter                                            |
|--------------|------------------------------------------------------|
| ADD-CHESE    | [GRNO=<number>], EXEC=<number>, SECR=<number>        |
|              | , [ALLOC=<param>], [MULTN=<param>], [REP=<number>]   |
|              | , [NOTRNG=<param>], [MBOX1=<param>], [MBOX2=<param>] |
|              | , [MBOX3=<param>], [MBOX4=<param>;                   |

### Example

Create an integrated executive/secretary arrangement belonging to groupnumber 20 and with two executives, two secretaries, and with multi-tone ringing. Each executive is assigned to a separate secretary. Secretary 2 is assigned a deputy secretary. The executives are added as executive 1 and executive 3.

Input:

```
ADD-  
CHESE:GRNO=20,EXEC=4700&000000&4710,SECR=4705&4715,ALLOC=E1S1&E3  
S2 ,MULTN=Y,REP=000000&6115,MBOX1=SECR,MBOX3=NONE;
```

It is not necessary to specify MBOX3 in this example because NONE is the default value.

## 44.2.2 CHANGE-CHESE

The following changes are possible:

1. Add station (executive, secretary, deputy secretary), or change the allocation/assignment of secretaries to executives
2. Executive number
3. Secretary number
4. Executive SLK Label
5. Secretary SLK Label
6. Multi-tone ringing
7. Notification burst after preset delay
8. Voice Mailbox

Depending on the requirements, case 1 above results in the following actions being necessary:

|                                                   | <b>Secretary already entered in the executive/secretary arrangement</b>                                                                                                | <b>Secretary not yet entered in the executive secretary arrangement</b>                                                                     |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Executive already entered in the exec/secr system | 1. Executive is not yet assigned to the secretary:<br>delete old allocation<br>enter new allocation<br>2. Executive is already assigned to the secretary:<br>no change | Enter secretary<br>Delete old allocation<br>Enter new allocation<br>Possible error messages:<br>Number of secretaries > 2                   |
| Executive not yet entered in the exec/secr system | Enter executive<br>Enter allocation<br>Possible error messages:<br>Number of executives > 4                                                                            | Enter executive<br>Enter secretary<br>Enter allocation<br>Possible error messages:<br>Number of executives > 4<br>Number of secretaries > 2 |
| Executive not specified in command                | No change                                                                                                                                                              | Enter secretary<br>Possible error messages:<br>Number of secretaries > 2                                                                    |

- When a deputy secretary is specified, old entries are overwritten only if the secretary already entered is not active.  
Changes in the hierarchical relationships are not permitted (e.g., an executive cannot become a secretary).
- If one of the specified stations is already a member of another executive/ secretary arrangements, the job is rejected (with the exception of deputy secretaries).

## CHESE - Executive/Secretary Arrangements (Integrated arrangements)

### Functions of the AMO

- When stations are changed (OLD ---> NEW), the existing activations of the old station (RNGXFER for executive or REP for secretary) are reset.
- As a NEWEXEC or Representative station number it is not allowed to enter a number of a hunting group master.
- Radio connected stations (CMI, AMO SBCSU)) and special subscribers configured by AMO SSCSU, are rejected as EXEC, NEWEXEC, SECR, NEWSECR and REP.
- Keypad subscribers are rejected as EXEC, NEWEXEC, SECR, NEWSECR.
- Subscribers with "Automatic Call Distribution" attribute AGENT are rejected as EXEC and NEWEXEC. Subscribers with at least one of the ACD attributes AGENT, SUPER, AUTOLOG or CAF are rejected as SECR and NEWSECR.
- Subscribers that are ONS members can not be assigned as a CHESE member.

### Procedure Overview

| Command Code | Parameter                                    |
|--------------|----------------------------------------------|
| CHANGE-CHESE | GRNO=<number>                                |
|              | ,TYPE=ADDSTN, [EXEC=<number>], SECR=<number> |
|              | , [REP=<number>]; (1)                        |
|              |                                              |
|              | ,TYPE=EXEC, OLDEXEC=<number>                 |
|              | ,NEWEXEC=<number>; (2)                       |
|              |                                              |
|              | ,TYPE=SECR, OLDSECR=<number>                 |
|              | ,NEWSECR=<number>; (3)                       |
|              |                                              |
|              | ,TYPE=EXECSLK, EXEC=<number>, KEY=RU1        |
|              | , [SLKTYPE=SLKSTNO];                         |
|              | , [SLKTYPE=SLKNAME];                         |
|              | , [SLKTYPE=SLKTEXT, SLKTEXT=<param>; (4)     |
|              |                                              |
|              | ,TYPE=SECRSLK, SECR=<number>, KEY=<param>    |
|              | , [SLKTYPE=SLKSTNO];                         |
|              | , [SLKTYPE=SLKNAME];                         |
|              | , [SLKTYPE=SLKTEXT, SLKTEXT=<param>; (5)     |

## CHESE - Executive/Secretary Arrangements (Integrated arrangements)

### Functions of the AMO

| Command Code | Parameter                                     |
|--------------|-----------------------------------------------|
|              | ,TYPE=MULTN,MULTN=<param>; (6)                |
|              | ,TYPE=NOTRNG,NOTRNG=<param>; (7)              |
|              | ,TYP=EXECATTR,EXEC=<number>,MBOX=<param>; (8) |

### Examples

Following integrated arrangement is configured:

|                   |          |         |        |  |
|-------------------|----------|---------|--------|--|
| GROUP NO.         | :        | 1       |        |  |
| MULTITONE RING    | :        | Y       |        |  |
| NOTIFICATION RING | :        | ON3     |        |  |
| EXEC              | SECR     | REP     | MBOX   |  |
| 3101              | 3103     | 3106    | EXEC   |  |
| 3110              | 3104     | 3103    | NONE   |  |
| STNNO             | KEY      | SLKTYPE | SLKTXT |  |
| 3101              | RNGXFER1 | SLKSTNO |        |  |
| 3103              | RNGXFER1 | SLKSTNO |        |  |
| 3103              | PUS1     | SLKSTNO |        |  |

1. Executive 2 should also have secretary 1

Input:

CHANGE-CHESE:GRNO=1,TYPE=ADDSTN,EXEC=3110,SECR=3103;

Secretary 2 is after this change a second secretary:

|                   |          |         |        |  |
|-------------------|----------|---------|--------|--|
| GROUP NO.         | :        | 1       |        |  |
| MULTITONE RING    | :        | Y       |        |  |
| NOTIFICATION RING | :        | ON3     |        |  |
| EXEC              | SECR     | REP     | MBOX   |  |
| 3101              | 3103     | 3106    | EXEC   |  |
| 3110              |          |         | NONE   |  |
|                   | 3104     | 3103    |        |  |
| STNNO             | KEY      | SLKTYPE | SLKTXT |  |
| 3101              | RNGXFER1 | SLKSTNO |        |  |
| 3103              | RNGXFER1 | SLKSTNO |        |  |
| 3103              | PUS1     | SLKSTNO |        |  |

2. Secretary 2 now is to be related to an executive

Input:

CHANGE-CHESE:GRNO=1,TYPE=ADDSTN,EXEC=3112,SECR=3104;

following picture is now to see:

## CHESE - Executive/Secretary Arrangements (Integrated arrangements)

### Functions of the AMO

|                         |          |         |        |
|-------------------------|----------|---------|--------|
| GROUP NO. : 1           |          |         |        |
| MULTITONE RING : Y      |          |         |        |
| NOTIFICATION RING : ON3 |          |         |        |
| EXEC                    | SECR     | REP     | MBOX   |
| 3101                    | 3103     | 3106    | EXEC   |
| 3110                    |          |         | NONE   |
| 3112                    | 3104     | 3103    | NONE   |
| STNNO                   | KEY      | SLKTYPE | SLKTXT |
| 3101                    | RNGXFER1 | SLKSTNO |        |
| 3103                    | RNGXFER1 | SLKSTNO |        |
| 3103                    | PUS1     | SLKSTNO |        |

3. the secretary phonenummer 3103 will be changed into 3105

Because this number also is entered as representative for secretary 2, one has to create two commands (the sequence is not important).

Input:

```
CHANGE-CHESE:GRNO=1,TYPE=SECR,OLDSECR=3103,NEWSECR=3105;  
CHANGE-CHESE:GRNO=1,TYPE=ADDSTN,SECR=3104,REP=3105;
```

new configuration:

|                         |          |         |        |
|-------------------------|----------|---------|--------|
| GROUP NO. : 1           |          |         |        |
| MULTITONE RING : Y      |          |         |        |
| NOTIFICATION RING : ON3 |          |         |        |
| EXEC                    | SECR     | REP     | MBOX   |
| 3101                    | 3105     | 3106    | EXEC   |
| 3110                    |          |         | NONE   |
| 3112                    | 3104     | 3105    | NONE   |
| STNNO                   | KEY      | SLKTYPE | SLKTXT |
| 3101                    | RNGXFER1 | SLKSTNO |        |
| 3105                    | RNGXFER1 | SLKSTNO |        |
| 3105                    | PUS1     | SLKSTNO |        |

4. For FWD/RNA, the executives 3101 und 3110 want to assign the mailboxes of their secretaries.

Input:

```
CHANGE-CHESE:GRNO=1,TYPE=EXECATTR,EXEC=3101,MBOX=SECR;  
CHANGE-CHESE:GRNO=1,TYPE=EXECATTR,EXEC=3110,MBOX=SECR;
```

new configuration:

|                         |      |      |      |
|-------------------------|------|------|------|
| GROUP NO. : 1           |      |      |      |
| MULTITONE RING : Y      |      |      |      |
| NOTIFICATION RING : ON3 |      |      |      |
| EXEC                    | SECR | REP  | MBOX |
| 3101                    | 3105 | 3106 | SECR |
| 3110                    |      |      | SECR |

## CHESE - Executive/Secretary Arrangements (Integrated arrangements)

Functions of the AMO

| 3112  | 3104     | 3105    | NONE    |
|-------|----------|---------|---------|
| STNNO | KEY      | SLKTYPE | SLKTEXT |
| 3101  | RNGXFER1 | SLKSTNO |         |
| 3105  | RNGXFER1 | SLKSTNO |         |
| 3105  | PUS1     | SLKSTNO |         |

### 5. Secretary is assigned to executive 3103.

Input:

CHANGE-

CHESE:GRNO=4,TYPE=EXEC SLK,EXEC=3101,KEY=RNGXFER1,SLKTYPE=SLKTEXT,  
SLKTEXT= Secretary;

CHANGE-

CHESE:GRNO=4,TYPE=SECR SLK,EXEC=3103,KEY=RNGXFER1,SLKTYPE=SLKTEXT,  
SLKTEXT= boss;

new configuration:

|       |                   |          |         |
|-------|-------------------|----------|---------|
| ----- |                   |          |         |
|       | GROUP NO.         | :        | 1       |
|       | MULTITONE RING    | :        | Y       |
|       | NOTIFICATION RING | :        | ON3     |
|       |                   |          |         |
|       | EXEC              | SECR     | REP     |
|       | 3101              | 3103     | 3104    |
|       | 3112              |          |         |
|       | 3110              | 3104     | 3103    |
|       |                   |          | MBOX    |
|       |                   |          | EXEC    |
|       |                   |          | SECR    |
|       |                   |          | NONE    |
| ----- |                   |          |         |
|       | STNNO             | KEY      | SLKTYPE |
|       | 3101              | RNGXFER1 | SLKTEXT |
|       | 3103              | RNGXFER1 | SLKTEXT |
|       | 3103              | PUS1     | SLKSTNO |
| ----- |                   |          |         |

## 44.2.3 DELETE-CHESE

The following options exist for cancellations:

1. all integrated executive/secretary arrangements in a system
2. one integrated executive/secretary arrangements or individual station

| Parameter EXEC, SECR or REP | AMO-Action                                                                                                                                                    |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| none                        | the whole group with GRNO will be deleted.                                                                                                                    |
| EXEC                        | executive will be deleted.                                                                                                                                    |
| SECR                        | a secretary will be deleted, if no executive is in relation. A related representative secretary also will be deleted.                                         |
| EXEC and SECR               | executive and secretary will be deleted, if the secretary is related only to one executive<br>A representative related to the secretary also will be deleted. |

Table 5 Cancel integrated arrangements

## CHESE - Executive/Secretary Arrangements (Integrated arrangements)

Functions of the AMO

| Parameter EXEC, SECR or REP | AMO-Action                                                                                |
|-----------------------------|-------------------------------------------------------------------------------------------|
| REP                         | rep. secretary will be deleted in those groups,where entered (max. two deletes possible). |
| REP and SECR or EXEC        | rep. secretary will be deleted, where related to SECR (or to the secretary of EXEC)       |

Table 5 Cancel integrated arrangements

- If there is more than the minimum configuration (one EXEC and one SECR) in a group deleted, the whole group will be cancelled.
- A message is output where an implicit deletion has occurred.
- A representative secretary will only be cancelled, if it is deactivated.
- When an executive or a secretary is cancelled, the existing activations are reset.
- To cancel an integrated arrangement the users of an executive and the secretary stations have to be locked and afterwards unlocked.
- Mailbox assignments cannot be deleted. This function can be performed by a CHANGE-command with parameter MBOX=NONE.

### Procedure Overview

| Command Code | Parameter                                               |
|--------------|---------------------------------------------------------|
| DELETE-CHESE | TYPE=SYS; (1)                                           |
|              |                                                         |
|              | TYPE=GR,GRNO=<number>, [EXEC=<number>], [SECR=<number>] |
|              | , [REP=<number>]; (2)                                   |

### Examples

following arrangement exists:

|                                                                                                                                                                           |          |         |        |

1. The representative station has to be deleted.

Input:

```
DELETE-CHESE:TYPE=GR,GRNO=1,REP=3106;
```

2. The representative station of secretary 3104 has to be deleted.

Input:

```
DELETE-CHESE:TYPE=GR,GRNO=1,SECR=3104,REP=3106;
```

or

```
DELETE-CHESE:TYPE=GR,GRNO=1,EXEC=3110,REP=3106;
```

## 44.2.4 DISPLAY-CHESE

1. Interrogate all integrated executive/secretary arrangements in a system
2. Interrogate one integrated executive/secretary arrangements
3. Interrogate individual stations to determine if they are members of an integrated executive/secretary arrangements

Because a station can simultaneously be a member of one executive/secretary system (secretary) and a representative secretary for another executive/secretary system, several different types of output are possible for (3).

When the system is interrogated, only created executive/secretary arrangements are output, i.e., negative acknowledgements are not output for executive/secretary systems that are not assigned. When individual stations are interrogated, all the data of the associated executive/secretary arrangements is output.

### Procedure Overview

| Command Code  | Parameter                   |
|---------------|-----------------------------|
| DISPLAY-CHESE | TYPE=SYS; (1)               |
|               |                             |
|               | TYPE=GR,GRNO=<number>; (2)  |
|               |                             |
|               | TYPE=STN,STNO=<number>; (3) |

### Example

Interrogate the integrated executive/secretary arrangements having group number 1.

Input:

CHESE - Executive/Secretary Arrangements (Integrated arrangements)

Parameter Description

DISPLAY-CHESE:TYPE=GR,GRNO=1;

Output:

|                                       |                   |   |          |  |  |         |  |  |  |  |  |  |  |  |  |  |        |  |  |

## 45 CLIMA - CLI Manipulation

The description of this AMO is only available in html format!

### 45.1 Configuration

Calls to a Domain will be routed to a specific trunk based on the configuration via AMO CLIMA.

With AMO CLIMA, a mapping table can be configured with a DOMAIN-NUMBER, where NUMBER represents a preconfigured trunk access code.

#### AMO LDPLN

- For the new DOMAIN table, a DOMAIN NUMBERING PLAN has to be configured.
- The 790 numbering plan in the LCR pool 8 will be reserved for the DOMAIN table.

```
ADD-LDPLN:LCRADM,790,8,20,"DOMAIN PATTERN PLAN";
```

---

**NOTE:** The 790 numbering plan in the LCR pool 8 is reserved for the DOMAIN table, therefore it must not be included by UPLOL in LDPLNS and LDPLN objects.

---

#### AMO CLIMA

- A new TABLE named DOMAIN has been added for domain mapping.
- The domain is mapped to a number which is a preconfigured trunk access code.
- The calls to a specific domain will be routed to the configured trunk according to the DOMAIN-NUMBER pair configured with AMO CLIMA.

```
ADD-CLIMA:DOMAIN,ATOS.NET,101;
```

```
// the Domain ATOS.NET will be routed to preconfigured trunk  
access code 101
```

```
<ADD-CLIMA
```

```
TABLE = ?

## 46 CLIST - List cyclic files

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restriction        | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The AMO CLIST serves to output files written cyclically by the FILE TASK.

Cyclic files are configured with AMO ASSGN. The difference between cyclic files and other files is the special file header structure. Cyclic organization means that when writing a file of limited length, the system returns to the beginning of file as soon as the file end is reached.

The old contents are then overwritten from the beginning.

In the Hicom system, C-files are filled with texts. These texts may be fault reports generated by the dependability system, text output from resident tasks (freerunning messages) or text output by AMOs. The AMO output function is confined initially to fault reports already processed by the MMI.

The main task of the AMO is to read text output from resident tasks (freerunning messages) and text output from AMOs.  
The AMO HISTO is used to read the HTS-Histo file.

The name of the C-file must begin with "C-". The AMO assumes that the cyclic files are found on the :AMD: area (Configured by AMO ASSGN).

The AMO displays the text stored in the cyclic file line by line. Either the entire cyclic file or a specified number of lines can be displayed.

There is a paging function (forward) similar to that of the AMO LIST. After outputting a complete screen page, the AMO requests confirmation indicating whether output is to be continued or terminated, or whether all the remaining lines are to be output at once.

The oldest line may be incomplete. This is caused by the overwrite function of cyclic files. This line will be displayed too, but there is no guarantee that the line is complete.

### 46.1 Restriction

This description is valid from SP300-V3.3

46.2 Interrelationships

- AMO-ASSGN : Device Assignment
- AMO-HISTO : Read HTS History File

46.3 Functions of the AMO

- [START-CLIST](#) : Outputting cyclic files

46.3.1 START-CLIST

The Start action outputs the entire cyclic file.

If the parameter ADR is specified, output begins with this line. (If ADR=5 the output begins with the fifth oldest line.)

If the parameter LEN is specified, the number of lines specified by LEN will be displayed, beginning with the very oldest line in the cyclic file or after the number of lines defined by ADR.

Procedure Overview

| Command Code | Parameter                                                             |
|--------------|-----------------------------------------------------------------------|
| START-CLIST  | FILENAME=<string>, [ADR=<number>], [LEN=<number>]<br>, [ANS=<PARAM>]; |

Examples

1. From the cyclic file C-File, display the 5 oldest lines.

Input:

START-CLIST:"C-FILE",,5,N;

Output:

```
+----- CUSTOMER DATA BACKUP & RESTORE -----+
|
| ROUTINE BACKUP      :  DEACTIVATED - BY AMO-ORDER
|
```

2. Display the entire cyclic file C-FILE.

Input:

START-CLIST:"C-FILE";

**Output:**

```

+----- CUSTOMER DATA BACKUP & RESTORE -----+
| ROUTINE BACKUP      : DEACTIVATED - BY AMO-ORDER |
| DESTINATION-FILE    : :PAS:TESTFILE              |

## 47 CMP - Compare of Files or PS's

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO CMP is used to compare individual files and entire program systems.

If a program system is compiled and tested on a reference system for the technical support staff, it may also be faster to get some subsystems to the system by means of private production. Subsystems are patched in the same way. The AMO CMP can be used to determine whether a hard disk functioning in the reference system is identical to a production delivery with imported, patched subsystems. This saves loading the production in the system, booting and matching the features.

It is necessary to give the fully qualified file names when comparing two individual files.

### 47.1 Restrictions

This description is valid from HiPath 4000 V6.0.

### 47.2 Interrelationships

None

### 47.3 Functions of the AMO

- [START-CMP](#) : Start the compare of two files

#### 47.3.1 START-CMP

Starts the compare; either two files are compared or two entire program systems, with one program system being on the load area :PDS: on the hard disk and the other on a delivery directory on the hard disk coming from the production.

**CMP - Compare of Files or PS's**  
Parameter Description

A direct compare of two load areas with TYPE=PS is not supported.

Delivery directorys on the hard disk could be generated by means of the AMOs DUMP-APS or START-BACK, or by means of PCHI or FT.

The name of the delivery directory is freely optional and in this description „:SCR:DD/" is used as name of the delivery directory.

In the event that there are two DIR files on the delivery directory, both program systems are compared.

The parameter VOLNAME is not necessary for delivery directorys on the hard disk.

**Procedure Overview**

| Command Code | Parameter                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------|
| START-CMP    | [ANS=<string>], [VOLNAME=<string>]<br> , [TYPE=SGL], FILENA1=<string>, FILENA2=<string><br><br> , [TYPE=PS]; |

**Examples**

- 1. Compare two program systems

Input:

START-CMP:," :SCR:DD/",PS;

- 2. Compare two files

Input:

START-CMP:,,SGL," :SCR:DD/ZODBIOS0.02.017"," :PDS:APSZ/ADM/DP/ABS/ZODBIOS0";

**47.4 Parameter Description**

|                 |                                                      |
|-----------------|------------------------------------------------------|
| ANS             | User-answer necessary                                |

## 48 CMUID - Registration of the CM User ID

The description of this AMO is only available in html format!

## **49 CODEW - Codeword for administration lock in SWU**

The description of this AMO is only available in html format!

**CODEW - Codeword for administration lock in SWU**

## 49.1 License Counting

Starting with OpenScape V8 R1 all trunks are license free and separate port licensing is possible for IP and TDM ports. The license model change was to aid a more competitive offering to customers (whereby TDM licenses have a lower cost than FLEX ones.)

Starting with OpenScape V11 TDM license is renamed to Standard license. Three types of licenses are offered:

1. FLEX (Valid for IP and TDM)
2. STANDARD (Valid for TDM only and Secondary Associated devices)
3. UNIFY PHONE (Valid for Unify Phone clients)

The sum of contracted/used FLEX and STANDARD licenses cannot exceed 12000.

### **FLEX License counting**

Flex licenses are intended to primarily cover IP subscribers.

If no STANDARD licenses are available, then FLEX licenses will also be consumed by TDM devices.

- each ADD-SBCSU, device type: OPTIP, UFIP or connection type: SIP increments FLEX counter by 1, except UFIP used as Circuit CLIENT (parameter CLNTDESK=CLIENT) which is license free.
- each ADD-ACSU, ACTYPE=ACWMQIP or ACW2QIP increments FLEX counter by 1

Primary Associated devices consumes a FLEX license.

### **STANDARD License counting**

STANDARD licenses cover Analog, Up0E, ISDN and Cordless, PSM, PSE V8 devices which used FLEX licenses in previous versions.

STANDARD licenses can be used only for the previous mentioned devices, while FLEX licenses can be used for all device types.

Once all TDM contracted licenses are used, next analog/TDM device added will use FLEX licenses.

The counting of used TDMs from will be done in following way:

- each ADD- SCSU entry increment TDM counter by 1 (except ACL stations - virtual help devices "INS=ACLSTN" and SIGNOFF devices )

- each CMI BASE station (configured via ADD-SBCSU) increment TDM counter by 4
- the following digital devices (configured via ADD-SBCSU) increment the TDM counter by 1 (qualified by the "device type" parameter in the AMO command): KEY300, SET500, SET600, SET700, OPTISET, S0PP. Furthermore, extension boards (CBUSEXP, MBUSEXP, OPTIEXP) increment the TDM counter by 1 likewise.
- the following digital devices (configured via ADD-SBCSU) increment the TDM counter by 2 (qualified by the "device type" parameter in the AMO command): SET500&, SET600&, SET700&, OPTISET&
- a primary rate interface (configured via ADD-SBCSU, "device type" parameter "S2PP") increments the TDM counter by 30
- the virtual devices (VIRTDTE configured via ADD-SBCSU) and SIGNOFF devices (changed on BCSU or SBCSU level) are license free
- each ADD-RCSU entry increment the TDM counter by 1
- each ADD-ACSU where ACTYPE is AC4 or ACW2Q or ACWMQ increment the TDM counter by 1
- each ADD-TSCSU entry increment the TDM counter by 1.
- each ADD-SSC entry increment the TDM counter by 1 (the list of ADD-SSC entries for same PEN on different LTUs are counted as 1 entry).

A Secondary Associated devices consumes a STANDARD license. When Associated devices are created/deleted the following licensing are followed by SBCSU and SCSU:

- "When a TDM device becomes Primary Associated device (at least one secondary associated device is created) then its STANDARD license is freed, and one FLEX license is grabbed.
- "When a TDM device loses its Primary Associated device attribute (all secondary associated devices are deleted), its FLEX license is freed, and one STANDARD license is grabbed.
- "When a Secondary associated device is created (including CLIENT), one STANDARD license is grabbed.
- "When Unify Phone client is created, an extra additional UNIFY PHONE license is grabbed to reflect the Unify Phone contract. UNIFY PHONE license now includes contract duration.

- Deskphone + Unify Phone e.g. requires one FLEX license, one STANDARD license and one UNIFY PHONE license
- "When a Secondary associated device is deleted (including CLIENT), its STANDARD license is freed (including Unify Phone license in case of Unify Phone client).

#### UNIFY PHONE license expiration:

- "When expiry date for UNIFY PHONE license is reached, LMT generates a new CODEW with ZERO UNIFY PHONE license units and sends it to RMX.
- "RMX accepts this CODEW, even if it is a contract violation, but rejects all consequent Unify Phone client's registration.
- "The other way round, when a new CODEW with valid UNIFY PHONE license units is received, RMX accepts consequent Unify Phone client's registration.
- "When a new CODEW is generated, LMT checks if the new CODEW has enough licenses for the currently configured Unify Phones and always provides 0 units in CODEW for UNIFY PHONE if contract/configuration is violated.

#### Examples:

- "CODEW with ZERO Unify PHONE license units is added:

## 50 COMGR - Communication Group Calling

|                    |                               |
|--------------------|-------------------------------|
| Interrelationships | Parameter Description         |
| AMO Functions      | Error Messages and Advisories |

Com group calling allows the user to call another station in a COM group via a COM group access code, followed by a COM group member number.

It also allows for two way communication through the speaker phone of member of a COM group, by use of the Intercom feature.

A device may access a COM Group call/COM Group speaker call without being a member of any COM Group. In addition, a device may be a member of a COM Group, and yet not have access to any COM Group calling.

Only Optiset- and Optipoint -devices can get an index two access a ComGroup call (AMO SBCSU). The same is with the classmarks (AMO SDAT).

Only digital stations are members of COM Groups. These may be optsets, vision2000, functional devices. Analog devices may not be members of COM Groups.

AMO COMGR makes it possible to add, display, delete and regenerate COM group data.

### 50.1 Interrelationships

- AMO DIMSU                      Dimensioning of features, switching unit
- AMO SDAT                      Administration of subscriber attributes and data
- AMO ZAND                      System data
- AMO SBCSU                    Station and s0-bus configuration, switching unit
- AMO TAPRO                    Programmable key definition for digital terminals
- AMO WABE                    Dialing plan, feature access codes

### 50.2 AMO Functions

- [ADD-COMGR](#)                      : Create (members of) COM groups

## COMGR - Communication Group Calling

### AMO Functions

- [DELETE-COMGR](#) : Delete (members of) COM groups
- [DISPLAY-COMGR](#) : Display (members of) COM groups
- [REGENERATE-COMGR](#) : Regenerate (members of) COM groups

### 50.2.1 ADD-COMGR

The definition of the function depends on whether there is an existing COM group, or if a new one is to be created.

If a specified COM group (GRNO) does not exist, or if no COM group is specified, one is created with the specified station, member numbers, and size.

If no COM group (GRNO) is specified, then the first available group number is automatically selected.

If the COM group already exists, it is expanded to include the specified stations.

There are two different sizes of COM groups:

- Small, which has a maximum of ten members, and which requires a one digit (0-9) member number.
- Large, which has a maximum of one hundred members, and which has a two digit (00-99) member number.

Extensions which are members of a COM group may either be local extensions, or they may reside on another node within the private network.

STNOs with leading zeroes can be entered as a member of a COM group.

The maximum total number of COM groups allowed per system is 1024.

A station number may be a member of more than one COM group, but may not be in a COM group more than once.

Each member of a COM group must be a digital device with a speaker or a functional device.

To change the size from large to small is not possible with the add command. All the members of the group has to be first deleted. However, changing the size from from small to large in the add command is a legal operation.

Station numbers are assigned to the corresponding members in the add command. There must be the same number of station numbers as member numbers. When chained ranges and single values are entered, the STNOs and MBNOs are checked for one to one correspondence (i.e.). Ranges and the single values in MBNO parameter should be in the same order as it is in the STNO parameter

It is possible to assign each COM group a name (Info string).

### Procedure Overview

| Command Code | Parameters                                                                        |
|--------------|-----------------------------------------------------------------------------------|
| ADD-COMGR    | STNO=<number>, MBNO=<number>, GRNO=<number><br>, [SIZE=<param>], [INFO=<string>]; |

#### Examples:

1. Create a small COM group with stations 2100-2109 and member numbers 0-9.

Input:

```
ADD-COMGR:STNO=2100&&2109,MBNO=0&&9;
```

Output:

```
H01: COM GROUP 1 HAS 10 MEMBERS
```

2. Add Station numbers 2231-2235 to COM group number 1 with member numbers 31-35, which makes it necessary to change the size from small to large.

Input:

```
ADD-COMGR:STNO=2231&&2235,MBNO=31&&35,GRNO=1,SIZE=L;
```

Output:

```
H01: COM GROUP 1 HAS 15 MEMBERS
```

## 50.2.2 DELETE-COMGR

Delete (members of) COM group(s) can perform the following functions:

1. delete all the station in a specific group
2. delete specific station(s) in specific group
3. delete a range of stations in the system

A GROUP is AUTOMATICALLY deleted when the last member of the group is deleted.

## COMGR - Communication Group Calling

### AMO Functions

To delete all the station numbers from a specific COM group, use, GRNO=the group number you want all the stations deleted from, and STNO=0&&999999999999. If you enter incorrect values in this command, error message is output.

#### Procedure Overview

| Command Code | Parameter                       |
|--------------|---------------------------------|
| DELETE-COMGR | STNO=<number>, [GRNO=<number>]; |

#### Example:

1. To remove station 2105 from COM group1.

Input:

```
DELETE-COMGR:STNO=2105,GRNO=1;
```

Output:

```
DELETE COMPLETED;
```

2. To remove station 2000 - 3000 and 3100 from the System and only stations 2101 && 2200 exists in the system.

Input:

```
DELETE-COMGR:STNO=2000&&3000&3100;
```

Output:

```
F18: THE RANGE 2000 && 2100 IS NOT IN ANY COM GROUP
```

```
F18: THE RANGE 2201 && 3000 IS NOT IN ANY COM GROUP
```

```
F17: STATION NUMBER 3100 IS NOT A MEMBER OF ANY COM GROUP
```

3. To remove station 2109 in the COM group 1 and the COM group 1 is empty.

Input:

```
DELETE-COMGR:STNO=2109,GRNO=1;
```

Output:

```
F08: COM GROUP 1 DOES NOT EXIST
```

## 50.2.3 DISPLAY-COMGR

COM group(s) (and their members) can be displayed in the following ways:

1. all the COM groups of a system
2. a specific COM group
3. specific station(s) in COM group(s).

The entire member list of the COM group is always output (even if only one station is specified). If several stations belonging to the same COM group are specified in the command (TYPE=STN), the COM group is output only once.

If all (or several COM groups in the system, or stations in a COM group are to be displayed, only the created COM groups or stations are displayed. If no COM groups exist when ALL COM groups are to be displayed, error message is output.

