|      |                                   | COS                                                         | = Output all stations which have the class of service specified in the parameter COSNO.                               |
|      |                                   | HW                                                          | = 'Telephone-based' selection for output. i.e. telephone equipment as specified with the STNTYPE parameter following. |
|      |                                   | LCOSV                                                       | = Output all stations which have the LCR class of service for VOICE specified in the parameter LCOSV.                 |
|      |                                   | LCOSD                                                       | = Output all stations which have the LCR class of service for DTE specified in the parameter LCOSD.                   |
|      |                                   | CONN                                                        | = Stations with specific connection type                                                                              |
|      | Default value                     | : ALL                                                       |                                                                                                                       |

## 168.4 Error Messages and Advisories

### Explanation of the Error Messages and Advisories:

<xxxxxx> denotes fields where the call number of the station concerned is output. Fields which output text variables are indicated by two pointed brackets in which the possible text variables are entered, separated by diagonal strokes (separatrices).

<yyyyyy> denotes a second station number (e.g. end of a range).

<ddd> denotes the Non-Voice Service of the station (FAX, DEE).

<zzzzzz> denotes the Non-Voice station numbers.

<param> denotes the parameter name.

<value> denotes the parameter value.

<nnnnn> denotes a 5 digit number (e.g. ACD routing table).

<nnnn> denotes a 4 digit number (e.g. PU group).

<nnn> denotes a 3 digit number (e.g. night option, music on hold).

<nn> denotes a 2 digit number (e.g. LTG number).

## 168.4.1 Error Messages

F01: <xxxxxx> THIS CALL NUMBER IS NOT CONFIGURED IN THE DIAL PLAN (DPLN).

F02: <xxxxxx> THE COS <nnnn> IS NOT YET ASSIGNED.

F03: <xxxxxx> THIS STATION HAS NOT YET BEEN CONFIGURED.

F04: <xxxxxx> THIS STATION CANNOT BE CONFIGURED WITH THE DVCFIG VALUES SPECIFIED.  
UNABLE TO FIND FREE <SLMA/SLMB/SLMA1/2/3/24/B/SLMAR>.

F05: <xxxxxx> THE PEN SPECIFIED FOR THIS STATION IS ALREADY OCCUPIED.

F06: <xxxxxx> THIS STATION IS ALREADY CONFIGURED.

F07: <xxxxxx> FOR DEVICE TYPE <DIGITE>, <KEYSTN/SUFDIAL/SOD> IS NOT ALLOWED.

F08: <xxxxxx> FOR STATIONS WITH SPECIAL EQUIPMENT AS WELL AS FOR VOICE PAGERS, DVCFIG  
MUST BE ANATE.

F09: <xxxxxx> THE NEW CALL NUMBER HAS NOT BEEN CONFIGURED IN THE DIAL PLAN  
(AMO WABE).

F10: <LTG/LTU> IS NOT CONFIGURED.

F11: <xxxxxx> THE <LCOSV/LCOSD> <nnnn> IS NOT ASSIGNED.

F12: <xxxxxx> INADMISSIBLE DEVICE COMBINATION SPECIFIED IN DVCFIG PARAMETER.

F13: <xxxxxx> THE STATION CANNOT BE PROCESSED.  
NO FREE SPACE IN <SU/LODEN/DTILTG/STN/DSSNA/AUXDIGI/BLK100>  
FEATURE MEMORY.

F15: <xxxxxx> THIS STATION IS CONFIGURED IN THE CALL PICKUP GROUP <nnnn>.  
PLEASE MODIFY THE CALL PICKUP GROUP ENTRY BEFORE PROCESSING.

F16: <xxxxxx> THIS STATION IS CONFIGURED IN A <VOICE/FAX/DTE> HUNTING GROUP.  
PLEASE MODIFY THE HUNTING GROUP ENTRY BEFORE PROCESSING.

F17: <xxxxxx> FOR STATIONS WITH SPECIAL EQUIPMENT AS WELL AS FOR VOICE PAGERS, DVCFIG  
MUST BE ANATE.

F18: <xxxxxx> THE STATION IS CONFIGURED IN NIGHT OPTION <nnn>.  
PLEASE MODIFY THE NIGHT OPTION ENTRY BEFORE PROCESSING.

F20: <xxxxxx> HMUSIC <nnn> IS NOT YET ASSIGNED ( ADD-RCSU: RECAPL=HMUSIC, ).

F22: <xxxxxx> THE MAXIMUM PLANNED NUMBER OF STATIONS HAS BEEN REACHED.  
THE NUMBER OF STATIONS ALLOWED CAN BE INCREASED WITH AMO DIMSU.

F24: <xxxxxx> THE NEW CALL NUMBER IS ALREADY CONFIGURED.

F27: <xxxxxx> INADMISSIBLE <LTG/LTU/SLOT/CCT> VALUE ENTERED IN PEN PARAMETER.

## SCSU - Subscriber Configuration of Switching Unit

### Error Messages and Advisories

- F29: <xxxxxxx> THE DEVICE CONFIGURATION ENTERED CANNOT BE CONFIGURED AT THE EXISTING PEN (WRONG BOARD TYPE OR NO BOARD PLUGGED).
- F30: <xxxxxxx> THE STATION IS ONLY PREBLOCKED. OPTIONS:  
- REPEAT COMMAND LATER  
- REPEAT COMMAND WITH IMMEDIATE DEACTIVATION (OFFTYPE=DI)  
- FIRST DEACTIVATE STATION BY: DEACT-DSSU:OFFTYPE=DI,...;  
AND REPEAT COMMAND
- F31: <xxxxxxx> THE STATION HAS BEEN BLOCKED BUT IT REMAINS STILL BUSY FOR CALL PROCESSING. PLEASE REPEAT COMMAND LATER.
- F32: <xxxxxxx> THE STATION MUST BE BLOCKED. OPTIONS:  
- REPEAT COMMAND WITH DEACTIVATION (OFFTYPE=DC/DI)  
- FIRST DEACTIVATE STATION BY: DEACT-DSSU:OFFTYPE=DC/DI,...;  
AND REPEAT COMMAND
- F37: <xxxxxxx> WAS ASSIGNED USING AMO <ACSU/SBCSU/SSCSU/DNIT>; PLEASE USE THIS AMO FOR FURTHER PROCESSING.
- F38: <xxxxxxx> THE SPEC VALUES KEYSTN AND IDCR MAY NEITHER BE SPECIFIED TOGETHER NOR BE COMBINED WITH OTHER SPEC VALUES.
- F39: <xxxxxxx> THE SPEC VALUES WITNS, SUFDIAL AND SOD MAY ONLY BE COMBINED WITH SPEC VALUE SSTN OR VCEPAGE.
- F41: <xxxxxxx> THIS STATION IS ALREADY ASSIGNED BY AMO <ACSU/SBCSU/SSCSU/DNIT>.
- F42: <xxxxxxx> THIS STATION IS ASSIGNED AS AN EXTERNAL STATION.
- F43: <xxxxxxx> SPEC = WITNS MUST NOT BE CHANGED BECAUSE STATION IS ALLOCATED TYPE = LSTNR IN AMO VBZGR.
- F44: <xxxxxxx> THE FOLLOWING DHPAR VALUES ONLY ARE POSSIBLE FOR SPEC = (SUFDIAL OR SOD): PREDIA, ASEND, BSEND, DTMFSTN, RING1.
- F45: <xxxxxxx> THE FOLLOWING DHPAR VALUES ONLY ARE POSSIBLE FOR SPEC /= (SUFDIAL OR SOD): LEDSIGN, VMSDP, FLASH, MWLED.
- F47: <xxxxxxx> STATION IS MAPPED TO STATION NO. <yyyyyy> VIA AMO-RUFUM; PLEASE USE THIS AMO FOR FURTHER PROCESSING.
- F48: <xxxxxxx> STATION CANNOT BE ASSIGNED. VIRTUAL LINE MEMORY SPACE EXCEEDED.
- F53: <xxxxxxx> ALARMNO <nnnn> IS NOT YET ASSIGNED (AMO-VADSU).
- F58: INS = SIGNOFF IS ONLY ALLOWED FOR DVCFIG = ANATE
- F59: <xxxxxxx> THE SLMA BOARD CONFIGURED AT THIS PEN CANNOT PERFORM VARIABLE DIALING TYPE RECOGNITION. ONLY DIALING TYPE DP OR DTMF IS ALLOWED.
- F60: <xxxxxxx> ALL PARAMETERS HAVE BEEN IGNORED. STATION DATA ARE NOT CHANGED.
- F61: <xxxxxxx> IN PARAMETER DHPAR THE VALUES LEDSIGN AND MWLED ARE NOT ALLOWED TO BE COMBINED.
- F62: <xxxxxxx> THE SLMA BOARD CONFIGURED AT THIS PEN IS NOT COMPATIBLE WITH DHPAR VALUES (SLMA1, SLMA2, SLMA3, SLMA24 OR SLMAB IS NECESSARY).
- F63: <xxxxxxx> THE SUBSCRIBER CANNOT BE ADDED; FLEX+TDM LICENCES <nnnnn> IS REACHED. PLEASE USE DISP-CODEW FOR DISPLAY OF THE CONTRACTED FEATURE PACKAGES. PLEASE CONTACT YOUR SERVICE CENTER IF YOU WISH TO ADD MORE SUBSCRIBERS  
CHANGE-CODEW:TRIAL=YES MAY ACTIVATE A TIME LIMITED TRIAL MODE.
- F64: <xxxxxxx> IN ADDITION TO DVCFIG = <ANATECM> THE PARAMETER <PULSTYPE/PULSLEV> MUST ALSO BE SPECIFIED.
- F65: <xxxxxxx> DVCFIG = <ANATECM> IS NOT ALLOWED AS FLOATING STATION OR ACL SUPPORT STATION.
- F66: <xxxxxxx> THE STATION CANNOT BE PROCESSED. IT IS STILL REFERENCED BY THE ACD ROUTING TABLES. DELETE THE STATION BY AMO ACDRT FROM ACD ROUTING TABLE <nnnnn> BEFORE REPEATING THIS COMMAND.
- F67: <xxxxxxx> THE STATION CANNOT BE PROCESSED. IT HAS STILL ASSIGNED AT LEAST ONE ACD-ATTRIBUTE. DELETE THE ATTRIBUTES BY AMO SDAT BEFORE REPEATING THIS COMMAND.  
(CHANGE-SDAT:STNO=<xxxxxxx>,TYPE=ATTRIBUTE,DATTR=AGENT&SUPER&AUTOLOG&CAF)
- F68: <xxxxxxx> THE STATION CANNOT BE DELETED BECAUSE OF LAW AND SECURITY REASONS. PLEASE CONTACT YOUR SYSTEM ADMINISTRATOR.

- F69: <xxxxxxx> THE SPECIFIED CONNECTION TYPE (PARAMETER ANSCHL) CANNOT BE CONFIGURED AT THE EXISTING PEN (WRONG BOARD TYPE ).
- F70: <xxxxxxx> THE STATION COULD NOT BE ADDED BECAUSE NO VIRTUAL NODE ID HAS BEEN CONFIGURED. PLEASE ADD VIRTUAL NODE ID USING AMO KNDEF (TYPE=OWN).
- F71: <xxxxxxx> THE STATION CANNOT BE PROCESSED BECAUSE THE REQUIRED CONFIRMATION BY CALL PROCESSING HAS NOT BEEN RECEIVED YET.  
PLEASE REPEAT COMMAND LATER.
- F72: <xxxxxxx> THE FICTITIOUS AUXDIGI STATION CANNOT BE DELETED BECAUSE IT IS ALREADY IN USE. OPTIONS:  
- REPEAT COMMAND LATER  
- REPEAT COMMAND WITH IMMEDIATE DEACTIVATION (OFFTYPE=DI)
- F73: ITR GROUP OF @@@@ cannot be changed since it is member of AN ONS GROUP.
- F74: DPLN GROUP OF @@@@ cannot be changed since it is member of AN ONS GROUP.
- F75: COSX GROUP OF @@@@ cannot be changed since it is member of AN ONS GROUP
- F76: <xxxxxxxxxxxx> THE FICTITIOUS AUXDIGI STATION CANNOT BE DELETED BECAUSE IT IS STILL USED IN AMO-DCIC. BEFORE DELETING THE STATION, DELETE THE CONFIGURATION IN AMO-DCIC
- F77: <xxxxxxxxxxxx> DPLN @@@ IS NOT ALLOWED FOR NODE <xxxxxxxxxxxx>.
- F78: IT IS NOT ALLOWED TO CONFIGURE SUBSCRIBERS FOR TMDNH (BOS) BOARDS SINCE TRUNKS ARE ALREADY CONFIGURED ON IT

## 168.4.2 Advisories

- H01: WHEN ENTERING STATION NUMBER RANGES, THE NUMBER OF DIGITS FOR EACH LIMIT MUST BE EQUAL. THE STNO RANGE <xxxxxxx>-<yyyyyy> CANNOT BE PROCESSED.
- H02: <xxxxxxx> NO FREE SPDI MEMORY. THE STATION IS CONFIGURED WITHOUT SPDI, RESPECTIVELY SPDI IS NOT CHANGED..
- H05: <xxxxxxx> THE PARAMETER DIAL IS NOT PERMITTED FOR DIGITAL DEVICES.  
ENTRIES WILL BE IGNORED.
- H06: <xxxxxxx> THIS STATION IS CONFIGURED AT PEN <nn-nn-nnn-nnn>.
- H07: A RANGE INPUT FOR THE PARAMETER STNO MUST NOT COMPRISE MORE THAN 600 STATIONS. THE RANGE HAS BEEN TRUNCATED TO <xxxxxxx>-<yyyyyy> FOR PROCESSING.
- H08: <xxxxxxx> STATION DATA DELETED.
- H09: <xxxxxxx> STATION DATA CHANGED.
- H11: <xxxxxxx> CONTROL HAS BEEN PASSED TO CALL PROCESSING FOR STATION ACTIVATION.
- H12: <xxxxxxx> THE STATION IS NOT ACTIVE.
- H13: <xxxxxxx> THE STATION IS NOT ACTIVE (ID CARD USER).
- H14: <xxxxxxx> DOWNLOADING OF PARAMETER <COFIDX/CCTIDX/PULSTYPE/CMIND/PULSLEV/DHPAR/DIAL> TO THE BOARD IS ONLY INITIATED AFTER DEACTIVATION AND REACTIVATION OF THE CIRCUIT  
( RESTART-DSSU:TYPE=PEN,PEN1=...; ).
- H16: <xxxxxxx> <COFIDX/CONN> IS A PEN-DEPENDANT PARAMETER WHICH IS IGNORED FOR VIRTUAL STATIONS (SIGNED OFF, FLOATING, ACLSTN).
- H18: <xxxxxxx> NO STATION HAS BEEN CONFIGURED.
- H19: THE STNO <xxxxxxx> HAS THE NEW NUMBER <yyyyyy>.  
PLAUSIBLE PARAMETER ENTRIES HAVE ALSO BEEN CHANGED.
- H20: NONE OF THE SPECIFIED STATIONS IS CONFIGURED BY SCSU.
- H22: <xxxxxxx> THE ACKST PARAMETER IS ONLY VALID FOR SLMA STATIONS.  
SPECIFIED VALUES ARE IGNORED.

## SCSU - Subscriber Configuration of Switching Unit

### Error Messages and Advisories

H23: <xxxxxxx> THIS STATION IS ASSIGNED.

H24: <xxxxxxx> PARAMETER ACKST=TE NOT ACCEPTED BECAUSE STATION IS ASSIGNED IN A NIGHT OPTION.

H25: <xxxxxxx> THE STATION IS NOT ACTIVE ( STATION SIGNED OFF ).

H26: <xxxxxxx> PARAMETER DIAL: FOR VIRTUAL ANALOG STATIONS (INS = SIGNOFF, FLOAT, ACLSTN) ONLY DIALING TYPE 'VAR' IS ALLOWED. THE SPECIFIED DIALING TYPE < DTMF / DP > IS IGNORED. THE ACTION IS PERFORMED WITH DIALING TYPE 'VAR'.

H28: <xxxxxxx> LIST OF 'FOREIGN' STATION NUMBERS REDIRECTED BY AMO TGER TO THIS STATION. THEY ARE NO LONGER AVAILABLE FOR THE LISTED NON VOICE SERVICE(S).

| SERVICE | STATION NUMBER(S)                                                    |
|---------|----------------------------------------------------------------------|
| <ddd>   | <zzzzzz>, <zzzzzz>, <zzzzzz>, <zzzzzz>, <zzzzzz>, <zzzzzz>, <zzzzzz> |

H30: <xxxxxxx> FOR THIS DEVICE COMBINATION THE PARAMETER <param> IS NOT VALID. THE PARAMETER HAS BEEN IGNORED.

H32: <xxxxxxx> WHEN THE LINE OPERATES WITH 12 KHZ OR 16 KHZ METERING PULSES THE LINE LENGTH IS RESTRICTED TO 200 METERS.

H33: <xxxxxxx> FOR DVCFIG = ANATECM CHARGE PULSE DURATION AND PAUSE CAN BE CHANGED BY AMO PTIME.

H34: SLMAR-PEN'S ARE SKIPPED FOR AUTOMATIC PEN SEARCH (ADD MORE THAN 1 STNO OR NO PEN IN COMMAND) FOR DVCFIG = ANATE, ANATE&...

H35: <xxxxxxx> TEXTSEL=<value> IS NOT EFFECTIVE BECAUSE THIS LANGUAGE IS NOT INSTALLED IN CENTRAL PBX DATA (AMO ZAND, PARAMETER TEXTSEL).

H36: <xxxxxxx> TEXTSEL=<value> IS ONLY EFFECTIVE FOR DIGITE'S. THE PARAMETER IS IGNORED.

H37: <xxxxxxx> FOR SLMA BOARDS, ID CARD USERS, ACL SUPPORT STATIONS AND SIGNED OFF STATIONS THE PARAMETER CCTIDX IS IGNORED

H38: <xxxxxxx> THE STATION IS NOT ACTIVE ( ACL SUPPORT STATION ).

H39: <xxxxxxx> DHPAR = MWLED IS A PEN-DEPENDANT PARAMETER WHICH IS IGNORED FOR VIRTUAL STATIONS (SIGNED OFF, FLOATING, ACLSTN). THE ACTION IS PERFORMED WITH DHPAR = LEDSIGN

H40: <xxxxxxx> STATION LOCKING OR DOWNLOADING NOT NECESSARY, PARAMETER OFFTYPE IS IGNORED

H41: <xxxxxxx> DOWNLOADING OF PARAMETER <COFIDX/CCTIDX/PULSTYPE/PULSLEV/DHPAR/DIAL/CMIND> TO THE BOARD IS INITIATED

H43: <xxxxxxx> AN OFF PREMISES STATION (CONN=OPST1) HAS BEEN CONFIGURED AT A TMDNH BOARD (PEN=nn-nn-nnn-nnn).

H44: <xxxxxxx> FOR THE ENTERED DEVICE TYPE ONLY CONNECTION TYPE DIR IS ALLOWED. THE ACTION IS PERFORMED WITH CONN=DIR.

H45: <xxxxxxx> THE AUTOMATIC PEN SEARCH FOR FREE PENS TAKES PLACE IN LTU SHELVES WITH SOURCE-GROUP=1 (SEE AMO UCSU).

H46: <xxxxxxx> THE AMO IS STILL WAITING FOR A CONFIRMATION BY CALL PROCESSING (MAX. 120 SEC)

H47: <xxxxxxx> THE CONTRACTED NUMBER OF FLEX+TDM LICENES IS EXCEEDED. THE SUBSCRIBER HAS BEEN MARKED AS TRIAL ENTITY. IT WILL BE BLOCKED, IF TRIAL MODE EXPIRES WITHOUT SUFFICIENT LICENSES.

H48: THE EXISTING DPLN OF THE STATION IS NOT IN ADPLN OF THE NEW NODE, SO IT IS INTERNALLY SET TO THE DPLN OF THE NEW NODE

H49: <xxxxxxxxxxxx> TEXTSEL=xxxxxxxx IS NOT EFFECTIVE BECAUSE THIS LANGUAGE HAS NOT BEEN SET UP IN AP SPECIFIC DATA (AMO UCSU, PARAMETER TEXTSEL)

### 168.4.3 Use of the Output Messages for Each Action

# 170 SDSM - Status Output for System Server

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The status of all modules, circuits and devices is stored in the memory of the ADS

AMO SDSM (Status Display of Service Modules) can be used to obtain an overview of the status of all modules, circuits and devices of the ADS.

## 170.1 Restrictions

This description is valid from SP300E-V3.0

## 170.2 Interrelationships

- AMO BCSM : Configuration of server modules
- AMO CONSY : Cabinet and Frame Configuration of System
- AMO DCSM : Configuration of server devices
- AMO LCSM : Configuration of server lines

## 170.3 Functions of the AMO

- [DISPLAY-SDSM](#) : Interrogation of the status of modules, circuits and devices of the servers.

### 170.3.1 DISPLAY-SDSM

Output of SYSTEM-STATUS informations in the ADS

The various options for STATUS interrogation are:

- all line periphery modules (FCD, LBC, LCC, LCR, LCU, RAX, VDC)
- all LCR and LCU module channels

- all memory periphery (IOPS, DC) modules and connected devices (HD, FD, CT, TP)

See parameter description of "STATUS" for a list of possible status outputs.

Procedure Overview

| Command Code | Parameter                                                           |
|--------------|---------------------------------------------------------------------|
| DISPLAY-SDSM | UNIT=<param>, [AREA=<param>]<br>, [STATUS=<param>], [LINK=<param>]; |

Examples

See also under "Explanation of the Various Output Masks"

See also under "Parameter Description"

- Status INS of SERVER areas LN, CHAN and FILE in ADS is to be output.

Input:

DISPLAY-SDSM:A1, LN&CHAN&FILE, INS;

Output:

H02: PARAMETER "STATUS" HAS NO INFLUENCE ON OUTPUT FOR AREA "FILE"

```

  CC-B:  48 MB
```

### Note

In the case of the memory periphery devices, the output is not affected by the parameter STATUS.

The local memory in SWU is not output with monoprocessor switches.

### 2. Interrogate area LN for ADS with PSIO module.

Input:

```
DISPLAY-SDSM:A1, LN, ALL;
```

Output:

```
A1 - LN
-----
MOUNTING LOCATION  MODULE NAME  NOM. BD(#-ACT)  STATUS
P101.80CM .CC81.060  PSIO           #Q2139-X       INS
  LTG:  1  LTU:  1  PBC:  10          DC STATUS: READY
```

### Explanation of the Various Output Masks

#### 1. Line 1: Module data

```
P201.B .A1 B.062 DM3L      Q2230-X200      INS
1111.2222.3333.444 5555    66666666666 77777
```

#### a) Explanation of the first line's fields.

- Field 1: Cabinet address
  - Cabinet row: P2
  - Cabinet number: 01

## SDSM - Status Output for System Server

### Functions of the AMO

- Field 2: Cabinet type: max. 5 characters (e.g. B, E, C, P, IS)  
Example: B = Base cabinet
- Field 3: Logical module frame name
  - SHELF TYPE: max. 3 characters (z.B. AD, VM, TF, UNS, ISE)
  - SHELF NUMBER: max. 1 character (1-7)
- Field 4: Module frame slot
- Field 5: Short module name or memory device name  
Examples for the memory device nameng  
A1H1- (controller)  
A1H11 (device)  
A1H1A (area)  
12345
- 4. Server name
  - A = Administration
  - V = Voice Mail Service
  - T = Tele-Communications Service
  - C = Call charges
- 5. Server number
- 6. Device type
  - H = Hard Disk
  - F = Floppy Disk
  - C = Cartridge
  - T = Tape device
- 7. Controller number
- 8. Device code
  - : Controller
  - 1-8 : Device number
  - A-P: Area designation hard disk only
- Field 6: Module code number
- Field 7: Module status
- b) Note on Fields 1 to 3:  
The data for this fields is entered in the ADS database by AMO  
CONSY. If the database  
is empty, the following values are output:
  - Field 1: \*\*
  - Field 2: \*\*
  - Field 3:
    - SHELF TYPE: Server id. (e.g. A1, V1, T1)
    - SHELF NUMBER:

B Base shelf  
 E Extension shelf  
 S Shelf of the SWU periphery (for PSIO modules)

- c) Note on Fields 5 and 6:  
 The data for the fields 'Short Module Name' and 'Module Code Number' are taken from the loaded subsystem ':PDS:APSU/BGDAT00', using the hardware code number as reference

Special aspects of the hardware code number:

If a module has the status 'NPR', the data referring to the should-be code number is output. Otherwise, the necessary data is determined with the aid of the actual code number (marked with '#')

If the hardware code number of a module cannot be evaluated, then the code number is output in the field 'Module Code Number' in hexadecimal form, and the field 'Short Module Name' is filled in with '\*'. For hardware code number 0 a string of '.' is output for the module code number and the short module name.

## 2. Line 1a: Additional data for PSIO module

|      |    |      |    |      |    |            |       |
|------|----|------|----|------|----|------------|-------|
| LTG: | 1  | LTU: | 1  | PBC: | 10 | DC STATUS: | READY |
|      | 11 |      | 22 |      | 33 |            | 44444 |

- Field 1: LTG number (two-figure number)
- Field 2: LTU number (two-figure number)
- Field 3: Peripheral board controller number (1-20)
- Field 4: Module status maintained by device control

## 3. Line 2: Channel data

|          |    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |     |     |
|----------|----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|-----|
| CHANNEL: | 01 | . | . | . | . | . | . | . | . | . | . | . | . | . | . | . | . | . | .   | INS |
|          | 11 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 222 |     |

- Field 1: Channel number
- Field 2: Channel status

# 170.4 Parameter Description

AREA                      Area within the Server

## SDSM - Status Output for System Server

### Parameter Description

Type of Input : 1 bis 4 single values, optional  
Possible Values : LN module of the line preiphery  
CHAN channels  
FILE module of the storage periphery with connected devices  
Default Value : LN

#### LINK

Type of status search function  
Type of Input : Single value, optional  
Possible Values : OR a system section is displayed if at least one of the wanted states is set  
AND a system section is only displayed if all wanted states have been set  
Default Value : OR  
Note : This parameter is only effective if something has been entered for parameter STATUS.

#### STATUS

Module states of the SERVER to be output  
Type of Input : 1 bis 4 single values, optional  
Possible Values : NCR not created  
CREA created  
PRES present  
INS in service  
AMO manually blocked by means of an AMO  
BLKY manually blocked by means of a key  
DEF blocked by dependability due to a fault  
CHECK seized by dependability  
DYNINIT hierarchically blocked  
UNACHLBC hierarchically blocked LBC  
UNACHLCX hierarchically blocked LCX  
ALL all states  
Default Value : Only out-of-service states are output.  
The states INS and CHECK and the combination of NCR and NPR are not output.  
Note : During input the type of search can be affected by means of parameter LINK.  
In the case of memory periphery devices, parameter AREA=FILE, this parameter has no effect on the output.

#### UNIT

System part which is to carry out the STATUS interrogation  
Type of Input : Single value, optional

Possible Values : A1 = Administration

The description of this AMO is only available in html format!

## 172 SELG - Administration of Selection Groups and Selection Tables

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The function of the AMO is to administrate the selection groups and the selection tables they contain.

The *selection groups* contain the data of the output device (base and reserve) the block sizes of the devices, as well as the queue size and the selection tables.

A maximum of 4 selection groups are provided which, in turn, each contain 8 selection tables.

These tables form the basis for determining whether a call detail record is to be output and the device to which it is to be sent.

The selection tables contain the selection features for the individual customers.

If a selection group is in operation, the allocation of a call detail recording code (CRDCODE), an attendant group (ATNDGR) and a communication service (SERVICE) is checked before a call detail record is output. In addition, selection features 1 and 2 (group parameters for AMO- SELG) are checked.

If output is required, i.e. the selection result is positive, the data record is output according to block layout, format (with the exception of NOFORM), and output device. If NOFORM is entered, there is no output (masking out of specific connections).

The selection tables are scanned in ascending order from 1 to 8 in each selection group. If the conditions for output are met in one of the selection tables, scanning is terminated. The call charge data record is processed further in the next selection group (even if the format is NOFORM).

In fast output mode (see AMO-FEACG, value FAST) only the first selection group can be used and the number of possible output devices is restricted.

### 172.1 Interrelationships

- AMO-DAVF : Administration of CDR display at attendant console
- AMO-FEACG : Administration of the feature bit string for call detail recording

## SELG - Administration of Selection Groups and Selection Tables

### Functions of the AMO

- AMO-FTBL : Administration of output format tables
- AMO-GEZU : SMDR/DMDR Device Allocation
- AMO-GRZW : Administration of limit value tables
- AMO-KDEV : Administration of the customer master file
- AMO-RCUT : Administration of the route code conversion table
- AMO-SELL : Administration of station and destination number lists
- AMO-SELS : Administration of selection group switches
- AMO-TTBL : Administration of tariff tables

## 172.2 Functions of the AMO

- **ADD-SELG** : Add entries to the selection groups and selection tables
- **CHANGE-SELG** : Change entries in the selection groups and selection tables
- **DELETE-SELG** : Delete entries from the selection groups and selection tables
- **DISPLAY-SELG / REGENERATE-SELG** : Interrogate selection groups and selection tables / Regenerate selection groups and selection tables

### 172.2.1 ADD-SELG

For the action ADD, the operator can choose between adding entries to or creating a selection group or a selection table.