### Procedure Overview

| Command Code  | Parameters                       |
|---------------|----------------------------------|
| DISPLAY-COMGR | TYPE=ALL, [INFOPAT=<string>; (1) |
|               | TYPE=GR, GRNO=<number>; (2)      |
|               | TYPE=STN, STNO=<number>; (3)     |

### Examples:

1. Display members of COM group 1

Input:

DISPLAY-COMGR:TYPE=GR,GRNO=1;

Output:

```

+-----+
|          GROUP NUMBER   : 1          |
|          SIZE           :  SMALL      |
|          SERVICE INFORMATION:         |
|  MEMBER NUMBER          STATION NUMBER |
|          |              |            |
|          1              3500          |
|          2              3101          |
+-----+
```

2. Display the COM group that station number 2598 is a member of COM group 23

Input:

DISPLAY-COMGR:TYPE=STN,STNO=2598;

Output:

```

+-----+
|          GROUP NUMBER   : 23          |
|          SIZE           :  SMALL      |
+-----+
```

**COMGR - Communication Group Calling**

| 4                                                  |      |      |      |      |      |      |      |      |      |      |
| 5                                                  |      |      |      |      |      |      |      |      |      |      |
| 6                                                  |      |      |      |      |      |      |      |      |      |      |
| 7                                                  |      |      |      |      |      |      |      |      |      |      |
| 8                                                  |      |      |      |      |      |      |      |      |      |      |
| 9                                                  |      |      |      |      |      |      |      |      |      |      |

**50.2.4 REGENERATE-COMGR**

Regenerate the existing COM groups in the following ways:

- 1. all the COM groups of a system
- 2. a specific COM group

3. specific station(s) in COM group(s).

### Procedure Overview

| Command Code     | Parameters                                                                 |
|------------------|----------------------------------------------------------------------------|
| REGENERATE-COMGR | TYPE=ALL;<br><br> TYPE=GR, GRNO=<number>;<br><br> TYPE=STN, STNO=<number>; |

### Examples

1. Regenerate COM group 1.

Input:

```
REGENERATE-COMGR:TYPE=GR,GRNO= 1;
```

Output:

```
ADD-COMGR:3500&&3501,1&2,1,s,;
```

2. Regenerate all COM groups of a switch

Input:

```
REGENERATE-COMGR:TYPE=ALL;
```

Output:

```
ADD-COMGR:3500&&3501,1&2,1,S,;
```

```
ADD-COMGR:3502&&3504,1&&3,2,L,;
```

## 50.3 Parameter Description

**GRNO**      Number of the com group

Type of Input      : Single value  
                          : optional (DELETE, ADD)  
                          : required ( DISPLAY, REGENERATE)

Possible Value      : 1-1024 (requested number of a group)

Default value      : First available group number (ADD)  
                          group number of which specified STNO is a member (DELETE).

**MBNO**      Member number of the station in the COM group

Used only in the ADD command

Type of Input      : Single value, optional

## COMGR - Communication Group Calling

### Parameter Description

|         |                                                                                 |                                                                        |
|---------|---------------------------------------------------------------------------------|------------------------------------------------------------------------|
|         |                                                                                 | : chained single values, range(s), chained range(s)                    |
|         | Possible values                                                                 | : 0 -99                                                                |
|         | Default value                                                                   | : --                                                                   |
| SIZE    | Size of the com Group                                                           |                                                                        |
|         | Used only in the ADD command                                                    |                                                                        |
|         | Type of Input                                                                   | : Single value, optional                                               |
|         | Possible values                                                                 | : S   small                   (0 - 9 members of a communication group) |
|         |                                                                                 | L   large               (00 - 99 members of a communication group)     |
|         | Default value                                                                   | : S   small                                                            |
| INFO    | Service informations, it is possible to assign a name to the COM group          |                                                                        |
|         | Type of Input                                                                   | : Single value, optional                                               |

|         | Default value                                                                   | :                                                                      |

## **50.4 Error Messages and Advisories**

### **50.4.1 Error Messages**

F01: STATION NUMBER <xxxx> NOT PRESENT  
F02 THE SYSTEM MEMORY HAS BEEN EXCEEDED  
F03: MAXIMUM NUMBER OF COM GROUPS REACHED, NUMBER HAS TO BE INCREASED BY MEANS OF  
ADD-DIMSU:COMGR=<xxx>;  
F04: STION NUMBER <stno> ALREDY A MEMBER OF COM GROUP <grno>  
F05: STATION NUMBER <stno> IS EITHER NOT A OPTISET NOR A OPTIP500 NOR A SET600  
F06: MEMBER NUMBER <stno> IS INVALID FOR A SMALL COM GROUP  
F07: NUMBER OF STATION NUMBERS AND NUMBER OF MEMBER NUMBERS DO NOT MATCH  
F08: COM GROUP <grno> DOES NOT EXIST  
F11: INCORRECT VALUES FOR DELETE WERE ENTERED  
F12: COM GROUP NUMBER TOO LARGE - REFER TO COMGR ALLOC IN AMO DIMEN  
F13: <xxxx> THE SPECIFIED CLASS OF SERVICE NUMBER IS LARGER THAN THE  
F14: GROUP SIZE CANNOT BE CHANGED FROM LARGE TO SMALL IN AN ADD OPERATION  
F15: STNO NUMBER <stno> IS NOT A MEMBER OF COM GROUP <grno>  
F16: THE RANGE <stn1> && <stn2> IS NOT IN THE COM GROUP <grno>  
F17: STATION NUMBER <stno> IS NOT A MEMBER OF ANY COM GROUP  
F18: THE RANGE <stn1> && <stn2> IS NOT IN ANY COM GROUP  
F19: THE LOWER AND UPPER LIMITS OF A STNO RANGE SHOULD HAVE SAME NUMBER OF DIGITS  
F20: CCIDXS OR CCIDXD HAS REACHED ITS CRITICAL LIMIT NUMBER HAS TO BE INCREASED BY  
MEANS OF ADD-DIMSU:CCIDXS=<xxx>; OR ADD-DIMSU:CCIDXD=<xxx>;  
F21: MAXIMUM NUMBER OF INFO FIELDS ARE USED, NUMBER HAS TO BE INCREASED BY MEANS OF  
ADD-DIMSU:INFO=<xxx>;  
F22: INDEX IS OUT OF RANGE  
F23: ENTERED STNO RANGE IS TOO LARGE .

### **50.4.2 Advisories**

H01: COM GROUP <grno> HAS <nomen> MEMBERS  
H02: STNO <stno> IN COM GROUP <grno> WILL BE OVERWRITTEN  
H03: THE INFO FIELD OF THE GROUP WILL BE CHANGED  
H04: A STNO CAN BE STILL ASSIGNED TO A DIFFERED MBNO  
H10: THERE ARE NO COM GROUPS IN THE SYSTEM

#### **Abbreviations Used**

|        |                                   |
|--------|-----------------------------------|
| <grno> | corresponds to the group number   |
| <mbo>  | corresponds to the member number  |
| <stnx> | corresponds to the station number |
| <xxx>  | corresponds to a digit            |

**50.4.3 Use of the Output Messages for Each Action**

|         |                                                                   |
|---------|-------------------------------------------------------------------|
| ADD     | : F01, F02, F03, F04, F05, F06, F07, F12, F13, F14, F19, H01, H02 |
| DISPLAY | : F08, F10                                                        |
| DELETE  | : F08, F10, F15, F16, F17, F18, F19                               |

# 51 CONSY - Administration of System Configuration Data

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

This AMO is used for the administration of the data for cabinet and frame configuration of a system. This data describes the physical layout and terminal configuration of the system.

## System Configuration Table

The system configuration data is stored in the system configuration table. It contains the following information:

per cabinet:

- cabinet name
- cabinet address

per shelf:

- frame name
- perhaps the LTU number (for frames of the SWU periphery)
- perhaps the processor identification for central shelves

Mounting levels which are not occupied are indicated by a dummy character. Each cabinet name or frame name stored in the table must have been previously defined in the appropriate type files.

| Cabinet name | Address |      |      |      |
|--------------|---------|------|------|------|
| Frame name   | LTU     | PID1 | PID2 | PID3 |
| Frame name   | LTU     | PID1 | PID2 | PID3 |
|              |         |      |      |      |
|              |         |      |      |      |
|              |         |      |      |      |
|              |         |      |      |      |
|              |         |      |      |      |
|              |         |      |      |      |

### Cabinet type and frame type files

The cabinet type and frame type files are produced as non-resident subsystems (similar to the UBGDAT). They must be explicitly loaded into the RAM with LOAD\_OVERLAY if the user wishes to access them directly; usually, however, they are accessed indirectly on the hard disk. They contain all valid cabinet type and frame type names. This data can only be changed with a patch during operation; administration of the files with the aid of AMOs is not provided for, since changes to the contents are rarely necessary (i.e. only when a new frame type or cabinet type is implemented). The two subsystems are updated by updating the CHILL source code.

|                                                                                                                         |       |

|                                                                                                                                                                                                             |      |         |                 |             |
|                                                                                                                                                                                                             |      |         |                 |             |

Table 8 Frame type file

The division of the cabinets into shelves is illustrated in the Service Manual in the "Hardware Survey" chapter. This chapter also contains a list of possible shelves.

From the variant HICOM Unity 1.0 the handling of cabinets and shelves have a particularity. The LTU range is divided in two parts: HHS (HICOM Host System) and AP (Access Point). The available values of the ranges

are: HHS 1-15 and AP 17-99. The LTU 16 is forbidden. There are existing shelves which are allowed only in HHS and others which are allowed only in the AP range.

The actions ADD and CHANGE internally test the validity of the entered LTU number (examples see later).

The names of cabs and frames are also used in the AMO specific files. Differences are just there:

- where different frames or cabinets have one official name (e.g. LTUS-Compact = LTUSC)
- where the same frames are configured in different system variants (e.g. CCM-frame in HICOM 3000E = CCME)
- where the official name is longer than 8 characters (e.g. CAB300EC1 = C3000EC1).

Which cabinet- and frame types are possible in a system? The classification of a switch (H80, H180, H600, ...) and the type of HW (noncompact, compact, ...) restricted the possible types of cabinets and frames.

The function DISPLAY-CONSY is helpful to get information about the permitted cabinet- and frame types.

Examples about that in the chapter 'DISPLAY-CONSY'.

Figure 5 Overview

### Structure of a cabinet address

Figure 6 Cabinet Address

## 51.1 Restrictions

This description is valid for HiPath 4000 V1.0.

## 51.2 Interrelationships

- AMO DBC : Database Configuration

## 51.3 Functions of the AMO

- [ADD-CONSY](#) : Add system configuration data.
- [CHANGE-CONSY](#) : Change the system configuration data.
- [DELETE-CONSY](#) : Delete the system configuration data.
- [COPY-CONSY](#) : Copy the system configuration data.
- [DISPLAY-CONSY](#) : Display the system configuration data.
- [REGENERATE-CONSY](#) : Regenerate the system configuration data.

### 51.3.1 ADD-CONSY

This function is used to add data to the system configuration table. This data is used for outputs of system layout plan and for physical error messages.

1. OPT=CAB: Add cabinet data.
2. OPT=FRAME: Add frame (=module frame) data.

Frame data may only be entered if the cabinet data has already been added (OPT = CAB).

FlexPack- construction (600ECS):

To distinguish the FlexPack -construction from the ordinary 600ECX- construction following pseudo-cabinets have been established:

|                       |          |                     |
|-----------------------|----------|---------------------|
| basic-cabinet         | C600ECS  | partnumber: G5298-X |
| expansion-cabinet     | C600ECS1 | partnumber: G5285-X |
| power-control-cabinet | C600PC   | partnumber: G5401-X |

These cabinets are fictive, therefore the partnumber which have been "borrowed" by the cabinets of the 600ECX- resp. the 80DSC- construction is also just a pseudo-partnumber.

For the 600ECS-configuration only the frames LTUW and L80XF are possible, whereas for the 600ECX-configuration only LTUW, resp. for the 80CXE the frames CC80F and L80XF are allowed.

Example for ECS-configuration see DISPLAY-CONSY.

Except the ECS-pseudo cabinets also a pseudo-cabinet has been introduced for the 80CXE-configuration. The cabinet has been defined als follows:

|        |                     |
|--------|---------------------|
| C80CXE | partnumber: G5284-X |
|--------|---------------------|

### Procedure Overview

| Command Code | Parameter                                                                          |
|--------------|------------------------------------------------------------------------------------|
| ADD-CONSY    | ADDR=<string>,OPT=CAB\FRAME                                                        |
|              | ,OPT=CAB,CAB=<string>; (1)                                                         |
|              | ,OPT=FRAME,SHELFNO=<number>,FRAME=<string><br>, [LTU=<number>], [PID=<param>]; (2) |

### Example

1. Add cabinet C1 under address P205.
- Input:

ADD-CONSY: P205,CAB,C1;

## 2. Add 600ECS (Flex Pack-configuration)

Input:

```
ADD-CONSY: "P101",CAB,"C600PC ";
ADD-CONSY:"P101",FRAME,1,"PSD ",,;
ADD-CONSY:"P101",FRAME,2,"PSD ",,;
ADD-CONSY:"P102",CAB,"C600ECS ";
ADD-CONSY:"P102",FRAME,1,"CCDAXD1 ",,"BPA"&"BPB"&"A1";
ADD-CONSY:"P102",FRAME,2,"L80XF ",1,;
ADD-CONSY:"P102",FRAME,3,"LTUW ",2,;
ADD-CONSY:"P102",FRAME,4,"L80XF ",3,;
ADD-CONSY:"P103",CAB,"C600ECS1";
ADD-CONSY:"P103",FRAME,1,"LTUW ",4,;
ADD-CONSY:"P103",FRAME,2,"LTUW ",5,;
ADD-CONSY:"P103",FRAME,3,"LTUW ",6,;
ADD-CONSY:"P103",FRAME,4,"L80XF ",7,;
ADD-CONSY:"P104",CAB,"C600ECS1";
ADD-CONSY:"P104",FRAME,1,"L80XF ",8,;
ADD-CONSY:"P104",FRAME,2,"L80XF ",9,;
ADD-CONSY:"P104",FRAME,3,"L80XF ",10,;
ADD-CONSY:"P104",FRAME,4,"L80XF ",11,;
ADD-CONSY:"P105",CAB,"C600ECS1";
ADD-CONSY:"P105",FRAME,1,"L80XF ",12,;
ADD-CONSY:"P105",FRAME,2,"L80XF ",13,;
ADD-CONSY:"P105",FRAME,3,"L80XF ",14,;
ADD-CONSY:"P105",FRAME,4,"L80XF ",15,;
```

## 3. Add cabinet CAB-NBB under address P106 and the shelf BP-NBB, AP-range.

```
ADD-CONSY:"P106",CAB,"CAB-NBB ";
ADD-CONSY:"P106",FRAME,1,"BP-NBB ",34;
```

## 51.3.2 CHANGE-CONSY

This function is used for changing cabinet type or frame type data in the system configuration table or changing boards in the frame data table. It also is possible to delete boards in setting CS=NOTDEF. In this case the inserts of BOARD and PEN will be ignored.

The type of data to be changed is specified with the parameter OPT.

1. OPT=CAB: Change the cabinet address.
2. OPT=FRAME: Change the frame data.
3. OPT=BOARD: Change a board in frame data table.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-CONSY | <pre>OPT=CAB\FRAME\BOARD   ,OPT=CAB,ADDR=&lt;string&gt;,ADDRNEW=&lt;string&gt;;   ,OPT=FRAME,ADDR=&lt;string&gt;,SHELFNO=&lt;number&gt;, {[SHELFNEW=&lt;number&gt;],[FRAME=&lt;string&gt;], [PID=&lt;param&gt;],[LTU=&lt;number&gt;]};   ,OPT=BOARD,FRAME=&lt;string&gt;,IDX=&lt;number&gt;, {[CS=&lt;param&gt;],[BOARD=&lt;string&gt;],[PEN=&lt;number&gt;], [HALF=&lt;param&gt;],[BDIDX=&lt;number&gt;]};</pre> |

### Examples

1. The name of the frame at shelf 7 in cabinet P205 is to be changed.

Input:

```
CHA-CONSY:FRAME,P205,7,,LTU,,;
```

2. The board DPM in frame GP-GSN has to be deleted.

Input:

```
CHA-CONSY:BOARD,GPGSN,6,NOTDEF,DPM,37;
```

## 51.3.3 DELETE-CONSY

This function is used to delete cabinet or frame entries in the system configuration table.

### Procedure Overview

| Command Code | Parameter                                               |
|--------------|---------------------------------------------------------|
| DELETE-CONSY | <pre>ADDR=&lt;string&gt;,[SHELFNO=&lt;number&gt;;</pre> |

## 51.3.4 COPY-CONSY

This function is used for copying cabinet type entries from one address to another address.

## Procedure Overview

| Command Code | Parameter                        |
|--------------|----------------------------------|
| COPY-CONSY   | ADDR=<string>, ADDRNEW=<string>; |

### 51.3.5 DISPLAY-CONSY

The data output is in tabular form depending of the option.

There are 3 Possibilities:

1. OPT=CAB: Display of data of a special or of all cabinets
2. OPT=CABTYPE: Display of data of all cabinets with a special name, a special type and/or which belong to a special class of HICOM
3. OPT=FRAMTYPE: Display of data of all frames with a special name, a special type and/or which belong to a special class of HICOM

If no value is explicitly specified for the parameter ADDR, the data for all cabinets are output.

## Procedure Overview

| Command Code  | Parameter                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-CONSY | OPT=CAB, [ADDR=<string>];<br><br>  OPT=CABTYPE, [CAB=<string>], [CLASS=<param>] ,<br>[ASSEMBLY=<param>];<br><br>  OPT=FRAMETYPE, [FRAME=<string>],<br>[CLASS=<param>], {ASSEMBLY=<param>}; |

## Examples

1. Display the data for the cabinet P205.

Input:

DIS-CONSY:CAB,P205;

Output:

|                                             |       |            |      |      |     |  |
|---------------------------------------------|-------|------------|------|------|-----|--|
| +-----+-----+-----+-----+-----+-----+-----+ |       |            |      |      |     |  |
| CAB: B                                      |       | ADDR: P205 |      |      |     |  |
| +-----+-----+-----+-----+-----+-----+-----+ |       |            |      |      |     |  |
| SHELFNO                                     | FRAME | PID1       | PID2 | PID3 | LTU |  |
| +-----+-----+-----+-----+-----+-----+-----+ |       |            |      |      |     |  |
| 1                                           | FP    |            |      |      |     |  |
| 2                                           | LTU   |            |      |      | 1   |  |
| 3                                           | LTU   |            |      |      | 2   |  |

## CONSY - Administration of System Configuration Data

### Functions of the AMO

|   |     |     |  |   |
|---|-----|-----|--|---|
| 4 | LTU |     |  | 3 |
| 5 | CC  | BPA |  |   |
| 6 | PS  |     |  |   |
| 7 | ADS | A1  |  |   |

2. Display of all permitted cabinet types which belong to a H600 NONCOMPACT system.

Input:

DIS-CONSY:CABTYPE,,H600,NONCOMP;

Output:

| CABINET | PRODUCTNO. |
|---------|------------|
| CABB    | G5208-X    |
| CABE    | G5209-X    |
| CABD1   | G5216-X    |
| CABIS   | G5218-X    |
| CABM1   | G5210-X    |

3. Display of all permitted frame types, which belong to systems with COMPACT hardware.

Input:

DIS-CONSY:FRAMTYPE,,,COMP;

Output:

| FRAME | PRODUCTNO. |
|-------|------------|
| CCS   | B5331-X    |
| ISEC  | B5332-X    |
| LTUSC | B5328-X    |

4. Display the data of a CABB cabinet.

Input:

DIS-CONSY:CABTYPE,CABB;

Output:

| CABINET:    | CABB    |
|-------------|---------|
| PRODUCTNO.: | G5208-X |
| CLASS:      | H600    |
| ASSEMBLY:   | NONCOMP |

## Functions of the AMO

### 51.3.6 REGENERATE-CONSY

## Procedure Overview

### Example

Input:

REG-CONSY:P205;

Output:

```
ADD-CONSY: P205,CAB,B;
ADD-CONSY: P205,FRAME,1,FP;
ADD-CONSY: P205,FRAME,2,LTU,1;
ADD-CONSY: P205,FRAME,3,LTU,2;
ADD-CONSY: P205,FRAME,4,LTU,3;
ADD-CONSY: P205,FRAME,5,CC,,BPA;
ADD-CONSY: P205,FRAME,6,PS;
ADD-CONSY: P205,FRAME,7,ADS,,A1;
CHANGE-CONSY:BOARD,GPGSN,6,NOTDEF,"DPM",37;
```

## 51.4 Parameter Description

|          |                                                                                                                                                                                                                                                                                             |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDR     | Cabinet address                                                                                                                                                                                                                                                                             |
|          | Type of Input : Single value,<br>mandatory (ADD, CHANGE, COPY, DELETE)<br>optional (DISPLAY, REGENERATE)                                                                                                                                                                                    |
|          | Possible Values : 4 chars., alphanumeric                                                                                                                                                                                                                                                    |
| ADDRNEW  | New cabinet address                                                                                                                                                                                                                                                                         |
|          | Type of Input : Single value,<br>mandatory                                                                                                                                                                                                                                                  |
|          | Possible Values : 4 chars., alphanumeric                                                                                                                                                                                                                                                    |
| ASSEMBLY | HW type                                                                                                                                                                                                                                                                                     |
|          | Type of Input : Single value,<br>optional                                                                                                                                                                                                                                                   |
|          | Possible Values : NONCOMP, COMPACT, EXTCOMP, ECX, ECDSC, ECCXE                                                                                                                                                                                                                              |
| BDIDX    | Rel. board index                                                                                                                                                                                                                                                                            |
|          | This index is important, if the same boards are used more than once in central SWU-Frames (e.g. MTS-, MBU- or MEM-boards) and signs the sequence of their use within the frame. Processes, which use the HW-data (e.g. AMO SDSU, SIT), need this index to address the different data bases. |
|          | Type of Input : Single value,<br>optional                                                                                                                                                                                                                                                   |
|          | Possible Values : 0 - 255                                                                                                                                                                                                                                                                   |
| BOARD    | Name of the board                                                                                                                                                                                                                                                                           |
|          | Type of Input : Single value,<br>optional                                                                                                                                                                                                                                                   |
|          | Possible Values : maximum 8 alphanumeric characters                                                                                                                                                                                                                                         |
| CAB      | Cabinet name                                                                                                                                                                                                                                                                                |
|          | Type of Input : Single value                                                                                                                                                                                                                                                                |

## CONSY - Administration of System Configuration Data

### Parameter Description

|       |                         |                                                                                                                                                                                                |
|-------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       |                         | mandatory (ADD, CHANGE, COPY, DELETE, REGENERATE)<br>optional (DISPLAY)                                                                                                                        |
|       | Possible Values         | : maximum 8 alphanumeric characters<br><br>(possible cabs are in SHB, Volume 1, Reg.2, Chapter 4)                                                                                              |
| CLASS | Classification of HICOM |                                                                                                                                                                                                |

A suitable module must be configured for the slot addressed by PEN (AMO BCSU).

The possible Slot values for PEN depend on the systems architecture and can be found in the BCSU AMO description.

## 54 COPY - Copy Files

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | AMO Functions         | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The AMO COPY enables the copying of files and hard-disk areas to and from hard-disk, tape and cartridge. File names may be partially qualified.

- Copying SAM-files:

SAM-files exist on hard-disk, tape and cartridge. They are copied with the aid of the DMS-commands PUT and GET. When SAM-files are overwritten, they are first deleted and then newly created.

- Conversion of file-types:

By declaring the parameter DESTTYPE, SAM-files can be copied to byte-files and vice-versa. For this action, the record-length-fields are removed or added as necessary. When copying byte-files to SAM-files, the record-length of the destination-file can be defined by declaring the parameter RECLLEN.

- Copying hard-disk-files:

When a byte-file on the hard-disk is overwritten, the file is not deleted and then newly created, but physically overwritten byte for byte and shortened or lengthened as necessary. This means that the directory-files remain unchanged. However, the more often the byte-files are extended (i.e. overwritten with larger files), the longer the access-time to the files becomes. For this reason, the user has the option of deleting a file to be overwritten using the AMO DEL (Delete Files).

### 54.1 Restrictions

This description is valid from SP300 E V3.0

### 54.2 Interrelationships

- AMO-complex FIDES : File and device service

**54.3 AMO Functions**

- **START-COPY** : Copying of files

**54.3.1 START-COPY**

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| START-COPY   | SRCFILE=<string>,DESTFILE=<string>, [UNIT=<param>]<br>, [DESTTYPE=<param>], [RECLLEN=<number>]<br>, [BLOCKLEN=<number>], [SRCADR=<number>]<br>, [DESTADR=<number>], [LEN=<number>], [BUF=<number>]<br>, [SRCVOL=<string>], [DESTVOL=<string>], [SEL=<param>]<br>, [WARN=<param>], [ANS=<param>], [DIALOG=<param>; |

**Example**

Copy files on a magnetic tape.The magnetic tape must be reserved with ACT-RTAPE.

Input:

START-COPY:":DBD:L31615/S0123X00100/RE/ADS",":M:RE.ADS";

Output:

COPY READY  
<:DBD:L31516/S0123X00100/RE/ADS> COPIED TO  
<:M:RE.ADS>  
  
COPY FINISHED  
STATUS = H'0000

**Note:**

If an error occurs after entering a START-COPY command, the device must be switched off with command DEACT-DSSM. The copy action will be executed after entering ACT-DSSM.

## 54.4 Parameter Description

|          |                                                                                                                                                                                                                                                                    |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## COPY - Copy Files

### Error Messages and Advisories

Module into which the AMO is to be loaded.

Type of Input : Single value  
optional

Possible : A1 = Administration and Data Server (ADS)  
Values

Default Value : A1

WARN

Warning

Inquiry, when overwriting files

Type of Input : Single value  
optional

Possible : Y = overwrite file  
Values

N = do not overwrite file

Default Value : Y

## 54.5 Error Messages and Advisories

### 54.5.1 Error Messages

F01: SOURCE FILE <srcfile>  
WITH THE FILE TYPE SAM VARIABLE, CAN'T BE COPIED TO DESTINATION FILE  
<destfile> WITH THE FILE TYPE SAM-FIX  
F02: SRC ADDR GREATER THAN SIZE OF SRC FILE  
F03: SRCADR + LEN ARE GREATER THAN SIZE OF SRCFILE LEN:= H'new-len  
F04: DEST. FILE ADDRESS TOO LONG  
F05: DEST ADDR + LEN ARE LARGER THAN SIZE OF DEST. DEVICE LEN:=H'len  
F06: DEVICE <device> CANNOT BE RESERVED AS IT IS ALREADY ACTIVATED  
F07: DESTINATION FILE IS DIRECTORY FILE  
F08: HARD BREAK  
F09: BOTH FILENAMES MUST BE WITH OR WITHOUT WILDCARDS  
F10: FILE AND AREA NOT ALLOWED ON THE SAME DEVICE  
F11: NO VOLUME IN DEVICE <devname>  
F12: VOLUME IN DEVICE <devname> IS WRITE PROTECTED

### 54.5.2 Advisories

H01: DEST. FILE <destfile> EXISTS: OVERWRITE ?

H02: <datnam> IS PHYSICALLY OPENED FOR WRITING !  
EXISTING FILE STRUCTURES MAY BE CORRUPTED; CONTINUE ?  
H03: BACKUP/RESTORE TERMINATED WITH ERROR :H'status ; NORMAL COPY (Y/N)  
H04: COPY STARTED  
H05: COPY ?  
H06: NUMBER OF COPIED BYTES: H'bytes  
H07: COPY FINISHED  
H08: NOTE: NOT ALL FILES COPIED  
H09: <srcfile> COPIED TO"  
<destfile>  
H10: <srcfile> COPIED TO"  
<destfile> FROM BYTE H'destadr  
H11: <srcfile> COPIED FROM BYTE H'srcadr TO  
<destfile>  
H12: <srcfile> COPIED FROM BYTE H'srcadr TO

## 58 CPTP - Communication parameters for TCP/IP-Connection

|                                    |                                       |                                       |
|------------------------------------|---------------------------------------|---------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error- and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                       |

The AMO CPTP (Communication parameters for TCP/IP-Connection) processes the parameters in the database for TCP/IP-Connection.

### 58.1 Restrictions

This description is valid from SP300-Rel.6.3

### 58.2 Interrelationships

There is no dependence on other AMOs.

### 58.3 Functions of the AMO

- [ADD-CPTP](#) : Create the communication parameters
- [DELETE-CPTP](#) : Delete the communication parameters
- [DISPLAY-CPTP](#) : Interrogate the communication parameters
- [REGENERATE-CPTP](#) : Regenerate the database for the communication parameters

#### 58.3.1 Dependency on CPTP

- TYPE=DPCON must be started before TYPE=APPL.
- The combination (EMSAPPL,DPPROC,DPAPPI) may only be used once.
- For stream oriented use a LOCPORT must not be assigned to different EMSAPPL.

58.3.2 ADD-CPTP

Depending on the values for the branch parameter TYPE, the following parameters can be added:

- 1. DP-Connections
- 2. Applications

Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-CPTP     | TYPE=DPCON (1)<br>, [NO=<number>], DPPROC=<string><br>, IPNO=<number>;                                                                                                                                                                                  |
|              | TYPE=APPL (2)<br>, [NO=<number>], EMSAPPL=<string><br>, DPPROC=<string>, DPAPPL=<string><br>, MSGBASED=YES<br>, LOCPORT=<number>, FARPORT=<number><br>, LOCTSAP=<string>, FARTSAP=<string>;<br>  , MSGBASED=NO<br>, LOCPORT=<number>, FARPORT=<number>; |

Examples

- 1. Create the parameters of a DP connection.

Input:

ADD-CPTP:DPCON,1,DPEXAMPL,"180.1.5.99";

- 2. Create the parameters for an application.

Input:

ADD-CPTP:APPL,2,APPL1,DPEXAMPL,APPLFAR,YES,102,102,IDAPPL1,IDAPPLFAR;  
;

58.3.3 DELETE-CPTP

Depending on the values for the branch parameter TYPE, the parameters of DP-connection or application can be deleted. Entering two chained values of parameter NO, a range of entries will be deleted.

## Procedure Overview

### Command Code

DELETE-CPTP

### Parameter

TYPE=<param>, NO=<number>;

### Examples

1. Delete the DP connection 1.

Input:

DELETE-CPTP:DPCON, 1;

2. Delete the applications 3 till 5.

Input:

DELETE-CPTP:APPL, 3-5;

## 58.3.4 DISPLAY-CPTP

Depending on the values for the branch parameter TYPE, the following parameters can be interrogated:

1. one (all) DP-Connection(s)
2. one (all) Application(s)
3. all DP-connections and all applications

## Procedure Overview

### Command Code

DISPLAY-CPTP

### Parameter

[TYPE=<param>], [NO=<number>];

### Examples

1. Display all communication parameters.

Input:

DISPLAY-CPTP;

Output:

```
DP-CONNECTION :
+-----+-----+-----+
| DP NO | DPPROC | IP NUMBER |
+-----+-----+-----+
|  1    | DPPROC1 | 180.1.5.99 |
+-----+-----+-----+
```

APPLICATION :

CPTP - Communication parameters for TCP/IP-Connection

Parameter Description

|      |          |          |          |       |      |       |           |            |  |
|------|----------|----------|----------|-------|------|-------|-----------|------------|--|
|      |          |          |          |       |      |       |           |            |  |
| APPL | EMSAPPL  | DPPROC   | DPAPPL   | MSG   | LOC  | FAR   | LOCAL     | FAR        |  |
| NO   |          |          |          | BASED | PORT | PORT  | TSAP      | TSAP       |  |
| __1  | EMSAPPL1 | DPPROC1_ | DPAPPL1_ | YES   | 102  | 102__ | IDAPPL1__ | IDAPPLFAR_ |  |

58.3.5 REGENERATE-CPTP

Procedure Overview

|                 |           |
|-----------------|-----------|
| Command Code    | Parameter |
| REGENERATE-CPTP | ;         |

Examples

Output all data as position-oriented ADD commands.