The AMO executes various tests when values are entered for a selection group.

The AMO first checks the entered values against the "bit string", to determine which features have been implemented. The checks refer to the output device i.e. if an output device not implemented in the system is specified (bit not set in the bit string), the AMO rejects this entry.

The AMO then verifies the individual parameter values and changes any incorrect values, which can logically only assume a specific value within the combination, to the correct values. Only certain specific value combinations are possible (depending on the base device specified).

| BASDEV | RESDEV    | BLBAS | BLRES    | RESOP     |

| DEV3    | available | available | avail.*) | available |
| DEV4    | available | available | avail.*) | available |

Table 9 Value Combination Table

\*) depending on reserve device

\*\*) There are only these output devices permitted in fast output mode (see AMO-FEACG, value FAST)

### Note

Thus, incorrect entries cannot be made because the AMO can automatically change most incorrectly entered values to correct values. If a parameter value is changed, the AMO reports this to the user.

For incorrect parameter values which cannot be corrected automatically (several logically acceptable values for one parameter), the AMO requests a re-entry.

When the selection features are entered in the selection table (entries in the selection table are possible only if the selection group has already been created), the AMO checks the compatibility of the values with each other. As in the case of the selection groups, certain parameters are dependent upon others (e.g. device and format).

| DEVICE | FORMAT   |
|--------|----------|
| NODEV  | NOFORM   |
| ATTEND | ATTEND   |
| CDRC1  | HDFORM   |
| CDRC2  | HDFORM   |
| CDRS   | CDRSFORM |

Table 10 Interrelationship of Device and Format

| DEV3   |                        |
| DEV4   |                        |

Table 10                      Interrelationship of Device and Format

**Note**

NOFORM can be specified for any device (if output is not desired).  
If an incorrect value is entered for the format in this case, the AMO automatically changes this value to the correct value (if possible), or requests a re-entry of the desired format.  
The user can specify several values for different parameters (communication service, route number, attendant console group, etc.). If, for example, several communication services are specified, all the call detail records for each of these communication services are output).  
The status of the selection group remains "OFF\_WITHOUT\_QUEUEING", i.e. although the selection group is ready, it must be put into operation explicitly by means of the AMO-SELS.

- 1. Entering values in a selection group
- 2. Entering values in a selection table

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                      |

### Command Code

### Parameter

```
,CDRULTE=<string>,CONNT=<string>,PCODE=<string>
,PPCF=<string>,STATAB1=<string>,STATAB2=<string>
,DNOTBL1=<string>,DNOTBL2=<string>
,CDRULT=<number>,CONNTL=<number>
,LEVEL0=<number>,LEVEL1=<number>,LEVEL2=<number>
,TIELINE=<pram>,EXPENS=<param>,[CONNTYP=<string>]
,COPIN=<number>,CARRIER=<number>,RECTYP=<string>;
```

### Examples:

1. Create selection group 1 with the following parameters:

Reserve operation possible,  
Base device CDRC1, reserve device is output device 1,  
The block size of base device has the value 1,  
The block size of reserve device has the value 60.

Input:

```
ADD-
SELG:TBL=SELG,SELGNO=1,RESOP=Y,BASDEV=CDRC1,RESDEV=DEV1,BL
BAS=1,BLRES=60;
```

2. The call charges of all outgoing calls set up by the attendant console are to be displayed on the attendant console on termination of each call.

This is to be done in selection group 2 using selection table 1.

Parameter Values:

## 172.2.2 CHANGE-SELG

Change one or more entries in a selection group, or a selection table. The user can simultaneously change the selection tables of a selection group when changing this selection group.

As is the case when creating the selection group, only specific combinations of parameter values are possible (see above). The same tests carried out for the action ADD-SELG are also executed for the action CHANGE-SELG.

If the base or reserve device is changed, the AMO checks whether the formats in the selection tables are still compatible with the devices. If the entries are not compatible, the selection tables containing

## Functions of the AMO

1. Change entries in a selection group
2. Change entries in a selection table

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

1. In selection group 1, the base device is to be changed to DEV1.

CHANGE-SELG:TBL=SELG,SELGNO=1,BASDEV=DEV1;

Input:

CHANGE-SELG:TBL=SELT,SELGNO=2,SELTABNO=1,SERVICE=FAX&amp;DTE;

172.2.3 DELETE-SELG

When a selection field is deleted, the user can specify whether the entire field (selection group), or only one selection table from a selection group is to be deleted.

When a selection group is deleted, the operating state of the selection group is set to "OFF\_WITHOUT\_QUEUEING". The respective entries for the base and reserve devices are set to NODEV, the block sizes (base and reserve) and the number of queued calls (CNTQEL) are set to 0, and all the selection tables in this selection group are deleted.

When one selection table is deleted in a selection group, all of the entries in this selection table are deleted.

If the last selection table in the selection group is deleted, then the selection group is set to "OFF\_WITHOUT\_QUEUEING".

Procedure Overview

| Command Code | Parameter                             |
|--------------|---------------------------------------|
| DELETE-SELG  | SELGNO=<number>, [SELTABNO=<number>]; |

Example

1. Selection table 2 is to be deleted in selection group 3.
- Input:
- DELETE-SELG:SELGNO=3, SELTABNO=2;

172.2.4 DISPLAY-SELG / REGENERATE-SELG

1. Interrogate the entries in the selection groups or the selection tables with output on screen in tabular form (DISPLAY)
2. Interrogate the entries in the selection groups or in the selection tables with generation of a command listing for the action ADD-SELG (REGENERATE).

Procedure Overview

| Command Code | Parameter                               |     |
|--------------|-----------------------------------------|-----|
| DISPLAY-SELG | [SELGNO=<number>], [SELTABNO=<number>]; | (1) |
| REGENERATE   | [SELGNO=<number>], [SELTABNO=<number>]; | (2) |

## Functions of the AMO

1. Output selection group data in tabular form:

Input:

Output:

```

+-----+
|                                     SELECTION GROUP   : 2
+-----+-----+
|
|                                     OPERATING STATE   :   OFF_WITHOUT_QUEUEING
|
|
|                                     RESOP             :   N
|                                     BASDEV            :   ATTEND
|                                     RESDEV            :   NODEV
|                                     BLBAS             :   1
|                                     BLRES            :   0
|
+-----+-----+
|
|                                     SELECTION GROUP   :   2
|                                     SELECTION TABLE  :   1
|
| FORMBAS      :   ATTEND
| FORMRES      :   NOFORM
|
| LEVEL0       :   0&&999
| LEVEL1       :   0&&254
| LEVEL2       :   0&&30
| CDRCD        :   0&&999999
|
| ATNDGR       :   0&&15
| SERVICE      :   VOICE
|
| CDRULT       :   0
| COPIN        :   0&&15
|
| CONNTL       :   00 : 00 : 00
| CARRIER     :   0&&9
|
| SELECTION FEATURES 1 :
|
| CTYPE        :   ALL
| CDRAC        :   ATND
| CDRC         :   N
| SECTION      :   N
| CONNTYP      :   OUTG
| RECTYP       :   ALL
|
| PAYPARTY     :   ALL
| SFSETUP      :   N
| CDRSTA       :   N
| TIE-LINE     :   N
|
| NSTAT        :   N
| CDBAD        :   N

|
+-----+-----+

```

2242

Only selection tables which contain entries are output.

If a selection group has no entries, the output of this group appears as follows:

Input:

DISPLAY-SELG:SELGNO=4;

Output:

| SELECTION GROUP : 4                    |  |         |  |
|----------------------------------------|--|---------|--|
| OPERATING STATE : OFF_WITHOUT_QUEUEING |  |         |  |
|                                        |  | RESOP : |  |
| BASDEV :                               |  | BLBAS : |  |
| RESDEV :                               |  | BLRES : |  |

## 2. Output selection group data in position oriented commands.

Input:

REGEN-SELG:SELGNO=2,SELTABNO=1;

Output:

```
ADD-SELG:SELG,2,N,ATTEND,NODEV,1,0;
CHANGE-SELG:SELT,2,1,ATTEND,NOFORM,TARGR01,A22;
CHANGE-SELG:SELT,2,1,,,,,0&999999;
CHANGE-SELG:SELT,2,1,,,,,VOICE;
CHANGE-SELG:SELT,2,1,,,,,0&15;
CHANGE-
SELG:SELT,2,1,,,,,ALL,ALL,N,N,N,N,N,Y,ATND,N,N,N,N,N,N,N,N,N;
CHANGE-SELG:SELT,2,1,,,,,0,000000;
CHANGE-
SELG:SELT,2,1,,,,,0&999,0&254,0&30;
CHANGE-
SELG:SELT,2,1,,,,,N,N,OUTG,0&15,0&9
,ALL;
```

## 172.3 Parameter Description

### 172.3.1 Parameter Description for Selection Groups

The parameters RESOP, BASDEV, RESDEV, BLBAS and BLRES form a min-1-group for the function CHANGE-SELG. At least one of these parameters must be declared.

BASDEV

Base output device

(See AMO-GEZU for dev. alloc. table)

|                 |                                                                          |                                         |
|-----------------|--------------------------------------------------------------------------|-----------------------------------------|
| Type of Input   | : Single value, required (ADD)<br>2. parameter of a min-1-group (CHANGE) |                                         |
| Possible Values | : ATTEND                                                                 | Display on attendant console            |
|                 | CDRC1                                                                    | Call detail recording - central, file 1 |
|                 | CDRC2                                                                    | Call detail recording - central, file 2 |
|                 | CDRS                                                                     | Station call detail recording file      |
|                 | TAPE                                                                     | Output on magnetic type                 |
|                 | DPS                                                                      | ON-LINE Transmission to DPS             |
|                 | DEV1                                                                     | Output on device 1                      |
|                 | DEV2                                                                     | Output on device 2                      |
|                 | DEV3                                                                     | Output on device 3                      |
|                 | DEV4                                                                     | Output on device 4                      |
|                 | FT                                                                       | File for file-transfer                  |

DEV1 to DEV4 are devices for individual customers with V254 interfaces that must be allocated to a physical device via the AMO-GEZU.

In fast output mode (see AMO-FEACG, Fast output) only the values TAPE, DPS, FT, will be accepted as entry

BLBAS

Block size of base output device

(‘Block size’ is understood to mean the number of call detail records per output block).

|                 |                                                                              |  |
|-----------------|------------------------------------------------------------------------------|--|
| Type of Input   | : Single value, required (ADD)<br>4. parameter of a min-1-group (CHANGE)     |  |
| Possible Values | : 1 - 127                                                                    |  |
| Important Note: | : Always enter the value 1 (individual output) for the device type ‘ATTEND’. |  |

BLRES

Block size of reserve output device (see BLBAS)

Type of Input : Single value, required (ADD)  
 5. parameter of a min-1-group (CHANGE)  
 Possible Values : 0 - 127

### RESDEV

Reserve output device

(See AMO-GEZU for device allocation table)

Type of Input : Single value, required (ADD)  
 3. parameter of a min-1-group (CHANGE)

Possible Values : NODEV No device  
 ATTEND Display at attendant console  
 CDRC1 Call detail recording - central, file 1  
 CDRC2 Call detail recording - central file 2  
 CDRS Station call detail recording file  
 TAPE Output on magnetic device  
 DPS ON-LINE transmission to DPS  
 DEV1 Output on device 1  
 DEV2 Output on device 2  
 DEV3 Output on device 3  
 DEV4 Output on device 4  
 FT File for file-transfer

Important Note : The device type of the reserve device need not be the same as that of the base device.

A reserve device entry is not permissible in the following instances:

Base device = ATTEND

Base device = CDRS

In fast output mode only values TAPE, DPS, FT will be accepted as entry.

**SELG - Administration of Selection Groups and Selection Tables**

Parameter Description

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESOP           | Reserve mode operation                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Type of Input   | : Single value, required (ADD)<br>1. parameter of a min-1-group (CHANGE)                                                                                                                                                                                                                                                                                                                                                                                                    |
| Possible Values | : Y<br>If a reserve device has been specified, reserve operation is started immediately in the event of a defective base device.<br><br>N<br>If a reserve device has been specified, reserve operation is not started until the queue capacity limit is reached.<br><br>Prior to each output on the reserve device, a check is made to determine whether the base device is still defective. Output is automatically switched to the base device as soon as it is repaired. |
| SELGNO          | Selection group number                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Type of Input   | : Single value,<br>required (ADD, CHANGE, DELETE),<br>optional (DISPLAY, REGENERATE)                                                                                                                                                                                                                                                                                                                                                                                        |
| Possible Values | : 1 - 4                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TBL             | SELG options: selection group or selection table                                                                                                                                                                                                                                                                                                                                                                                                                            |

**172.3.2 Parameter Description for Selection Tables**

**Note:** The following rules apply to parameters with the possible values 'Y' or 'N':

- 'Y' = A selection will be made (parameter specified as a selection criterion).
- 'N' = A selection will not be made (not specified as a selection criterion).

**Example:**

Parameter CDCH=Y: Only data records with call charge units are output on the device.

Parameter CDCH=N: Data records both with and without call charge units are output (i.e. records are included in output selected according to other criteria).

## SELG - Administration of Selection Groups and Selection Tables

### Parameter Description

|                 |                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------|
| ATNDGR          | Attendant group number (see AMO VFGR)                                                                                           |
| Type of Input   | : Single value, chained single values, ranges, required (ADD), optional (CHANGE)                                                |
| Possible Values | : 0 - 15                                                                                                                        |
| CARRIER         | Number of Carrier                                                                                                               |
|                 | Single value, 5 chained single values, ranges, required (ADD), optional (CHANGE)                                                |
| Possible Values | : 0 - 9                                                                                                                         |
| Default Value   | : 0&&9                                                                                                                          |
| CDBAD           | Output of faulty (bad) call detail records                                                                                      |
| Type of Input   | : Single value, required (ADD), optional (CHANGE)                                                                               |
| Possible Values | : N (not specified as a selection criterion)<br>Output of call data records with or without errors.                             |
|                 | Y Only bad data records are output.                                                                                             |
| CDCHU           | Call detail records output with appropriate call charge units                                                                   |
| Type of Input   | : Single value, required (ADD), optional (CHANGE)                                                                               |
| Possible Values | : N (not specified as selection criterion).<br>Call detail records with and without call charge units are output in this table. |
|                 | Y Only call charge data records with call charge units are output.                                                              |
| CDRAC           | Call detail recording at ATND (user/ attendant call setup)                                                                      |

## SELG - Administration of Selection Groups and Selection Tables

### Parameter Description

|        |                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Possible Values | :                          | ALL                                             | Output of all calls      |
|                 |                            | ATND                                            | Attendant console        |
|                 |                            | MTLC                                            | PBX tie line limit       |
|                 |                            | NIGHT                                           | Output of all call types |

If only calls from stations (STN) are to be output, one selection table must be created for each of the paying parties ATND, MTLC, and NIGHT in the selection group. PAYPARTY=ALL must be entered in the following selection table.

**Reason:** Code for STN is missing.

Calls with the codes MTLC, ATND, and NIGHT must be output or masked out previously (NOFORM for FORMAT).

A virtual attendant console number can be entered for the attendant console using AMO-TLZO.

A virtual line number (paying party) must be entered for the PBX (MTLC) using AMO-TLZO.

|                 |                      |                                                 |                                                               |
|-----------------|----------------------|-------------------------------------------------|---------------------------------------------------------------|
| PCODE           | Personal code number |                                                 |                                                               |

|          | Type of Input                                               | : Single value, required (ADD);<br>optional (CHANGE)                                         |                                                                                                                            |
|          | Possible Values                                             | : Y                                                                                          |                                                                                                                            |

N

STATAB1      Paying party is member of station table 1

Type of Input      : Single value, required (ADD),  
optional (CHANGE)

Possible Values      : N      (not specified as a selection criterion)  
Y      The paying party must be included in station table 1 (must be created with AMO-SELL), if this selection criterion is specified. If the output format in the selection table is NOFORM, then these call detail records will not be output (masking out of call detail records of specific stations).

STATAB2      Paying party is member of station table 2

Type of Input      : Single value, required (ADD),  
optional (CHANGE)

Possible Values      : Y, N

See STATAB1

If STATAB1 and STATAB2 have the value 'Y', the paying parties must be entered in subscriber tables 1 or 2 in order to either obtain a printout or mask out the data record.

TARIF      Tariff used for call charge calculation

Type of Input      : Single value, required (ADD),  
optional (CHANGE)

Possible Values      : NOCALC      No call charge calculation  
(However, if the output device is an attendant console, the call charge units are output).

|         |                      |
|---------|----------------------|
| TARGR00 | Tariff Group Table 0 |
| TARGR01 | Tariff Group Table 1 |
| TARGR02 | Tariff Group Table 2 |
| TARGR03 | Tariff Group Table 3 |
| TARGR04 | Tariff Group Table 4 |
| TARGR05 | Tariff Group Table 5 |

For call charge calculations the tariff group tables (0 to 5) must be created by means of AMO-TTBL.

In addition, the holiday tables and the tariff period tables must be created with the AMOs FETA and TABT respectively.

If CDRAC is specified, and TARIF=NOCALC, then the call charge units are still displayed at the attendant console.

## SELG - Administration of Selection Groups and Selection Tables

### Error Messages and Advisories

|                 |                                                                                                                  |

## 172.4 Error Messages and Advisories

### 172.4.1 Error Messages

F01: FEATURE (DEVICE) IS NOT AVAILABLE - SWITCH ON WITH AMO FEACG  
**Solution:** switch on feature with AMO-FEACG

F02: BLOCK SIZES ARE TOO LARGE, MAX @@@@ STILL POSSIBLE!

F03: MINIMUM NUMBER OF QUEUE ELEMENTS ARE NO LONGER PRESENT  
**Solution:** prompt values, decrease blocksize in the other Selectiongroups, until the minimum number of queue elements are available again.

F04: SELECTION GROUP DOES NOT EXIST

F05: not used

F06: FORMAT OF THE BASE DEVICE MUST BE FORM01 TO FORM16

F07: FORMAT OF THE RESERVE DEVICE MUST BE FORM01 TO FORM16

F08: not used

F09: SELECTION GROUP IS DELETED

F10: SELECTION TABLE IS DELETED

F11: TIME-LIMIT ENTRY NOT POSSIBLE

F12: SELECTION GROUP ALREADY EXISTS

F13: SELECTION TABLE ALREADY EXISTS

F14: IF A SELECTION TABLE IS SPECIFIED, A SELECTION GROUP MUST BE SPECIFIED AS WELL

F15: not used

F16: ONLY FOLLOWING VALUES ARE FOR DESTCNT ALLOWED: A0...A22 OR L0...L22

F17: IN CASE OF FAST OUTPUT THERE IS ONLY THE SELECTION GROUP 1 POSSIBLE

F18: BASIC DEVICE NOT ALLOWED IN FAST OUTPUT MODE ONLY THE DEVICES TAPE, DPS AND FT ARE ALLOWED

F19: RESERVE DEVICE NOT ALLOWED IN FAST OUTPUT MODE ONLY THE DEVICES TAPE, DPS AND FT ARE ALLOWED  
F20: PLEASE ENTER VALUES IN RISING ORDER

### 172.4.2 Advisories

H01: RESERVE DEVICE MUST BE NODEV, IS CHANGED TO NODEV  
H02: not used  
H03: NO RESERVE OPERATION POSSIBLE, ENTRY CHANGED TO NO  
H04: BLBAS MUST BE 1, IS CHANGED TO 1  
H05: BLRES MUST BE 0, IS CHANGED TO 0  
H06: BLRES MUST BE 1, IS CHANGED TO 1  
H07: BLOCKSIZE FOR THIS DEVICE MUST BE AT LEAST 1. ENTRY CHANGED TO 1  
H08: FORMAT OF BASE DEVICE MUST BE TTXFORM, CHANGED TO TTXFORM  
H09: FORMAT OF BASE DEVICE MUST BE ATTEND, CHANGED TO ATTEND  
H10: FORMAT OF THE BASE DEVICE MUST BE HDFORM, CHANGED TO HDFORM  
H11: FORMAT OF THE BASE DEVICE MUST BE CDRSFORM, IS CHANGED TO CDRSFORM  
H12: FORMAT OF THE RESERVE DEVICE MUST BE NOFORM, CHANGED TO NOFORM  
H13: FORMAT OF THE RESERVE DEVICE MUST BE ATTEND, CHANGED TO ATTEND  
H14: FORMAT OF THE RESERVE DEVICE MUST BE HDFORM, CHANGED TO HDFORM  
H15: FORMAT OF THE RESERVE DEVICE MUST BE CDRSFORM, CHANGED TO CDRSFORM  
H16: INCOMPATIBILITY WITH THE FORMATS IN THE SELECTION TABLES DUE TO CHANGES IN THE SELECTION GROUP. FORMAT OF BASE DEVICE MUST BE NOFORM OR FORM01-FORM16, CHANGED TO NOFORM  
H17: LAST SELECTION TABLE OF THIS SELECTION GROUP HAS BEEN DELETED, SELECTION GROUP HAS BEEN DEACTIVATED  
H18: INCOMPATIBILITY WITH THE FORMATS IN THE SELECTION TABLES DUE TO CHANGES IN THE SELECTION GROUP. FORMAT OF RESERVE DEVICE MUST BE NOFORM OR FORM01-FORM16, CHANGED TO NOFORM  
H19: THE TABLE SETUP IS SUCCESSFUL ONLY, IF PARAMETER SERVICE IS SPECIFIED  
H20: IN CASE OF FAST OUTPUT THERE ARE ONLY THE SELECTION GROUPS 1,2,3 POSSIBLE

### 172.4.3 Output texts

# 173 SELL - Administration of Station and Destination Number Lists

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The station number tables and the destination number tables are customer-specific tables, i.e. they are created by the system user. The user of the Hicom system can enter specific station numbers or destination numbers in these lists, which can then be used to select the output.

The station numbers correspond to the field CHRGEE in the ticket (see AMO-FTBL).

The destination numbers correspond to the field DESTPTY in the ticket (see AMO-FTBL).

## 173.1 Interrelationships

- AMO-SELG : Administration of the selection groups and tables

## 173.2 Functions of the AMO

- [ADD-SELL](#) : Enter station or destination numbers
- [DELETE-SELL](#) : Cancel entries or lists
- [DISPLAY-SELL / REGENERATE-SELL](#) : Interrogate list contents / Regenerate the lists

### 173.2.1 ADD-SELL

A number is entered in the destination number table or the station number table. However, in this case the AMO does not check whether the number to be entered is a valid destination or station number.

The station numbers can have a maximum of 22 digits and are entered in the station number list in ascending order.

**SELL - Administration of Station and Destination Number Lists**

Functions of the AMO

The destination numbers can have a maximum of 22 digits. The numbers are entered in the destination number lists arranged according to the communication service. Within a communication service, the destination numbers are arranged in ascending order.

To each number the node numbers are appropriate. The node numbers (parameters LEVEL0, LEVEL1 and LEVEL2) must be indicated for creating a number. They enable a unique allocation in the network.

If a number (inclusive node number) already exists in the table, this number is not entered and a message is sent to the user (error message F01: NUMBER IS ALREADY IN THE TABLE).

Furthermore, destination numbers are not entered, if the first part of a destination number (with same node number) has already been entered.

If, for example, destination number 02 has already been entered in the destination number table and the user enters a new destination number 023, this number (023) is already covered by the first destination number(02). Thus, destination number 023 is rejected.

If there is no more space available in the table, the AMO is not executed and a corresponding message is sent to the user.

For station number table a maximum of 300 and for destination number table a maximum of 100 entries can be carried out.

- 1. Entry of station numbers in the station number list
- 2. Entry of destination numbers with the service ID in the destination number list

**Procedure Overview**

| Command Code | Parameters                                                                       |     |
|--------------|----------------------------------------------------------------------------------|-----|
| ADD-SELL     | TBL=STNTBL1 2,STNO=<number>,LEVEL0=<number><br>,LEVEL1=<number>,LEVEL2=<number>; | (1) |
|              | TBL=DNOTBL1 2,STNO=<string>;                                                     | (2) |

**Examples**

- 1. Station number 123456 with node numbers 1, 1, 30 is to be entered in station table 1.

Input:

ADD-SELL:STNTBL1,123456,1,1,30;

2. For specific stations (e.g. reception=123, doorman=456, telephone booth=789) with node numbers 1, 1, 30 an immediate printout is to be carried out.

Possible implementation:

These stations are entered in station table 1. Parameter STNTBL1 can then be used to select in AMO SELG.

Input:

```
ADD-SELL:STNTBL1,123&456&789,1,1,30;
```

3. All calls routed to customer companies participating in shared tenant service are to be output to a special device.

Directory numbers: 06089722, 00432227293.

Possible implementation:

The destination numbers of these companies are entered in destination number table 1. Parameter DNOTBL1 can then be used to select in AMO SELG, as follows:

Input:

```
ADD-SELL:DNOTBL1,06089722;  
ADD-SELL:DNOTBL1,00432227293;
```

or as a chained entry, since both have the same communication service.

Input:

```
ADD-SELL:DNOTBL1,06089722&00432227293;
```

### 173.2.2 DELETE-SELL

If a number is deleted in a table, AMO rearranges the remaining entries in an orderly sequence.

Several numbers can be deleted at once (several individual values or range).

Only if one number in a table is deleted, then must both the number (parameter STNO), and the node number (parameter LEVEL0), subdomain number (parameter LEVEL1) and the domain number (parameter LEVEL2) are indicated.

If the whole table is deleted, the specification of the parameters STNO, LEVEL0, LEVEL1 and LEVEL2 is omitted.

If the last number is deleted from a table, or if the entire table is deleted, the AMO checks whether this table is still going to be used in the selection. If this is the case, a warning is issued to the user.

If a non-existent number is to be deleted, a warning is issued to the user.

**SELL - Administration of Station and Destination Number Lists**  
Functions of the AMO

- 1. Delete a station number or a station number table
- 2. Delete a destination number or a destination number table

**Procedure Overview**

| Command Code | Parameter                                                                                   |     |
|--------------|---------------------------------------------------------------------------------------------|-----|
| DELETE-SELL  | [TBL=STNTBL1   2] , [STNO=<number> , LEVEL0=<number> , LEVEL1=<number> , LEVEL2=<number>] ; | (1) |
|              | [TBL=DNOTBL1   2] , [STNO=<string>] ;                                                       | (2) |

**Example**

- 1. Delete station number 123456 with node numbers 1, 1, 30 from station number table 1.

Input:  
DELETE-SELL:STNTBL1,123456,1,1,30;

- 2. Delete the entire station number table 1.

Input:  
DELETE-SELL:STNTBL1;

**173.2.3 DISPLAY-SELL / REGENERATE-SELL**

- 1. Interrogate the entries in the destination number table and the station number table with output in list format (DISPLAY).
- 2. Interrogate the entries in the destination number table and the station number table with output in position-related commands (REGEN).

**Procedure Overview**

| Command Code    | Parameter                                                                                   |     |
|-----------------|---------------------------------------------------------------------------------------------|-----|
| DISPLAY-SELL    | [TBL=STNTBL1   2] , [STNO=<number> , LEVEL0=<number> , LEVEL1=<number> , LEVEL2=<number>] ; | (1) |
|                 | [TBL=DNOTBL1   2] , [STNO=<number>] ;                                                       |     |
| REGENERATE-SELL | [TBL=STNTBL1   2] ;                                                                         | (2) |
|                 | [TBL=DNOTBL1   2] ;                                                                         |     |

### Examples

1. Interrogate destination number table 1.

Input:

DISPLAY-SELL:DNOTBL1;

Output:

```

                                DESTINATION NUMBER TABLE : 1

ENTRY NO.      DEST. NUMBER  LENGTH
-----
1              0043222      7
2              013059       6
3              0445546      7
4              0513059      7
5              06089722     8
6              07897221     8
7              A32BD12      7
    
```

2. Interrogate station numbers 100430 to 200987 in station number table 1 with node numbers 1, 1, 10. The entries located between the range limits are output.

Input:

DISPLAY-SELL:STNTBL1,100430&&200987,1,1,10;

Output:

```

                                STATION NUMBER TABLE : 1

ENTRY NUMBER  STATION NUMBER  LENGTH  LEVEL0  LEVEL1  LEVEL2
-----
1              100430        6         1        1       10
3              125731        6         1        1       10
4              199999        6         1        1       10
    
```

3. Interrogate whether station number 887192 with node numbers 1, 1, 30 is contained in station number table 1.

The station number must be always indicated with the node numbers.