Input:

REG-CPTP;

Output:

ADD-CPTP:DPCON,1,"DPEXAMPL","180.1.5.99";  
ADD-  
CPTP:APPL,2,"APPL1","DPEXAMPL","APPLFAR",YES,102,102,"IDAPPL1","IDAPPLFAR";

58.4 Parameter Description

|         |                                                                                                                                                                                                                           |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DPAPPL  | Name of the farend application; name need only be known to the local application and CMS, not to the far end application.<br>Type of Input : Single value, mandatory<br>Possible : 1 - 8 chars; 1st char /= ' '<br>Values |
| DPPROC  | Name of the farend host; name need only be known to the local application and CMS, not to the far end application.<br>Type of Input : Single value, mandatory<br>Possible : 1 - 8 chars; 1st char /= ' '<br>Values        |
| EMSAPPL | Name of the local application; name need only be known to the local application and CMS, not to the far end application.<br>Type of Input : Single value, mandatory                                                       |

## CPTP - Communication parameters for TCP/IP-Connection

### Parameter Description

|          |                                                                                                                                                                                                                                                                                                        |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | Possible Values : 1 - 8 chars; 1st char /= ' '                                                                                                                                                                                                                                                         |
| FARPORT  | <p>A well known server port number to which an application can connect via CMS. This port number must be identical with that in the far end host.</p> <p>Type of Input : Single value, mandatory</p> <p>Possible Values : 1 - 65535 (except 102 for stream based)</p>                                  |
| FARTSAP  | <p>Identification of the far end application according ISO-8073.</p> <p>Type of Input : Single value, mandatory</p> <p>Possible Values : 1 - 10 chars; 1st char /= ' '</p>                                                                                                                             |
| IPNO     | <p>THE IP address of the far end application. This address must also be set on the far end host.</p> <p>Type of Input : Single value, mandatory</p> <p>Possible Values : 7 - 15 chars; (0-255.0-255.0-255)</p>                                                                                         |
| LOCPORT  | <p>A well known port number to which a far end application can connect. It is up to the client to know what application is associated with this well known CMS port.</p> <p>Type of Input : Single value, mandatory</p> <p>Possible Values : 712 - 811 (stream based)</p> <p>: 102 (message based)</p> |
| LOCTSAP  | <p>Identification of the own application according ISO-8073. The host has to know this identification.</p> <p>Type of Input : Single value, mandatory</p> <p>Possible Values : 1 - 10 chars; 1st char /= ' '</p>                                                                                       |
| MSGBASED | <p>Specific type of data transmission to application.</p> <p>Type of Input : Single value, mandatory</p> <p>Possible Values : YES: application gets the data message based (protocol ISO-8073 is used)</p> <p>NO: application gets the data stream based</p>                                           |
| NO       | <p>Using ADD-CPTP NO is a free number in the table of DPCON or APPL (according TYPE). If NO is not entered, then the AMO looks for a free place in the table. If there is no free place, then an error message will be displayed.</p>                                                                  |

## CPTP - Communication parameters for TCP/IP-Connection

### Error- and Advisories

Type of Input : Single value,  
optional  
mandatory (DELETE)

Possible : 1 - 255  
Values two chained values are allowed with DELETE

#### TYPE

Type of Configuration

Type of Input : Single value,  
optional  
mandatory (ADD)

Possible : DPCON = DP Connection  
Values APPL = Application

## 58.5 Error- and Advisories

### 58.5.1 Error Messages

F01: A CONFIGURATION ALREADY EXISTS FOR THE DP-CONNECTION <no>.  
F02: A CONFIGURATION ALREADY EXISTS FOR THE APPLICATION <no>.  
F03: THE PARAMETER <param> CONTAINS INVALID CHARACTER.  
F04: THE COMBINATION EMS-APPLICATION <emsappl>, DP-PROCID <dpproc>  
AND DP-APPLICATION <dpappl> MAY ONLY BE USED ONCE.  
F05: FOR THE DP-CONNECTION <no> IS ALREADY AN APPLICATION ADDED.  
F06: THE MAXIMUM NUMBER OF DP-CONNECTIONS IS ALREADY REACHED.  
F07: THE MAXIMUM NUMBER OF APPLICATIONS IS ALREADY REACHED.  
F08: THE DP-CONNECTION <dpproc> IS NOT CONFIGURED.  
F09: A LOCPORT MUST NOT BE ASSIGNED TO DIFFERENT EMSAPPL.  
F10: FARPORT 102 IS NOT ALLOWED.  
F11: WRONG FORMAT OF IP-NUMBER.  
F12: DP-CONNECTION FOR <dpproc> ALREADY EXISTS.  
F13: NOT PERMITTED NUMBER OF DOTS IN IP-ADDR.  
F14: NUMBERS OCCURING IN AN IP-ADDR MUST NOT BE LARGER THAN 255.

### 58.5.2 Advisories

H01: THE DP-CONNECTION IS ADDED WITH THE CONNECTION NUMBER <no>.  
H02: THE APPLICATION IS ADDED WITH THE CONNECTION NUMBER <no>.  
H03: NO CONFIGURATION EXISTS FOR DP-CONNECTION.  
H04: NO CONFIGURATION EXISTS FOR APPLICATION  
H05: FOR SEVERAL DP-CONNECTIONS ARE APPLICATIONS STILL ADDED.  
H06: A CONFIGURATION ALREADY EXISTS FOR THE DP-CONNECTION <@@@>.

## 59 CRON - Timed command execution

|                      |                               |
|----------------------|-------------------------------|
| Restrictions         | Parameter Description         |
| Functions of the AMO | Error Messages and Advisories |

The AMO CRON is used to execute MML-commands at specified times, either only once or periodical (every ten minutes, hourly, daily, weekly or monthly). The AMO is based on a scheduling mechanism in the system which is activated in time-intervals of ten minutes. The MML-commands which are to be executed are stored in a time-schedule table which resides on hard disk.

An entry of the time-schedule table contains the following information:

- the MML-command which is to be executed
- a time specification when the MML-command should be executed
- an option that specifies, how often a MML-command is to be executed (O=once or P=periodical)

The time specification consists of five parameter entries that specify the minute (0, 10, 20, 30, 40 or 50), hour (0-23), day of the month (1-31), month of the year (1-12) and day of the week (0-6, with 0=Sunday). Each of these parameters may contain:

- a number in the range indicated above
- an asterisk (\*) meaning all legal values

Time specifications can be made in any combination. Parameters which are not specified or contain asterisks will be interpreted as "don't care", meaning all legal values (every ten minutes, hourly, daily, weekly or monthly respectively). The specification of days may be made by two parameters (DAY and WEEKDAY). If both are specified, both are adhered. For example WEEKDAY=5, DAY=13 would run a MML-command on every Friday the thirteenth.

All executed MML-commands are recorded in the MML-Logbook ( see AMO LOGBK). The result can be displayed using AMO-LOGBK. If however the MMI checking the command detects an error, there are not prompted parameters like in dialogue but the job will be discarded. There will be no entry to the AMO-LOGBK.

Attention: The user has to check the correctness of the MML-command.

MML-commands which are to be executed only once are removed automatically from the time-schedule table when they are (successfully or unsuccessfully) executed. MML-commands which are to be executed periodically remain in the time-schedule table.

## 59.1 Restrictions

- Since the MML-command contains hyphens ( punctuation marks ), it has to be set between double quotation marks. Therefore the MML-command itself occurring in an ADD-command of AMO CRON **must not contain double quotation marks !**

- The length of the MML-command is **max. 78 characters.**

**Remark:** Up to version HiPath 4000 V1.0 inclusively the length of the MML-command is **max. 48 characters**

- On principle AMO's residently loaded **cannot** be executed via AMO CRON at specified times.

**AMO DSSM is the only** residently loaded AMO. Therefore **AMO DSSM cannot be executed via AMO CRON.**

- All 'dialog - AMO's cannot be executed via AMO CRON.

To these belong e.g.:

- AMO TRACS
- AMO TRACA
- AMO DEBUG
- AMO DISPA

**Remark:**

A 'dialog - AMO' has the following characteristic properties:

1. The AMO must be started using a command ( e.g.: EXEC-DISPA:A1; )
2. Only after the start commands can be entered ( dialog - modus ). The entering of commands is prompted.
3. The AMO must be terminated using a command.

- By the following reasons the AMO CRON should only be used by EXPERTS:

1. The correctness of parameter values **is not checked in any way** by AMO CRON. Therefore the **user is exclusively responsible** for the correctness and executability of the entered commands.
2. The application of many AMO's requires **special system know how.**

3. Loss of data, falsification of data or a restart of the system can be the **result of an improper use** of AMO's.

## 59.2 Functions of the AMO

- **ADD-CRON** : Add a new entry to the time-schedule table
- **CHANGE-CRON** : Change an existing time-schedule table entry
- **DELETE-CRON** : Delete one or more enties from the time-schedule table
- **DISPLAY-CRON** : List one or more (all) time-schedule table entries
- **REGENERATE-CRON** : Regenerate commands from the time-schedule table

### 59.2.1 ADD-CRON

This action adds a new entry to the time-schedule table.

Procedure Overview

| Command Code | Parameter                 |
|--------------|---------------------------|
| ADD-CRON     | [POS =<number>],          |
|              | [EXEC =<param>],          |
|              | [MINUTE =<number> or *],  |
|              | [HOUR =<number> or *],    |
|              | [DAY =<number> or *],     |
|              | [MONTH =<number> or *],   |
|              | [WEEKDAY =<number> or *], |
|              | COMMAND =<string>;        |

#### Examples

Installation of a weekly database backup (every Sunday at 23:30).

Input:

```
ADD-CRON: , 30, 23, , , 0, "EXEC-UPDAT:BP;" ;
```

Installation of a class of service switchover during Christmas (from 12:00 Dec 24 to 6:00 Dec 27 for class of service switchover group number 7).

Input:

```
ADD-CRON: , 00, 12, 24, 12, , , "CHANGE-BERUM: COSX, 7, 2;" ;
ADD-CRON: , 00, 06, 27, 12, , , "CHANGE-BERUM: COSX, 7, 1;" ;
```

### 59.2.2 CHANGE-CRON

This action changes one or more existing entries of the time-schedule table.

#### Procedure Overview

| Command Code | Parameter                 |
|--------------|---------------------------|
| CHANGE-CRON  | POS      =<number> ,      |
|              | {EXEC    =<param> ,       |
|              | MINUTE  =<number> or * ,  |
|              | HOURL   =<number> or * ,  |
|              | DAY      =<number> or * , |
|              | MONTH   =<number> or * ,  |
|              | WEEKDAY =<number> or * ,  |
|              | COMMAND =<string>;        |

#### Example

Change the weekly database back-up from Sunday into Saturday (first position in the table).

Input:

```
CHANGE-CRON:POS=1,WEEKDAY=6;
```

#### Remark:

In entries originating from the **JOB Task** the parameters '**EXE**' and '**COMMAND**' **cannot be changed**. For these entries one has JOB /= 0.

### 59.2.3 DELETE-CRON

This action deletes one or more entries from the time-schedule table.

#### Procedure Overview

| Command Code | Parameter     |
|--------------|---------------|
| DELETE-CRON  | POS=<number>; |

#### Example

Delete all entries from the time-schedule table (incl. the file with the time-schedule table).

Input:

DEL-CRON:1&&32;

**REMARK:**

CRON Table entries having JOB /= 0 cannot be deleted with AMO CRON.  
Use AMO JOB to delete such entries.

**59.2.4 DISPLAY-CRON**

This action lists one or more (all) time-schedule table entries.

**Procedure Overview**

| Command Code | Parameter       |
|--------------|-----------------|
| DISPLAY-CRON | [POS=<number>]; |

**Example**

List all entries of the time-schedule table.

Input:

DISPLAY-CRON;

Output:

```

                                TIME-SCHEDULE TABLE
|POS|JOB |EXE|MIN| H |DAY|MNT|WDY| COMMAND
+---+-----+---+---+---+---+---+-----+
| 1 | 19 | R |30 |23 | 2 | 3 | 2 |
|:DMS: BATCH/C009AN160094.C
| 2 | 0 | R | 0 |11 |13 | * | 5 |
| EXEC-REST:SYSTEM;
| 3 | 20 | R | 0 |12 |24 |12 | 3 |
|:DMS: BATCH/C009AN160094.C
| 4 | 0 | R | 0 | 6 |27 |12 | * |
| CHANGE-BERUM: COSX,7,1;
| 5 | 0 | R |20 |13 |10 | 6 | 5 |
|
|ADD-ATCSM:A1,KO,TYPE,PCS-
CAPT,0D0A,0C,0,1B40,1B41,1B5B306D,1B5B386D,03,62,80;
| 5 | 21 | R |30 |23 | 1 | 4 | 6 |
| :DMS: BATCH/C009AN160094.C

```

**REMARK:**

Entries with JOB /= 0 were inserted by the JOB Task.

**59.2.5 REGENERATE-CRON**

This action regenerates one or more (all) time-schedule table entries.

CRON - Timed command execution

Parameter Description

Procedure Overview

| Command Code    | Parameter       |
|-----------------|-----------------|
| REGENERATE-CRON | [POS=<number>]; |

Example

Regenerate all entries of the time-schedule table.

Input:

REG-CRON;

Output:

ADD-CRON:1,P,30,23,\*,\*,6,"EXEC-UPDAT:BP;";  
ADD-CRON:2,P,0,11,13,\*,5,"EXEC-REST:SYSTEM;";  
ADD-CRON:3,P,0,12,24,12,\*, "CHANGE-BERUM: COSX,7,2;";  
ADD-CRON:4,P,0,6,27,12,\*, "CHANGE-BERUM: COSX,7,1;";

59.3 Parameter Description

|         |                                                                                                                                                  |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| COMMAND | MML-command to be executed<br>Type of Input : text string, mandatory<br>Possible Values : 1-78 characters                                        |
| DAY     | Day of the month<br>Type of Input : single value, optional<br>Possible Values : 1-31<br>* daily (or on the day of the week)<br>Default Value : * |
| EXEC    | Execution<br>Type of Input : single value, optional<br>Possible Values : O once<br>P periodical<br>Default Value : P                             |
| HOURL   | Hour<br>Type of Input : single value, optional<br>Possible Values : 0-23                                                                         |

|         |                                                                                                                                      |                            |                                      |
|---------|--------------------------------------------------------------------------------------------------------------------------------------|----------------------------|--------------------------------------|

## 60 CTIME - Call Processing Timers

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

By means of AMO CTIME, the customer-specific timers can be changed, interrogated, and regenerated.

The customer-specific timers are divided into the following groups to give a better overview:.

- ATND : Timers for the attendant console
- CCM : Timers for the multiple search code calling
- CPTIME1(\*) : Timers for call processing part 1 -MURAT
- CPTIME2(\*) : Timer for call processing part 2- MURAT
- TRK : Timers for trunks
- VECOTIME : Timers for VECOTIME

(\*)The branch for the timers for call processing, CP, has been divided into two parts named CP1 and CP2 at the version L2.003.

All tables that are processed by this AMO are initialized by the database. As a result, the creation branch of this AMO is omitted. The data is merely changed, interrogated and regenerated.

All the parameters for this AMO are optional and are not cross-checked.

### 60.1 Interrelationships

- AMO TACSU : Configuration of Analog Trunk Circuits
- AMO TDCSU : Configuration of Digital Trunk Circuits
- AMO TSCSU : Configuration of Special Circuits in the SWU

### 60.2 Functions of the AMO

- [CHANGE-CTIME](#) : Change customer-specific timers for CP
- [DISPLAY-CTIME](#) : Interrogate customer-specific timers for CP
- [REGENERATE-CTIME](#) : Regenerate customer-specific timers for CP

## 60.2.1 CHANGE-CTIME

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 60.2.2 DISPLAY-CTIME

### Procedure Overview

| Command Code  | Parameter        |
|---------------|------------------|
| DISPLAY-CTIME | TYPESWU=<param>; |

### Example

Interrogate the customer-specific timers for call processing part 1:

Input:

DISPLAY-CTIME:CP1;

Output:

CALL PROCESSING TIMERS 1:

|                      |                    |                    |
|----------------------|--------------------|--------------------|
| USERGD2 = 2 SEC.     | USERGD5 = 5 SEC.   | LONGPATH = 2 SEC.  |
| CBK = 20 SEC.        | ANSADV = 20 SEC.   | PARK = 30 SEC.     |
| SPDPD = 5 SEC.       | RECALL = 30 SEC.   | CDRDISDE = 10 SEC. |
| ECCSSUPV = 15 SEC.   | FAXCD = 5 SEC.     | DCIEOD = 5 SEC.    |
| AUTOTONE = 200 MS.   | RELREC = 90 SEC.   | TSUPVCB = 2 SEC.   |
| ONHOOK = 15 MIN.     | TSUPVAUT = 30 SEC. | CBRLN = 40 SEC.    |
| KNLEN = 30 SEC.      | RELCON = 90 SEC.   | LCREOD = 10 SEC.   |
| RECNIIGHT = 180 SEC. | RECPARK = 120 SEC. | PINVO1 = 300 SEC.  |
| PINVO2 = 300 SEC.    | PINVO3 = 300 SEC.  | PINVO4 = 300 SEC.  |
| PINVO5 = 300 SEC.    | PINVO6 = 300 SEC.  | PINVO7 = 300 SEC.  |

## CTIME - Call Processing Timers

### Functions of the AMO

|          |   |           |          |   |           |          |   |           |  |
|----------|---|-----------|----------|---|-----------|----------|---|-----------|--|
| PINNV1   | = | 1800 SEC. | PINNV2   | = | 1800 SEC. | PINNV3   | = | 1800 SEC. |  |

| LCRET    | = | 5 SEC.    | NOTRNG   | = | 5 SEC.    | FAXOFLPM | = | 30 SEC.   |  |
| ROUTEREQ | = | 5 SEC.    | CTHLDREC | = | 300 SEC.  | UUS3T1   | = | 10 SEC.   |  |
| UUS3T2   | = | 10 SEC.   | UUS3T3   | = | 10 SEC.   | QDELESTA | = | 1 SEC.    |  |

### Example

Interrogate the customer-specific timers for call processing part 2:

Input:

DISPLAY-CTIME:CP2;

Output:

```
CALL PROCESSING TIMERS 2:
+-----+-----+-----+
| CCBS5  = 3600 SEC. | AOCT1   = 15 SEC. | AOCT2   = 15 SEC. |
| CTLS1   = 2 SEC.  | CTLS2   = 2 SEC. | GPUNST  = 1800 SEC. |
| DCPA1   = 10 SEC. | DCPA2   = 15 SEC. | DCPA3   = 10 SEC. |
| RTAD    = 0 SEC.  | PINVO10 = 300 SEC. | PINNV10 = 1800 SEC. |
| T400    = 20 SEC. | PREDCALL= 20 SEC. | NIRECALL= 900 SEC. |
| TRKTOTRK= 120 SEC. | REPAUSE  = 3 SEC. | SYSRCPAR= 30 SEC. |
| AUTCMPON= 60 SEC. | PINVO11 = 300 SEC. | PINNV11 = 1800 SEC. |
| PINVO12 = 300 SEC. | PINNV12 = 1800 SEC. | PINVO13 = 300 SEC. |
| PINNV13 = 1800 SEC. | PINVO14 = 300 SEC. | PINNV14 = 1800 SEC. |
| PINVO15 = 300 SEC. | PINNV15 = 1800 SEC. | VARDIALT= 20 SEC. |
| FTRQTOUT= 10 SEC. | FTWOTOUT= 180 SEC. | GWNAAVAIL= 60 SEC. |
| SMPFTIME= 8 SEC.  |              |              |
+-----+-----+-----+
```

### Example

Interrogate the customer-specific timers for trunks:

Input:

DISPLAY-CTIME:TRK;

Output:

```
CCT/SET TIMERS:
+-----+-----+-----+
| PREEMT  = 90 SEC. | NOANSCON = 30 SEC. | NOCALLTR = 30 SEC. |
| ATNDTRNS = 30 SEC. | RPTSZ    = 5 SEC.  | RPTSZEND = 40 SEC. |
+-----+-----+-----+
```

## CTIME - Call Processing Timers

### Functions of the AMO

```
| PRREQI   =   30 SEC. | PRREQC   =   15 SEC. | NEWCONN  =  110 SEC. |
+-----+-----+-----+
```

#### Example

Interrogate the customer-specific timers for the attendant console:

Input:

```
DISPLAY-CTIME:ATND;
```

Output:

```
ATTENDANT CONSOLE TIMERS:
```

```
+-----+-----+-----+
| ATNDCALL =   60 SEC. | ATNDCQ  =    2 SEC. | ATNDHOLD =    5 SEC. |
| ATNDDIS  =   20 SEC. | CQPRIO  =   15 SEC. | CQOFL    =   30 SEC. |
| ATNDTNSR =    7 SEC. |              |              |
+-----+-----+-----+
```

#### Example

Interrogate the customer-specific timers for the multiple search code calling:

Input:

```
DISPLAY-CTIME:CCM;
```

Output:

```
MULTIPLE-CC TIMERS:
```

```
+-----+-----+-----+
| NOTRDY1  =    3 SEC. | NOTRDY2  =    6 SEC. | WAIT1    = 1000 MS. |
| WAIT2    = 2000 MS. | CLRANS1  =   20 SEC. | CLRANS2  =   30 SEC. |
| CLRANS3  =   50 SEC. | CLRANS4  =  120 SEC. |              |
+-----+-----+-----+
```

#### Example

Interrogate the timers for the VECOTIME

Input:

```
DISPLAY-CTIME:VECOTIME;
```

Output:

```
VECO TIMERS:
```

```
+-----+-----+-----+
| CBMNXTBD =   20 MIN. | CBMBDANS =   30 SEC. |              |
+-----+-----+-----+
```

**60.2.3 REGENERATE-CTIME**

All the values in the database are output with this function.

**Procedure Overview**

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-CTIME | ;         |

**Example**

Regenerate timers for call processing.

Input:

REG-CTIME;

Output:

CHANGE-CTIME:CP1,2,5,2,20,20,30,5,30,10,3,5,5,200,90,2,15,  
30,40,30,90,10,180,120,300,300,300,  
300,300,300,300,1800,1800,1800,1800,  
1800,1800,1800,20,20,12,15,15,5,5,30,5,300,  
10,10,10,1;  
  
CHANGE-CTIME:CP2,3600,15,15,2,2,1800,10,15,10,0,300,1800,  
20,20,900,120,3,30,60,300,1800,300,1800,300,1800,300,1800,300,1800,20,10,180,60,  
8;  
CHANGE-CTIME:TRK, 90,30,30,30,5,40,30,15,110,900;  
CHANGE-CTIME:ATND,60,2,5,60,15,30,7;  
CHANGE-CTIME:CCM, 3,6,1000,2000,20,30,50,120;  
CHANGE-CTIME:VEECOTIME, 30,20;

**60.3 Parameter Description**

|         |                                                                                                                                                                   |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ANNDIAL | Time until announcement for dial.<br>Type of Input : single value, optional<br>Possible Values : 5 - 120 sec<br>Default Value : 5 sec                             |
| ANSADV  | No answer advance:<br>Timer for call forwarding - no answer<br>Type of Input : single value, optional<br>Possible Values : 3 - 3600 sec<br>Default Value : 20 sec |
| AOCT1   | Answer supevision of charge request<br>Type of Input : single value, optional<br>Possible Values : 2 - 99 sec                                                     |

## CTIME - Call Processing Timers

### Parameter Description

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | Default Value : 7 sec                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| ATNDTRNS | Transfer to attendant:<br><br>This timer is used for the following two functions:<br>1. Time after which a parallel call to the attendant position is to be made after ringing has been sent to an idle station which does not answer.<br>2. Time after which trunk calls in the call queuer will be indicated by rapid flashing of the overload LED. The overload indicator must have been activated using AMO ZAND (TYPE=ALLDATA, ACOVLT=YES).<br><br>Type of Input : single value, optional<br>Possible Values : 5 - 3600 sec<br>Default Value : 30 sec |
| AUTOTONE | "ON" time for answer tone on SLMA (answering device for comp.-controlled call setup).<br><br>Type of Input : single value, optional<br>Possible Values : 100 - 999 ms<br>Default Value : 200 ms                                                                                                                                                                                                                                                                                                                                                            |
| AUTCMPON | auto camp on timer.<br><br>Type of Input : single value, optional<br>Possible Values : 1- 60 sec<br>Default Value : 5 sec                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CBK      | Time after which a recall is to be stopped (Call back).<br>This timer will be used even for Recall Time T-CCBS3..<br><br>Type of Input : single value, optional<br>Possible Values : 10 - 100 sec<br>Default Value : 20 sec                                                                                                                                                                                                                                                                                                                                |
| CBMBDANS | response time of the particular LTUCC board.<br><br>Type of Input : single value, optional<br>Possible Values : 1 - 300 sec<br>Default Value : 30 sec                                                                                                                                                                                                                                                                                                                                                                                                      |
| CBMNXTBD | control timer for checking the LTUCC boards.<br><br>Type of Input : single value, optional<br>Possible Values : 2 - 30 min<br>Default Value : 20 min                                                                                                                                                                                                                                                                                                                                                                                                       |
| CBRLEN   | Ringing time for callback notification:<br>Only applies, if the parameter RRGBKTN is declared in the TYPE=ALLDATA branch of the AMO ZAND, if called party is free but does not answer.<br><br>Type of Input : single value, optional<br>Possible Values : 10 - 120 sec<br>Default Value : 40 sec                                                                                                                                                                                                                                                           |

|          | Default Value                                                                                                          | : 2 sec.                 |
| CTLS2    | Controlled trunk and line selection timer 2                                                                            |                          |
|          | Type of Input                                                                                                          | : Single value, optional |
|          | Possible Values                                                                                                        | : 0 - 300 sec.           |
|          | Default Value                                                                                                          | : 2 sec.                 |
| DANNDIAL | Duration of announcement for dial.                                                                                     |                          |
|          | Type of Input                                                                                                          | : single value, optional |
|          | Possible Values                                                                                                        | : 5 - 180 sec            |
|          | Default Value                                                                                                          | : 15 sec                 |
| DCIEOD   | End-of-dial supervision when setting up a trunk call or a tie-trunk call for a DCI from an associated ANATE or DIGITE. |                          |
|          | Type of Input                                                                                                          | : single value, optional |
|          | Possible Values                                                                                                        | : 3 - 9 sec              |
|          | Default Value                                                                                                          | : 5 sec                  |
| DCPA1    | Directed call park - park destination is idle.                                                                         |                          |
|          | Type of Input                                                                                                          | : single value, optional |
|          | Possible Values                                                                                                        | : 1 - 999 sec            |
|          | Default Value                                                                                                          | : 10 sec                 |
| DCPA2    | Directed call park - recall timer of the parked party.                                                                 |                          |
|          | Type of Input                                                                                                          | : single value, optional |
|          | Possible Values                                                                                                        | : 1 - 999 sec            |
|          | Default Value                                                                                                          | : 15 sec                 |
| DCPA3    | Directed call park - park destination is busy.                                                                         |                          |
|          | Type of Input                                                                                                          | : single value, optional |
|          | Possible Values                                                                                                        | : 1 - 999 sec            |

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | Default Value : 10 sec                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DISPCH   | Time between actualization of charge display:<br>Actualization of charge display at station by desired interval. The adjusted value is only an approximate value which can be exceeded when the switching unit is hardly working to capacity by processes of high priority.<br>The parameter is only effective if charges will really be displayed.<br>Type of Input : single value, optional<br>Possible Values : 10 - 300 sec<br>Default Value : 20 sec |
| ECCSSUPV | External computer controlled call setup (ECCS) supervision time.<br>Type of Input : single value, optional<br>Possible Values : 1 - 255 sec<br>Default Value : 15 sec                                                                                                                                                                                                                                                                                     |
| FAXCD    | After the code FAX is dialed from a digite, the timer starts during a call (while in the call state). If no DN is dialed, a FAX call is set up to the other party after the timer expires if the other party has a FAX device.<br>Type of Input : single value, optional<br>Possible Values : 1 - 9 sec<br>Default Value : 5 sec                                                                                                                          |
| FAXOFLPM | Fax overflow time to PhoneMail:<br>The time before the overflow to PhoneMail takes place in the case "no answer"<br>Type of Input : single value, optional<br>Possible Values : 1 - 999 sec<br>Default Value : 30 sec                                                                                                                                                                                                                                     |
| FTRQTOUT | Final Tones:<br>i.e busy, reorder etc. that require timeout<br>Type of Input : single value, optional<br>Possible Values : 5 - 3600 sec<br>Default Value : 10 sec                                                                                                                                                                                                                                                                                         |
| FTWOTOUT | Final Tones that do not require timeout<br>Type of Input : single value, optional<br>Possible Values : 5 - 3600 sec<br>Default Value : 180 sec                                                                                                                                                                                                                                                                                                            |
| FWDDISK  | NO ANSWER ADVANCE TIMER FROM CLIENT TO DESKPHONE CIRCUIT<br>Type of Input : single value, group member<br>Possible Values : numeric, 1-30                                                                                                                                                                                                                                                                                                                 |
| FWDCELL  | NO ANSWER ADVANCE TIMER FROM DESK TO MOBILE FOR OSMO&CIRCUIT<br>Type of Input : single value, group member<br>Possible Values : numeric, 1-30                                                                                                                                                                                                                                                                                                             |
| FWDVM    | NO ANS ADV TIMER TO VM FOR OSMO & TO CFNR DEST FOR CIRCUIT                                                                                                                                                                                                                                                                                                                                                                                                |

## CTIME - Call Processing Timers

### Parameter Description

|          |                                                                                                                           |                            |
|----------|---------------------------------------------------------------------------------------------------------------------------|----------------------------|
| FWDCFNR  | Type of Input                                                                                                             | single value, group member |
|          | Possible Values                                                                                                           | numeric, 1-30              |
| FWDCFNR  | NO ANSWER ADVANCE TIMER FOR OSMO ONLY                                                                                     |                            |
|          | Type of Input                                                                                                             | single value, group member |
| GPUNST   | Possible Values                                                                                                           | numeric, 1-30              |
|          | Network-wide group pick-up tsc teardown timer                                                                             |                            |
| GPUNST   | Type of Input                                                                                                             | : single value, optional   |
|          | Possible Values                                                                                                           | : 60 - 64800 sec           |
|          | Default Value                                                                                                             | 180 sec                    |
| GWNAVAIL | Time during a gateway is marked as not reachable                                                                          |                            |
|          | Type of Input                                                                                                             | : single value, optional   |
| GWNAVAIL | Possible Values                                                                                                           | : 1 - 300 sec              |
|          | Default Value                                                                                                             | 60 sec                     |
| KNLEN    | Length of knocking signal for DID calls from CO.                                                                          |                            |
|          | Type of Input                                                                                                             | : single value, optional   |
| KNLEN    | Possible Values                                                                                                           | : 10 - 120 sec             |
|          | Default Value                                                                                                             | : 30 sec                   |
| LCREOD   | LCR (least cost routing) end-of-dial timer:                                                                               |                            |
|          | This timer is restarted after each digit dialed. Upon expiry of the timer, it is assumed that dialing has been completed. |                            |
| LCREOD   | Type of Input                                                                                                             | : single value, optional   |
|          | Possible Values                                                                                                           | : 3 - 30 sec               |
|          | Default Value                                                                                                             | : 10 sec                   |
| LCRET    | Expensive route tone supervision.                                                                                         |                            |
|          | Type of Input                                                                                                             | : single value, optional   |
| LCRET    | Possible Values                                                                                                           | : 2 - 10 sec               |
|          | Default Value                                                                                                             | : 5 sec                    |
| LONGPATH | Reserve long path (multi-mts (stage) system only):                                                                        |                            |
|          | Timer for delayed release of the long route via CSN (for systems with a 3-stage switching network).                       |                            |
| LONGPATH | Type of Input                                                                                                             | : single value, optional   |
|          | Possible Values                                                                                                           | : 1 - 5 sec                |
|          | Default Value                                                                                                             | : 2 sec                    |
| NEWCONN  | Supervision time for new connection request: supervision of a new connection setup.                                       |                            |
|          | Type of Input                                                                                                             | : single value, optional   |
| NEWCONN  | Possible Values                                                                                                           | : 0 - 300 sec              |
|          | Default Value                                                                                                             | 110 sec                    |
| NIRECALL | night recall timer                                                                                                        |                            |
|          | Type of Input                                                                                                             | : single value, optional   |

|          |                                                                                                                                                                                                                                                                                                                                                    |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | Possible Values : 60 - 1800 sec<br>Default Value : 900 sec                                                                                                                                                                                                                                                                                         |
| NOANSCON | No answer consultation:<br>The timer is set for a trunk which recalls to the initiator when the transfer was not successful. If the initiator does not answer, the call is forwarded on to the attendant after the timer expires.<br>Type of Input : single value, optional<br>Possible Value : 5 - 3600 sec<br>Default Value : 30 sec             |
| NOCALLTR | No call transfer:<br>Ringing time in the case of a transfer to an available subscriber, or checking time in the case of a transfer to a busy subscriber. After the timer expires, the initiator is recalled and timer "NOANSCON" is started.<br>Type of Input : single value, optional<br>Possible Values : 5 - 3600 sec<br>Default Value : 30 sec |
| NOTRDY1  | Time after which the the input of search jobs is negatively acknowledged if the TCOM (multi-purpose outgoing trunk circuit for special equipment) is "out of service".<br>Type of Input : single value, optional<br>Possible Values : 1 - 5 sec<br>Default Value : 3 sec                                                                           |
| NOTRDY2  | Time after which the the input of search jobs is negatively acknowledged if the TCOM (multi-purpose outgoing trunk circuit for special equipment) is "out of service".<br>Type of Input : single value, optional<br>Possible Values : 5 - 10 sec<br>Default Value : 6 sec                                                                          |
| NOTRNG   | Periodical repeated notification ring<br>Type of Input : single value, optional<br>Possible Values : 5 - 30 sec<br>Default Value : 5 sec                                                                                                                                                                                                           |
| OFLPM    | AC queue overflow to phonemail:<br>The timer will be started on entering the incoming CO trunk call into the AC queue if this function is activated.<br>Type of Input : single value, optional<br>Possible Values : 1 - 999 sec<br>Default Value : 20 sec                                                                                          |
| ONHOOK   | Time between deactivation and B-station going on-hook (1TR6).<br>Type of Input : single value, optional<br>Possible Values : 10 - 60 min<br>Default Value : 15 min                                                                                                                                                                                 |
| PARK     | Time for callback in the case of a parked subscriber, park unit/location is released.                                                                                                                                                                                                                                                              |

## CTIME - Call Processing Timers

### Parameter Description

|         |                                                                                                                                                     |                          |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
|         | Type of Input                                                                                                                                       | : single value, optional |
|         | Possible Values                                                                                                                                     | : 10 - 3600 sec          |
|         | Default Value                                                                                                                                       | : 30 sec                 |
| PINNV1  | Time for validation of the pin, of COPIN 1 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=1,PINDUR=TIME).   |                          |
|         | Type of Input                                                                                                                                       | : single value, optional |
|         | Possible Values                                                                                                                                     | : 1 - 64800 sec          |
|         | Default Value                                                                                                                                       | : 1800 sec               |
| PINNV2  | Time for validation of the pin, of COPIN 2 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=2,PINDUR=TIME).   |                          |
|         | Type of Input                                                                                                                                       | : single value, optional |
|         | Possible Values                                                                                                                                     | : 1 - 64800 sec          |
|         | Default Value                                                                                                                                       | : 1800 sec               |
| PINNV3  | Time for validation of the pin, of COPIN 3 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=3,PINDUR=TIME).   |                          |
|         | Type of Input                                                                                                                                       | : single value, optional |
|         | Possible Values                                                                                                                                     | : 1 - 64800 sec          |
|         | Default Value                                                                                                                                       | : 1800 sec               |
| PINNV4  | Time for validation of the pin, of COPIN 1 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=4,PINDUR=TIME).   |                          |
|         | Type of Input                                                                                                                                       | : single value, optional |
|         | Possible Values                                                                                                                                     | : 1 - 64800 sec          |
|         | Default Value                                                                                                                                       | : 1800 sec               |
| PINNV5  | Time for validation of the pin, of COPIN 1 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=5,PINDUR=TIME).   |                          |
|         | Type of Input                                                                                                                                       | : single value, optional |
|         | Possible Values                                                                                                                                     | : 1 - 64800 sec          |
|         | Default Value                                                                                                                                       | : 1800 sec               |
| PINNV6  | Time for validation of the pin, of COPIN 1 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=6,PINDUR=TIME).   |                          |
|         | Type of Input                                                                                                                                       | : single value, optional |
|         | Possible Values                                                                                                                                     | : 1 - 64800 sec          |
|         | Default Value                                                                                                                                       | : 1800 sec               |
| PINNV7  | Time for validation of the pin, of COPIN 7 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=7,PINDUR=TIME).   |                          |
|         | Type of Input                                                                                                                                       | : single value, optional |
|         | Possible Values                                                                                                                                     | : 1 - 64800 sec          |
|         | Default Value                                                                                                                                       | : 1800 sec               |
| PINNV10 | Time for validation of the pin, of COPIN 10 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=10,PINDUR=TIME). |                          |
|         | Type of Input                                                                                                                                       | : single value, optional |

|         |                                                                                                                                                                                                                                                              |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | Possible Values : 0 - 64800 sec                                                                                                                                                                                                                              |
|         | Default Value : 1800 sec                                                                                                                                                                                                                                     |
| PINNV11 | Time for validation of the pin, of COPIN 11 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=11,PINDUR=TIME).<br>Type of Input : single value, optional<br>Possible Values : 0 - 64800 sec<br>Default Value : 1800 sec |
| PINNV12 | Time for validation of the pin, of COPIN 12 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=12,PINDUR=TIME).<br>Type of Input : single value, optional<br>Possible Values : 0 - 64800 sec<br>Default Value : 1800 sec |
| PINNV13 | Time for validation of the pin, of COPIN 13 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=13,PINDUR=TIME).<br>Type of Input : single value, optional<br>Possible Values : 0 - 64800 sec<br>Default Value : 1800 sec |
| PINNV14 | Time for validation of the pin, of COPIN 14 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=14,PINDUR=TIME).<br>Type of Input : single value, optional<br>Possible Values : 0 - 64800 sec<br>Default Value : 1800 sec |
| PINNV15 | Time for validation of the pin, of COPIN 15 for non-voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=15,PINDUR=TIME).<br>Type of Input : single value, optional<br>Possible Values : 0 - 64800 sec<br>Default Value : 1800 sec |
| PINVO1  | Time for validation of the pin, of COPIN 1 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=1,PINDUR=TIME).<br>Type of Input : single value, optional<br>Possible Values : 1 - 64800 sec<br>Default Value : 300 sec        |
| PINVO2  | Time for validation of the pin, of COPIN 2 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=2,PINDUR=TIME).<br>Type of Input : single value, optional<br>Possible Values : 1 - 64800 sec                                   |

## CTIME - Call Processing Timers

### Parameter Description

|         |                                                                                                                                                 |                          |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
|         | Default Value                                                                                                                                   | : 300 sec                |
| PINVO3  | Time for validation of the pin, of COPIN 3 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=3,PINDUR=TIME).   |                          |
|         | Type of Input                                                                                                                                   | : single value, optional |
|         | Possible Values                                                                                                                                 | : 1 - 64800 sec          |
|         | Default Value                                                                                                                                   | : 300 sec                |
| PINVO4  | Time for validation of the pin, of COPIN 4 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=4,PINDUR=TIME).   |                          |
|         | Type of Input                                                                                                                                   | : single value, optional |
|         | Possible Values                                                                                                                                 | : 1 - 64800 sec          |
|         | Default Value                                                                                                                                   | : 300 sec                |
| PINVO5  | Time for validation of the pin, of COPIN 5 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=5,PINDUR=TIME).   |                          |
|         | Type of Input                                                                                                                                   | : single value, optional |
|         | Possible Values                                                                                                                                 | : 1 - 64800 sec          |
|         | Default Value                                                                                                                                   | : 300 sec                |
| PINVO6  | Time for validation of the pin, of COPIN 6 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=6,PINDUR=TIME).   |                          |
|         | Type of Input                                                                                                                                   | : single value, optional |
|         | Possible Values                                                                                                                                 | : 1 - 64800 sec          |
|         | Default Value                                                                                                                                   | : 300 sec                |
| PINVO7  | Time for validation of the pin, of COPIN 7 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=7,PINDUR=TIME).   |                          |
|         | Type of Input                                                                                                                                   | : single value, optional |
|         | Possible Values                                                                                                                                 | : 1 - 64800 sec          |
|         | Default Value                                                                                                                                   | : 300 sec                |
| PINVO10 | Time for validation of the pin, of COPIN 10 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=10,PINDUR=TIME). |                          |
|         | Type of Input                                                                                                                                   | : single value, optional |
|         | Possible Values                                                                                                                                 | : 0 - 64800 sec          |
|         | Default Value                                                                                                                                   | : 300 sec                |
| PINVO11 | Time for validation of the pin, of COPIN 11 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=11,PINDUR=TIME). |                          |
|         | Type of Input                                                                                                                                   | : single value, optional |
|         | Possible Values                                                                                                                                 | : 0 - 64800 sec          |
|         | Default Value                                                                                                                                   | : 300 sec                |
| PINVO12 | Time for validation of the pin, of COPIN 12 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=12,PINDUR=TIME). |                          |
|         | Type of Input                                                                                                                                   | : single value, optional |
|         | Possible Values                                                                                                                                 | : 0 - 64800 sec          |

|          |                                                                                                                                                                                                                                                         |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | Default Value : 300 sec                                                                                                                                                                                                                                 |
| PINVO13  | Time for validation of the pin, of COPIN 13 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=13,PINDUR=TIME).<br>Type of Input : single value, optional<br>Possible Values : 0 - 64800 sec<br>Default Value : 300 sec |
| PINVO14  | Time for validation of the pin, of COPIN 14 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=14,PINDUR=TIME).<br>Type of Input : single value, optional<br>Possible Values : 0 - 64800 sec<br>Default Value : 300 sec |
| PINVO15  | Time for validation of the pin, of COPIN 15 for voice, if pin has not been deactivated (see AMO PERSI, CHANGE TYPE=COPIN,COPIN=15,PINDUR=TIME).<br>Type of Input : single value, optional<br>Possible Values : 0 - 64800 sec<br>Default Value : 300 sec |
| PREDCALL | timer for making predictive call attempt.<br>Type of Input : single value, optional<br>Possible Values : 3-255 sec<br>Default Value : 20 sec                                                                                                            |
| PREEMT   | Preemption: Higher-order deactivation timer for releasing outgoing calls if no-one answers a callback (due to call charge pulses).<br>Type of Input : single value, optional<br>Possible Values : 90 - 240 sec<br>Default Value : 90 sec                |
| PRREQC   | Supervision time of state PR-REQ-COMPLETING:<br>supervision, if the old way will be released without errors.<br>Type of Input : single value, optional<br>Possible Values : 0 - 300 sec<br>Default Value : 15 sec                                       |
| PRREQI   | Supervision time of state PR-REQ-INITIATED:<br>supervision, if there is an answer from Cooperating PTNX.<br>Type of Input : single value, optional<br>Possible Values : 0 - 300 sec<br>Default Value : 30 sec                                           |
| RECALL   | Recall transferring party:<br>Timer for recall if a subscriber is transferred and subscriber does not answer after the transfer (or checking time if the transfer is to a busy subscriber).                                                             |

## CTIME - Call Processing Timers

### Parameter Description

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | Type of Input : single value, optional                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|           | Possible Values : 5 - 3600 sec                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|           | Default Value : 30 sec                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| REC NIGHT | Max. automatic recall time for night station:<br>the timer will be started if there is a call-back for incoming co and if the waiting co trunk will be set for call state. The timer is also used for maximum duration of the calls in ringing state that are not queued to ACD. If the release destination doesn't answer the connection will be released after timing.<br><b>Remark:</b> for analog trunk boards (e.g. TMANI, TMANIN), the connection release will depend on either the Central Office or on the caller. |
|           | Type of Input : single value, optional                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|           | Possible Values : 10 - 64800 sec                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|           | Default Value : 180 sec                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| RECPARK   | Max. park time of trunk calls before recall to attendant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| WAIT1    | <p>Time for dummy task 1 (enhanced code calling):<br/>This time will be assigned by the AMO TSCSU when TCOM (mult.-purpose outgoing trunk circuit for special equipment) is created for PSM (multiple code calling system).</p> <p>Type of Input : single value, optional</p> <p>Possible Values : 500 - 30000 ms..</p> <p>Default Value : 1000 ms.</p> |
| WAIT2    | <p>Time for dummy task 2 (enhanced code calling):<br/>This time will be assigned by the AMO TSCSU when TCOM (mult.-purpose outgoing trunk circuit for special equipment) is created for PSM (multiple code calling system).</p> <p>Type of Input : single value, optional</p> <p>Possible Values : 500 - 30000 ms..</p> <p>Default Value : 2000 ms.</p> |

## 60.4 Error Messages and Advisories

H01: IF SPEED DIALING WITH AUTOMATIC SUFFIX DIALING IS USED, THEN THE VALUE OF SPDPD TIMER <xx> MUST BE LOWER THAN THE VALUE OF LCREOD TIMER <xx>.

## 61 DAGR - Administration of File parameters in CDR

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

This AMO can be used to change the file parameters for the output files in CDR (Call Detail Recording).

With this AMO the file sizes for the CDRC files and the FT-file (File for file-transfer) are administrated. For the FT-file there are additional parameters for the administration.

These file sizes at first have a maximum of 65535 data records for each of the CDRC files (CDRC-FILE1, CDRC-FILE2) and for the FT-file.

As a rule, the file sizes are initialized in the database as follows:

CDRC file1: with 65000 data records

CDRC file2: with 0 data records

FT file: with 0 data records

The abbreviation FT file means: File for File Transfer

The files are generated with these file sizes with output the first data record to the repective file. If a different size is desired, it can be changed during generation of the database.

If a different file size is desired at a later time, the new file size must be created using AMO-DAGR and the old file must be deleted on the HARD DISK. The new file with the new size is generated automatically when the first data record is stored.

Note:

The standard value of file size for CDRC files and FT file (parameter NO) has the range between 30000 and 40000 data records.

### 61.1 Interrelationships

None

## 61.2 Functions of the AMO

- **ADD-DAGR** : Add the file parameters
- **CHANGE-DAGR** : Change the file parameters
- **DELETE-DAGR** : Delete the file parameters
- **COPY-DAGR** : Start the copy of the file
- **DISPLAY-DAGR / REGENERATE-DAGR** : Interrogate the file parameters  
Regenerate the file parameters

### 61.2.1 ADD-DAGR

Add the parameters for the output files of CDR. The output files are the CDRC-files (CDRC1 and CDRC2) and the FT-file.

For the CDRC-files there are only the file-sizes which can be added. The maximum size for each file is 65535 data records.

For the FT-file is the file size not a fixed limit. This file size ensures that the file will be created with this sizes.

For the FT-file the parameters for controlling the copy of the file (Copy time and Copy period) as well as the customer specific file name and the output code of the data records can be added.

For the copy time the day and the hour of the first copy time will be entered. At this it will be checked if the day is possible for the actual or the next month. If this is not a possible date, then the AMO gives an error message and the value is interrogated again. The copy period is the time after which the next copy will be started. The value 0 means that there is no copy period (only the first copy).

Is the end of file reached during the storage of the data records, the copy of the file to the customer specific filename is started. Is the customer specific file not picked up, then the FT-file will be added to this file. With this action it is possible that the file size of the FT-file will be exceeded. In this case it is possible that the data records are added to the file as long there is no more space on the CDR-Area (":CGD:-Area") of the Hard disk.

With the parameter output code it will be defined in which code (ASCII or EBCDIC) the data record is formatted. If the output code is changed (from ASCII to EBCDIC or reverse) the AMO gives an advisory that the file has to be copied and transferred. In this case a manually copy of the file must be started that the file can be transferred. This avoids that there are different formatted data record in the file.

Is the output code changed and the customer specific FT-file is not picked up, then the change will not be done. The change must be done in the following way:

1. Switch the corresponding selection group to COLLECT (AMO-SELS).
2. Start copy of the FT-file with action COPY.
3. Pick up the customer specific FT-file with the file transfer.
4. Change the file parameter output code.
5. Switch on the corresponding selection group (AMO-SELS).

### Procedure Overview

| Command Code | Parameter                                                                            |     |
|--------------|--------------------------------------------------------------------------------------|-----|
| ADD-DAGR     | FILE=CDRC1, NO=<number>;                                                             | (1) |
|              | FILE=CDRC2, NO=<number>;                                                             | (2) |
|              | FILE=FT, NO=<number>, CODE=<name>, TIME=<number>,<br>PERIOD=<number>, NAME=<string>; | (3) |

### Examples

1. Add the file size for FILE CDRC1 with 9000 data records

Input:

```
ADD-DAGR:CDRC1,9000;
```

2. Add the parameters for the FT-file with 40000 data records, Output code ASCII, first copy time on the 20th of the actual month at 23 o'clock with period 48 hours. Name of the customer specific file is "FILETRANSFER1".

Input:

```
ADD-DAGR:FT,40000,ASC,20-23,48,"FILETRANSFER1";
```

## 61.2.2 CHANGE-DAGR

Change the file parameters. For the CDRC-files there can be only the file sizes be changed.

For the FT-file the parameters for the file size, the copy time, the copy period, the output code and the customer specific file name can be changed. The AMO checks if the output code is changed (from ASCII to EBCDIC or reverse). In this case, the AMO outputs an advisory

message. A manually copy of the file must be performed that the file can be transferred. Is the file not yet picked up, then the same actions must be performed as at the action ADD.

The copy time will be checked in the same way as at the action add.

The parameters in the branch for the FT-file are a group of parameters where at least on e parameter has to be entered.

Procedure Overview

| Command Code | Parameter                                                                                 |     |
|--------------|-------------------------------------------------------------------------------------------|-----|
| CHANGE-DAGR  | FILE=CDRC1,NO=<number>;                                                                   | (1) |
|              | FILE=CDRC2,NO=<number>;                                                                   | (2) |
|              | FILE=FT,{ (min 1)NO=<number>,CODE=<name>,TIME=<number>,<br>PERIOD=<number>,NAME=<string>; | (3) |

Examples

1. Change FILE CDRC1 to 30000 data records  
Input:  
CHANGE-DAGR:CDRC1,9000;
2. Change the file size for the FT-file to 30000 data records and the copy period to 36 hours.  
Input:  
CHANGE-DAGR:FT,30000,,,36;

61.2.3 DELETE-DAGR

Delete the file parameters. The values for the file sizes will be set to 0. The values for the FT-file will be set to the initial values (copy time 0, copy period 0, output code ASCII, customer specific file name "FT\_FILE\_INTERN").

Procedure Overview

| Command Code | Parameter    |  |
|--------------|--------------|--|
| DELETE-DAGR  | FILE=<name>; |  |

### Example

1. Delete the number of data records for FILE CDRC1

Input:

```
DELETE-DAGR:CDRC1;
```

## 61.2.4 COPY-DAGR

Manually copy of the FT-file to the customer specific file name for file transfer.

### Procedure Overview

#### Command Code

COPY-DAGR

#### Parameter

;

### Example

1. Start the copy of the FT-file.

Input:

```
COPY-DAGR;
```

## 61.2.5 DISPLAY-DAGR / REGENERATE-DAGR

1. Interrogate the file parameters for CDR in list format (DISPLAY).
2. Interrogate the file parameters for CDR with output in position-related commands for regeneration (REGEN).

### Procedure Overview

#### Command Code

DISPLAY-DAGR

| REGENERATE-DAGR

#### Parameter

;

(1)

(2)

Examples

1. Output of the file parameters for CDR in list format.

Input:

DISPLAY-DAGR;

Output:

```
FILE-PARAMETERS OF DMS-FILES OF CALL CHARGE REGISTRATION

FILE NAME                NUMBER OF RECORDS IN THE FILE
CDRC1                     30000
CDRC2                     0
FT                        30000

PARAMETERS FOR THE FILE FOR FILE-TRANSFER:

OUTPUT-CODE              : ASC
COPY TIME (DD-HH)        : 20-23
COPY PERIOD (HOURS)      : 036
NAME OF THE TRANSFER FILE : FILETRANSFER1
```

2. Regenerate the file parameters

Input:

REG-DAGR;

Output:

```
ADD-DAGR:CDRC1,30000;
ADD-DAGR:CDRC2,0;
ADD-DAGR:FT,30000,ASC,20-23,36,"FILETRANSFER1";
```

61.3 Parameter Description

|                 |                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------|

## 62 DASM - Hard disk area allocation - physical

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

A physical device (hard disk) can be subdivided into fixed *memory areas*.

In the mnemonic name, areas are denoted by the letters 'A' and 'E' to 'K'.

Figure 7 Disk area allocation

Every physical device has a *management area* which contains the following data beginning at sector 1:

- Partition table to distribute the physical device between RMX and LINUX
- Data over that on the physical device initialized areas
- Coordination table if more than one controller is connected at the SCSI bus
- Dependability data

## DASM - Hard disk area allocation - physical

### Restrictions

The entries into the data base occur with the AMO DASM.

The areas are arranged and initialized on the physical device with the AMO INIT.

---

**NOTE:** The management area is a protected area. A device contains up to 7 user areas. **Flash Memory** have only one management area which, however, covers the entire range. No areas will be added/deleted to/from an external device. An attempt to **add/delete areas on a controller** to which an external device has been assigned will be rejected with an error message.

---

## 62.1 Restrictions

This description is valid from HiPath 4000 V6.0.

## 62.2 Interrelationships

- AMO DCSM : Disk configuration
- AMO DDSM : Disk status

## 62.3 Functions of the AMO

- [ADD-DASM](#) : Add memory areas (device areas) in the DB
- [DELETE-DASM](#) : Delete memory areas from the DB

### 62.3.1 ADD-DASM

The areas are so configured that, beginning with the last block of any area already present in the DB, they cover the entire disk. If the specified area sizes are insufficient, the AMO can append another one. In addition, an obligatory management area is installed for each hard disk.

The mnemonic name of the area is announced when the disk area has been successfully installed.

### Procedure Overview

| Command Code | Parameter                                                               |
|--------------|-------------------------------------------------------------------------|
| ADD-DASM     | [UNIT=<param>] , CNO=<number> , [ALEN=<number>]<br>, [AGRAN=<number>] ; |

#### Examples

1. Installing two user areas of length 250 and 500 on device 1.

Input:

```
ADD-DASM: , 1, 250&500, 2048&4096;
```

### 62.3.2 DELETE-DASM

All areas of the specified device, starting with that area which is defined by FROMAREA, are erased from the database with this function.

**Example: FROMAREA = G ; G, H, I, J and K will be errased.**

If no area is entered (independent from device type) , all installed areas will be deleted.

---

**NOTE:** When areas are only deleted without following [ADD-DASM](#), a REGEN with following GENDB will add an area with the free space. (siehe [ADD-DASM](#)).

---

### Procedure Overview

| Command Code | Parameter                                            |
|--------------|------------------------------------------------------|
| DELETE-DASM  | [UNIT=<param>] , CNO=<number> , [FROMAREA=<param>] ; |

#### Examples

1. All areas of the device on controller 1, starting with area F, are to be deleted on the administration and data server.

Input:

```
DELETE-DASM:A1, 1, F;
```

2. Delete all areas of device on controller 7

Input:

```
DEL-DASM:A1, 7;
```

## 62.4 Parameter Description

|          |                                           |                                                       |
|----------|-------------------------------------------|-------------------------------------------------------|
| AGRAN    | Area granularity                          |                                                       |
|          | Type of Input                             | : max. 8 chained (with '&') single values<br>optional |
|          | Possible Values                           | : 2048, 4096                                          |
|          | Default Value                             | : 2048                                                |
| ALEN     | Area size (in units of 64kByte)           |                                                       |
|          | (Area size = length of user-area)         |                                                       |
|          | (1 MByte corresponds to 16 64kByte units) |                                                       |
|          | Type of Input                             | : max. 8 chained (with '&') single values<br>optional |

F05: AREAS ON CONTROLLER <cn> HAVE NOT BEEN CREATED  
F06: DEVICE IS IN TEST STATUS  
F07: DEVICE IS BLOCKED DUE TO A DEFECT  
F08: AREA <:area:> IS BLOCKED DUE TO A DEFECT  
F09: FOR THE AREA <:area:> A DUPLICATE RECORDING IS STILL ADDED  
F10: AREA <:area:> IS IN SERVICE  
F11: AREA <:area:> IS RESERVED EXCLUSIVELY  
F12: AMO CANNOT EXECUTE AT THE MOMENT  
F13: DEVICE <:devnam:> IS A HD, PARAMETER ALN MUST BE SPECIFIED  
F14: AREA GRANULARITY MUST BE A MULTIPLE OF DEVICE GRANULARITY  
F15: DEVICE <:devnam:> IS NOT A HD, PARAMETER ALN OR AGRAN MUST NOT BE SPECIFIED  
F16: ALL AREAS AVAILABLE ARE ASSIGNED  
F17: ALL BLOCKS OF THE HD ARE USED BY AREAS  
F18: THE SPECIFIED AREA HAS NOT BEEN CREATED  
F19: IT IS NOT PERMISSIBLE TO CONFIGURE/DELETE AREAS ON EXTERNAL DEVICES

### **62.5.2 Advisories**

H01: AREA <aereakz> HAS BEEN CREATED WITH areasize MBYTE (blonum 64K-BLOCKS)  
H03: CAUTION! SIZE OF LAST AREA DIFFERS FROM REQUIRED SIZE  
H04: AREA <aereakz> HAS MORE BLOCKS AS THE ERROR ANALYSING TOOL CAN HANDLE.  
IF YOU USE AGRAN=agran THE ERROR ANALYSIS IS POSSIBLE.  
H05: THE ERROR ANALYSING TOOL CAN NOT HANDLE AREAS WITH AGRAN > 7680  
H06: ALL AREAS AVAILABLE ARE ASSIGNED

## **DASM - Hard disk area allocation - physical**

Error Messages and Advisories

## 63 DATE - Date/Time of Day

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The AMO DATE can be used to change and display the date and time of day in the system and to display it.

### 63.1 Restrictions

This description is valid from SP300-V3.4

### 63.2 Interrelationships

- AMO-SONUS : Resident SONUS-Task

### 63.3 Functions of the AMO

- [CHANGE-DATE](#) : Changing the date and/or time of day
- [DISPLAY-DATE](#) : Displaying the date/time of day
- [REGE-DATE](#) : Regenerate of GMTDIR and TIMEOFFS parameter

#### 63.3.1 CHANGE-DATE

The parameters: YEAR, MONTH, DAY, HOUR, MINUTE, and SECOND are optional; however, they form a group. Thus, at least one parameter of this group must be specified. Only the parameters entered in the CHANGE-command will be changed in the system time / date, the remaining values stay unchanged.

If the date is changed, a check is made to determine whether or not the date is valid. If the value of this date is invalid (e.g. 1985-02-31), the date parameters will be prompted.

The parameter MODE specifies if the configured time is the normal time or DST.

## DATE - Date/Time of Day

### Functions of the AMO

The parameter **GMTDIR** defines the direction of the time shift related to GMT and the parameter **TIMEOFFS** defines the time gap from GMT in minutes. It makes only sense to specify both parameters, so if a direction is given without an configured (zero) or given offset zero the AMO generates an advisory H04.

On compact systems, the value NOSYNC for parameter SYNC will be refused and an error-message (F3) will be output.

#### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-DATE  | { YEAR=<number>, MONTH=<number>, DAY=<number><br>, HOUR=<number>, MINUTE=<number>, SECOND=<number> ,<br>[GMTDIR=<string>] , [TIMEOFFS=<number>] , [MODE=<string>]}<br>, [SYNC=<string>]; |

#### Note:

To prevent unintentional changes of the system time by the SONUS-task, it is recommended to switch off the task before entering the first CHANGE-DATE command and to switch it on to the previous working mode after the last alteration to the system time / -date by AMO DATE.

Before first change:  
SWITCHOVER-SONUS:OFF;

After last change:  
SWITCHOVER-SONUS:EC or HD; (depending on previous working mode)

#### Example

Setting the date to 18 October 1985 and the time of day to 11:15:00.

Input:

```
CHANGE-DATE:1985,10,18,11,15,00,EAST,60,NT;
```

## 63.3.2 DISPLAY-DATE

Displaying the actual date and time of day in the system.

#### Procedure Overview

| Command Code | Parameter |
|--------------|-----------|
| DISPLAY-DATE | ;         |

### Example

Displaying date and time of day.

Input:

DISPLAY-DATE;

Output:

```
+-----+
| FRIDAY                                     |
| DATE:          TIME :                    |
| 2005-04-22      17:18:30                 |
|                                                    |
| NUMBER OF DAY : 112                       |
| NORMAL TIME                                           |
| GMTDIR: EAST  TIMEOFFS:60                 |
+-----+
```

## 63.3.3 REGE-DATE

Regenerating of the actual GMTDIR and TIMEOFFS parameters.

### Procedure Overview

| Command Code | Parameter |
|--------------|-----------|
| REGE-DATE    | ;         |

### Example

Regenerating of the actual GMTDIR and TIMEOFFS parameters.