Input:

DISPLAY-SELL:STNTBL1,887192,1,1,30;

Output:

```

                                STATION NUMBER TABLE : 1

ENTRY NUMBER  STATION NUMBER  LENGTH  LEVEL0  LEVEL1  LEVEL2
-----
7              887192        6         1        1       30
    
```

4. Interrogate the station number table 1 without entries.

Input:

## SELL - Administration of Station and Destination Number Lists

### Functions of the AMO

DISP-SELL:STNTBL1;

Output:

STATION NUMBER TABLE : 1

| ENTRY NUMBER | STATION NUMBER | LENGTH | LEVEL0 | LEVEL1 | LEVEL2 |
|--------------|----------------|--------|--------|--------|--------|
|--------------|----------------|--------|--------|--------|--------|

5. Interrogate of the two station number tables and the two destination number tables without entries.

Input:

DISP-SELL;

Output:

STATION NUMBER TABLE : 1

| ENTRY NUMBER | STATION NUMBER | LENGTH | LEVEL0 | LEVEL1 | LEVEL2 |
|--------------|----------------|--------|--------|--------|--------|
|--------------|----------------|--------|--------|--------|--------|

STATION NUMBER TABLE : 2

| ENTRY NUMBER | STATION NUMBER | LENGTH | LEVEL0 | LEVEL1 | LEVEL2 |
|--------------|----------------|--------|--------|--------|--------|
|--------------|----------------|--------|--------|--------|--------|

DESTINATION NUMBER TABLE : 1

| ENTRY NO. | DEST. NUMBER | LENGTH |
|-----------|--------------|--------|
|-----------|--------------|--------|

DESTINATION NUMBER TABLE : 2

| ENTRY NO. | DEST. NUMBER | LENGTH |
|-----------|--------------|--------|
|-----------|--------------|--------|

6. Interrogate the destination number table 1 with output in position-related commands.

Input:

REGEN-SELL:DNOTBL1;

Output:

```
ADD-SELL:DNOTBL1,"0043222";
ADD-SELL:DNOTBL1,"013059";
ADD-SELL:DNOTBL1,"0445546";
ADD-SELL:DNOTBL1,"0513059";
ADD-SELL:DNOTBL1,"06089722";
ADD-SELL:DNOTBL1,"07897221";
ADD-SELL:DNOTBL1,"A32BD12";
```

7. Interrogate station number table 1 with output in position-related commands.

Input:

REGEN-SELL:STNTBL1;

Output:

```
ADD-SELL:STNTBL1,"100430",1,1,10;
ADD-SELL:STNTBL1,"123",1,1,30;
ADD-SELL:STNTBL1,"125731",1,1,10;
ADD-SELL:STNTBL1,"199999",1,1,10;
ADD-SELL:STNTBL1,"456",1,1,30;
ADD-SELL:STNTBL1,"789",1,1,30;
ADD-SELL:STNTBL1,"887192",1,1,30;
```

## 173.3 Parameter Description

|                 |                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LEVEL0          | Node number                                                                                                                                                                             |
| Type of Input   | : Single value, required (ADD)<br>optional (DELETE, DISPLAY)                                                                                                                            |
| Possible Values | : 0-999                                                                                                                                                                                 |
| LEVEL1          | Subdomain number                                                                                                                                                                        |
| Type of Input   | : Single value, required (ADD)<br>optional (DELETE, DISPLAY)                                                                                                                            |
| Possible Values | : 0-254                                                                                                                                                                                 |
| LEVEL2          | Domain number                                                                                                                                                                           |
| Type of Input   | : Single value, required (ADD)<br>optional (DELETE, DISPLAY)                                                                                                                            |

## 174 SELS - Switching the Selection Groups

|                      |                               |
|----------------------|-------------------------------|
| Interrelationships   | Parameter Description         |
| Functions of the AMO | Error Messages and Advisories |

The task of this AMO is to permit the selection groups to be switched on or off as desired.

The determination as to whether a call charge data record is to be checked by the Selection Tables of a selection group is dependent on, among other things, the current operating state of the corresponding selection group.

Therefore, each selection group is assigned corresponding state parameters.

These can be changed by means of AMOs.

Thus, it is possible to intermittently switch the station message detail recording (SMDR) on or off.

A distinction is made between the following operating states:

- State 'ON'  
The selection group is switched on.  
A statement is to be made by the Selection Table allocated to the selection group. When output is made, the processed call charge data record is inserted into the output queue of the selection group, and thus released for output.
- State 'OFF WITH QUE'  
The selection group is conditionally switched on. The call charge data record is processed and inserted into the output queue the same as in the state "ON". However, output is blocked until the selection group is reset to the operating state "ON" or "OFF WITHOUT QUE".  
All call charge data records that are already inserted into the output queue for output at this time, or that will be changed into this operating state in the future, remain secured for output as long as the memory capacity of the overflow memory or of the group-specific memory has been reached. When the memory capacity is reached, the output to the reserve device is started.  
In this operating state, the allocated basic output device can, with reference to the output of this selection group, be maintained without a loss of data.
- State 'OFF WITHOUT QUE '  
The selection group is conditionally switched off.  
In this operating state, no call charge data record is processed in the Selection Tables of this selection group, and thus no output is made.

## SELS - Switching the Selection Groups

### Interrelationships

However, all call charge data records that are already inserted into the output queue at the time of the removal from service are still output. In the block output mode, this can result in the formation of a partial block.

- State 'OFF'  
The selection group is switched off.  
In this operating state, call charge data records are not processed in the selection tables of this selection group. All call charge data records inserted into the queue at the time of the removal from service are deleted.

At the operation mode "fast output" (configured by AMO FEACG) the output will be restricted to the first selection group. It will not be possible to switch a selection group higher than selection group one.

## 174.1 Interrelationships

- AMO SELG : Administration of the Selection Groups and Tables
- AMO-FEACG : SMDR/DMDR Feature List

## 174.2 Functions of the AMO

- [ACTIVATE-SELS](#) : Switch On a Selection Group
- [DEACTIVATE-SELS](#) : Switch Off a Selection Group
- [COLLECT-SELS](#) : Switch Off a Selection Group With an Entry in the Queue
- [STOP-SELS](#) : Switch Off a Selection Group Without Making an Entry in the Queue
- [DISPLAY-SELS / REGENERATE-SELS](#) : Interrogate the Operating States of Selection Groups / Regenerate Selection Groups

### 174.2.1 ACTIVATE-SELS

Switch on the selection group, i.e., the state "ON" is entered into the status code of the selection group.

At this time, the AMO checks to ensure that the corresponding selection group is created with at least one selection table.

In the operation mode "fast output" it will be checked if the value for the selection group is bigger than 1. In this case an error message occurs.

### Procedure Overview

**Command Code**`ACTIVATE-SELS`**Parameters**`SELGRNO=<number>;`**Example**

1. Switch on selection group 1

Input:

`ACTIVATE-SELS:1;`

## 174.2.2 DEACTIVATE-SELS

Switch off a selection group, i.e., the state "OFF" is entered into the status code.

### Procedure Overview

**Command Code**`DEACTIVATE-SELS`**Parameters**`SELGRNO=<number>;`**Example**

1. Switch off selection group 2 without an entry in the queue.

Input:

`DEACTIVATE-SELS:2;`

## 174.2.3 COLLECT-SELS

Switch off a selection group with an entry in the queue, i.e., the state "OFF\_WITH\_QUE" is entered into the status code. Otherwise, the function corresponds to ACTIVATE-SELS.

In the operation mode "fast output" it will be checked if the value for the selection group is bigger than 1. In this case an error message occurs.

**Procedure Overview**

**Command Code**  
COLLECT-SELS

**Parameters**  
SELGRNO=<number>;

**Example**

- 1. Switch off selection group number 3 with queue

Input:

COLLECT-SELS:3;

**174.2.4 STOP-SELS**

Switch off a selection group without an entry in the queue, i.e., the state "OFF\_WITHOUT\_QUE" is entered into the status code of the selection group.

In the operation mode "fast output" it will be checked if the value for the selection group is bigger than 1. In this case an error message occurs.

**Procedure Overview**

**Command Code**  
STOP-SELS

**Parameters**  
SELGRNO=<number>;

**Example**

- 1. Switch off selection group 4

Input:

STOP-SELS:4;

**174.2.5 DISPLAY-SELS / REGENERATE-SELS**

- 1. Interrogate the operating states of the selection groups with output in list format (DISPLAY).
- 2. Interrogate the operating states of the selection groups with output in position-oriented commands for the regeneration (SAVDB).  
There is only an output of the active selection groups (state "ON").

### Procedure Overview

| Command Code    | Parameter           |     |
|-----------------|---------------------|-----|
| DISPLAY-SELS    | [SELGRNO=<number>]; | (1) |
| REGENERATE-SELS | [SELGRNO=<number>]; | (2) |

### Examples

- Interrogate the operating states of all selection groups

Input:

DISPLAY-SELS;

Output:

| OPERATING CONDITIONS OF THE SELECTION |         |           |
|---------------------------------------|---------|-----------|
| GROUPS                                |         |           |
| CONDITION                             | SELGRNO | OPERATING |
|                                       | 1       | ON        |
|                                       | 2       | STOP      |
|                                       | 3       | STOP      |
|                                       | 4       | STOP      |

- Interrogate the operating state of selection group 1:

Input:

DISPLAY-SELS:1;

Output:

| OPERATING CONDITIONS OF THE SELECTION |         |           |
|---------------------------------------|---------|-----------|
| GROUPS                                |         |           |
| CONDITION                             | SELGRNO | OPERATING |
|                                       | 1       | ON        |

- Interrogate the operating states of all selection groups for the regeneration.

Input:

REGEN-SELS;

Output:

ACTIVATE-SELS:1;

# 175 SIGNL - Error signalling control

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

System dependability (DEP-S) and call processing (VT) send error messages and advisories to signalling task (SIT). The SIT converts these messages from binary to ASCII format and distributes them as signalling messages (SIM) to defined output devices.

These signalling messages can be selected and can be suppressed. The information required for this is located in the database ADS in tables SDT (signalling distribution table) and FET (error element table) - see Diagnostics Service Manual A30950-S1-X301-\*-7620.

The tasks of the AMO-SIGNL (signalling control) are as follows:

1. to manipulate the message signalling, i.e., whether messages are to be signaled and if so, to which symbolic devices;
2. to regenerate the data administered by the AMO-SIGNL;
3. to output an SIT-internal error statistics table and to erase it;
4. to cancel the alarm memory (AL) in the attendant console task (see SHB Volume 'Dependability').
5. to administer the error element special table (FST) (SIT table for controlling the priority of messages depending on the action involved).
6. to activate and deactivate certain items to controlling message output. These are
  - IMPTMSG (forced output of important messages, replaces the former F1000)
  - FILTER (only restart messages and special events)
  - ALLMSG (all messages to this device)
  - SHORTFM (short message)
7. To handle user defined text
8. to display system data
  - state of SWU
  - state of ADP
  - state of ref clock
  - state of trunk failure switchover
  - alarms

Figure 1 shows the functional incorporation of AMO-SIGNL into the AM-OS.

Figure 26 Position of AMO-SIGNL in Hicom Software

**Definitions**

An edited signalling message (SIM) consists of a header line and optional supplementary lines in accordance with the section 'Format of the Output Message' in Volume 'Dependability'. An example is shown below.

The components of the header line are as follows:

1. Message identification (MID) with code CD (1 digit) and message number NO;
2. Priority for remote operation CD (2 digits) and number (1 digit);
3. serial number of message
4. Action;
5. Originator module;
6. Error class (EVT), F1 field;
7. Error (SUBEVENT), F2 field;
8. Date;
9. Time of day.

The components 4, 5, 6 and 7 are contained in the received message and are edited using text tables.

The components 1, 2 and 3 are added by SIT via the SDT from the FET.

For each signalling message class, the following are defined in SDT:

- EVT\_STATE : For evaluation of EVT signalling
- SEV\_TYPE : For evaluation of SUB-EVT
- E\_M\_IDX : Error class mask index
- FE\_NUM : Number of error elements of EVT
- FET\_IDX : Start index of EVT in the error element table.

For each signalling message, i.e., for error elements (RS\_SUB\_EVT), within a message class the following are defined in FET (DA\_S\_ST\_FET\_ARRAY):

- S\_FREE : Identifier for signalling the error element
- MSG\_ID\_KEY : Code for message identification
  - 'A' alarm
  - 'F' error

## SIGNL - Error signalling control

- MSG\_ID\_NO : 'M' advisory  
: 'U' undefined error element  
: Number of MSG\_ID in the range of 1000 - 9999
- AFR\_PRIO : Priority for AFR (consisting of code (CD) and number (NO))  
: 'E' Unambiguous error (error with single implication)  
: 'M' Ambiguous error (error with multiple implications)  
: '1'-'9' Priority
- DEV\_ACT : Current symbolic devices for SIM output
- DEV\_KONF : Configured symbolic devices
- S\_M\_IDX : SEV/error text masks IDX for field F2 of SIM header line

The components marked with '•' can be manipulated by the AMO.

The edited SIM are output to defined logical devices to which corresponding physical devices are assigned.

Following are the symbolic devices of SIT:

|      |                                                 |
|------|-------------------------------------------------|
| DPT1 | Data processing terminal                        |
| DPT2 | Printer                                         |
| DPT3 | Not used (e.g., spare for filetask)             |
| DPT4 | HISTO file                                      |
| NDP4 | No output to DPT4 for given MID                 |
| ATND | Attendant console (ATND)                        |
| AFR  | Remote operation                                |
| MAP  | Maintenance and alarm panel.                    |
| SICO | signalling control                              |
| AFR1 | automatic fault report (multiple destination 1) |
| AFR2 | automatic fault report (multiple destination 2) |
| AFR3 | automatic fault report (multiple destination 3) |

### Note

The MAP receives only the component ZUSTAND (state) of the received error message or advisory from SIT.

## Message appearance:

### 1. Full message format

|   |   |   |   |   |   |   |   |   |

## Table for user defined texts (FMTEXT)

This is a table with 30 entries for user defined text per message id (Fxxxx). Each element consists of

- MSG\_ID\_KEY : Code for message identification only 'F' allowed
- MSG\_ID\_NO : Number of the MSG\_ID in the range from 1000 - 9999
- TEXT : textstring of up to 74 characters

## Table for switch functions (SWITCH)

This is a table for the following switch functions (see below)

- IMPTMSG : powerset of devices with IMPTMSG activated
- FILTER : powerset of devices with FILTER activated
- ALLMSG : tpowerset of devices with ALLMSG activated
- SHORTFM : tpowerset of devices with SHORTFM activated

Following are the symbolic devices usable for switch function:

**SIGNL - Error signalling control**

Restrictions

|      |                                                 |
|------|-------------------------------------------------|
| DPT1 | Data processing terminal                        |
| DPT2 | Printer                                         |
| DPT3 | Not used (e.g., spare for filetask)             |
| ATND | Attendant console (ATND)                        |
| AFR1 | automatic fault report (multiple destination 1) |
| AFR2 | automatic fault report (multiple destination 2) |
| AFR3 | automatic fault report (multiple destination 3) |

Note: DPT4 is always ALLMSG and unchangable.