Input:

REGE-DATE;

Output:

CHANGE-DATE:GMTDIR=WEST,TIMEOFFS=30;

## 63.4 Parameter Description

DAY                      Day input  
Type of Input    : Single value, optional

## DATE - Date/Time of Day

### Parameter Description

|        |                          |                          |                                   |
|--------|--------------------------|--------------------------|-----------------------------------|
|        | Possible Values          | : 01 - 31                |                                   |
| GMTDIR | Direction related to GMT |                          |                                   |
|        | Type of Input            | : Single value, optional |                                   |
|        | Possible Values          | : EAST                   | Time offset will be added         |
|        |                          | WEST                     | Time offset will be subtracted    |
|        | Default Value            | : EAST                   | Time offset will be added         |
| HOUR   | Time of day - hour       |                          |                                   |
|        | Type of Input            | : Single value, optional |                                   |
|        | Possible Values          | : 00 - 23                |                                   |
| MINUTE | Time of day - minutes    |                          |                                   |
|        | Type of Input            | : Single value, optional |                                   |
|        | Possible Values          | : 00 - 59                |                                   |
| MODE   | Mode of Time             |                          |                                   |
|        | Type of Input            | : Single value, optional |                                   |
|        | Possible Values          | : DST                    | Daylight Saving Time              |
|        |                          | NT                       | Normal Time                       |
|        | Default Value            | : NT                     | Normal Time                       |
| MONTH  | Input of month           |                          |                                   |
|        | Type of Input            | : Single value, optional |                                   |
|        | Possible Values          | : 01 - 12                |                                   |
| SECOND | Time of day - seconds    |                          |                                   |
|        | Type of Input            | : Single value, optional |                                   |
|        | Possible Values          | : 00 - 59                |                                   |
| SYNC   | Means of synchronization |                          |                                   |
|        | Type of Input            | : Single value, optional |                                   |
|        | Possible Values          | : MAC                    | Synchronization by hardware clock |

|          |                        |                          |
|----------|------------------------|--------------------------|
|          |                        | (MAC Module)             |
|          | NOSYNC                 | No synchronization       |
|          | Default Value          | : MAC                    |
| TIMEOFFS | Time offset in Minutes |                          |
|          | Type of Input          | : Single value, optional |
|          | Possible Values        | : 0,1440                 |
|          | Default Value          | : 0                      |
| YEAR     | Entry of year          |                          |
|          | Type of Input          | : Single value, optional |
|          | Possible Values        | : 1989 - 2078            |

## 63.5 Error Messages and Advisories

### 63.5.1 Error Messages

F01: DATE INADMISSIBLE  
F02: DATE / TIME IN SYSTEM INVALID: PLEASE ENTER IN FULL  
F03: FOR PARAMETER "SYNC", THE VALUE "NOSYNC" IS NOT ALLOWED ON A COMPACT SYSTEM.  
F04: COMMAND IS ONLY ALLOWED IN TEST LABS.

### 63.5.2 Advisories

H01: NO VALID TIME SET IN SYSTEM. INITIATE SOFT RESTART.  
H02: NO VALID ENTRY FOR DATE / TIME IN SYSTEM  
H03: EXCEPTION ^ec^ WHEN CHANGING TIME / DATE:  
POSSIBLE REASON: BATTERY BUFFERING OF THE HW-CLOCK.  
H04: COMBINATION OF GMTDIR AND TIMEOFFS ZERO DOESN'T MAKE SENSE - ADJUST ALSO PARAMETER TIMEOFFS.  
H05: If parameter MODE is not specified properly, the switching time and device display are wrong !! In any case the feature Different Time Zones does not work properly.

## **DATE - Date/Time of Day**

### **Error Messages and Advisories**

- H06: The relative time difference to GMT was re-calculated because of changed parameters TIMEOFFS and/or MODE and/or DSTOFFS.
- H07: The change of parameters GMTRTG, TIMEOFFS and/or MODE needs an initialization of SONUS in case of automatical DST switching (EU standard) Call SWITCHOVER-SONUS:AUTO; unconditional.
- H08: COMMAND IS ONLY ALLOWED IN TEST LABS.
- H09: IF MODE IS SET TO NT, DSTOFFS WILL BE RESET TO 0.

## 64 DAVF - Display Characteristics for Call Charge Output

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The AMO-DAVF administers the display characteristics for the call charge display on the Hicom attendant terminal and the display.

These characteristics are as follows:

- the decimal point of the output and
- the designation of the currency unit

The default value for the decimal point is '2'.

The default value for the currency unit is 'DM'.

### 64.1 Interrelationships

- AMO TTBL : Administration of tariff tables

### 64.2 Functions of the AMO

- [CHANGE-DAVF](#) : Changing the decimal point or the currency unit for display on the Hicom attendant terminal
- [DISPLAY-DAVF / REGENERATE-DAVF](#) : Displaying the decimal point or the currency unit for display on the Hicom attendant terminal  
Regenerating the decimal point and the currency unit for display on the Hicom attendant terminal

#### 64.2.1 CHANGE-DAVF

Changing the decimal point or the currency unit for the display of call charges on the Hicom attendant terminal and the display.

A value between -3 and +3 and 2T, 3T can be entered for this purpose. (0 = no decimal point). The decimal point has the following meaning (see also AMO-TTBL):

DAVF - Display Characteristics for Call Charge Output

Functions of the AMO

- 1. Examples:  
Decimal point: +3 value: 30558 Output: 305,580  
Decimal point: +2 value: 30558 Output: 305,58  
Decimal point: +1 (Rounded upwards)value: 30558 Output: 305,6  
Decimal point: 0 (Rounded upwards)value: 30558 Output: 306  
Decimal point: -1 (Rounded upwards)value: 30558 Output: 3056  
Decimal point: -2 value: 30558 Output: 30558  
Decimal point: -3 value: 30558 Output: 305580  
Comma position: 2T (Rounded upwards)Value: 30558 Output: 30,56  
Comma position: 3T Value: 30558 Output: 30,558

A character string with 3 characters (e.g., 'DM', 'OES') can be entered for the currency unit.

Procedure Overview

| Command Code | Parameter                                                |
|--------------|----------------------------------------------------------|
| CHANGE-DAVF  | COMPOS=<string>,NAME=<string>;                           |
|              | 1. Example                                               |
|              | Changing the currency unit to DM and to 2 decimal points |
|              | Input                                                    |
|              | CHA-DAVF:2,DM;                                           |

64.2.2 DISPLAY-DAVF / REGENERATE-DAVF

- 1. Displaying the decimal point and the currency unit for the display on the Hicom attendant terminal and on the display with output in list format (DISPLAY).
- 2. Displaying the decimal point and the currency unit for the display on the Hicom attendant terminal and on the display with output in position-oriented commands for regeneration (SAVDB).

Procedure Overview

| Command Code    | Parameter |
|-----------------|-----------|
| DISPLAY-DAVF    | (1)       |
| REGENERATE-DAVF | (2)       |

**Example**

1. Example of list output of the display characteristics for the call charge display on the Hicom attendant terminal (decimal point and currency unit):

Input:

DIS-DAVF;

Output:

PRESENTATION PROPERTIES FOR THE CALL CHARGE DISPLAY ON ATND/  
DISPLAY

DECIMAL POSITION : +2

CURRENCY : DM

2. Displaying the display characteristics for the call charge display on the Hicom attendant terminal and the display.

Input:

REG-DAVF;

Output:

CHANGE-DAVF:+2,"DM ";

## 64.3 Parameter Description

|        |                                                                                                                                                                                                                                                                                           |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPOS | Position of decimal point in the call charge display on the Hicom attendant terminal<br>Type of Input : Single value, mandatory<br>Possible Values : -3 to +3 and 2T, 3T                                                                                                                  |
| NAME   | Designation of the currency unit in the call charge display on the Hicom attendant terminal<br>Type of Input : Single value, mandatory<br>Possible Values : 3 characters (without restriction)<br><br>If the currency unit consists of less than 3 characters, blanks are to be inserted. |

## **64.4 Error Messages and Advisories**

### **64.4.1 Error Messages**

None

## **64.5 Advisories**

H01: FOR THE DECIMAL POINT IS ONLY THE RANGE FROM -3 TO +3 AND 2T, 3T VALID

## 65 DBC - Database Configuration

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

AMO DBC ( *Administration of DB configuration file* ) is used to administer the database configuration data on the HD and in the processors. This data is used to give an exact definition of the type of system (e.g. 350E.35)

This data can be changed, interrogated or regenerated.

The database configuration file exists already on the HD for the start-up of the switch.

### 65.1 Interrelationships

- AMO APC : Parameter APPL,SERVER=SWU  
: EXEC

### 65.2 Functions of the AMO

- [CHANGE-DBC](#) : Change the database configuration data
- [DISPLAY-DBC](#) : Interrogate the database configuration data
- [REGENERATE-DBC](#) : Regenerate the database configuration data
- [EXEC-DBC](#) : Change the database configuration data taking into account the data from the hardware configuration table
- [ADD-DBC](#) : Change the architecture type and location taking into account the data from the hardware configuration table for generating customer databases on a support switch

65.2.1 CHANGE-DBC

Change the database configuration data on the hard disk.

**NOTE:** As the AMO DBC obtains its information from the application table on the hard disk, it does not check for the existence of the individual subsystem files or their load status, nor does it check the available hardware.  
Any check for the available hardware is not possible because the hardware connected to the support processors differs from the customer’s hardware.

Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-DBC   | { (min 1) BAPPL=<text>, DBAPPL=<text>, ASSEMBLY=<param><br>, CLASS=<param>, OPMODE=<param>, SYSTEM=<text><br>, DIMEN=<text>, RESSWUDB=<param>, LOCATION=<param><br>, ADPSLOT=<number>, SWUSLOT=<number>, MONOSLOT=<number><br>, ADPMEM=<number>, SWUMEM=<number>, MONOMEM=<number>; |

Note

A check of inconsistency between the parameters (error message F01) is done with parameter ASSEMBLY, CLASS and OPMODE.  
Trying to generate the System with the same parameters several times will stop the AMO with error message F09.  
If only one value for the overlay area of a processor type (Slot or Mem) is set to zero, the AMO will set the second value to zero, too. The AMO stops with the advisory message H05.  
Trying to change only slots or memory for the overlay area of a processor type, if the values were set to zero before, the AMO will stop with error message F20.  
Due to possible frequent changes of the values of the parameter DIMEN, there are no restrictions to them. For valid inputs see advisory message H02. The valid inputs for this parameter are taken from the DBC dimensioning table on hard disk. This table can be read with the following command:  
STA-LIST:":PDS:APSU/DBCDIM0",,,M,N;  
The DBC dimensioning table should not be modified.

**Examples**

1. Changing the database configuration table for a HICOM 600, EXTENDED-COMPACT-EXTENDED, DUPLEX, subsystem names from basic application DUAL128, database application DUAL128, system-identification Hicom, DB-dimensioning name DUAL128:

Input:

```
CHANGE-DBC:DUAL128,DUAL128,ECX,H600,DUPLEX,HICOM,DUAL128;
```

Output:

```
CHANGE-DBC:DUAL128,DUAL128,ECX,H600,DUPLEX,HICOM,DUAL128;
H500: AMO DBC STARTED
H01: IN ORDER TO LOAD THE CHANGES IN THE CONFIGURATION TABLE,
INITIATE
      RELOAD AND GENERATE THE SWU-DATABASE.
AMO-DBC -...      DATABASE CONFIGURATION
CHANGE COMPLETED;
```

2. Changing the System-Identification:

Input:

```
CHANGE-DBC:SYSTEM=TEST-ANL;
```

Output:

```
CHANGE-DBC:SYSTEM=TEST-ANL;
H500: AMO DBC STARTED

AMO-DBC -...      DATABASE CONFIGURATION
CHANGE COMPLETED;
```

**Note**

This call causes the data of the DB configuration table on the HD and in all available processors to be updated (synchronous state).

Special case: While in split operation, the configuration tables of the SWU which is in call-processing state, of the ADS, and of the LTG must not be overwritten. In this case the configuration table will not be distributed to the above listed processors.

There is a version counter in DB configuration table which guarantees the synchronization of all memories even if there is a breakdown of the System. This counter is increased with all important changes.

The version counter can also be incremented with the command CHANGE-DBC:RESSWUDB=Y; The input must be confirmed if changing this parameter. With any change of the version counter, however, the system must be regenerated.

**Caution**

The AMO modifies the version counter whenever important data of the DB configuration table is changed. This means that any generated customer data will be lost and need to be REGENERATED.

The next table shows in which cases customer data will be lost:

| Changes of: | Regeneration necessary: |    |
|-------------|-------------------------|----|
|             | YES                     | NO |
| BAPPL       | X                       |    |
| DBAPPL      | X                       |    |
| ASSEMBLY    | X                       |    |
| CLASS       | X                       |    |
| DEVLINE     | X                       |    |
| OPMODE      | X                       |    |
| SYSTEM      |                         | X  |
| DIMEN       | X                       |    |
| RESSWUDB    | X                       |    |

Table 9 parameter table

65.2.2 DISPLAY-DBC

Procedure Overview

|              |                   |  |
|--------------|-------------------|--|
| Command Code | Parameter         |  |
| DISPLAY-DBC  | [VERBOSE=<param>; |  |
|              | Example           |  |
|              | Input:            |  |
|              | DISPLAY-DBC;      |  |

Output:

```
DISPLAY-DBC;
H500: AMO DBC STARTED

+-----+
| SYSTEM CLASSIFICATION   : SYSTEM 600          (H600 ) |

|   SLOTS         : 200   MEMORY SPACE : 1000 KB |
+-----+

AMO-DBC -109      DATABASE CONFIGURATION
DISPLAY COMPLETED;
```

**NOTE:** If the CONFIGURATION DATA cannot be loaded, the AMO is terminated and error message F04 is displayed. If the DBC dimensioning data cannot be loaded or the table contains invalid data, the AMO is terminated and the error message F16 or F17 respectively is displayed.

Short-explanation of used abbreviations

- LOG. SIU LINE : Logical Line of SIGNALING-UNIT
- LOG. CONF LINE : Logical Line of CONFERENCE-UNIT
- LOG. DCL LINE : Logical Line of Data-Communication-Line Unit

### 65.2.3 REGENERATE-DBC

Regenerate the database configuration data on the hard disk.

#### Procedure Overview

| Command Code   | Parameter |
|----------------|-----------|
| REGENERATE-DBC | ;         |

#### Example

Regenerate the database configuration file:

Input:

REGENERATE-DBC;

Output:

```
REGENERATE-DBC;  
H500: AMO DBC STARTED  
  
EXEC-DBC:"350E          ",35;  
CHANGE-DBC:SYSTEM=HICOM      ;  
  
AMO-DBC -109          DATABASE CONFIGURATION  
REGENERATE COMPLETED;
```

#### Note

If the CONFIGURATION DATA cannot be loaded, the AMO is terminated and error message F04 issued.

If the hardware architecture table cannot be loaded, the AMO is terminated and error message F12 issued.

A ADD-DBC command can not be regenerated. This command is regenerated as a EXEC-DBC command and if necessary a CHANGE-DBC command.

### 65.2.4 EXEC-DBC

Change the database configuration data taking into account the data from the hardware configuration table.

**NOTE:** This AMO action was introduced to facilitate system generation. After the parameters ARCH and ARCHTYPE have been entered, a table is checked on the hard disk. All the necessary values are then

taken from this table. The table can be read with the following command:

```
STA-LIST:"PDS:APSU/HWARCH0",,,M,N;
```

This table is generated by STARTUP and should not be modified.

### Procedure Overview

#### Command Code

EXEC-DBC

#### Parameter

ARCH=<param>, ARCTYPE=<param>

#### Example

Generate the following system: SYSTEM 600, EXTENDED-COMPACT-EXTENDED, DUPLEX

#### Input:

```
EXEC-DBC:350E,35;
```

#### Output:

```
EXEC-DBC:350E,35;
H500: AMO DBC STARTED
H01: IN ORDER TO LOAD THE CHANGES IN THE CONFIGURATION TABLE,
INITIATE
      RELOAD AND GENERATE THE SWU-DATABASE.
H04: EXEC-APC TASK MUST BE CARRIED OUT.
AMO-DBC -109      DATABASE CONFIGURATION
EXEC COMPLETED;
```

#### Note

If the CONFIGURATION DATA cannot be loaded, the AMO is terminated and error message F04 issued.

If the hardware architecture table cannot be loaded, the AMO is terminated and error message F12 issued.

If the hardware architecture table contains incomplete and/or invalid values, the AMO is terminated with error message F14.

#### Caution

Each time the command EXEC-DBC is applied to the configuration table, the version counter is incremented by the AMO. As a result of this, the customer database is reset, i.e. the customer data is deleted.

In such a case, the customer database must be REGENERATED !

65.2.5 ADD-DBC

Change the architecture type and location taking into account the data from the hardware configuration table for generating customer databases on a support switch.

Note

This AMO action was introduced to facilitate system generation on a support switch. After the parameter ARCHTYPE has been entered, a table is checked on the hard disk. All the necessary values are then taken from this table. The table can be read with the following command:

```
STA-LIST:":PDS:APSU/HWARCH0",,,M,N;
```

This table is generated by STARTUP and should not be modified.

A ADD-DBC command can only be executed after a EXEC-DBC command.

Only the decimal place of the architecture type can differ from the previous architecture type. Architecture types of one architecture with the same digit on the second place of the architecture type (e.g. 01, 11, 21, 31) have the same applications.

Between a EXEC-DBC command and ADD-DBC command, the following parameters must not be changed: BAPPL, DBAPPL, ASSEMBLY, CLASS and DIMEN. The parameter OPMODE can be changed between EXEC-DBC and ADD-DBC command.

The version counter is not increased for a ADD-DBC command.

Procedure Overview

| Command Code | Parameter        |
|--------------|------------------|
| ADD-DBC      | ARCHTYPE=<param> |

Example

Generate the following system: SYSTEM 600, EXTENDED-COMPACT-EXTENDED, DUPLEX on a 40CMX support switch

Input:

```
EXEC-DBC:350E,35;  
ADD-DBC:85;
```

Output:

```
ADD-DBC:85;  
H500: AMO DBC STARTED  
H04: EXEC-APC TASK MUST BE CARRIED OUT.  
AMO-DBC -109      DATABASE CONFIGURATION  
ADD COMPLETED;
```

**Note**

If the CONFIGURATION DATA cannot be loaded, the AMO is terminated and error message F04 issued.

If the hardware architecture table cannot be loaded, the AMO is terminated and error message F12 issued.

If the hardware architecture table contains incomplete and/or invalid values, the AMO is terminated with error message F14.

If the second place of the architecture type is not the same as the previous one, the AMO will be terminated with error message F18.

If one of the following parameters was changed after the EXEC-DBC command, the AMO will be terminated with error message F19:  
BAPPL, DBAPPL, ASSEMBLY, CLASS, DIMEN.

## 65.3 Parameter Description

|                 |                                                           |
|-----------------|-----------------------------------------------------------|
| ADPMEM          | Size of the overlay area in the ADP in multiples of 100KB |
| Type of Input   | Single value, optional                                    |
| Possible Values | 0, 10-30                                                  |
| ADPSLOT         | Number of slots in the overlay area for ADP               |
| Type of Input   | Single value, optional                                    |
| Possible Values | 0, 200-1000                                               |
| ARCH            | Hardware Architecture                                     |
| Type of Input   | : Single value, mandatory                                 |
| Possible Values | : String, 10-digit                                        |
| ARCHTYPE        | Hardware Architecture Type                                |
| Type of Input   | : Single value, mandatory                                 |
| Possible Values | : 0-255                                                   |
| ASSEMBLY        | Hardware assembly                                         |
| Type of Input   | : Single value, optional                                  |
| Possible Values | : ECX, ECDSC, CXE                                         |
| BAPPL           | Basic application                                         |
| Type of Input   | : Single value, optional                                  |

## DBC - Database Configuration

### Parameter Description

|          |                                                                  |                                                                                                       |
|----------|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
|          | Possible Values                                                  | : String, 8-digit                                                                                     |
| CLASS    | Configuration level                                              |                                                                                                       |
|          | Type of Input                                                    | : Single value, optional                                                                              |
|          | Possible Values                                                  | : H40, H80, H600                                                                                      |
| DBAPPL   | Database application                                             |                                                                                                       |
|          | Type of Input                                                    | : Single value, optional                                                                              |
|          | Possible Values                                                  | : String, 8-digit                                                                                     |
| DIMEN    | Customer and Application oriented Memory Dimensioning            |                                                                                                       |
|          | Type of Input                                                    | : Single value, optional                                                                              |
|          | Possible Values                                                  | : String, 8-digit                                                                                     |
|          | Valid Inputs                                                     | : e.g. MONO64, MONO128, DUAL128<br>(The valid values are taken from the dimension table on hard disk) |
| LOCATION | System location                                                  |                                                                                                       |
|          | Type of Input                                                    | : Single value, optional                                                                              |
|          | Possible Values                                                  | : TESTLAB, CUSTOMER, SUPPORT                                                                          |
|          | Default Value                                                    | : CUSTOMER                                                                                            |
| MONOMEM  | Size of the overlay area at monoprocessing in multiples of 100KB |                                                                                                       |
|          | Type of Input                                                    | Single value, optional                                                                                |
|          | Possible Values                                                  | 0, 10-40                                                                                              |
| MONOSLOT | Number of slots in the overlay area at monoprocessing            |                                                                                                       |
|          | Type of Input                                                    | Single value, optional                                                                                |
|          | Possible Values                                                  | 0, 200-500                                                                                            |
| OPMODE   | Operating mode                                                   |                                                                                                       |
|          | Type of Input                                                    | : Single value, optional                                                                              |
|          | Possible Values                                                  | : SIMPLEX, DUPLEX                                                                                     |
| RESSWUDB | Reset of SWU-Database                                            |                                                                                                       |

## 65.4 Error Messages and Advisories

### 65.4.1 Error Messages

F01: INVALID PARAMETER COMBINATION <bappl>,<dbappl>,<assembly>,<class>,<opmode>,<system>,<location>.

F02: APPLICATION TABLE CANNOT BE LOADED FROM HARD DISK.

F03: APPLICATION <appl> IS UNKNOWN.

F04: DB CONFIGURATION DATA CANNOT BE LOADED.

F05: DB CONFIGURATION DATA CANNOT BE WRITTEN.

F09: DB CONFIGURATION DATA HAVE ALREADY BEEN GENERATED WITH THOSE PARAMETERS.

F10: DIMENNAME <dimen> IS UNKNOWN.

F11: THE DB CONFIGURATION DATABASE CONTAINS INVALID DATA (RUN EXEC-DBC).

F12: THE HARDWARE ARCHITECTURE TABLE CANNOT BE LOADED.  
ERRORCODE (errnumb) - REFER TO SERVICE MANUAL.

F13: VALUE <value> FOR PARAMETER <param> IN HW-ARCHITECTURE TABLE IS NOT VALID.

F14: HARDWARE ARCHITECTURE TABLE CONTAINS INVALID OR INCOMPLETE INFORMATION ON SPECIFIED ARCHITECTURE OR ARCHITECTURE TYPE.  
ERRORCODE (errnumb) - REFER TO SERVICE MANUAL.

F15: DETECTION OF SPLIT OPERATION NOT POSSIBLE.

F16: THE DIMEN TABLE CANNOT BE LOADED.

F17: THE DIMEN TABLE CONTAINS INVALID OR INCOMPLETE DATA.

F18: VALUE FOR HARDWARE ARCHITECTURE TYPE IS NOT ALLOWED.  
(RUN EXEC-DBC)

F19: THE DB CONFIGURATION TABLE AND THE HARDWARE ARCHITECTURE TABLE CONTAIN DIFFERENT VALUES FOR PARAMETER <param>.  
(RUN EXEC-DBC)

F20: VALUE FOR PARAMETER <param> IS NOT ALLOWED.

**Description of possible values for (errnumb)**

- 1111: Parameter occurs more than once in architecture table
- 1112: Not all DBC parameters contained in architecture table
- 1113: Structural error in architecture table
- 1115: Architecture type not found
- 1118: Incomplete DBC data in architecture table

**65.4.2 Advisories**

- H01: IN ORDER TO LOAD THE CHANGES IN THE CONFIGURATION TABLE, INITIATE RELOAD AND GENERATE THE SWU-DATABASE.
- H02: AT THIS TIME VALID LAYOUT-NAMES ARE:  
<dimen>           ... <text>  
Note: These values are taken from the DBC dimensioning table on hard disk.
- H03: ARE YOU SURE ?
- H04: EXEC-APC TASK MUST BE CARRIED OUT.
- H05: VALUE OF PARAMETER <param> IS SET TO ZERO, TOO.
- H06: IN ORDER TO LOAD THE CHANGES IN THE CONFIGURATION TABLE, INITIATE A RELOAD.
- H07: PARAMETER MONO (AMO-CPCI) IS SET TO ^mono^ TO AVOID INCONSISTENCY WITH AMO-DBC (PLEASE SEE 'Note on Parameter MONO' IN AMO DESCRIPTION OF AMO-CPCI FOR FURTHER INFORMATION).
- H08: FOR DASIST FUNCTIONALITY TO WORK A SWU RESTART IS NOW REQUIRED FOR EACH SWU PROCESSOR.
- H09: DB CONFIGURATION DATA HAVE ALREADY BEEN GENERATED WITH THOSE PARAMETERS.

**65.4.3 Actions and Associated Error Messages**

## 66 DCIC - Configuration of DCI

|                      |                               |
|----------------------|-------------------------------|
| Interrelationships   | Parameter Description         |
| Functions of the AMO | Error Messages and Advisories |

AMO DCIC makes it possible to create the static *database for DCIs* (data communication interface) and to display, change, delete, and regenerate the same. The DCI can be assigned on a standard SLMB or a SLMB\_16 module.

The DCI is assigned any terminal that is created by means of AMO SCSU (AUXDIGI) as an associated station. The associated station can also be a station without hardware (virtual station, AMO SCSU, INS=FLOAT).

The ADD function also allows activation of the DCIs immediately. Already assigned DCIs can be activated or deactivated only by means of the switch AMO DSSU.

The AMO will add the Parameters for the DCI when needed.

These data are for basic parameter set:

0A,0A,00,00,00,04,21,11,0D,02,0F,04,1F,31,01,  
02,28,07,0F,7F,11,03,11,3D,38,01,27,08,01,0A,  
17,01,00,00,00,00,00,00,00,00,00

and for the supplementary set:

03,14,50,03,08,04,08,50,03,08,04,08,50,03,08,  
04,08,50,00,00,00,00,00,00,00,00,00,00,00,00,  
00,00,00,00,00,00,00,00,00,00,00,00,00,00,  
00,00,00,00,00,00,00,00,00,00,00,00,00,00

### 66.1 Interrelationships

The AMOs below must be called in the sequence given:

- AMO SCSU : Subscriber configuration of switching unit Configuration of stations to be associated with the DCI

## 66.2 Functions of the AMO

- **ADD-DCIC** : Assign the static DB for DCIs
- **CHANGE-DCIC** : Change the static DB for DCIs
- **DELETE-DCIC** : Cancel the static DB for DCIs
- **DISPLAY-DCIC / REGENERATE-DCIC** : Interrogate the static DB for DCIs  
Regenerate the static DB for DCIs

### 66.2.1 ADD-DCIC

The ADD-DCIC function is used to assign a new DCI.

The parameter PEN describes the physical port of the DCI. If PEN is not specified, a compatible available port is searched for and displayed.

The parameter STNO is used to make a terminal device previously created by means of SCSU an associated station. A DTE (data terminal equipment) must not be assigned for this STNO, nor may a DTE be allocated by means of AMO TGER.

The parameter INS can be used to activate the DCI at the same time the static data are written. The DCI is activated by means of an order to the device control (DC)

#### Procedure Overview

| Command Code | Parameter                                           |
|--------------|-----------------------------------------------------|
| ADD-DCIC     | [PEN=<gg-uu-sss-cc>], STNO=<number>, [INS=<param>]; |

#### Examples

1. Create a DCI with associated telephone 2101, a predefined PEN, and activate immediately.

Input:

```
AD-DCIC:1-1-1-0,2101,Y;
```

Output:

```
ADD-DCIC:1-1-1-0,2101,Y;
```

```
H1 : DCI ASSIGNED AT PEN 1-1-1-0
```

```
H4 : DCI RELEASED FOR CALL PROCESSING
```

2. Create a DCI with associated telephone 2101, an available PEN, but do not activate.

Input:

```
AD-DCIC:,2101,N;
```

Output:

```
H1 : DCI ASSIGNED AT PEN 1-1-1-1
```

## 66.2.2 CHANGE-DCIC

The function CHANGE-DCIC can be used to change the STNO of DCIs.

If the PEN is to be changed, the DCI must first be deleted and then reassigned at the new port.

Only DCIs that were previously deactivated by means of the switch-AMO DSSU can be changed. After the change is completed, the DCI can be activated again by the switch AMO using "activation with loading".

### Procedure Overview

| Command Code | Parameter                          |
|--------------|------------------------------------|
| CHANGE-DCIC  | PEN=<gg-uu-sss-cc>, STNO=<number>; |

### Example

Change the associated telephone of the DCI at PEN 1-1-1-0 from 2101 to 2110.

Input:

```
CHA-DCIC:1-1-1-0,2110;
```

Output:

```
CHANGE-DCIC:1-1-1-0,2110;
```

```
H06: DCI CHANGED AT PEN 01-01-001-00
```

## 66.2.3 DELETE-DCIC

Using the function DELETE, the static data from assigned DCIs are cancelled and the device table memory is returned to the system. Only DCIs that were previously deactivated by means of AMO DSSU can be deleted.

Only the PEN of the DCI need be specified to cancel this DCI. If a PEN range is specified, a search is made for DCIs. The PENs of the cancelled DCIs and the DCIs that cannot be cancelled are output.

## DCIC - Configuration of DCI

### Functions of the AMO

#### Procedure Overview

| Command Code | Parameter                                   |
|--------------|---------------------------------------------|
| DELETE-DCIC  | PEN1=<gg-uu-sss-cc>, [PEN2=<gg-uu-sss-cc>]; |

#### Example

Cancel all DCIs at PENs 1-1-1-0 to 1-4-1-0.

Input:

```
DEL-DCIC:1-1-1-0,1-4-1-0
```

Output:

```
DELETE-DCIC:1-1-1-0,1-4-1-0
```

```
H05 : DCI AT PEN 1-1-1-3 COULD NOT BE DELETED BECAUSE IT MUST BE  
DEACTIVATED
```

## 66.2.4 DISPLAY-DCIC / REGENERATE-DCIC

Using the function DISPLAY-DCIC, the parameters from one or more DCIs can be output. For this purpose, only the PEN need be specified. If a PEN range is specified, a search is made for assigned DCIs. If the PEN is not specified, the entire PEN range is searched.

The function REGENERATE can be used to output the parameters of one or more DCIs when they are interrogated, but in the form of position-oriented commands. The parameter INS is generated at this time in dependency on the current DC state of the DCI (if the DC state is = "NEQ", then INS = "N" , otherwise INS = "Y" ).

#### Procedure Overview

| Command Code    | Parameter                                     |
|-----------------|-----------------------------------------------|
| DISPLAY-DCIC    | [PEN1=<gg-uu-sss-cc>], [PEN2=<gg-uu-sss-cc>]; |
| REGENERATE-DCIC | [PEN1=<gg-uu-sss-cc>], [PEN2=<gg-uu-sss-cc>]; |

#### Examples

1. Interrogate the parameters of the DCI at PEN 1-1-1-0.

Input:

```
DIS-DCIC:1-1-1-0;
```

Output in format 1:

```
DISPLAY-DCIC:1-1-1-0;
```

```
+-----+-----+
```

|              |      |
|--------------|------|
| PEN          | STNO |
| 01-01-001-00 | 2101 |

**Explanation:**

PEN = Port equipment number of DCI  
STNO = Station number of the associated telephone  
Regenerate the DCIs in the range from 1-1-1-0 to 1-1-1-1.

**Input:**

REG-DCIC: 1-1-1-0,1-1-1-1;

**Output in format 2:**

ADD-DCIC:1- 1-1-0,2101,Y;

## 66.3 Parameter Description

|     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## DCIC - Configuration of DCI

### Error Messages and Advisories

If this parameter is not specified, the AMO searches for an available port at which a suitable module (SLMB or SLMB\_16) has been configured (AMO BCSU). The available ports of a partially assigned SLMB module are always considered before new unassigned modules. If PEN is specified, the AMO checks to determine if a compatible module has been configured for the port.

|      |                                                                                                                                                                                                                                                                                                                                                                                          |

## 67 DCSM - Device Configuration of the Servers

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">AMO Functions</a>         | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO DCSM configures the *device periphery of the servers* , i.e. hard disk, flash memory or an external device are marked as logically existent in the operating system.

### 67.1 Restrictions

This description is valid from HiPath 4000 V1.0.

### 67.2 Interrelationships

- AMO DASM : Hard disk area allocation - physical
- AMO DDSM : Device display of a server
- AMO DSSM : Disk switchover

### 67.3 AMO Functions

- [ADD-DCSM](#) : Create or add a server device
- [DELETE-DCSM](#) : Cancel a server device
- [CHANGE-DCSM](#) : Change a server device

#### 67.3.1 ADD-DCSM

This call is used to configure a physical storage/nonstorage medium or an external device on a given controller. The storage medium can be a Hard Disk, a Flash-Memory or an external device.

Because a Flash-Memory can be configured only on controller 8 of the database, an attempt to configure Flash-Memory not on controller 8, or to configure any other device on controller 8, will be rejected with an error message.

## DCSM - Device Configuration of the Servers

### AMO Functions

External devices are devices that are connected to the SCSI-Bus and are not used by RMX.

#### Procedure Overview

| Command Code | Parameter                                                                                                           |
|--------------|---------------------------------------------------------------------------------------------------------------------|
| ADD-DCSM     | [UNIT=<param>],CNO=<number><br> ,DEVTYPE=HD,PNO=<text>;<br> ,DEVTYPE=FM,PNO=<text>;<br> ,DEVTYPE=EXT,[INFO=<text>]; |

#### Examples

1. Configure a hard disk

Input:

```
ADD-DCSM:A1,2,HD,2GIGA;
```

2. Configure a flash memory

Input:

```
ADD-DCSM:A1,8,FM,FM128;
```

3. Configure an external device

Input:

```
ADD-DCSM:A1,4,EXT,BACKUP;
```

## 67.3.2 DELETE-DCSM

Cancelling a device from the system configuration.

---

**NOTE:** The device areas must first be cancelled explicitly.  
The device to be cancelled must be deactivated.

---

#### Procedure Overview

| Command Code | Parameter                    |
|--------------|------------------------------|
| DELETE-DCSM  | [UNIT=<param>],CNO=<number>; |

#### Examples

1. The device on controller 2 of the ADS is cancelled.

Input:

```
DELETE-DCSM:,2;
```

2. The device on controller 4 (external device) of the ADS is canceled

Input:

```
DELETE-DCSM:A1,4;
```

### 67.3.3 CHANGE-DCSM

This action is used to change the part number or the information of an external device in an existing area configuration.

The following restrictions must be observed:

1. The device granularity must not be changed
2. The device size must be greater than that of the device to be change
3. The device types (HD, EXT, FM) must not be changed

#### Procedure Overview

| Command Code | Parameter                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------|
| CHANGE-DCSM  | [UNIT=<param>],CNO=<number><br> ,DEVTYPE=HD,PNO=<text>;<br> ,DEVTYPE=FM,PNO=<text>;<br> ,DEVTYPE=EXT,INFO=<text>; |

#### Example

1. Controller 2 is assigned a Hard disk with the part number HD001 in place of an already existing Hard disk.

Input:

```
ADD-DCSM:,2,HD,2GIGA;  
CHANGE-DCSM:A1,2,HD,HD001;
```

## 67.4 Parameter Description

|                 |                                                                                        |
|-----------------|----------------------------------------------------------------------------------------|
| CNO             | Controller number                                                                      |
| Type of Input   | : Single value<br>mandatory                                                            |
| Possible Values | : 1 - 8                                                                                |
| Note            | : The controller number 1 corresponds to the physical controller ID 0 on the SCSI bus. |

## DCSM - Device Configuration of the Servers

### Error Messages and Advisories

|                 |                                                                               |

## 68 DDRSM - Device Double Recording Server Modul

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

AMO DDRSM configures and controls the double recording.

AMO DDRSM can activate or deactivate a double recording and can copy the contents of master area(s)/device to slave one(s). 'PHY'-areas used by UNIX in previous variants will not be handled by AMO DDRSM, either.

The state of the double recording can be checked with the function DISPLAY-DDSM.

The states `PRESENT` or `BLOCKED BY AMO` for master and `SYNCHRON` for slave mean, that the synchronization of the slave with the master will take place after master is activated.

The states `IN SERVICE` for master and `PRESENT` or `BLOCKED BY AMO` for slave mean, that the synchronization will take place after slave is activated.

The states `IN SERVICE` for master and `SYNCHRON` for slave mean, that the synchronization is in progress.

The states `IN SERVICE` for master and `IN SERVICE` for slave mean, that synchronization has been completed and the double recording is active.

### 68.1 Restrictions

This description is valid from HiPath 4000 V6.0.

### 68.2 Interrelationships

- AMO-DTSM : Device Type Service Module
- AMO-DCSM : Device Configuration Service Module
- AMO-DASM : Device Area Service Module
- AMO-DPSM : Device Pair Allocation Server Module
- AMO-DSSM : Device Switch Server Module

- AMO-DDSM : Display Device Server Module
- AMO-DLSM : Device Logical Service Module

**68.3 Functions of the AMO**

- [ACTIVATE-DDRSM](#) : Activate Double Recording
- [DEACTIVATE-DDRSM](#) : Deactivate Double Recording
- [COPY-DDRSM](#) : Copy Master Area/Device to the Slave one

**68.3.1 ACTIVATE-DDRSM**

With the function ACTIVATE-DDRSM for area(s) it is possible to configure the pair allocation and activate the double recording between the master and slave area(s), with the exception of 'PHY'-areas.

With ACTIVATE-DDRSM for devices the pair allocation will be configured and double recording will be activated between all areas of both devices, with the exception of 'PHY'-areas.

**Procedure Overview**

| Command Code   | Parameter                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------|
| ACTIVATE-DDRSM | [UNIT=<param>], MASTERID=<number>, [MASTERAR=<param>], SLAVEID=<number>, [SLAVEAR=<param>], [REPLY=<param>]; |

**Examples**

1. Configure pair allocation between devices on controller 2 (master) and 3 (slave) and activate the double recording.  
 Input:  
 ACT-DDRSM: , 2 , , 3 ;
2. Configure pair allocation between area F on controller 2 (master) and area G on controller 3 (slave) and activate the double recording.  
 Input:  
 ACT-DDRSM:A1, 2, F, 3, G;
3. Configure pair allocations between areas E and G on controller 2 (master) and areas F and E on controller 3 (slave) and activate the double recording.

Input:

ACT-DDRSM: , 2, E&G, 3, F&E;

### 68.3.2 DEACTIVATE-DDRSM

With the function DEACTIVATE-DDRSM for area(s) (an) existing double recording(s) between the master and slave areas will be deactivated, pair allocation(s) will be deleted, and the defined area(s) will be deactivated.

With the function DEACTIVATE-DDRSM for a device (always all areas of the device are affected!) all existing double recordings of the device will be deactivated, the pair allocations will be deleted and the specified device will be deactivated.

If the function DEACTIVATE-DDRSM is executed during a synchronization process, the state of the corresponding areas will be set to `INCONSISTENT`.

'PHY'-areas cannot be deactivated.

#### Procedure Overview

| Command Code     | Parameter                                                         |
|------------------|-------------------------------------------------------------------|
| DEACTIVATE-DDRSM | [UNIT=<param>], ID=<number>, [AREA=<param>]<br>, [REPLY=<param>]; |

#### Examples

1. Deactivate device on controller 2 and delete pair allocations of all areas on this device.

Input:

DEACT-DDRSM: , 2;

2. Deactivate area E on controller 2 and delete pair allocation of this area.

Input:

DEACT-DDRSM: A1, 2, E;

3. Deactivate areas F and G on controller 2 and delete pair allocations of these areas.

Input:

DEACT-DDRSM: , 2, F&G;

### 68.3.3 COPY-DDRSM

With the function COPY-DDRSM for area(s) it is possible to copy the contents of (a) master area(s) to (a) slave one(s) (with the exception of 'PHY'-areas).

With the function COPY-DDRSM for devices it is possible to copy the contents of all areas of a master device to the corresponding slave ones (with the exception of 'PHY'-areas).

The copy process **cannot** be stopped by breaking off the AMO with the aid of the system command **CANCEL!** Only the AMO execution will be aborted that way. At the end of the copy process an **OS CALL FAULT** will be displayed, since the mailbox of the AMO is no more accessible for the end message.

#### Procedure Overview

| Command Code | Parameter                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------|
| COPY-DDRSM   | [UNIT=<param>], MASTERID=<number>, [MASTERAR=<param>]<br>, SLAVEID=<number>, [SLAVEAR=<param>], [REPLY=<param>]; |

#### Examples

1. Copy contents of device on controller 2 (master) to device on controller 3 (slave).

Input:

```
COPY-DDRSM: , 2, , 3, , N;
```

2. Copy contents of area F on controller 1(master) to area G on controller 4 (slave).

Input:

```
COPY-DDRSM: A1, 1, F, 4, G, N;
```

3. Copy contents of areas E and G on controller 6 (master) to areas E and H on controller 1 (slave).

Input:

```
COPY-DDRSM: , 6, E&G, 1, E&H;
```

4. Creating the "Gold Load Area" with the contents of the actual PDS area.

Input:

```
COPY-DDRSM: A1, 1, E, 6, J, N;
```

## 68.4 Parameter Description

|          |                                      |                                                     |       |

## 69 DDSM - Device Display of the Server

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">AMO Functions</a>         | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO DDSM is used to *DISPLAY the device configuration*

- from the database
- from the administration area
- or directly from the SCSI devices.

Both specific (e.g.: the device periphery of a server) and complete queries can be initiated.

With the aid of the action REGENERATE, a file is generated for the system configuration regeneration, that contain position-oriented AMO commands in the order they are required to configure the device periphery (DCSM, DASM, DLSP, DPSM).

### 69.1 Restrictions

This description is valid from HiPath 4000 V6.0.

### 69.2 Interrelationships

- AMO DASM : Device Areas, Server Modules
- AMO DCSM : Device Configuration, Server Modules
- AMO DLSP : Device logical areas, Server Modules
- AMO DPSM : Device Pair Allocation, Server Modules
- AMO DSSM : Device Switch for Server Modules
- AMO INIT : Hard Disk Area Initializing

### 69.3 AMO Functions

- [DISPLAY-DDSM](#) : Interrogate the device configuration
- [REGENERATE-DDSM](#) : Regenerate the device configuration

69.3.1 DISPLAY-DDSM

Display the device periphery of the servers in list format.

The following queries can be initiated:

- all configuration data of a server
- controller data including the devices
- data from the partition table (if exists)
- area data
- area name data
- active load device / load area
- data from SCSI Inquiry

Advisory: Sum of FNODES (TYPE=HD) corresponds to the parameter MAXFILES in AMO INIT.

Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                         |

## 69.3.2 REGENERATE-DDSM

This action is used to generate a file which contains position-oriented commands (AMOs).

The regeneration is then executed with a new database and by means of the generated file.

The following AMOs will be regenerated:

|          |                                        |
|----------|----------------------------------------|
| ADD-DCSM | Device Configuration Server Modules    |
| ADD-DASM | Device Areas, Server Modules           |
| ADD-DLSM | Device Logical Areas, Server Modules   |
| ADD-DPSM | Device Pair Allocation, Server Modules |

### Procedure Overview:

| Command Code    | Parameter      |
|-----------------|----------------|
| REGENERATE-DDSM | [UNIT=<param>; |

### Example:

Regenerate the device configuration in the administration and data server A1.

### Input:

```
REGENERATE-DDSM;
```

### Output:

```
ADD-DCSM:A1,1,HD,"M1300";
ADD-
DASM:A1,1,3200&992&560&960&160&3200&11725,4096&4096&4096&4096&40
96&4096&4096;
ADD-DLSM:A1,1,E,"PDS:";
ADD-
DLSM:A1,1,F,"DBDA:"&"DBD:"&"TMD:"&"PAS:"&"AMD:"&"DMP:";

|         |                                         | C              | = controller                         |
|         |                                         | HD             | = hard disk data                     |
|         |                                         | SCSI           | = SCSI inquiry data                  |
| UNIT    | Functional system unit i.e. server code |                |                                      |
|         | Type of Input                           | : Single value |                                      |

optional

Possible Values : A1 = Administration and data server (ADS)

Default Value : A1

### Name conventions for mnemonic device names:

|                                                                                |        |                   |
|--------------------------------------------------------------------------------|--------|-------------------|
| 1. Unit - type:                                                                | A      | (ADS)             |
| 2. Module number:                                                              | 1      |                   |
| 3. Device type:                                                                | H      | (HD/MO)           |
|                                                                                | M      | (Flash Memory)    |
|                                                                                | E      | (external device) |
| 4. Controller number:                                                          | 1....8 |                   |
| 5. Device number:                                                              | 1      |                   |
| or                                                                             |        |                   |
| Area code:                                                                     | A....K |                   |
| e.g.: device name of the hard disc (HD) on the first controller in ADS (A1H1A) |        |                   |

### List of most used logical device names:

|        |                                                                                                                               |
|--------|-------------------------------------------------------------------------------------------------------------------------------|
| :PDS:  | Program disk                                                                                                                  |
| :DBD:  | Debug disk                                                                                                                    |
| :AMD:  | Administration and maintenance disk                                                                                           |

## 70 DEBUG - Access to the System DEBUG Facility

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

Using this AMO, the Hicom debugger can be operated from the administration and maintenance terminal (AMT) via a DPS connection (remote maintenance).

### Note

Throughout this description, the term DEBUG has been used to denote the Hicom-Debugger, and the term AMO to denote the AMO DEBUG.

The various DEBUG commands are not explained in this AMO - description, but can be found in the DEBUG User Manual.

### 70.1 Interrelationships

DEBUG: The AMO serves as an I/O interface for DEBUG.

### 70.2 Functions of the AMO

- [EXEC-DEBUG](#) : Starting AMO DEBUG and entering the DIALOG

#### 70.2.1 EXEC-DEBUG

When starting the AMO, the user specifies which DEBUG is to be accessed via the parameter PROCID. The AMO itself runs exclusively in the ADS.

Input data is requested in dialog mode. Once started, the AMO remains in dialog mode for approximately 15 minutes. If no entry is made during this time, or if it is not terminated by the user (with the command 'DEND'), the AMO is automatically terminated.

Like any other AMO, it can also be terminated by pressing the keys <CTRL>+<X> on the AMT.

**Procedure Overview**

| Command Code                                    | Parameter       |
|-------------------------------------------------|-----------------|
| EXEC-DEBUG                                      | PROCID=<param>; |
| <b>Example</b>                                  |                 |
| Input:                                          |                 |
| <EXEC-DEBUG: BPA;                               |                 |
| Output (see also text below):                   |                 |
| EXEC-DEBUG:BPA;<br>H500: AMO DEBUG STARTED<br>* |                 |

**70.2.2 Command Description (Dialog Input)**

When entering DEBUG commands, the following points should be noted:

Immediately after starting the AMO, the user receives a DEBUG output which shows the DEBUG status.:

Status:    "\*)"   DEBUG is in command request mode  
          "\*\*\*"   DEBUG is in comment mode

There then follows the following output, which shows the user that an input is requested:

DEBUG INPUT FOR <processor name> PLEASE :  
\*

This AMO output is simultaneously an indication that the previously entered DEBUG command was processed by Hicom DEBUG.

When this prompt appears, the user may enter the desired DEBUG command string (see parameter CMDSYS).

**Example**  
Start AMO DEBUG.

Input:

EX-DEBUG:BPA;

Output:

          \*  
          DEBUG INPUT FOR BPA PLEASE :  
The following four commands are input in order to output a

memory area using the Hicom DEBUG. The debug input should be sent to the Hicom DEBUG in processor BPA (= SWU). Because the input is mainly DEBUG texts, please refer to the User Manual for Hicom DEBUG for explanations.

Hicom DEBUG indicates that it is in the command mode by outputting an asterisk "\*", and that it is in the statement mode by outputting a double asterisk "\*\*".

**Input:**

\*START

**Output:**

```
304I START      :DEBUG V2.3 KV2: SESSION STARTED AT:
19:12:48  20/10/1986
*
DEBUG INPUT FOR BPA PLEASE:
```

**Entry into Direct Dialog with Hicom DEBUG**

**Input:**

\*IN

**Output:**

```
**
DEBUG INPUT FOR BPA PLEASE :
```

**Output a Memory Area;**

**Input:**

\*"TRACE C:1:123:456 (10);!"

**Output:**

```
0615T TRACE     :TRACE INSTRUCTION EXECUTED
01:0123:0456 = 50 8E 46 06 B8 00 00 06 50 E8 17 E7 E9 3D 01
8E
**
DEBUG INPUT FOR BPA PLEASE :
```

**Terminate the Input**

**Input:**

\*END

**Output:**

```
*
DEBUG INPUT FOR BPA PLEASE :
```

**Terminate the Hicom DEBUG**

**Input:**

\*DEND

**Output:**

## **DEBUG - Access to the System DEBUG Facility**

Functions of the AMO

```
AMO-DEBUG -...    ACCESS TO THE SYSTEM DEBUG FACILITY  
EXEC COMPLETED;
```

## 70.3 Parameter Description

|                 |                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CMDSYS          | Input of a system DEBUG command                                                                                                                                     |
|                 | Type of Input : Single value, mandatory                                                                                                                             |
| Possible Values | : DEBUG command string (see DEBUG User Manual).                                                                                                                     |
|                 | If the string contains special characters such as ":" or ";", it must be entered in inverted commas. The input "DEND" terminates the dialog with DEBUG and the AMO. |
| PROCID          | Entry of processor ID                                                                                                                                               |
|                 | Specifies the ID of the processor with the HICOM DEBUG to be accessed.                                                                                              |
| Type of Input   | : Single value, required                                                                                                                                            |
|                 | Possible Values and associated processor numbers:                                                                                                                   |
|                 | A1 ADS                                                                                                                                                              |
|                 | BP Base processor active (CC)                                                                                                                                       |
|                 | BPA Base processor A (CC)                                                                                                                                           |
|                 | BPB Base processor B (CC)                                                                                                                                           |
|                 | BPS Base processor standby (CC)                                                                                                                                     |

## 71 DEFPP - Define Paying Party

|                      |                               |
|----------------------|-------------------------------|
| Interrelationships   | Parameter Description         |
| Functions of the AMO | Error Messages and Advisories |

This AMO is used for add and administration of the paying party assignment table.

By means of AMO DEFPP the chargee (paying party) of an outgoing or incoming connection from the stations / lines (trunks) taken part with the connection can be selected. The selected chargee is answered to the call processing and transferred during network connection in the further process of the connection over the network.

For internal connections the chargee cannot be selected freely.

The chargee (paying party) of a connection is selected now central in the call charge recording from the station taken part with a connection and answered to the call processing.

The paying party assignment table is divided according to the connection type (CONNTYPE) into three areas for internal connections (INT), for outgoing connections (OUTG) and for incoming connections (INCO).

Each of these partial tables consists again of three sections:

- user definitions
- special system definitions
- system default

With this AMO only the user defined entries can be changed.

For internal connections no entries can be made.

The user definition entries outvote the special system definition entries and the system default value. If a user defined entry for the actual situation is found, this is first taken.

If no user defined entry is available, the applicable special system definition entry is taken. Even if none of the special system definition entries is applicable, the system default value is finally used.

The special system definition entries and the system default value are preallocated. Only the user defined entries must be made, if other stations / lines (trunks) involved of a connection, than in the instruction manual *call record structure* described, which costs are to take over.

The user can make maximal 512 table entries. The following entries are already preallocated by the system:

- 2 special system definitions (at present)
- 3 system defaults

Therefore 507 user-defined table entries remain.

### General description

#### Determination of the paying party parameters

In each entry of the paying party assignment table a call processing oriented situation is represented in each case.

In order to find the optimum entry of a processing oriented situation in the paying party assignment table, the following parameters are needed:

CONNTYPE ... type of connection,  
SUPLSERV .... supplementary service,  
SUBSID ..... subscriber identification,  
TRANSTYP .... call transfer situation and  
TRUNK ..... description see further below

The chargee CHARGE 1 to 6 (parameter CHARGEEn) can be assigned to these call processing oriented situations in six columns, whereby the sequence of the chargee is determining in the actual situation. If no entries of the chargee are available, the default values (special system definitions or system default) determined previously are taken.

During each call or change of call status it is possible to try to find a as well as possible entry with the informations available at this time in the paying party assignment table.

With the found entry a list is, also after priority to graduated possible stations which the costs of this call section to take over is, at the disposal.

The first station also in the available call information is available, as payment is selected.

#### Parameter description for TRUNK

A trunk area TRUNK has a lower and upper limit value, whereby each limit value is structured as follows:

LTU-SLOT-CCT-BCHAN

If the entire possible trunk area is taken off, the value ANY is output.

The default value of parameters BCHAN, CCT, LTU and SLOT is set to ANY.

If only a subrange is covered for example by parameter CCT, then the entire area must be indicated for parameter BCHAN (see error messages F05, F06 and F07 in [Section 71.4.1, "Error Messages"](#))

The complete description of parameters BCHAN, CCT, LTU and SLOT see [Section 71.3, "Parameter Description"](#).

### Parameter description for SUBSID (subscriber identification)

The following values for the subscriber identification (SUBSID) are entered into the paying party assignment table:

ANY ..... any identification  
 ATTEND .... attendant  
 HAS ..... PBX set  
 NIGHT ..... night server  
 SECR ..... secretary und  
 SUBSCR ... subscriber

There are two different cases (for the determination of the chargee (paying party)) with the selection of the values of the subscriber identification:

- normal case:
  - For internal connections (CONNTYPE=INT) the values for subscriber identification are taken from the *calling party* (calling station (caller)).
  - For outgoing connections (CONNTYPE=OUTG) the values for subscriber identification are taken from the *calling party* (calling station (caller)).
  - For incoming connections (CONNTYPE=INCO) the values for subscriber identification are taken from the *connected party* (station with that a connection came).
- special cases:
  - With a call forwarding (SUPPLSERV=CALLFOR) the subscriber identification is taken from the *last redirecting party* (last rerouted subscriber).
  - With a call pickup (SUPPLSERV=PICKUP) the subscriber identification is taken from the *connected party* (station with that a connection came).
  - With a call transfer (SUPPLSERV=TRANSFER) the subscriber identification is taken from the *transferring party* (attendant subscriber with a transfer call).

If at this time the station (party), from which in the special case the subscriber identification is taken is not available, the subscriber identification is determined in accordance with the normal case.

The special cases are independent of the connection type (CONNTYPE).

### Definitions for internal connections

For the *system default* for internal calls

the call pays the used homeland station of a mobile calling station with a personal identification number (PIN) on an other terminal identified (*paying party selection 1: Number of the homeland station of the calling station, that identifies itself with a personal identification number (PIN) on an other terminal*) or

the used key line with the calling station (*paying party selection 2: Number of the other line on use of a key set, which is used for the call*) or

the caller (*paying party selection 3: Calling station (caller)*).

In each case the number first available of this sequence is selected.

```
CHRGEE1=MOUCALL,  
CHRGEE2=KEYCALL,  
CHRGEE3=CALLING;
```

### Definitions for outgoing connections

For the *special system definitions* with outgoing connections two entries are created:

1. An internal station builds up two outgoing calls (*call transfer situation: Both partners are in the public network*) and transfers the call (*supplementary service: Call transfer*).

In case of a call forwarding of a consultation hold to an external station (FWD) the first rerouted (internal) station has to pay the cost (*paying party selection 1: First rerouted subscriber*) or

the attend station is chargee of both connections (*paying party selection 2: Attendant subscriber with a transfer call*).

```
SUPLSERV=TRANSFER,  
TRANSTYP=BOPPUB,  
CHRGEE1=FIRSTRED,  
CHRGEE2=TRANSPTY;
```

2. A station is called, with a call forwarding (FWD) to external (*supplementary service: Call forwarding*),

in this case the last rerouted station has to pay the costs of the connection (*paying party selection 1: Last rerouted subscriber*).

```
SUPLSERV=CALLFOR,
CHRGEE1=LASTRED;
```

For the *system default* for outgoing calls

the call pays the chargee who is determined in a other system of the network and transferred (*paying party selection 1: Chargee was determinated before in the network and transferred*) or

the used homeland station of a mobile calling station with a personal identification number (PIN) on an other terminal identified (*paying party selection 2: Number of the homeland station of the calling station, that identifies itself with a personal identification number (PIN) on an other terminal*) or

the used key line with the calling station (*paying party selection 3: Number of the other line on use of a key set, which is used for the call*) or

the caller (*paying party selection 4: Calling station (caller)*) or

if the call number is unknown, the calling trunk or its virtual number (AMO-TLZO) (*paying party selection 5: number of calling (incoming/outgoing) trunk determinated with the help of AMO-TLZO*).

In each case the number first available of this sequence is selected.

```
CHRGEE1=BILLING,
CHRGEE2=MOUCALL,
CHRGEE3=KEYCALL,
CHRGEE4=CALLING,
CHRGEE5=TRUNK;
```

### **Definitions for incoming connections**

For the *special system definitions* with outgoing connections two entries are created:

1. A station is called by external (*supplementary service: Call transfer*) and transfers the call to a external station again (*call transfer situation: Both partners are in the public network*).

In the case of a call forwarding (FWD) of a consultation hold to an external station, the first rerouted (internal) subscriber has to pay the cost (*paying party selection 1: First rerouted subscriber*) or

the attend station remains is chargee of both connections (*paying party selection 2: Attendant subscriber with a transfer call*).

```
SUPLSERV=TRANSFER,
TRANSTYP=BOPPUB,
CHRGEE1=FIRSTRED,
CHRGEE2=TRANSPTY;
```

2. If an incoming call is forwarded (*supplementary service: Call forwarding*),

in this case the originally called station has to pay the costs of the connection (*paying party selection 1: Dialed number (called)*).

If the number of the called station should not be available yet, then the calling (coming) trunk has to pay the connection (*paying party selection 2: Number of calling (incoming/outgoing) trunk determined with the help of AMO-TLZO*).

```
SUPLSERV=CALLFOR,  
CHRGEE1=FIRSTRED,  
CHRGEE2=CALLED,  
CHRGEE3=TRUNK;
```

For the *system default* for outgoing calls

the call pays the chargee who is determined in a other system of the network and transferred (*paying party selection 1: Chargee was determined before in the network and transferred*) or

the used key line of the reached station (*paying party selection 2: Number of the other line on use of a key set, which is used for the receiving of the call.*) or

the station with that a connection came (*paying party selection 3: Station with that a connection came.*) or

the called station (*paying party selection 4: Dialed number (called)*) or

if the call number is unknown, the calling trunk or its virtual number (AMO-TLZO) (*paying party selection 5: number of calling (incoming/outgoing) trunk determined with the help of AMO-TLZO*).

In each case the number first available of this sequence is selected.

```
CHRGEE1=BILLING,  
CHRGEE2=KEYCONN,  
CHRGEE3=CONNECT,  
CHRGEE4=CALLED,  
CHRGEE5=TRUNK;
```

### Interrelationships to AMO-GEFE

This AMO influences the paying party allocation.

The allocation of the costs (that is the chargee) is influenced by the AMO GEFE with connecting transfer by the attendant terminal or by secretary on executive.

More detailed informations see description of AMO-GEFE (ATTNDINT, ATTNDINC and ATTNDOUT).

**Interrelationships to AMO-PERSI**

This AMO influences the paying party allocation also.

If in branch COPIN (class of pin) the parameter value COPIN (adjustable per pin) the parameter DISPRSTN (displaying the remote station number to the call partner) is set to YES, then the fields CALLING and MOBILE USER before the determination of the chargee are exchanged (The visited station is to be selected as chargee).

More detailed informations see description of AMO-PERSI.

## 71.1 Interrelationships

There are no direct dependencies, however logical interrelationships with the following AMOs:

- AMO-TLZO : Administration of the station assignment table
- AMO-GEFE ; Administering the charge registration parameters
- AMO-PERSI : Personal identification data

## 71.2 Functions of the AMO

- [ADD-DEFPP](#) : Create an entry in the paying party assignment table
- [CHANGE-DEFPP](#) : Change an entry of the paying party assignment table
- [DELETE-DEFPP](#) : Delete the entries in the paying party assignment table
- [DISPLAY-DEFPP / REGENERATE-DEFPP](#) : Interrogate of the entries of the paying party assignment table  
Regenerate the entries of the paying party assignment table

### 71.2.1 ADD-DEFPP

When creating an entry with the appropriate call processing oriented data is entered in each case into the paying party assignment table.

## DEFPP - Define Paying Party

Functions of the AMO

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-DEFPP    | CONNTYPE=<param>, [SUPLSERV=<param>], [SUBSID=<param>]<br>, [TRANSTYP=<param>], [LTU=<number>], [SLOT=<number>]<br>, [CCT=<number>], [BCHAN=<number>], CHRGEE1=<param><br>, [CHRGEE2=<param>], [CHRGEE3=<param>], [CHRGEE4=<param>]<br>, [CHRGEE5=<param>], [CHRGEE6=<param>]; |

#### Examples:

##### 1. Creating of outgoing connections.

Two outgoing connections (CONNTYPE=OUTG) with the following parameters are created:

User defined entry outgoing 1:

A station is called, with a call forwarding (FWD) to external (*supplementary service: call forwarding*).

The costs of the call has to pay the first rerouted subscriber (*paying party selection 1: first rerouted subscriber*).

```
SUPLSERV=CALLFOR,  
CHRGEE1=FIRSTRED;
```

Without this entry the default values (special system definitions or system default) are used. The entered values you can find in [Section , "Definitions for outgoing connections"](#).

User defined entry outgoing 2:

An external call will pass through by several systems and transferred from attendant to external (*supplementary service: call transfer, subscriber identification: attendant (AC), call transfer situation: both partners are in the public network*).

The costs of the call has to pay the chargee who is determined in a other system of the network and transferred (*paying party selection 1: chargee was determinated before in the network and transferred*) or

the caller (*paying party selection 2: calling station (caller)*) or

if this does not admit the incoming trunk (AMO-TLZO) (*paying party selection 3: number of calling (incoming) trunk determinated with the help of AMO-TLZO*).

```
SUPLSERV=TRANSFER,  
SUBSID=ATTEND,  
TRANSTYP=BOPUB,  
CHRGEE1=BILLING,  
CHRGEE2=CALLING,  
CHRGEE3=TRUNK;
```

Without this entry the default values (special system definitions or system default) are used. The entered values you can find in [Section , "Definitions for outgoing connections"](#).

**Input:**

```
ADD-DEFPP:CONNTYPE=OUTG,SUPLSERV=CALLFOR,CHRGEE1=FIRSTRED;
ADD-
DEFPP:CONNTYPE=OUTG,SUPLSERV=TRANSFER,SUBSID=ATTEND,TRANSTYP=
BOPPUB
,CHRGEE1=BILLING,CHRGEE2=CALLING,CHRGEE3=TRUNK;
```

**2. Creating of incoming connections.**

Two incoming connections (CONNTYPE=INCO) with the following parameters are created:

**User defined entry incoming 1:**

The attendant console (AC) is called by external station *(supplementary service: call transfer, subscriber identification: attendant, call transfer situation: both partners are in the public network)*.

The costs of the call has to pay the external station, which is attend from the attendant console (AC) *(paying party selection 1: station, with that a connection came)* or

if no call number was given from OFFICE, the incoming trunk *(paying party selection 2: number of calling (incoming) trunk determinated with the help of AMO-TLZO)*.

```
SUPLSERV=TRANSFER,
SUBSID=ATTEND,
TRANSTYP=BOPPUB,
CHRGEE1=CONNECT,
CHRGEE2=TRUNK;
```

Without this entry the default values (special system definitions or system default) are used. The entered values you can find in [Section , "Definitions for incoming connections"](#).

**User defined entry incoming 2:**

An incoming call from trunk 1-91-3-1 *(line trunk unit (LTU): 1, specification of the mounting pitch in the LTU (SLOT): 91, circuit number: 3, number of ISDN B-channel: 1)*

is to be paid by the incoming trunk (AMO-TLZO) *(paying party selection 1: number of calling (incoming/outgoing) trunk determinated with the help of AMO-TLZO)*.