**Error Element Special Table (FST)**

For certain error numbers, it is necessary to ascertain the priorities (important for remote operations) on the basis of the action in question. For this purpose, a local table of signalling tasks (SIT) exists, the administration of which is carried out by the AMO-SIGNL.

Each element (DA\_M\_ST\_FE\_STAB\_ELEM\_STR) of the FST (DAD\_S\_ST\_FE\_STAB) contains the following components:

- MSG\_ID\_NO : Number of the MSG\_ID in the range from 1000 - 9999  
Initialization: DA\_Y\_ST\_E\_KZ\_FE\_STAB
- ACTION : Action of dependability system (DB\_M\_RS\_ACTION\_SET)  
Initialization: DB\_RS\_NO\_ACTION
- AFR\_PRIO : Priority for AFR
  - : 'E' unambiguous error
  - 'M' ambiguous error
  - '1'-'9' Priority
  - Initialization: 'M4'

**175.1 Restrictions**

This description is valid from H300E V2.0

**175.2 Interrelationships**

none

## 175.3 Functions of the AMO

- **ADD-SIGNL** :
  - (TYPE=EVT) Create a new individual message (CD and NO) within a message class (U1020 -> Fxxxx).
  - (TYPE=FST) Create elements in the error element special table.
  - (TYPE=FMTEXT) Create a user defined text to a particular message. This text will be displayed in short format only.
- **ACTIVATE-SIGNL** :
  - (SWITCH=IMPTMSG) The devices entered in this function will forced receive all restart messages and special events, independent of other settings
  - (SWITCH=FILTER) The devices entered in this function will receive service relevant messages only
  - (SWITCH=ALLMSG) The devices entered in this function will receive all messages independent of other settings
  - (SWITCH=SHORTFM) The devices entered in this function will receive messages in short form
- **DEACTIVATE-SIGNL** :
  - (SWITCH=IMPTMSG) Above function for entered devices deactivated
  - (SWITCH=FILTER) Above function for entered devices deactivated
  - (SWITCH=ALLMSG) Above function for entered devices deactivated
  - (SWITCH=SHORTFM) Above function for entered devices deactivated
- **CHANGE-SIGNL** :
  - (TYPE=EVT) Change the data of a defined message class (status, current and configured symbolic devices).
  - (TYPE=MID) Change the data of an error element or a signalling message.
  - (output authorization, priority, current and configured devices).
  - (TYPE=NID) Change the message identification (MID) of an already defined signalling message.
  - (TYPE=FST) Change the priority of elements in the error element special table.
- **DELETE-SIGNL** :
  - (TYPE=EVT) Delete symbolic devices within message classes and/or altogether
  - (TYPE=MID) Delete the symbolic devices of one or more signalling messages.
  - (TYPE=AL) Delete the alarm memory (AL) in the Attendant Console Task (ACT).
  - (TYPE=SIT) Delete the SIT-internal error statistics table.
  - (TYPE=FST) Delete elements from the error element special table.
  - (TYPE=FMTEXT) Delete an element from the FMTEXT table.
- **SET-SIGNL** : Set the current output device to the configured standard device assignment
  - (TYPE=EVT) for one, two or more or all message classes.

## SIGNL - Error signalling control

Functions of the AMO

- **DISPLAY-SIGNL** :
  - (TYPE=MID) for one or more signalling messages;
  - (TYPE=ALL) Display the names (discrete single values of the current implemented message class with specification of numeric values message classes not implemented.
  - (TYPE=EVT, FORMAT=STA) Display the status
  - (FREE, LOCK, UNDEF, OOS) of one, two or more or all message classes.
  - (TYPE=EVT, FORMAT=SEV) Display the error messages allocated to one, two or more or all message classes in table form.
  - (TYPE=MID) Display the the data of an error element for a signalling message:  
Output authorization- S-FREE  
Priority- AFR-PRIO  
current symbolic devices- DEV-ACT  
configured symbolic devices- DEV-KONF
  - (TYPE=SIF) Display the SIT-internal error statistics table.
  - (TYPE=FST) Display elements of the error element special table.
  - (TYPE=LOCKMSG) Display messages that cannot be output for any reason, e.g locked.
  - (TYPE=SYSTEM) Display system status information:
    - state og CCA,CCB,ADP
    - state of reference clock
    - state of failure switchover
    - alarms
  - (TYPE=STATUS) Display settings of IMPTMSG, ALLMSG, FILTER, SHORTFM, user defined FMTEXT, LOCK settings
- **REGENERATE-SIGNL** :
  - Regenerate all settings administered by the AMO-SIGNL.

### 175.3.1 ADD-SIGNL

Assign the following:

- a new individual message (CD and NO) within a message class (U1020 -> Fxxxx);
- elements to the error element special table.
- user defined text for certain MIDs

#### Procedure Overview

| Command Code | Parameter              |
|--------------|------------------------|
| ADD-SIGNL    | TYPE=EVT, EVT=<param>; |

### Command Code

### Parameter

TYPE=FST, NO=<number>, ACTION=<param>, PRI=<param>;

TYP=FMTEXT, CD=<param>, NO=<number>, TEXT=<"textstring">

### Note

The user enters only the EVT parameter and is prompted further in dialog (see actions OUTPUT, INPUT). It contains a table with FET index, FE-NO and associated MID-NR.

Undefined FE elements contain the MID-NR 1020. The FET-IDX can be used to subsequently assign a new MID-NR to these FE elements.

FET-IDX is the start index of the message class in the SDT plus FE-NO.

### Example

1. Assignment of a new MSG code and an MSG number to the error element in the error element table (FET) with index 0061.

Input:

ADD-SIGNL:EVT,OS;

Output:

ADD-SIGNL:EVT,OS;  
H500: AMO SIGNL STARTED

| OS | FET-IDX | FE-NO | MID-NO |

Output:

AMO-SIGNL -... ERROR SIGNALLING CONTROL  
ADD COMPLETED;

### 2. Adding a user defined text

Input:

ADD-SIGNL:F,2468,"this is a user defined text";

Output:

ADD-SIGNL:F,2468,"this is a user defined text";

H500: AMO SIGNL STARTED

AMO-SIGNL -... ERROR SIGNALLING CONTROL  
ADD COMPLETED;

## **175.3.2 ACTIVATE-SIGNL**

Setting of

1. the set of devices that have to get any restart messages and special events independently of other settings (IMPTMSG = important messages).
2. the set of devices that have to get service relevant messages only. Other messages are suppressed (FILTER)
3. the set of devices that have to get all messages independently of other settings (ALLMSG).

- the set of devices that have to get short messages (SHORTFM, see above)

**Prozedure overview**

| Command Code | Parameter                                                                                                                          |
|--------------|------------------------------------------------------------------------------------------------------------------------------------|
| ADD-SIGNL    | SWITCH=IMPTMSG, DEV=<param><br><br>SWITCH=FILTER, DEV=<param><br><br>SWITCH=ALLMSG, DEV=<param><br><br>SWITCH=SHORTFM, DEV=<param> |

**Examples**

- Activating several devices for the switch function FILTER

Input:

```
ACT-SIGNL:FILTER,DPT2&AFR1&AC;
```

Output:

```
ACT-SIGNL:FILTER,DPT2&AFR1&AC;
H500: AMO SIGNL STARTED
```

```
AMO-SIGNL-...      SIGNALLING CONTROL
ACTIVATE COMPLETED;
```

- Activating one device for SWITCH funktion ALLMSG

Input:

```
ACT-SIGNL:ALLMSG,DPT3;
```

Output:

```
ACT-SIGNL:ALLMSG,DPT3;
H500: AMO SIGNL STARTED
```

```
AMO-SIGNL-...      SIGNALLING CONTROL
ACTIVATE COMPLETED;
```

- activating several devices for the switch function SHORTFM

Input:

```
ADD-SIGNL:SHORTFM,DPT1&AC&AFR2&AFR3;
```

Output:

```
ADD-SIGNL:SHORTFM,DPT1&AC&AFR2&AFR3;  
H500:  AMO SIGNL STARTED  
  
AMO-SIGNL-...      SIGNALLING CONTROL  
ACTIVATE COMPLETED;
```

**175.3.3 DEACTIVATE-SIGNL**

Removing

- 1. the entered set of devices for IMPTMSG from SWITCH\_TAB.
- 2. the entered set of devices for FILTER from SWITCH\_TAB.
- 3. the entered set of devices for ALLMSG from SWITCH\_TAB.
- 4. the entered set of devices for SHORTFM from SWITCH\_TAB.

**Prozedurübersicht**

| Kommandocode     | Parameter                    |
|------------------|------------------------------|
| DEACTIVATE-SIGNL | SWITCH=IMPTMSG, DEV=<param>] |
|                  | SWITCH=FILTER, DEV=<param>   |
|                  | SWITCH=ALLMSG, DEV=<param>   |
|                  | SWITCH=SHORTFM, DEV=<param>  |

**Example**

Excluding several devices for switch fuction FILTER

Input:

```
DEACT-SIGNL:FILTER,DPT2&AFR1&AC;
```

Output:

```
DEACT-SIGNL:FILTER,DPT2&AFR1&AC;  
H500:  AMO SIGNL STARTED  
  
AMO-SIGNL-...      SIGNALLING CONTROL  
DEACTIVATE COMPLETED;
```

**175.3.4 CHANGE-SIGNL**

The following data can be changed:

1. the status, current and configured symbolic devices or one, two or more or all message classes;
2. the data of an error element for a signalling message;
3. the message identification (MID);
4. the priority of elements in the error element special table (FST).

### Note

The symbolic devices are added to those already generated.

### Procedure Overview

#### Command Code

CHANGE-SIGNL

#### Parameter

```
TYPE=EVT,EVT=<param>,{[STATE=<param>],[ASD=<param>]
,[CSD=<param>]};

TYPE=MID,CD=<param>,NO=<number>,{[OUT=<param>]
,[PRI=<param>],[ASD=<param>],[CSD=<param>]};

TYPE=NID,OLDCD=<param>,OLDNO=<number>
,NEWCD=<param>,NEWNO=<number>;

TYPE=FST,NO=<number>,ACTION=<param>,PRI=<param>;
```

### Example

Change the priority of error message 3062 to E4.

Input:

```
CHANGE-SIGNL:MID,F,3062,,E4;
```

Output:

```
CHANGE-SIGNL:MID,F,3062,,E4;
H500: AMO SIGNL STARTED
```

```
AMO-SIGNL -... ERROR SIGNALLING CONTROL
CHANGE COMPLETED;
```

## 175.3.5 DELETE-SIGNL

Delete the following:

1. symbolic devices within message classes and/or altogether
2. symbolic devices of one or more signalling messages
3. the alarm memory in the Attendant Console Task

**SIGNL - Error signalling control**

Functions of the AMO

- 4. the SIT-internal error statistics table
- 5. elements from the error element special table (FST)
- 6. a user defined text for a particula message ID

**Notes**

If the value ALL is specified in the parameter ASD and/or CSD when canceling symbolic devices, all generated devices are canceled.

**Procedure Overview**

| Command Code | Parameter                                                           |
|--------------|---------------------------------------------------------------------|
| DELETE-SIGNL | TYPE=EVT,EVT=<param>,{ [ASD=<param>],[CSD=<param>]};                |
|              | TYPE=MID,CD=<param>,NO=<number>,{ [ASD=<param>]<br>,[CSD=<param>]}; |
|              | TYPE=AL;                                                            |
|              | TYPE=SIF;                                                           |
|              | TYPE=FST,NO=<number>,[ACTION=<param>];                              |
|              | TYPE=FMTEXT,CD=<param>,NO=<number>                                  |

**Example**

Delete the SIT-internal error statistics table.

Input:

DELETE-SIGNL:SIF;

Output:

DELETE-SIGNL:SIF;  
H500: AMO SIGNAL STARTED  
  
AMO-SIGNL -... ERROR SIGNALLING CONTROL  
DELETE COMPLETED;

**175.3.6 SET-SIGNL**

Set the current output devices to the configured standard device assignment

- 1. for one, two or more or all message classes;
- 2. for one. two or more signalling messages.

## Procedure Overview

### Command Code

SET-SIGNL

### Parameter

TYPE=EVT, EVT=<param>;

TYPE=MID, CD=<param>, NO=<number>;

### Example

Set the current output device to the configured standard device assignment for error message 3062.

Input:

SET-SIGNL:MID, F, 3062;

Output:

SET-SIGNL:MID, F, 3062;  
H500: AMO SIGNL STARTED

AMO-SIGNL -... ERROR SIGNALLING CONTROL  
SET COMPLETED;

## 175.3.7 DISPLAY-SIGNL

The following can be displayed:

1. the numeric values of message classes (TYPE = ALL);
2. the status of a message class (TYPE = EVT, FORMAT = STA);
3. the error elements of a message class (TYPE = EVT, FORMAT = SEV);
4. the data of an error element for a signalling message (TYPE = MID);
5. the SIT-internal error statistics table (TYPE = SIF);
6. elements of the error element special table (TYPE = FST).
7. the current STATUS of SWITCH\_TAB, FMTEXT table, action per message ID, locked message IDs
8. the current system state of the system as CCA, CCB, ADP state, ref clock state, alarms and state of failure switchover

## Procedure Overview

### Command Code

DISPLAY-SIGNL

### Parameter

TYPE=ALL;

| Command Code | Parameter                              |
|--------------|----------------------------------------|
|              | TYPE=EVT, EVT=<param>, FORMAT=<param>; |
|              | TYPE=MID, CD=<param>, NO=<number>;     |
|              | TYPE=SIF;                              |
|              | TYPE=FST, [NO=<number>];               |
|              | TYPE=STATUS;                           |
|              | TYPE=SYSTEM;                           |

**Examples**

1. Displaying the numeric values of message classes.

Input:

DISPLAY-SIGNL:ALL;

Output:

DISPLAY-SIGNL:ALL;  
H500: AMO SIGNL STARTED

NAMES AND VALUES OF MESSAGE CLASSES:

|                                                         |          |  |      |  |        |  |      |  |
|---------------------------------------------------------|----------|--|------|--|--------|--|------|--|