```
LTU=1,
SLOT=91,
CCT=3,
BCHAN=1,
CHRGEE1=TRUNK;
```

Without this entry the default values (special system definitions or system default) are used. The entered values you can find in [Section , "Definitions for incoming connections"](#).

Input:

```
ADD-
DEFPP:CONNTYPE=INCO, SUPLSERV=TRANSFER, SUBSID=ATTEND, TRANSTYP=
BOPUPB
      , CHRGEE1=CONNECT, CHRGEE2=TRUNK;
ADD-
DEFPP:CONNTYPE=INCO, LTU=1, SLOT=91, CCT=3, BCHAN=1, CHRGEE1=TRUNK
;
```

**71.2.2 CHANGE-DEFPP**

Modifying entries from the paying party assignment tables can be executed only for user defined entries.

The following parameters are used for the identification of an entry and remain unchanged therefore:

- CONNTYPE ... selection according to type of connection
- SUPLSERV .... specification of supplementary service
- SUBSID ..... subscriber identification
- TRANSTYP .... call transfer situation
- LTU ..... line trunk unit
- SLOT ..... mounting pitch in the LTU)
- CCT ..... circuit number and
- BCHAN ..... number of ISDN B-channel.

At least the value CHRGEE1, i.e. the first value of the paying party assignment tables (PAYPART1 to PAYPART6) must be entered in the list. The entire list is always modified.

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-DEFPP | CONNTYPE=<param>, [SUPLSERV=<param>], [SUBSID=<param>]<br>, [TRANSTYP=<param>], [LTU=<number>], [SLOT=<number>]<br>, [CCT=<number>], [BCHAN=<number>], CHRGEE1=<param><br>, [CHRGEE2=<param>], [CHRGEE3=<param>], [CHRGEE4=<param>]<br>, [CHRGEE5=<param>], [CHRGEE6=<param>]; |

**Examples**

1. Change of parameters of outgoing connections.  
The following parameters of the outgoing connection (CONNTYPE=OUTG) are changed:  
User defined entry outgoing 1:

A station is called, with a call forwarding (FWD) to external  
(*supplementary service: call forwarding*).

The costs of the call has to pay the caller (*paying party selection 1: calling station (caller)*).

```
SUPLSERV=CALLFOR,
CHRGEE1=CALLING;
```

Input:

```
CHANGE-DEFPP:CONNTYPE=OUTG, SUPLSERV=CALLFOR, CHRGEE1=CALLING;
```

## 2. Change of parameters of incoming connections.

The following parameters of the incoming connection  
(CONNTYPE=INCO) are changed:

User defined entry incoming 1:

The attendant console (AC) is called by external station  
(*supplementary service: call transfer, subscriber identification: attendant, call transfer situation: both partners are in the public network*).

The costs of the call are assigned now to the virtual number  
(*paying party selection 1: number of calling (incoming) trunk determined with the help of AMO-TLZO*).

```
SUPLSERV=TRANSFER,
SUBSID=ATTEND,
TRANSTYP=BOPUB,
CHRGEE1=TRUNK;
```

Input:

```
CHANGE-
DEFPP:CONNTYPE=INCO, SUPLSERV=TRANSFER, SUBSID=ATTEND, TRANSTYP=
BOPUB, CHRGEE1=TRUNK;
```

## 71.2.3 DELETE-DEFPP

Deleting entries from the paying party assignment tables can be executed only for user defined entries.

For the deletion of an entry of a connection from the paying party assignment table must all parameters when creating were used, to be indicated.

For the deletion of all entries of a connecting type from the paying party assignment tables the type of the connection (CONNTYPE) must be indicated.

## DEFPP - Define Paying Party

Functions of the AMO

### Procedure Overview

#### Command Code

```
DELETE-DEFPP
```

#### Parameter

```
CONNTYPE=<param>, [SUPLSERV=<param>], [SUBSID=<param>]  
, [TRANSTYP=<param>], [LTU=<number>], [SLOT=<number>]  
, [CCT=<number>], [BCHAN=<number>];
```

#### Example

1. Delete a certain user defined entry for outgoing connections (CONNTYPE=OUTG) from the paying party assignment table.

Input:

```
DEL-DEFPP:CONNTYPE=OUTG, SUPLSERV=CALLFOR;
```

2. Delete all user defined entries for outgoing connections (CONNTYPE=OUTG) from the paying party assignment table.

Input:

```
DEL-DEFPP:CONNTYPE=OUTG;
```

## 71.2.4 DISPLAY-DEFPP / REGENERATE-DEFPP

Interrogate the paying party assignment table all entries are output in list format.

The output can according to the type of the connection (internal:

CONNTYPE=INCO, outgoing: CONNTYPE=OUTG or incoming:

CONNTYPE=INCO) to be selected.

If no value for parameter CONNTYPE will be indicated, all connections (internal, outgoing and incoming) are output in list format. The default value of parameter CONNTYPE is set to ALL.

With the REGEN command only the entries are generated from the area of the *user defined entries*, not however the entries from the table of *special system definitions*.

With regenerating no parameter is input.

1. Interrogate the paying party assignment table with output in list format (DISPLAY).
2. Interrogate the paying party assignment table with output in position oriented commands for regeneration (REGENERATE).

## Procedure Overview

| Command Code     | Parameter           |     |
|------------------|---------------------|-----|
| DISPLAY-DEFPP    | [CONNTYPE=<param>]; | (1) |
| REGENERATE-DEFPP | ;                   | (2) |

## Examples

1. Interrogate the paying party assignment table for all (internal / outgoing / incoming) connections (CONNTYPE=ALL) with output in list format.

Input:

DISP-DEFPP:CONNTYPE=ALL;

or

DISP-DEFPP;

Output:

CONNECTION TYPE: INT

SYSTEM DEFAULT:

|                 | BPTYPUB                                    | = B-side from public network.                                                                                                                                                                                                           |  |

## **71.4 Error Messages and Advisories**

### **71.4.1 Error Messages**

F01: PARAMETER TRANSTYP IS ALLOWED ONLY, IF PARAMETER SUPLSERV = TRANSFER OR NORMAL.  
F02: PARAMETER LTU IS MISSING.  
F03: PARAMETER SLOT IS MISSING.  
F04: PARAMETER CCT IS MISSING.  
F05: RANGE IN PARAMETER LTU IS ONLY ALLOWED, IF PARAMETERS SLOT, CCT AND BCHAN COVER THEIR WHOLE RANGE.  
F06: RANGE IN PARAMETER SLOT IS ONLY ALLOWED, IF PARAMETERS CCT AND BCHAN COVER THEIR WHOLE RANGE.  
F07: RANGE IN PARAMETER CCT IS ONLY ALLOWED, IF PARAMETER BCHAN COVERS IT'S WHOLE RANGE.  
F08: ENTRY ALREADY EXISTS.  
F09: TRUNK RANGE OVERLAPPING WITH EXISTING ENTRY.  
F10: TABLE IS FULL.  
F11: ENTRY NOT FOUND.  
F12: AN ELEMENT OF THE PAYING PARTY LIST IS MULTIPLE AVAILABLE.  
F13: ENTRIES FOR CONNECTION TYPE INTERNAL ARE NOT POSSIBLE.  
F14: THE AREA IS EMPTY.

### **71.4.2 Advisories**

H01: ATTENTION! ENTRIES ARE PERFORMED WITHIN THE TABLE SPECIAL SYSTEM DEFINITIONS.  
H02: THE PAYING PARTY ENTRY IS ALWAYS SET ON THE FIRST FREE SPACE.  
H03: ATTENTION! POSSIBLE CHANGES ARE PERFORMED AT PRESENT WITHIN THE TABLE SPECIAL SYSTEM DEFINITIONS.  
H04: SPECIAL SYSTEM DEFINITIONS DOES NOT REGENERATE.

## 72 DEFTM - Define Traffic Measurement

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

This AMO is used for

- set up and administration of the DB table "list of measurement objects".
- Starting and stopping of the measurement. In addition a switch (PMON) in the database of the ADP is used.
- Determining the measurement range by the created parameters from the measurement object file.

The table "measurement objects" consists of two fields. These both fields together determine a range of objects:

- lower boundary of the range of objects
- upper boundary of the range of objects

The object area is described by its lower and upper boundary.

The switch ALLON states the fact that all objects, except processor load and the attendant console activity, are recorded by the measurement.

If no measurement objects are defined in the list of measurement objects, and the switch ALLON is set to N(o), no measurement takes place.

If measurement objects are defined in the list of measurement objects, and the switch ALLON is set to N(o), then the measurement of measurement objects of the list of measurement objects takes place.

Is the switch ALLON set to Y(es), all measurement objects are recorded. All entries of the list of measurement objects have no effect, are preserved however for a new measurement.

The user can make max. 500 entries into the list of measurement objects.

Measurement objects are:

- subscriber number (range)
- trunk number (range)
- trunk group number (range)
- attendant number (range)

## DEFTM - Define Traffic Measurement

### Interrelationships

- attendant group number (range)
- pilot number of a hunt group

#### General description

##### Parameter description for TRUNK

A trunk range TRUNK has a lower and upper limit value, whereby each limit value is structured as follows:

LTU-SLOT-CCT

If the entire possible trunk range is taken off, the value ANY is output.

The default value of parameters CCT, LTU and SLOT is set to ANY.

If only a subrange is covered for example by parameter LTU, then the entire area must be indicated for parameter CCT (see error messages F05 and F06 in [Section 72.4.1, "Error Messages"](#))

The complete description of parameters CCT, LTU and SLOT see [Section 72.3, "Parameter Description"](#).

## 72.1 Interrelationships

There are no direct dependencies to other AMOs:

## 72.2 Functions of the AMO

- [ADD-DEFTM](#) : Create an entry or a range in the measurement object table
- [CHANGE DEFTM](#) : Starting and stopping of the measurement and the definition of the parameters of the measurement
- [DELETE DEFTM](#) : Delete of entries in the measurement object table
- [DISPLAY-DEFTM / REGENERATE-DEFTM](#) : Interrogate of the parameters and entries of the measurement object table  
Regenerate of entries of the measurement object table

### 72.2.1 ADD-DEFTM

When creating an entry with the appropriate data of the measurement object (measurement object types) is entered in each case into the measurement object table.

## Procedure Overview

| Command Code | Parameter                                                            |     |
|--------------|----------------------------------------------------------------------|-----|
| ADD-DEFTM    | OBJECT=SUBSCR, NUMBER=<number>;                                      | (1) |
|              | OBJECT=TRUNK, LTU=<number>, [ SLOT=<number>]<br>  , [ CCT=<number>]; | (2) |
|              | OBJECT=ATTND, NUMBER=<number>;                                       | (3) |
|              | OBJECT=TRUNKGRP, TRUNKGRNO=<number>;                                 | (4) |
|              | OBJECT=ATTNDGRP, ATNDGRNO=<number>;                                  | (5) |
|              | OBJECT=HUNTHEAD, NUMBER=<number>;                                    | (6) |

### Examples:

1. Creating of a subscriber with the number 3444.

Input:

```
ADD-DEFTM:OBJECT=SUBSCR,NUMBER=3444;
```

2. Creating of the trunk 1-79-4.

Line trunk unit: 1

specification of the mounting pitch in the LTU: 79 and  
circuit number: 4

Input:

```
ADD-DEFTM:OBJECT=TRUNK,LTU=1,SLOT=79,CCT=4;
```

3. Creating of an attendant with the number 4402.

Input:

```
ADD-DEFTM:OBJECT=ATTND,NUMBER=4402;
```

4. Creating of a trunk group with the number 75.

Input:

```
ADD-DEFTM:OBJECT=TRUNKGRP,TRUNKGRNO=75;
```

5. Creating of an attendant group with the number 0.

Input:

```
ADD-DEFTM:OBJECT=ATTNDGRP,ATNDGRNO=0;
```

6. Creating of a hunt group with the pilot number 2404.

Input:

```
ADD-DEFTM:OBJECT=HUNTHEAD,NUMBER=2404;
```

### 72.2.2 CHANGE DEFTM

When changing the measurement is started or stopped.

The following switches are used:

- **PMON:**  
Central switch for performance management (PM), needed to start/stop PM.  
If this switch is off, all installed measurement objects of AMO-DEFTM have no effect.  
The recording of measurement data begins only with the activating of this switch.
- **ALLON:**  
All objects, except processor load and the attendant console activity, are recorded by the measurement.  
Is this switch set, all entries in the list of measurement objects have no effect.  
Is this switch not set, then the measurement of measurement objects of the list of measurement objects takes place.
- **LOADON:**  
A special CDR record is generated every 10 seconds, containing processor load (SWU and ADP)
- **ACACTON:**  
Events of the attendant console (AC) will be monitored:
  - AC activates/deactivates nightservice,
  - AC pulls/reconnect the jack,
  - AC is out of/in service.

#### Procedure Overview

| Command Code                                                                                                                                                                                                                                          | Parameter                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| CHANGE-DEFTM                                                                                                                                                                                                                                          | { (min 1) PMON=<param>, ALLON=<param>, LOADON=<param>, ACACTON=<param>}; |
| <b>Examples:</b><br><ol style="list-style-type: none"><li>Switch on the central switch for performance management (PM).<br/>Input:<br/>CHANGE-DEFTM:PMON=Y;</li><li>Switch on all measurement objects.<br/>Input:<br/>CHANGE-DEFTM:ALLON=Y;</li></ol> |                                                                          |

3. Switch on of the measurement objects (from measurement object table).

Input:

```
CHANGE-DEFTM:ALLON=N;
```

4. A special CDR record is generated every 10 seconds, containing processor load (SWU and ADP).

Input:

```
CHANGE-DEFTM:LOADON=Y;
```

5. Activation/deactivation of night service at attendant console (AC).

Input:

```
CHANGE-DEFTM:ACACTON=Y;
```

## 72.2.3 DELETE DEFTM

For the deletion of entries from the measurement object tables, the appropriate measurement object type must be indicated.

Are all entries to be deleted, the parameter `OBJECT=ALL` must be indicated.

If a range of objects is created, only the whole created range of objects can be deleted again.

### Procedure Overview

| Command Code | Parameter                                                      |     |
|--------------|----------------------------------------------------------------|-----|
| DELETE-DEFTM | OBJECT=ALL;                                                    | (1) |
|              | OBJECT=SUBSCR, [NUMBER=<number>];                              | (2) |
|              | OBJECT=TRUNK, [LTU=<number>], [SLOT=<number>], [CCT=<number>]; | (3) |
|              | OBJECT=ATTND, [NUMBER=<number>];                               | (4) |
|              | OBJECT=TRUNKGRP, [TRUNKGRNO=<number>];                         | (5) |
|              | OBJECT=ATTNDGRP, [ATTNDGRNO=<number>];                         | (6) |
|              | OBJECT=HUNTHEAD, [NUMBER=<number>];                            | (7) |

**Examples:**

- 1. Delete a certain entry (attendant with the number 4402) from the measurement object table.

Input:

```
DEL-DEFTM:OBJECT=ATTND,NUMBER=4402;
```

- 2. Delete all entries from the measurement object table.

Input:

```
DEL-DEFTM:OBJECT=ALL;
```

**72.2.4 DISPLAY-DEFTM / REGENERATE-DEFTM**

Interrogate the measurement object table all entries are output in list format.

The output can according to the type of measurement objects, i. e. OBJECT=SUBSCR, be selected.

The output mask consists of 7 sections:

- Switch PMON (PM), ALLON (ALL), LOADON (LOAD) and ACACTON (AC)
- Subscriber number (OBJECT=SUBSCR)
- Trunk number (OBJECT=TRUNK)
- Trunk group number (OBJECT=TRUNKGRP)
- Attendant number (OBJECT=ATTND)
- Attendant group number (OBJECT=ATTNDGRP)
- Pilot number of a hunt group (OBJECT=HUNTHEAD)

With regenerating no parameter is input.

- 1. Interrogation of measurement object table with output in list format (DISPLAY).
- 2. Interrogation of measurement object table with output in position oriented commands for regeneration (REGENERATE).

**Procedure Overview**

| Command Code  | Parameter         |     |
|---------------|-------------------|-----|
| DISPLAY-DEFTM | [OBJECT=<param>]; | (1) |

| Command Code     | Parameter |     |
|------------------|-----------|-----|
| REGENERATE-DEFTM | ;         | (2) |

**Examples:**

1. Interrogation of measurement object table for all measurement objects.

Input:

DISP-DEFTM;

Output:

H500: AMO DEFTM STARTED

PM: ACTIVE  
ALL: DEACTIVATED  
LOAD: ACTIVE  
AC: ACTIVE

OBJECT: SUBSCRIBERS (RANGE)

3444;

OBJECT: TRUNK (RANGE)

1-79-4

OBJECT: TRUNK NUMBER GROUP (RANGES)

75

OBJECT: ATTENDANT NUMBER (RANGES)

4402;

OBJECT: ATTENDANT GROUP NUMBERS (RANGES)

0

OBJECT: SUBSCRIBERS (RANGE) OF HEADS OF HUNTGROUPS  
2404;

AMO-DEFTM-111 SET UP AND ADMINISTRATION OF TRAFFIC  
MEASUREMENT TABLE  
DISPLAY COMPLETED;

2. Regenerate the measurement object table with output in position oriented commands.

Input:

**DEFTM - Define Traffic Measurement**

Parameter Description

```
REG-DEFTM;

Output:

H500:  AMO DEFTM STARTED
ADD-DEFTM:SUBSCR,3444;
ADD-DEFTM:TRUNK,1,79,4;
ADD-DEFTM:TRUNKGRP,75;
ADD-DEFTM:ATTND,4402;
ADD-DEFTM:ATTNDGRP,0;
ADD-DEFTM:HUNTHEAD,2404;
AMO-DEFTM-111      SET UP AND ADMINISTRATION OF TRAFFIC
MEASUREMENT TABLE
REGENERATE COMPLETED;
```

**72.3 Parameter Description**

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACACTON  | <p>Events of attendant console (AC) will be monitored:<br/>AC activates/deactivates nightservice,<br/>AC pulls/reconnect the jack,<br/>AC is out of/in service.</p> <p>Type of Input : Single value, optional, 4. parameter of a min-1-group (CHANGE)</p> <p>Possible Values : Y = Yes<br/>N = No</p> <p>Default Value : N</p>                                                                                                                                                        |
| ALLON    | <p>All objects will be monitored, except processor load and attendant console activity.<br/>If this switch is on, all settings in the list of measurement objects of AMO_DEFTM have no effect.<br/>Is this switch not set, then the measurement of measurement objects of the list of measurement objects takes place.</p> <p>Type of Input : Single value, optional, 2. parameter of a min-1-group (CHANGE)</p> <p>Possible Values : Y = Yes<br/>N = No</p> <p>Default Value : N</p> |
| ATNDGRNO | <p>Attendant group number (AMO-VFGR)</p> <p>Type of Input : Single value, required (ADD)<br/>single value, optional (DELETE)<br/>range, optional</p> <p>Possible Values : 0 to 15</p>                                                                                                                                                                                                                                                                                                 |
| CCT      | <p>Circuit number</p> <p>Type of Input : Single value, optional<br/>range, optional</p>                                                                                                                                                                                                                                                                                                                                                                                               |

Possible Values : 0 to 255

**LOADON** A special CDR record is generated every 10 seconds, containing processor load (SWU and ADP)

Type of Input : Single value, optional, 3. parameter of a min-1-group (CHANGE)

Possible Values : Y = Yes  
N = No

Default Value : N

**LTU** Line Trunk Unit

Type of Input : Single value, required (ADD)  
single value, optional (DELETE)  
range, optional

Possible Values : 1 to 99

Note : LTU 16 is used Hicom internal.

**NUMBER** Station number

Type of Input : Single value, required (ADD)  
single value, optional (DELETE)  
range, optional

Possible Values : max. 22 digits, digits 0 to 9

**OBJECT** Add, delete and display of measurement object types

Type of Input : Single value, required (ADD, DELETE)  
single value, optional (DISPLAY)  
range, optional

Possible Values : ALL = All objects (DELETE and DISPLAY only)  
ATTND = Attendant number  
ATTNDGRP = Attendant group number  
HUNTHEAD = Pilot number of a hunt group  
TRUNK = Trunk number  
TRUNKGRP = Trunk group number  
SUBSCR = Subscriber number

Default Value : ALL = All objects (DISPLAY only)

**PMON** Central switch for performance management (PM), needed to start/stop PM.  
If this switch is off, all other settings of AMO-DEFTM have no effect.

Type of Input : Single value, optional, 1. parameter of a min-1-group (CHANGE)

## DEFTM - Define Traffic Measurement

### Error Messages and Advisories

Possible Values : Y = Yes  
N = No  
Default Value : N

SLOT Specification of the mounting pitch in the LTU  
Type of Input : Single value, optional  
range, optional  
Possible Values : 1 to 121

TRKGRNO Trunk group number (AMO-BUEND)  
Type of Input : Single value, required (ADD)  
single value, optional (DELETE)  
range, optional  
Possible Values : 1 to 512

## 72.4 Error Messages and Advisories

### 72.4.1 Error Messages

F01: SUBSCRIBER, ATTENDANT, TRUNK GROUP, ATTENDANT GROUP OR NUMBER OF HUNT GROUP OVERLAPPING WITH EXISTING ENTRY.

F02: not used

F03: PARAMETER SLOT IS MISSING.

F04: ENTRY ALREADY EXISTS.

F05: RANGE IN PARAMETER LTU IS ONLY ALLOWED, IF PARAMETERS SLOT AND CCT COVER THEIR WHOLE RANGE.

F06: RANGE IN PARAMETER SLOT IS ONLY ALLOWED, IF PARAMETER CCT COVERS ITS WHOLE RANGE.

F07: ENTRY ALREADY EXISTS, WHERE TRUNK RANGE OVERLAPS.

F08: TABLE IS FULL.

F09: ENTRY NOT FOUND.

F10: ONLY THE WHOLE RANGE CAN BE DELETED.

F11: AREA LIMITS MUST BE OF THE SAME LENGTH.

F12: SUBSCRIBER, ATTENDANT OR NUMBER OF HUNT GROUP INCLUDING EXISTING ENTRY.

F13: THE AREA IS EMPTY.

F14: THE VALUE OF PARAMETER ACTLEV IS ONLY TO BE ALLOWED TO BE SMALLER OR EQUAL THE VALUE OF DEACTLEV.

## **72.4.2 Advisories**

H01: CONSECUTIVE RANGES WITHOUT ELEMENTS INBETWEEN HAVE BEEN JOINED.

**DEFTM - Define Traffic Measurement**  
Error Messages and Advisories

## 73 DEL - Delete Files

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">AMO Functions</a>         | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

This call is used to delete one or several files by specifying a partly qualified file name.

The names of those files that could not be deleted (e.g., directory file not empty, file does not exist in catalog) are output on the console.

### 73.1 Restrictions

This description is valid from SP300 E V3.0.

### 73.2 Interrelationships

- AMO-complex FIDES : File and device service  
(see System AMO Section 'ISY startup system')

### 73.3 AMO Functions

- [START-DEL](#) : Deletion of Files

#### 73.3.1 START-DEL

##### Note

By specifying an SEL parameter, an inquiry as to whether or not to delete is displayed on the operating terminal prior to the deletion.

By specifying the WARN parameter, the question before deleting an open file can be suppressed.

### Parameter Description

## Procedure Overview

| Command Code | Parameter                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------|
| START-DEL    | FILENAME=<string>, [SEL=<param>], [WARN=<param>]<br>, [ANS=<param>], [DIALOG=<param>], [UNIT=<param>]; |

### Example

Deleting file AAA/BBB/CCC on area PDS.

Input:

```
START-DEL:":PDS:AAA/BBB/CCC";
```

## 73.4 Parameter Description

Answer

Will be requested if user reply is required

Type of Input : Single value  
optional

|                 |     |                                              |
|-----------------|-----|----------------------------------------------|
| Possible Values | : Y | = file is deleted                            |
|                 | N   | = file is not deleted                        |
|                 | I   | = action is interrupted                      |
|                 | C   | = all additional files specified are deleted |

Dialog code

Dialog. Text to be output on the terminal by programs if the 'fides' function is called.

Type of Input : Single value  
optional

Possible Values : Y = yes

Default Value : N

Name of file to be deleted

Type of Input : Single value  
mandatory

Possible Values : fully qualified or partly qualified hard disk or floppy disk file name (maximum of 32 positions)

## Configuration of partially qualified file names

Selection mode when partly qualified file names are specified

Type of Input : Single value  
optional

Possible Values : Y = yes, execute function  
N = no, do not execute function

UNIT Functional system unit i.e. server code

Type of Input : Single value  
optional

Possible Values : A1 = Administration and Data Server

Default Value : A1

WARN Ask question if file to be deleted is open

Type of Input : Single value  
optional

Possible Values : Y = yes, ask if file is open  
N = no, don't ask if file is open

Default Value : Y

## 73.5 Error Messages and Advisories

### 73.5.1 Error Messages

None

### 73.5.2 Advisories

```
H01: DELETE ?
H02: <filename> NOT DELETED
H03: <filename> DELETED
H04: DIR : <filename> DELETED
H05: DELETE FINISHED

## 75 DIDCR - Direct Inward Dial Conversion Table

|                    |                             |
|--------------------|-----------------------------|
| Interrelationships | Parameter Description       |
| AMO Functions      | Error and Advisory Messages |

The DIDCR (DID Digit Conversion Rule) AMO sets up the Digit Conversion Rule tables (DIDCR tables) for the E&M and the DID trunks. The E&M and the DID trunks will receive up to 16 dial pulse digits. The received digits may be converted to another digit string prior to digit translation. The DID digit conversion resulting string will be selected from a DIDCR table according to the E&M and DID trunk they arrive on. Each DIDCR table has a header consisting of two entries. The first entry indicates the total number of incoming digits and the second entry indicates the number of digits to be deleted from the total number of incoming digits. The field entry in the DIDCR table consists of a maximum of six digits.

For Primary Rate Interface (PRI) channels the number of digits supplied in the called party number IE (Information Element) may differ based on several factors including the Network Service which is used for that channel. Therefore the PRI channels access the DID Rule Tables through a Service Rule table (SRT table) which is indexed based on the Network Service provided for incoming calls. It is possible to enter a DID RULEIDX for up to 9 11 Network Services in each Service Rule table.

The first (4) services of the Service Rule table are reserved for Megacom/MCI-800 (INWATS), Software Defined Networks (VPN), Accunet (SDS) and Multiquest (PPC900). These Network Services have the capability of specifying whether or not to request SID (Station Identification) or ANI (Automatic Number Identification) information. SID is also known as CPN (Calling Party Number) and ANI is also known as BN (Billing Number). The RULEIDX entered for each of these particular Network Services will index into the DIDCR table and to its SID/ANI table. If one of these three Network Services should specify a preference for SID or ANI information, then the CHANGE command can be used to update the request from its initial value of "NOREQU".

- DID digit translation

- . on trunks that support DID translation, the system can receive a maximum of 16 digits from the Central Office
- . the system is able to delete a maximum of 14 digits of the received number insuring a minimum of 2 digits remaining
- . the system uses the leading 2 digits of the remaining digits

## DIDCR - Direct Inward Dial Conversion Table

- . digit conversion occurs as follows:
  - 2 digits remaining:
    - . converted to internal number (maximum 16 digits)
  - greater than 2 digits remaining:
    - . leading 2 digits are removed from the digit string and are used as the index into a table to retrieve the prefix digits which are prefixed to the remaining digit string. (The prefix and remaining digits must not exceed 16 digits)
    - EXAMPLE:
      - using element 20 in table 1 of the display example. 766209 comes in on a trunk, the leading 3 digits are deleted, the next 2 digits are used as an index into the table which gives us the prefix 12345 and the 9 from the original number is appended resulting in 123459.
- . the resulting extension/feature access number conforms to the rules for extension/feature numbers and is used by the system to route the call
- . to provide DNIS or SID/ANI displays, SID/ANI routing, or routing to a Route Control Group (RCG) the resulting number will need to be defined as an internal routing number. Refer to the AMO DNIT for further details.
- . the parameters for the DID digit translation are defined for each trunk individually
- The system supports a maximum of 16 SRT tables and a maximum of 20 DID translation tables each table with:
  - . 100 numbers and
  - . for 4 Network Services (INWATS,VPN,SDS,PPC900) each 100 SID/ANI data information.

The administration of DIDCR tables is performed by AMO DIDCR which has the following functions :

The ability to

- add or delete one or more (up to 20) Digit Conversion Rule tables.
- delete one or more (up to 16) SRT tables.
- modify or delete a single element within a DIDCR table.
- modify or delete SID/ANI data information.
- modify or delete a single element within a SRT table.
- display a DIDCR table with all trunks associated with it.

## DIDCR - Direct Inward Dial Conversion Table

- display a SRT table.
- display SID/ANI data request information.
- regenerate the customer data of DIDCR tables, and the SID/ANI data.
- regenerate the customer data of SRT table.

The RULEIDX or the SRTIDX (Service Rule table index) parameter is set in AMO TDCSU when a DID, E&M or PRI trunk is created. The SRTIDX in AMO TDCSU is the same as the SRTABLE in DIDCR. The AMO should do a cross check if the RULEIDX to a DIDCR table, or the SRTIDX to a SRT table has been created or not. Therefore AMO DIDCR must run before running AMO TDCSU.

The AMO DIDCR has to ensure the following conditions:

1. the AMO should do a cross check to see if the modified RULEIDX in a SRT table is pointing to an existing DIDCR table.
2. the AMO should do a cross check to see if a DIDCR table or a SRT table is being accessed by an INDEX in the Static Line tablea before they can be deleted.
3. the total number of incoming expected DID digits minus the number of digits to be deleted should be greater or equal to two.
4. the total number of digits created by the translation and the remaining digits is not > 16.

### KEYWORD DESCRIPTION (Valid for all actions)

The set of MML (Man Machine Language) keyword parameters for DID Digit Conversion Rule description is listed in the following table:

|               |         |   |                                      |
|---------------|---------|---|--------------------------------------|
| +*****+*****+ |         |   |                                      |
| *             | Keyword | * | Meaning of the parameter             |
| *             | TERSE   | * |                                      |
| +*****+*****+ |         |   |                                      |
| *             |         | * |                                      |
| *             | DELDIG  | * | Number of digits to be deleted from  |
| *             |         | * | the total number of digits assigned  |
| *             |         | * | to a DID trunk.                      |
| *             |         | * |                                      |
| *             | DIGITS  | * | Digits to be entered in the selected |
| *             |         | * | DIDCR table.                         |
| *             |         | * |                                      |
| *             | NETSVC  | * | Network Service used in the SRTABLE  |
| *             |         | * | and index to the SID/ANI data        |
| *             |         | * |                                      |

## 75.2.1 ADD-DIDCR

To add a DIDCR table ,the craftsperson enters the rule table number, the total number of incoming digits, the number of digits to be deleted and the actual digits which are part of the resulting digit conversion string. The number of DIDCR tables to be created is limited to 20 tables maximum. Before the table is created all empty entries will be initialized to H'FFFF plus the index. The DIDCR table will not be created until the total number of incoming digits and the number of digits to be deleted are entered.

Parameter RULEIDX may not be a range in ADD command.

When initiating this verb the following checks are performed. Each check produces a reaction and a prompt or end.

**Table 10: ADD-DIDCR Error Messages**

| Check Performed                                                                                       | Reaction | Prompt or End |
|-------------------------------------------------------------------------------------------------------|----------|---------------|
| A CHARACTER OTHER THAN (0:9),*,# WAS USED IN THE VALUE FOR DIGITS                                     | F1       | DIGITS        |
| THE TOTAL NUMBER OF RECEIVER DIGITS MUST BE AT LEAST TWO MORE THAN THE NUMBER OF DIGITS TO BE DELETED | F2       | DELDIG        |
| THE ENTERED DID RULE TABLE HAS ALREADY BEEN CREATED                                                   | F4       | End           |
| THE ENTERED DIGIT STRING FOR TBLIDX IS AN INVALID LENGTH                                              | F5       | DIGITS        |
| TOO MANY VALUES FOR PARAMETER DIGITS HAS BEEN ENTERED (UP TO 9 DIGITS CAN BE ENTERED AT ONE TIME)     | F10      | End           |
| THE NUMBER OF VALUES ENTERED FOR TBLIDX AND DIGITS MUST BE THE SAME                                   | F15      | DIGITS        |
| TOO MANY TABLE INDICES ENTERED (NO MORE THAN 9 MAY BE ENTERED)                                        | F16      | TBLIDX        |

## DIDCR - Direct Inward Dial Conversion Table

### AMO Functions

**Table 11: ADD-DIDCR Advisory Messages**

| Check Performed                                                               | Reaction | Prompt or End |
|-------------------------------------------------------------------------------|----------|---------------|
| THE DIDCR TABLE REFERENCED BY THE ENTERED RULEIDX DOES NOT EXIST (TOTDIG = 0) | H8       | End           |

### Procedure Overview

| Command Code | Parameters                                                                                   |
|--------------|----------------------------------------------------------------------------------------------|
| ADD-DIDCR    | RULEIDX=<number>,TOTDIG=<number>,<br>DELDIG=<number>,[TBLIDX=<number>],<br>[DIGITS=<number>; |

#### Example 1:

Set up only the DID Rule tables 1 and 4.

Input:

ADD-DIDCR:1,5,3;

Output:

```
ADD-DIDCR:1,5,3;
H500: AMO DIDCR STARTED
AMO-DIDCR-...    DIRECT INWARD DIAL DIGIT_CONVERSION_RULE
ADD EXECUTED;
```

Input:

ADD-DIDCR:4,16,14;

Output:

```
ADD-DIDCR:4,16,14;
H500: AMO DIDCR STARTED
AMO-DIDCR-...    DIRECT INWARD DIAL DIGIT_CONVERSION_RULE
ADD EXECUTED;
```

#### Example 2:

Set up the DID Rule table and the Conversion-data at the same time.

Input:

ADD-DIDCR:2,6,3,01&&04,1&22&333&4444;

Output:

ADD-DIDCR:2,6,3,01&&04,1&22&333&4444;

H500: AMO DIDCR STARTED

AMO-DIDCR-... DIRECT INWARD DIAL DIGIT\_CONVERSION\_RULE

ADD EXECUTED;

## 75.2.2 CHANGE-DIDCR

The elements within the SRT table, or a DIDCR table can be changed by using the function CHANGE-DIDCR.

The craftsperson can change

- the actual digit string for single or multiple field entries in the selected DIDCR table. Parameter RULEIDX may not be a range in CHANGE command.
- the actual SID/ANI data for a single field entry or for a range of field entries for a Network Service and a specified RULEIDX.
- the actual RULEIDX in a SRT table.

When initiating this verb the following checks are performed. Each check produces a reaction and a prompt or end.

**Table 12: CHANGE-DIDCR Error Messages**

| Check Performed                                                                                   | Reaction | Prompt or End |
|---------------------------------------------------------------------------------------------------|----------|---------------|
| A CHARACTER OTHER THAN (0:9),*,# WAS USED IN THE VALUE FOR DIGITS                                 | F1       | DIGITS        |
| THE ENTERED DIDTAB DOES NOT EXIST                                                                 | F3       | End           |
| THE ENTERED DIGIT STRING FOR TBLIDX IS AN INVALID LENGH                                           | F5       | DIGITS        |
| THE ENTERED SERVICE RULE TABLE IS CONFIGURED BY PRI SERVICE TRUNKS                                | F6       | End           |
| TOO MANY VALUES FOR PARAMETER DIGITS HAS BEEN ENTERED (UP TO 9 DIGITS CAN BE ENTERED AT ONE TIME) | F10      | End           |

## DIDCR - Direct Inward Dial Conversion Table

### AMO Functions

**Table 12: CHANGE-DIDCR Error Messages**

| Check Performed                                                       | Reaction | Prompt or End |
|-----------------------------------------------------------------------|----------|---------------|
| NO CHANGE WAS MADE ALL DATA ENTERED IS THE SAME AS THE ACTUAL DATA    | F13      | End           |
| SID/ANI DATA CAN ONLY BE USED WITH THE SERVICES INWATS,VPN,SDS,PPC900 | F14      | End           |
| THE NUMBER OF VALUES ENTERED FOR TBLIDX AND DIGITS MUST BE THE SAME   | F15      | DIGITS        |
| TOO MANY TABLE INDICES ENTERED (NO MORE THAN 9 MAY BE ENTERED)        | F16      | TBLIDX        |

If the craftsperson changes the RULEIDX in a SRT table, a check will be made to ensure that the entered RULEIDX points to a DIDCR table which is initialized. The same check will be made for the SID/ANI data information which belongs to this RULEIDX. If one of these tables is not initialized, the corresponding advisory message is displayed: CHANGE-DIDCR Advisory table

**Table 13: CHANGE-DIDCR Advisory Messages**

| Check Performed                                                                                               | Reaction | Prompt or End |
|---------------------------------------------------------------------------------------------------------------|----------|---------------|
| SID/ANI REQUEST DATA ASSOCIATED WITH THE SERVICE RULE TABLE AND SERVICE TYPE HAS BEEN INITIALIZED TO "NOREQU" | H6       | End           |
| THE DIDCR TABLE REFERENCED BY THE ENTERED RULEIDX DOES NOT EXIST (TOTDIG = 0)                                 | H8       | End           |

### Procedure Overview

|                         |                                                                                |
|-------------------------|--------------------------------------------------------------------------------|

| CHANGE-DIDCR            | TYPE=DID,RULEIDX=<NUMBER>,TBLIDX=<NUMBER>,<br>DIGITS=<number>;                 |
|                         |                                                                                |
|                         | TYPE=SRT,SRTABLE=<number>,NETSVC=<param>,<br>RULEIDX=<number>;                 |
|                         |                                                                                |
|                         | TYPE=SVC,NETSVC=<param>,RULEIDX=<number>,<br>SVCIDX=<number>,SVCDATA=<string>; |
|                         |                                                                                |

Example 1:

Change elements in the DIDCR table 2.

Input:

```
CHANGE-DIDCR:DID,2,91&&99,101&102&103&104&105&106&107&108&109;
```

Output:

```
CHANGE-DIDCR:DID,2,91&&99,101&102&103&104&105&106&107&108&109;
```

```
H500: AMO DIDCR STARTED
```

```
AMO-DIDCR-... DIRECT INWARD DIAL DIGIT_CONVERSION_RULE
```

```
CHANGE EXECUTED;
```

Input:

```
CHANGE-DIDCR:DID,2,52&&55,25&355&4555&55555;
```

Output:

```
CHANGE-DIDCR:DID,2,52&&55,25&355&4555&55555;
```

```
H500: AMO DIDCR STARTED
```

```
AMO-DIDCR-... DIRECT INWARD DIAL DIGIT_CONVERSION_RULE
```

```
CHANGE EXECUTED;
```

#### Example 2:

Change the RULEIDX in the SRT table 1 for Network Service VPN and INTLWATS.

Input:

```
CHANGE-DIDCR:SRT,1,VPN,2;
```

Output:

```
CHANGE-DIDCR:SRT,1,VPN,2;
```

```
H500: AMO DIDCR STARTED
```

```
H6: SID/ANI DATA ACCESSED BY SERVICE SDN IS INITIALIZED TO "NOREQU".
```

```
AMO-DIDCR-... DIRECT INWARD DIAL DIGIT_CONVERSION_RULE
```

```
CHANGE EXECUTED;
```

Input:

```
CHANGE-DIDCR:SRT,1,INTLWATS,2;
```

Output:

```
CHANGE-DIDCR:SRT,1,INTLWATS,2;
```

```
H500: AMO DIDCR STARTED
```

```
AMO-DIDCR-... DIRECT INWARD DIAL DIGIT_CONVERSION_RULE
```

```
CHANGE EXECUTED;
```

#### Example 3:

Change the SID/ANI Data for RULEIDX 1 and Network Service

## DIDCR - Direct Inward Dial Conversion Table

### AMO Functions

INWATS.

Input:

CHANGE-DIDCR:SVC,INWATS,1,0&&15,ANI;

Output:

CHANGE-DIDCR:SVC,INWATS,1,0&&15,ANI;

H500: AMO DIDCR STARTED

AMO-DIDCR-... DIRECT INWARD DIAL DIGIT\_CONVERSION\_RULE  
CHANGE EXECUTED;

Input:

CHANGE-DIDCR:SVC,INWATS,1,16&&21,SID;

Output:

CHANGE-DIDCR:SVC,INWATS,1,16&&21,SID;

H500: AMO DIDCR STARTED

AMO-DIDCR-... DIRECT INWARD DIAL DIGIT\_CONVERSION\_RULE  
CHANGE EXECUTED;

Input:

CHANGE-DIDCR:SVC,INWATS,1,33,SIDPREF;

Output:

CHANGE-DIDCR:SVC,INWATS,1,33,SIDPREF;

H500: AMO DIDCR STARTED

AMO-DIDCR-... DIRECT INWARD DIAL DIGIT\_CONVERSION\_RULE  
CHANGE EXECUTED;

## 75.2.3 DELETE-DIDCR

Allocation of DIDCR tables can be cancelled by means of the function DELETE-DIDCR. The execution of the function is limited to the tables with entry values (i.e. The table should be created before it can be deleted). The craftsperson can delete a DIDCR table, a SRT table or SID/ANI data information not referenced by a trunk defined by TDCSU.

If TBLIDX elements in a DIDCR table are deleted, then each TBLIDX element will be reinitialized to H'FFFF plus its own TBLIDX.

If SID/ANI data is requested to be deleted for a Network Service from a DIDCR table then each deleted SVCIDX will be reinitialized to "NOREQU". This action could also be accomplished by using the change verb to change each SVCIDX to "NOREQU".

When initiating this verb the following checks are performed. Each check produces a reaction and a prompt or end.

**Table 14: DELETE-DIDCR Error Messages**

| Check Performed                                                                        | Reaction | Prompt or End |
|----------------------------------------------------------------------------------------|----------|---------------|
| THE ENTERED DIDTAB DOES NOT EXIST                                                      | F3       | End           |
| COULD NOT DELETE BECAUSE PRI SERVICE RULE TABLE IS ACCESSED BY PRI TRUNKS              | F6       | End           |
| TBLIDX NOT ALLOWED IF RULEIDX IS A RANGE                                               | F8       | End           |
| THE ENTERED SERVICE RULE TABLE DOES NOT EXIST                                          | F12      | End           |
| NO CHANGE WAS MADE ALL DATA ENTERED IS THE SAME AS THE ACTUAL DATA                     | F13      | End           |
| SID/ANI DATA CAN ONLY BE USED WITH THE SERVICES INWATS,VPN,SDS,PPC900                  | F14      | End           |
| THE ENTERED DID TABLE WAS NOT DELETED BECAUSE IT IS ACCESSED BY DID OR E&M TRUNKS      | F17      | End           |
| THE ENTERED DID TABLE WAS NOT DELETED BECAUSE IT IS ACCESSED BY PRI SERVICE RULE TABLE | F18      | End           |

**Table 15: DELETE-DIDCR Advisory Messages**

| Check Performed                                    | Reaction | Prompt or End |
|----------------------------------------------------|----------|---------------|
| THERE ARE NO VALUES TO DELETE IN THE ENTERED RANGE | H9       | End           |

### Procedure Overview

| Command Code | Parameters                                                        |
|--------------|-------------------------------------------------------------------|
| DELETE-DIDCR | TYPE=DID, RULEIDX=<NUMBER>, [TBLIDX=<NUMBER>];                    |
|              | TYPE=SRT, SRTABLE=<number>,<br>[NETSVC=<param>];                  |
|              | TYPE=SVC, NETSVC=<param>, RULEIDX=<number>,<br>[SVCIDX=<number>]; |

## DIDCR - Direct Inward Dial Conversion Table

### AMO Functions

#### Example 1:

Delete the entries from 55-93 in the DIDCR table 2.

Input:

```
DELETE-DIDCR:DID,2,55&&93;
```

Output:

```
DELETE-DIDCR:DID,2,55&&93;
H500: AMO DIDCR STARTED
AMO-DIDCR-...    DIRECT INWARD DIAL DIGIT_CONVERSION_RULE
DELETE EXECUTED;
```

#### Example 2:

Delete the DIDCR tables 3-5.

Input:

```
DELETE-DIDCR:DID,3&&5;
```

Output:

```
DELETE-DIDCR:DID,3&&5;
H500: AMO DIDCR STARTED
F3: DID RULE TABLE 3 DOES NOT EXIST.
F3: DID RULE TABLE 5 DOES NOT EXIST.
AMO-DIDCR-...    DIRECT INWARD DIAL DIGIT_CONVERSION_RULE
DELETE EXECUTED;
```

#### Example 3:

Delete Network Service INTLWATS in the SRT table 1.

Input:

```
DELETE-DIDCR:SRT,1,INTLWATS;
```

Output:

```
DELETE-DIDCR:SRT,1,INTLWATS;
H500: AMO DIDCR STARTED
AMO-DIDCR-...    DIRECT INWARD DIAL DIGIT_CONVERSION_RULE
DELETE EXECUTED;
```

#### Example 4:

Delete the SRT table 2.

Input:

```
DELETE-DIDCR:SRT,2;
```

Output:

```
DELETE-DIDCR:SRT,2;
H500: AMO DIDCR STARTED
AMO-DIDCR-...    DIRECT INWARD DIAL DIGIT_CONVERSION_RULE
DELETE EXECUTED;
```

**Example 5:**

Delete the SID/ANI data information 14-17 for Network Service INWATS from the DIDCR table.

Input:

```
DELETE-DIDCR:SVC,INWATS,1,14&&17;
```

Output:

```
DELETE-DIDCR:SVC,INWATS,1,14&&17;
H500: AMO DIDCR STARTED
AMO-DIDCR-...    DIRECT INWARD DIAL DIGIT_CONVERSION_RULE
DELETE EXECUTED;
```

**75.2.4 DISPLAY-DIDCR**

The elements of a DIDCR table or a Service Rule Rule can be output on a terminal by means of function DISPLAY-DIDCR. The craftsperson has the option to display

- all or a specific number of the DIDCR tables
- all the DID trunks associated with a table.
- all the PRI trunks associated with a table.
- all or a specific number of the SRT tables.
- all SID/ANI data information depending on a RULEIDX and a Network Service.

If the display action " TYPE=RULETBL " is used then the display is a screen showing the RULEIDX, the total number of expected DID digits, the number of digits to be deleted and the Digit Conversion Rule String elements.

If in the display action " TYPE=DIDTRUNK" is used then the DID trunks associated with the entered RULEIDX will be displayed.

If in the display action " TYPE=PRITRUNK" is used then the PRI trunks associated with the entered RULEIDX will be displayed.

## DIDCR - Direct Inward Dial Conversion Table

### AMO Functions

If in the display action " TYPE=SPECTBL " is used then the display is a screen showing the RULEIDX, the total number of expected DID digits and the number of digits to be deleted for all created DIDCR tables.

If in the display action " TYPE=SRT " is used without any parameters then all existing SRT tables will be displayed.

When initiating this verb the following checks are performed. Each check produces a reaction and a prompt or end.

**Table 16: DISPLAY-DIDCR Error Messages**

| Check Performed                                     | Reaction | Prompt or End |
|-----------------------------------------------------|----------|---------------|
| THE ENTERED SERVICE RULE TABLE HAS NOT BEEN CREATED | F12      | End           |

**Table 17: DISPLAY-DIDCR Advisory Messages**

| Check Performed                                                                                                            | Reaction | Prompt or End |
|----------------------------------------------------------------------------------------------------------------------------|----------|---------------|
| THERE IS NO CONFIGURATION DATA TO DISPLAY FOR THE ENTERED DISPLAY COMMAND                                                  | H1       | End           |
| THERE ARE NONE OF THE REQUESTED TYPE OF TRUNKS WHICH REFERENCE THE DID TABLE ASSOCIATED WITH THE ENTERED RULEIDX PARAMETER | H2       | End           |
| THE DID TABLE REFERENCED BY THE RULEIDX PARAMETER HAS NOT BEEN CONFIGURED (TOTDIG = 0)                                     | H3       | End           |

AMO-DIDCR-... DIRECT INWARD DIAL DIGIT\_CONVERSION\_RULE  
DISPLAY EXECUTED;

NOTE: The DID Conversion Rule uses the first two DIGITS of the incoming expected DIGITS as an index into the DIDCR table.

The remaining DIGITS and the table entry build the new number

**DIDCR - Direct Inward Dial Conversion Table**  
AMO Functions

for the System to route the Call. If no conversion is wanted, the table entry defaults to its own TBLIDX value (0-99) and this will be displayed as empty spaces in the table. So if for TBLIDX 12 the value 12 is entered, the display will not show this entry.

Example 2:

Display trunks supporting DID which reference rule index 2.

Input:

DISPLAY-DIDCR:DIDTRUNK,2;

Output:

DISPLAY-DIDCR:DIDTRUNK,2;  
H500: AMO DIDCR STARTED

## 75.2.5 REGENERATE-DIDCR

The action Regenerate will create a list of commands generated for this AMO which permits the data in the SWU to be transferred to positioned oriented commands. Thus all current customer data can be saved before any changes made and brought back into the SWU during a future generating run.

There are no error/advisory messages associated with the verb REGENERATE-DIDCR.

### Procedure Overview

| Command Code     | Parameters                    |
|------------------|-------------------------------|
| REGENERATE-DIDCR | TYPE=DID, [RULEIDX=<NUMBER>]; |
|                  | TYPE=SRT, [SRTABLE=<number>]; |
|                  | TYPE=SVC, NETSVC=<param>,     |
|                  | [RULEIDX=<number>];           |
|                  |                               |

Example 1:

Output regeneration commands for rule index 1 and 2.

Input:

```
REGENERATE-DIDCR:DID,1&&2;
```

Output:

```
REGENERATE-DIDCR:DID,1&&2;
H500: AMO DIDCR STARTED
```

## 75.4 Error and Advisory Messages

### 75.4.1 ERROR MESSAGES

F1: INVALID CHARACTERS IN THE INPUT FOR 'DIGITS'.

F2: TOTAL NUMBER OF RECEIVED DIGITS MUST BE AT LEAST TWO MORE THAN NUMBER OF DIGITS TO BE DELETED.

F3: NO DIGIT CONVERSION TABLE WITH RULEIDX=@@ AVAILABLE.

F4: DIGIT CONVERSION TABLE RULEIDX=@@ IS ALREADY CREATED.

F5: INVALID LENGTH FOR 'DIGITS' AT TBLIDX=@@. THE SPECIFIED PREFIX TOGETHER WITH THE DIGITS REMAINING FROM ORIGINAL DIALED NUMBER MUST NOT EXCEED THE LENGTH 16.

F6: SERVICE RULE TABLE SRTABLE=@@ IS REFERENCED BY PRI TRUNKS (SEE AMO TDCSU, SRTIDX).

F7: NO VALUES ENTERED FOR 'TBLIDX'.

F8: NO 'TBLIDX' ALLOWED FOR CHAINED INPUT FOR 'RULEIDX'.

F9: NO VALUES ENTERED FOR 'DIGITS'.

F10: TOO MANY VALUES CHAINED FOR 'DIGITS'.

F11: UNUSED

F12: NO SERVICE RULE TABLE WITH SRTABLE=@@ AVAILABLE.

F13: NO VALUES CHANGED IN EXISTING DATA.

F14: SID/ANI DATA AVAILABLE ONLY FOR NETSVC=INWATS/VPN/SDS/PPC900.

## **DIDCR - Direct Inward Dial Conversion Table**

### **Error and Advisory Messages**

F15: UNEQUAL NUMBERS OF VALUES CHAINED FOR 'TBLIDX' AND 'DIGITS'.

F16: MORE THAN 9 CHAINED VALUES ENTERED FOR 'DIGITS'.

F17: DIGIT CONVERSION TABLE RULEIDX=@@ NOT DELETED:  
STILL REFERENCED BY DID OR E&M TRUNKS.  
(SEE AMO TACSU, RULEIDX)

F18: DIGIT CONVERSION TABLE RULEIDX=@@ NOT DELETED:  
STILL REFERENCED BY A SERVICE RULE TABLE.

## **75.4.2 ADVISORY MESSAGES**

H1: NO DIGIT CONVERSION DATA CONFIGURED.

H2: DIGIT CONVERSION TABLE RULEIDX=@@ IS NOT REFERENCED BY  
PORTS.  
NO PEN=LTG-LTU-SLOT-CIRCUIT WILL THEREFORE BE LISTED.

H3: NO DIGIT CONVERSION TABLE WITH RULEIDX=@@ EXISTS.

H4: UNUSED

H5: NO SID/ANI DATA AVAILABLE FOR NETSVC=@@@@ AND RULEIDX=@@.

H6: THE SID/ANI DATA FOR NETSVC=@@@@ ARE INITIALIZED TO  
'NOREQU'.

H7: UNUSED.

H8: NO DIGIT CONVERSION TABLE WITH RULEIDX=@@ EXISTS.

H9: NO VALUES TO BE DELETED IN THE RANGE ENTERED.

## 76 DIMSU - Feature Capacities

The AMO DIMSU allows an administrator to create and change database memory allocations to satisfy the requirements of a particular customer.

This flexible memory administration facility is known as FLEXAMA.

The limits for memory partitioning are set at the theoretical maximum for extreme capacity configurations. Standards (standard layouts) should be determined for the allocation procedure, and the default values in the database should be used.

The variant specific maximum values of each parameter will be taken from the database.

### 76.1 Interrelationships

Interrelationships exist to all AMOs used for configuring terminals or features in the SWU.

- AMO-DIAGS : The DB-switch S07 can be used for database generation on support switches. This switch activates a test whether LTG memory is sufficient, only.

### 76.2 Functions of the AMO

- [ADD-DIMSU](#) : Create feature capacities
- [DISPLAY-DIMSU](#) : Interrogate feature capacities, default and max. values for the parameters (system-specific).
- [REGENERATE-DIMSU](#) : Regenerate feature capacities
- [TEST-DIMSU](#) : Test if required memory-capacities are admissible.
- [EXEC-DIMSU](#) : Assign memory according to the database default values.

#### 76.2.1 ADD-DIMSU

This action allocates or changes the memory entries. The AMO verifies the input parameters and displays an advisory message showing the value update (ACTUAL) in case of a valid input.

The value ACTUAL determines the number of storage elements to be assigned.

The memory allocations are processed in the sequence of the parameters in the parameter tree.

If the requested memory space is insufficient for a specified parameter value, then an error message is output. The memory allocations processed before the error message are correct. The memory allocations processed for subsequent parameters after the error message are also correct if the memory space is sufficient.

If some of the assigned storage elements are no longer required for a parameter, the ACTUAL value can be reduced to the highest used element (MAX\_USED). If no assigned storage element is used, the ACTUAL value can be reset to 0.

**NOTE:** Exception, parameters CCIDXS and CCIDXD: These parameters can only be increased.

8

**CAUTION**

The following parameters use only dynamic memory. The default value should be used for these parameters (if necessary, the value can be increased).

ACDCQ, ACDLOGON, ATNDCQ, CBK, CFWHIST, COSTI, CPB, CPDBUF, DTITMD, GENBUF, HGMEMB, HT, HTCQB, LODS0, LODTMD, PINBUF, SILI, SYNAN

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                                                                                                                 |

## DIMSU - Feature Capacities

### Functions of the AMO

| Command Code | Parameter                                                                                                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | ,STMACIR=<number>, STMI=<number>, STMIHFA=<number><br>,STMIHFA2<number>, STMI2IGW=<number>, SLC24=<number><br>,AP=<number>, GWREG<number>, SCTPATH=<number><br>,CCAP=<number>, APEGPR=<number>; |

The branch-off parameter is optional. Only parameters of the same branch can be used in one ADD-command.

#### Example

Input:

```
ADD-DIMSU:OPTCC=1000;
```

Output:

```
ADD-DIMSU:OPTCC=1000;
H500:  AMO DIMSU STARTED
H00:  +-----+
      |      OPTCC.ACTUAL   : 1000 |
      |      .PREVIOUS: 500  |
      +-----+
AMO-DIMSU-170          DIMENSIONING OF FEATURES, SWITCHING UNIT
ADD COMPLETED;
```

## 76.2.2 DISPLAY-DIMSU

Each parameter has three status values. These are as follows:

- ACTUAL
- USED
- MAX-USED

The value ACTUAL defines the number of storage elements allocated and is changed using the action ADD.

---

**NOTE:** Exception, parameter COS, LODR, LROUT and LRTPROF: The number of the created class of service, the outdial rule for least cost routing, the LCR route element or the routing profile is equivalent to the index of the memory location. (e.g. If creating COS 1, 200 and 400 with AMO COSSU, the ACTUAL value of the DIMSU parameter COS must be at least 400.)

---

The value USED describes the number of used memory elements. A comparison with the ACTUAL value shows how much of the allocated memory is still unused and can be used for creating devices and/or features.

The value MAX-USED describes the index of largest storage elements used. A comparison with the ACTUAL value shows how much of the allocated memory is still free, and can be reallocated.

The reduction of the memory entries to MAX-USED can be carried out in the case of a memory shortage, if, during operation, it is seen that ACTUAL > MAX-USED. The reduction of the memory entries to a value lower than MAX-USED is only possible if the USED value is 0.

Each further AMO which configures elements from the allocated memory pool, changes the administration data USED and MAX-USED.

When deleting devices or features, MAX-USED is not changed.

The database contains the maximum values and default values for each parameter depending on the capacity configuration of the system. These values can be interrogated using the DISPLAY branch of the AMO.

### Procedure Overview

| Command Code  | Parameter                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-DIMSU | [TYPE=ALL] , [PARAM=<param>] ;<br><br>  [TYPE=BASIC] ;<br><br>  [TYPE=USER] ;<br><br>  [TYPE=NETWORK] ;<br><br>  [TYPE=APPLICAT] ;<br><br>  [TYPE=SYSTEM] ; |

The branch-off parameter is optional.

### Examples of different display outputs:

1. Display all parameters arranged in groups.

Input:

```
DISPLAY-DIMSU;
```

Output:

## DIMSU - Feature Capacities

500,18000,1200,12000,24000,1200,20,3200,400,18000,  
24000,3600,3600,63,30;  
AMO-DIMSU-170 DIMENSIONING OF FEATURES, SWITCHING UNIT  
REGENERATE COMPLETED;

76.2.4 TEST-DIMSU

This action can be used to verify that the memory capacity of a particular system is sufficient for assigning the required feature memory dimensions. After the function ADD the TEST command has been executed. As a result advisory message H01 is given out.

Additional Flexama memory for device search (MASTERGROUPS and SUBGROUPS) is necessary for adding routes (AMO RICHT), trunk groups (AMO BUEND), hunt groups (AMO SA), night variants (AMO NAVAR) and attendant console groups (AMO VFGR). AMO LRNGZ allocates speed dialing lists. This has to be considered for TEST-DIMSU in case the database is not completely generated.

Procedure Overview

| Command Code | Parameter     |
|--------------|---------------|
| TEST-DIMSU   | LIST=<param>; |

Examples

- 1. Determine percentage values of the currently allocated memory.

Input:

TEST-DIMSU;

Output:

```

TEST-DIMSU;
H500: AMO DIMSU STARTED
H01: CC: 65 % OF THE TOTAL STATIC MEMORY AREAS AND 41 % OF THE
TOTAL
      DYNAMIC MEMORY AREAS RESERVED FOR THE FLEXAMA ARE USED.
      (UP TO 20% OF THE MEMORY MAY NOT BE AVAILABLE IF IT IS
HEAVILY
      FRAGMENTED) .
H01: LTG: 51 % OF THE TOTAL STATIC MEMORY AREAS AND 48 % OF THE
TOTAL
      DYNAMIC MEMORY AREAS RESERVED FOR THE FLEXAMA ARE USED.
      (UP TO 20% OF THE MEMORY MAY NOT BE AVAILABLE IF IT IS
HEAVILY
      FRAGMENTED) .
AMO-DIMSU-170      DIMENSIONING OF FEATURES, SWITCHING UNIT
TEST COMPLETED;

```

**2. Determine allocated memory for all parameters separately. Output in list format.**

**Input:**

```
TEST-DIMSU:LIST=y;
```

**Output:**

```

TEST-DIMSU:LIST=Y;
H500: AMO DIMSU STARTED

TEST COMPLETED;

## 76.2.5 EXEC-DIMSU

This action assigns memory according to the database default values. It is intended to simplify the setup of a system with default feature capacities. Customer-specific variations from the default values can be done afterwards with the command ADD-DIMSU.

The memory entries which will be allocated are the same as in the action ADD-DIMSU. The AMO checks for each memory, whether the default value is larger than the highest element currently used (MAX-USED-value).

Error message F01 is issued for all parameters where the default value is smaller than the corresponding MAX-USED value. This can occur only in an already created database. In this case, the action will be executed partially. Starting with an empty database it is guaranteed that all memory entries can be assigned with their respective default values.

### Procedure Overview

| Command Code | Parameter          |
|--------------|--------------------|
| EXEC-DIMSU   | [FEASET=DEFAULT] ; |

## 76.3 Parameter Description

| PARAM | DIMSU Parameter                                      |   |                                                             |
|-------|------------------------------------------------------|---|-------------------------------------------------------------|
|       | Type of Input                                        | : | Single value, linked single values, optional                |
|       | Possible Values                                      | : | CCIDX, CCIDX, GPIDX, STN, BUS, OPTCC, OPTEXP, ATND, ES,     |
|       |                                                      |   | ESSTN, S2PP, AUXDIGI, PRI, TRK, CRCP, DPLNCD, DPLNGR,       |

## DIMSU - Feature Capacities

### Parameter Description

|      |                      |                                                        |
|------|----------------------|--------------------------------------------------------|
|      | Possible Values      | : Y,N                                                  |
|      | Default Value:       | N                                                      |
| TYPE | Branch-off parameter |                                                        |
|      | Type of Input        | : Single value, optional                               |
|      | Possible Values      | : ADMCC, ADMLTG (ADD)                                  |
|      |                      | APPLICAT, BASIC, NETWORK, SYSTEM, USER (ADD / DISPLAY) |
|      |                      | ALL (DISPLAY)                                          |
|      | Default Value:       | ALL (DISPLAY)                                          |

### Parameters for Database Administration

All memory entries belonging to a parameter are administered in the FLEXAMA lists. By means of the action ADD, the administration lists can be enlarged if required, using the parameters CCIDXS, CCIDXD and GPIDX respectively.

Conditions for the following parameters:

- Default Value: pre-initialized
- Type of input: Single value, optional
- Possible Values: Default value - MAX-Value (variant specific, can be determined with DISPLAY-DIMSU)

|        |                                                     |  |  |
|--------|-----------------------------------------------------|--|--|
| CCIDXD | DBMA-INDEX for dynamic CC-DB (Database Admin. Data) |  |  |
|        |                                                     |  |  |
| CCIDXS | DBMA-INDEX for static CC-DB (Database Admin. Data)  |  |  |
|        |                                                     |  |  |
| GPIDX  | DBMA-INDEX for GP-DB (Database LTG Admin. Data)     |  |  |

### Parameters for the Database

Conditions for the following parameters:

- Type of input: Single value, optional
- Possible Values: 0 - MAX-Value (variant specific, can be determined with DISPLAY-DIMSU)

|          |                                                                                                                                                              |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