AMO-SIGNL -...   ERROR SIGNALLING CONTROL
REGENERATE COMPLETED;

```

(\*1) Using this delete command, all symbolic devices for all messages are canceled. This is necessary, since only those devices which would otherwise remain in the standard data base can be added with the CHANGE function.

## **SIGNL - Error signalling control**

### Parameter Description

|                 |                                                                                 |
|-----------------|---------------------------------------------------------------------------------|
| IDX             | Index of events in the FET (fault element table)                                |
| Type of Input   | : Single value, mandatory                                                       |
| Possible Values | : 0000 - 9999                                                                   |
| NEWCD           | New message key code                                                            |
| Type of Input   | : Single value, mandatory                                                       |
| Possible Values | : A (alarm message)                                                             |
|                 | B (begin message)                                                               |
|                 | E (end message)                                                                 |
|                 | F (error message)                                                               |
|                 | I (integrity message; positive)                                                 |
|                 | M (miscellaneous inf. message; advisory)                                        |
|                 | U (undefined error element)                                                     |
| NEWNO           | New fault number                                                                |
| Type of Input   | : Single value, mandatory                                                       |
| Possible Values | : See volume on Dependability<br>A30950-S37-X110-*-20, Section 6                |
| NO              | Message number                                                                  |
| Type of Input   | : Chained single values, ranges,<br>mandatory<br>optional (DISPLAY of type FST) |
| Possible Values | : See volume on Dependability<br>A30950-S37-X110-*-20, Section 6                |
| OLDCD           | Old message key code                                                            |
| Type of Input   | : Single value, mandatory                                                       |
| Possible Values | : A (alarm message)                                                             |
|                 | B (begin message)                                                               |
|                 | E (end message)                                                                 |
|                 | F (error message)                                                               |
|                 | I (integrity message; positive)                                                 |
|                 | M (miscellaneous inf. message; advisory)                                        |
|                 | U (undefined error element)                                                     |
| OLDNO           | Old message number                                                              |
| Type of Input   | : Single value, mandatory                                                       |

|        |                                       |
|--------|---------------------------------------|
| NID    | = New Message Identification          |
| SIF    | = SIT-internal fault statistics table |
| STATUS | Status information                    |
| SYSTEM | SYSTEM information                    |

#### **Parameter Groups**

Parameter groups have been defined in the following actions:

- CHANGE (TYPE=EVT): parameters STATE, ASD and CSD;
- CHANGE (TYPE=MID): parameters OUT, PRI, ASD and CSD;
- DELETE (TYPE=EVT, MID): parameters ASD and CSD;
- ACTIVATE : parameter DEV
- DEACTIVATE: parameter DEV

At least one parameter must be specified in each case.

# 178 SONUS - Daylight Saving / Standard Time Switchover

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

Switchover from standard time to daylight saving time (DLS) and vice versa is handled by a resident task. This task has three function-modes:

- **Automatic**  
the task computes the switchover-dates itself according to the directives of the European Community (EU) regarding DLS / standard time switchover (last Sunday in March and September respectively), or to the US-directives (first Sunday in April and last Sunday in October), depending on the program system loaded to the actual switch.
- **Read from file;**  
the task is processing the dates contained in a table situated in a file on the hard disc of the system (switchover table).  
This mode is used, when the switchover dates differ from the standard valid for the region, to which the program system refers (see above).
- **Deactivated;**  
the task is inoperative.

Normally, no switchover table is existing in the system, the task is operating in the automatic mode.

The AMO SONUS serves to maintain the switchover table, and to adjust the function mode of the resident task.

The table can hold up to 20 switchover dates. Accordingly, the system can be preset for ten years at two switchovers a year (in function mode "read from file").

## 178.1 Interrelationships

- **AMO DATE** : Altering system date and/or time

### 178.2 Functions of the AMO

- **ADD-SONUS** : Installing/changing the table of switchover dates
- **DISPLAY-SONUS** : Displaying the table of switchover dates
- **SWITCHOVER-SONUS** : Switchover the function mode of the resident task
- **REGENERATE-SONUS** : Regenerate the table of switchover dates.

#### 178.2.1 ADD-SONUS

Installing/changing the table of switchover dates.

The table containing the switchover dates is read. If there is no file containing the table, one will be created by AMO SONUS.

The AMO checks, if the date is logically correct, and if it is older than the date obtained from the system time. One switchover to daylight saving and one to standard time is permitted for each year. The date specified in the AMO call is entered at the correct place in the switchover data. If a similar switchover has already been entered for this year, it will be overwritten.

To warrant the correct function of the time-switchover, all entries should be valid for the same hemisphere. The first entry lays down the hemisphere, for which the table is valid. All consecutive entries are checked against this first entry for validity.

The table will hold up to 20 switchover dates. Old dates are removed in every ADD. Dates more than nine years in advance of the year of the system time are rejected.

If there's no valid system time, no switchovers can be entered.

For a faultless operation of the DLS / standard time switchover, the entries to DLS and standard time should follow each other in alternating order. The AMO therefore checks whether the preceding entry is the logical reversal in the opposite direction.

When daylight saving time reverts to standard time, the period between 02:00 and 03:00 hours runs twice. To avoid mistakes, you are not allowed to change the time table during this period on the day of switchover.

## Procedure Overview

| Command Code | Parameter                                                      |
|--------------|----------------------------------------------------------------|
| ADD-SONUS    | YEAR=<number>, MONTH=<number>, DAY=<number><br>, TYPE=<param>; |

## Examples

1. Installing a switchover to standard time

Input:

```
ADD-SONUS:1988,09,25,STD;
```

2. Installing a switchover to daylight saving time

Input:

```
ADD-SONUS:1989,03,26,DLS;
```

## Note:

If the table is created by the AMO, the function mode is set to "read from file".

## 178.2.2 DISPLAY-SONUS

Displaying the table of switchover dates.

The table is read and the switchover dates found are compared with the date from the system. The output only shows dates that haven't yet expired. If no valid dates are found or if there is no such table, message H3 will be output.

If the function mode is set to AUTOMATIC, the message H4 will be output.

For each year, one line is output. The first column contains the switchover dates to daylight saving, the second those to standard time. If one of these dates is missing, its field will be left blank. If there are no entries for a certain year, there'll be no output for it.

## Procedure Overview

| Command Code  | Parameter |
|---------------|-----------|
| DISPLAY-SONUS | ;         |

## SONUS - Daylight Saving / Standard Time Swchover

Functions of the AMO

### Example

Displaying the swchover table

Input:

```
DISPLAY-SONUS;
```

Output:

| SWITCHOVER TO<br>DAYLIGHT SAVING |  | STANDARD TIME |
|----------------------------------|--|---------------|
| 1988-03-27                       |  | 1988-09-25    |
| 1990-03-25                       |  |               |
| 1991-03-24                       |  | 1991-09-29    |
|                                  |  | 1992-09-27    |
| SWITCHOVER TIME                  |  |               |
| 02:00 HRS                        |  | 03:00 HRS     |

ADJUSTED FUNCTION MODE OF SONUS - TASK : AUTOMATIC

H04: US-STANDARD APPLIES FOR THE AUTOMATIC TIME-SWITCHOVER.

### 178.2.3 SWITCHOVER-SONUS

Change the function mode of the swchover task.

Three different modes can be chosen from:

- HD : read the swchover dates from the table in a hard disk file;
- AUTO : the task computes the swchover dates
  - according to the directives of the European Community (EU) regarding DLS / standard time swchover in european program systems  
(DEVELOPMENT LINE = EUROPE DEVELOPMENT at DISPLAY-DBC;)
  - according to US-standard on american program systems  
(DEVELOPMENT LINE = US DEVELOPMENT at DISPLAY-DBC;)
- OFF : the task is deactivated

The AMO reads the table and the swchover mark will be changed according to the input.

If there is no SONUS-file on the hard disk, one will be created, similar to the ADD branch. The table of swchover dates will be initialised with dummy information. Thereafter the swchover mark will be adjusted according to the input command.

**Procedure Overview**

| Command Code     | Parameter      |
|------------------|----------------|
| SWITCHOVER-SONUS | FUNCT=<param>; |

**Example**

Switch over the resident task to automatic

Input:

SWITCHOVER-SONUS:AUTO;

Output:

H04: US-STANDARD APPLIES FOR THE AUTOMATIC TIME-SWITCHOVER.

**178.2.4 REGENERATE-SONUS**

Regenerate the table of switchover dates

The file is read and the switchover dates found are compared with the date from the system. The output only shows dates that haven't yet expired. If no valid dates are found or if there is no such table, message H3 will be output.

After all dates have been processed, the AMO adjusts the switchover mark by generation of a SWITCHOVER command (on new installation of the file it is set to "read from file").

**Procedure Overview**

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-SONUS | ;         |

**Example**

Regenerate the switchover table

Input:

REGENERATE-SONUS;

Output:

ADD-SONUS:1988,3,27,DLS;  
ADD-SONUS:1988,9,25,STD;  
ADD-SONUS:1990,3,25,DLS;  
ADD-SONUS:1991,3,24,DLS;  
ADD-SONUS:1991,9,29,STD;  
ADD-SONUS:1992,9,27,STD;  
SWITCHOVER-SONUS:AUTO;

| YEAR  | Date - Year                                                                              |                                                                                                                                                                                                                                                                                                                                                                              |
|       | Type of Input                                                                            | : Single value, mandatory                                                                                                                                                                                                                                                                                                                                                    |
|       | Possible Values                                                                          | : 1988 - 2079                                                                                                                                                                                                                                                                                                                                                                |

## 178.4 Error Messages and Advisories

### 178.4.1 Error Messages

F01: DATE INVALID.  
 F02: THE ENTERED SWITCHOVER DATE IS IN THE PAST.  
 F03: SWITCHOVER ON SWITCH DAY NOT POSSIBLE BETWEEN <time> AND <time> HOURS.  
 F04: SWITCHOVER DATA ENTRY ONLY POSSIBLE 10 YEARS IN ADVANCE  
 F05: DATE/TIME NOT ASSIGNED IN SYSTEM.  
 F06: THE FILE CONTAINING THE SWITCHOVER DATA IS NOT ON SYSTEM HARD DISK.  
 F07: ACCESS TO THE FILE OF SWITCHOVER DATA IS NOT POSSIBLE, AS THE AREA CONTAINING THE FILE IS LOCKED.  
 ACTIVATE WITH: "  
 F08: THE COMBINATION OF VALUES ENTERED FOR THE PARAMETERS "MONTH" AND "TYPE" DOES NOT LOGICALLY MATCH THE PRESENT TABLE OF SWITCHOVER DATES.  
 F09: DMS ERROR ON ACCESS TO ":AMD:SONUS/UZTAB". DMS STATUS @@@@.

## SONUS - Daylight Saving / Standard Time Switchover

### Error Messages and Advisories

#### Note:

If there are no valid entries in the table of switchover dates, there are no restrictions regarding month and changeover type. The first entry determines the validity of the table for the northern or southern global hemisphere (e.g. switchover to DLS in January - June -> northern hemisphere, switchover to DLS in July - December -> southern hemisphere). Thereafter only entries for the same hemisphere are possible.

### 178.4.2 Advisories

- H01: FOR <date>, A SWITCHOVER TO <type> HAS ALREADY BEEN ENTERED.  
(The date output in the message is overwritten.)
- H02: FOR <year>, NO SWITCHOVER TO <type> HAS BEEN ENTERED.  
(The AMO checks whether the preceding entry is the logical predecessor.)
- H03: NO VALID ENTRIES WERE FOUND IN THE SWITCHOVER TABLE.  
(The file on the hard disk does not exist or doesn't contain any valid switchover dates.)
- H04: <region>-STANDARD APPLIES FOR THE AUTOMATIC TIME-SWITCHOVER.
- H05: THE CONFIGURATION TABLE OF THE SYSTEM COULD NOT BE READ.

### 178.4.3 List of abbreviations

- |          |                                          |
|----------|------------------------------------------|
| <date>   | Date consisting of year, month, day      |
| <region> | EU or US (see chapter SWITCHOVER-SONUS)  |
| <time>   | Time in hours and minutes (e.g. 02:00)   |
| <type>   | Type of switchover (DLS / STANDARD TIME) |
| <year>   | Year of changeover                       |

# 179 SPES - Supervision Parameters of External Servers

|                                    |                                       |                                             |
|------------------------------------|---------------------------------------|---------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error and advisory messages</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                             |

The AMO "Supervision Parameters of External Servers" (SPES) handles the database for external servers respectively switches the states of supervision.

## 179.1 Restrictions

This description is valid from SP300-Rel6.3

## 179.2 Interrelationships

- There are no interrelationships to other AMOs.

## 179.3 Functions of the AMO

- [ADD-SPES](#) : Adding an external server in the database
- [DELETE-SPES](#) : Deleting an external server in the database
- [ACTIVATE-SPES](#) : Activating supervision of an external server
- [DEACTIVATE-SPES](#) : Deactivating supervision of an external server
- [DISPLAY-SPES](#) : Displaying the content of database for all added external servers
- [REGENERATE-SPES](#) : Regenerating the adding commands from database

### 179.3.1 ADD-SPES

For the specified ESID (Identification number of external server) - the allowed range will be "U4" to "U7" - the supervision time period can be added. This period is within the range 3 to 1000 minutes. If the parameter PERIOD is not specified the AMO will add the default value of 3 min.

#### Procedure Overview

| Command Code | Parameter                        |
|--------------|----------------------------------|
| ADD-SPES     | ESID=<param>, [PERIOD=<number>]; |

#### Examples

1. Adding default time period for external server U4 :

Input:

```
ADD-SPES:U4;
```

2. Adding time period 10 minutes for external server U5 :

Input:

```
ADD-SPES:U5,10;
```

### 179.3.2 DELETE-SPES

The database entry of the specified external server will be deleted.

#### Procedure Overview

| Command Code | Parameter     |
|--------------|---------------|
| DELETE-SPES  | ESID=<param>; |

#### Example

1. Deleting external server U5 from database :

Input:

```
DEL-SPES:U5;
```

### 179.3.3 ACTIVATE-SPES

The external server specified by parameter ESID will be activated.

**Procedure Overview**

| Command Code  | Parameter     |
|---------------|---------------|
| ACTIVATE-SPES | ESID=<param>; |

**Example**

1. Activating supervision of external server U4 :

Input:

ACT-SPES:U4;

**179.3.4 DEACTIVATE-SPES**

The external server specified by parameter ESID will be deactivated.

**Procedure Overview**

| Command Code    | Parameter     |
|-----------------|---------------|
| DEACTIVATE-SPES | ESID=<param>; |

**Example**

1. Deactivating supervision of external server U4 :

Input:

DEACT-SPES:U4;

**179.3.5 DISPLAY-SPES**

The content of database will be displayed for added external servers.

**Procedure Overview**

| Command Code | Parameter        |
|--------------|------------------|
| DISPLAY-SPES | [ESID=<param>] ; |

**Examples**

1. Display database entry of external server U6 :

Input:

DISPL-SPES:U6;

Output:

SPES - Supervision Parameters of External Servers

Parameter Description

|      |         |          |
|------|---------|----------|
| ESID | PERIOD  | STATE    |
| U6   | 321 MIN | DEACTIVE |

2. Displaying all added external servers of database :

Input:

DISPL-SPES;

Output:

|      |          |          |
|------|----------|----------|
| ESID | PERIOD   | STATE    |
| U4   | 3 MIN    | DEACTIVE |
| U6   | 321 MIN  | DEACTIVE |
| U7   | 1000 MIN | ACTIVE   |

179.3.6 REGENERATE-SPES

The content of database will be regenerated as add commands, the states of external servers will not be regenerated.

Procedure Overview

|                 |           |
|-----------------|-----------|
| Command Code    | Parameter |
| REGENERATE-SPES | ;         |

Example

1. Regenerating the content of database :

Input:

REGEN-SPES;

Output:

ADD-SPES:U4,3;  
ADD-SPES:U6,321;  
ADD-SPES:U7,1000;

179.4 Parameter Description

|               |                                                                 |
|---------------|-----------------------------------------------------------------|
| ESID          | Identification number of external server                        |
| Type of Input | : Single value<br>mandatory (ADD, DELETE, ACTIVATE, DEACTIVATE) |

|                 |                                                |                       |                     |
|-----------------|------------------------------------------------|-----------------------|---------------------|
|                 |                                                | optional<br>(DISPLAY) |                     |
| Possible Values | : U4                                           |                       | = External server 1 |
|                 | U5                                             |                       | = External server 2 |
|                 | U6                                             |                       | = External server 3 |
|                 | U7                                             |                       | = External server 4 |
| PERIOD          | Time period for supervision of external server |                       |                     |
| Type of Input   | : Single value                                 |                       |                     |
|                 | optional (ADD)                                 |                       |                     |
| Possible Values | : Time in minutes (3-1000)                     |                       |                     |
| Default Value   | : 3 min                                        |                       |                     |

## 179.5 Error and advisory messages

### 179.5.1 Error Messages

```

F01: EXTERNAL SERVER U<number> HAS ALREADY BEEN ADDED
F02: SUPERVISION FOR EXTERNAL SERVER U<number> IS IN PROGRESS, PLEASE DEACTIVATE
    FIRST
F03: EXTERNAL SERVER U<number> IS NOT ADDED IN DATABASE
F04: RESOURCES ARE NOT AVAILABLE, INTERNAL STATUS: <number>
F05: SUPERVISION FOR EXTERNAL SERVER U<number> IS ALREADY IN PROGRESS
F06: SUPERVISION FOR EXTERNAL SERVER U<number> IS ALREADY DEACTIVATED

```

The internal status at message F04 can get one of following values :

- 1 ... Interface mailbox is not available
- 2 ... No memory for internal messages available
- 3 ... No send message could be done

### 179.5.2 Advisories

```

H01: NO EXTERNAL SERVER ADDED IN DATABASE
H02: EXTERNAL SERVER U<number> IS NOT ADDED IN DATABASE
H03: AMO IS STILL WAITING, OTHER DUTY IN PROGRESS

```

## **SPES - Supervision Parameters of External Servers**

Error and advisory messages

## 180 SSC - Special Subscriber (Station) Configuration

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
|                    | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

With AMO SSC (Special Station Configuration) it is possible to create, cancel, interrogate and regenerate data for the terminal connections "MSGR" (= messenger), "GENANS" (= general answering), "CC" (= answering station terminal connection for single code calling system), "VMXMWI" (= message waiting information) and "EXTANN" (= external announcement), which together are referred to as "special stations".

*Special stations* cannot be changed. They can only be cancelled and recreated.

The special 'station numbers' (henceforth 'STNO') are exclusively A&M administration numbers. Therefore, they are not created in the digit evaluation tables or in the STNO-LODEN conversion tables. small

- The terminal connection MSGR can be allocated to an executive/ secretary system from a DIGITE 260 by way of a check of this exec/ sec system or it can be assigned to one or more executive/secretary systems from an operator terminal by means of AMO-ZIEL. Messenger calls (MSGR) are activated by members of executive/ secretary systems by pressing the messenger call key on the voice terminal.
- Calls to the corresponding attendant console group (ACGR) are routed to terminal connection GENANS when night variant "trunk answer" is active. Ringing is applied at this terminal connection. However, the signal is not sent to a specific telephone set, but to ringers which can be heard over a wide area. The call can be taken at any telephone set by dialing a code. A maximum of 16 GENANS terminal connections are provided; these can be allocated to the ACGR as desired.
- A caller can page an absent called party with the single CC facilities by suffix-dialing a code. The paging inlet is connected to an ACC (adapter circuit for special devices). The answer inlet is connected to the terminal connection CC. By dialing the answer code from any telephone set, the called party can set up the connection to the calling party via the CC. The paging code and the answer code are linked (with respect to the relevant data) by means of AMO-RICHT.
- To transfer the mailbox information to the extensions of its node a server connected via a Common Voice Mail Interface (VMX) requires an SLMA terminal connection that has been configured like an anate

## SSC - Special Subscriber (Station) Configuration

### Interrelationships

but cannot be dialed by other subscribers. The server seizes the system via the terminal connection and transfers the mailbox information to the mailbox LED of the subscriber using code points MWION and MWIOFF. The server is allocated to the Common Voice Mail Interface by means of AMO SA. A maximum of 10 of these special terminal connections can be configured at any one node.

- To get the possibility to make external announcements (=EXTANN), there will be a configuration at a SLMA/SLMA1/SLMA24. Each such announcement will get 1 or max. 16 special signals, to make sure to get the right announcement later on.

At the ports at which a special station is to be set up, an SLMA, SLMA1 or SLMA24 must have been created by means of AMO-BCSU.

AMO-SSC has enhanced with a new parameter LTU to assign certain CPTONs of external announcement to certain LTUs.

If parameter LTU is not specified, all configured LTUs in the whole range from 1 to 99 are marked as assigned (for HHS it means 1 to 15 and for AP range it means each configured LTU).

In case LTU parameter is specified, all given LTUs in the AP range are considered as far as the concerning AP is configured. For HHS range it means that only one LTU in this range leads to the configuration of all 15 LTUs.

## 180.1 Interrelationships

- AMO BCSU : Configure mounting location for module in SWU
- AMO DSSU : Device switch of switching unit
- AMO NAVAR : Administration of static night variants
- AMO RICHT : Route
- AMO SA : Hunting group
- AMO ZIEL : Destination addresses for stations

## 180.2 Functions of the AMO

- [ADD-SSC](#) : Create a special station
- [DELETE-SSC](#) : Cancel a special station
- [DISPLAY-SSC](#) : Interrogate all special stations

- **REGENERATE-SSC** : Regenerate all special stations

## 180.2.1 ADD-SSC

The parameter PEN (= port) designates the terminal connection at which the special station is connected. If the PEN parameter is not entered, the system is searched for an available port.

The entered parameters cannot be altered.

A special station can only be cancelled and newly created.

### Procedure Overview

| Command Code | Parameter                                                                                                                     |
|--------------|-------------------------------------------------------------------------------------------------------------------------------|
| ADD-SSC      | [PEN=<gg-uu-bbb-ss>]<br>,TYPE=MSGR,MSGRNO=<number> (1)<br>, [COFIDX=<number>], [INS=<param>];                                 |
|              | TYPE=GENANS,UNANO=<number> (2)<br>, [COFIDX=<number>], [INS=<param>];                                                         |
|              | TYPE=CC,CCNO=<number> (3)<br>, [COFIDX=<number>], ITR=<number>, [INS=<param>];                                                |
|              | TYPE=VMXMWI,MSTNO=<number> (4)<br>, [COFIDX=<number>], COS=<number><br>, LCOSV1=<number>, [DPLN=<number>]<br>, [INS=<param>]; |
|              | TYPE=EXTANN,CPCALL=<param> (5)<br>, [COFIDX=<number>], [CLASSMRK=<param>];<br>, [LTU=<number>];                               |

### Examples

1. Create and put into service a messenger station with STNO 101. An available port is to be allocated by the AMO.

Input:

```
ADD-SSC:,MSGR,101,,Y;
```

Output:

```
H01: THE MSGR USER 101 WAS ADDED IN LOCATION 1-1-1-1.
```

2. Create a CC station with STNO 9 at port 1-1-1-0, allocate to traffic relations group 15 and put into service.

## SSC - Special Subscriber (Station) Configuration

### Functions of the AMO

Input:

ADD-SSC:1-1-1-0,CC,9,0,15,Y;

Output:

H01: THE CC USER 9 WAS ADDED IN LOCATION 1-1-1-0.

3. Create an EXTANN station with CPCALL=EXTDTN, the PEN will be searched by AMO.

Input:

ADD-SSC:,EXTANN,EXTDTN,1,;

Output:

H05: AT LOCATION 1-4-79-1, THE EXTANN USER WITH THE FOLLOWING CP  
CALL TONES  
WAS ADDED:  
EXTDTN

4. To the EXTANN station at port 1-4-79-1 will be added the CP-Calls INTDTN and BUSY. Reset classmarks to EC&G711.

Input:

ADD-SSC:1-4-79-1,EXTANN,INTDTN&BUSY,EC&G711;

Output:

H08: TO THE EXTANN SUBSCRIBER AT LOCATION 1-4-79-1,  
THE FOLLOWING CPCALL TONES HAVE BEEN ADDED:  
INTDTN&BUSY

## 180.2.2 DELETE-SSC

A messenger station can be cancelled only if it is not allocated to an executive/secretary system.

A GENANS terminal connection can be cancelled only if it is not allocated to a night variant.

A CC answer station can be cancelled only if it is not allocated to a single CC.

A VMXMWI messenger station can be cancelled only if it is not allocated to the server.

The special stations to be cancelled must be released by means of the corresponding AMOs.

These are:

- MSGR with AMO ZIEL
- GENANS with AMO NAVAR the entire night variant to which the GENANS location is allocated must be cancelled.

- CC with AMO RICHT the route must be cancelled because the CC answer station is connected to the ACC.
- VMXMWI with AMO SA the allocation to the server (entries in Call Type Table) must be cancelled.

Prior to cancellation, a special station must be blocked manually by means of AMO DSSU.

It is possible to cancel only special CP-Calls of one EXTANN user and this user still will exist or to cancel a whole EXTANN user with all his CP-Calls.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                             |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DELETE-SSC   | TYPE=MSGR,MSGRNO=<number>;<br><br> TYPE=GENANS,UNANO=<number>;<br><br> TYPE=CC,CCNO=<number>;<br><br> TYPE=VMXMWI,MSTNO=<number>;<br><br> TYPE=EXTANN,CPCALL=<param>, [LTU=<number>]; |

### Examples

1. Cancel CC station with STNO 9. Because the CC station is in operation, it must first be blocked by means of AMO-DSSU.

Input:

```
DEACTIVATE-DSSU:DI,PEN,1-1-1-0;
```

Output:

```
H03: SLMA 1.1.1.0 DEACTIVATED (AMO)
```

Input:

```
DELETE-SSC:CC,9;
```

Output:

```
H02: CC USER 9 HAS BEEN DELETED.
```

2. Cancel EXTANN with CPCALL=EXTDTN.

Input:

```
DELETE-SSC:EXTANN,EXTDTN;
```

Output:

SSC - Special Subscriber (Station) Configuration

Functions of the AMO

H06: THE EXTANN USER WITH CPCALL=EXTDTN HAS BEEN DELETED.

3. Cancel the CPCALL=INTDTN of an EXTANN.

Input:

DELETE-SSC:EXTANN,INTDTN;

Output:

H07: THE CPCALL=INTDTN HAS BEEN DELETED.

180.2.3 DISPLAY-SSC

Procedure Overview

| Command Code | Parameter                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-SSC  | TYPE=MSGR;<br><br>  TYPE=GENANS;<br><br>  TYPE=CC;<br><br>  TYPE=VMXMWI;<br><br>  TYPE=EXTANN, [LTU=<number>];<br><br>  TYPE=ALL; |

Example

Interrogate all special stations.

Input:

DISPLAY-SSC:ALL;

Output:

|         |        |        |      |        |            |            |      |            |  |  |
|---------|--------|--------|------|--------|------------|------------|------|------------|--|--|
| +-----+ |        |        |      |        |            |            |      |            |  |  |

## 180.2.4 REGENERATE-SSC

### Procedure Overview

| Command Code   | Parameter                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| REGENERATE-SSC | TYPE=MSGR;<br><br>  TYPE=GENANS;<br><br>  TYPE=CC;<br><br>  TYPE=VMXMWI;<br><br>  TYPE=EXTANN, [LTU=<number>];<br><br>  TYPE=ALL; |

### Example

Regenerate all special stations.

Input:

REGEN-SSC:ALL;

Output:

```

ADD-SSC: 1-1-1-1, MSGR, 101, 0, Y;
ADD-SSC: 1-1-13-15, CC, 8, 0, 15, Y;
ADD-SSC: 1-1-13-12, VMXMWI, 10, 0, 10, 1, 0, Y;
ADD-SSC: 1-1-1-0, CC, 9, 0, 15, Y;
ADD-SSC: 1-4-79-1, EXTANN, EXTDTN&INTDTN&BUSY, 1, EC&G711;
  
```

## 180.3 Parameter Description

|      |                                                                                                                                                                            |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CCNO | Code calling access code (STNO of the CC terminal connection)<br>The CCNO must not be assigned yet. The size of the STNO range depends on the maximum number of single CC. |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## SSC - Special Subscriber (Station) Configuration

### Parameter Description

Type of Input : single value, mandatory  
Possible values : 0 - 9

#### CLASSMRK DNIL classmarks (for feature IPDA)

Type of Input : max. 4 single values, concatenated with '&', optional (ADD)

|         |                                                   |
|---------|---------------------------------------------------|
| VAD     | voice activity detection                          |
| EC      | echo cancellation                                 |
| G711    | no voice compression, according to G.711          |
| G729    | voice compression (mandatory) according to G.729A |
| G729OPT | voice compression (optional) according to G.729A  |
| INIT    | initialisation of classmarks to default           |
| NONE    | deactivation of all classmarks                    |

Default Value EC&G711&G729OPT

#### COFIDX Index of COFI data file to be loaded (index of a data block with which the SICOFI components must be loaded on an SLMA)

Type of Input : single value, optional  
Possible values : 0- data block for short lines ( $L < 100$  m)  
1- data block for lines of medium length ( $100 \text{ m} < L < 1000$  m)  
2- data block for long lines ( $L > 1000$  m)  
Default Value : 0

#### COS Class of service

Type of Input : single value, mandatory  
Possible values : 0 - 1199

#### CPCALL HICOM-signal. Every CPCALL belongs to one EXTANN.

Type of Input : single value, 1 to max. 16 values, optional (ADD, DELETE)

Possible values :

|          |                                       |
|----------|---------------------------------------|
| ALERT    | notification/alert tone,              |
| ANNICPT  | announcement for attendant intercept, |
| BONHK    | B party on hook,                      |
| BUSY     | busy tone,                            |
| CAMP     | knocking/camp-on/call waiting tone,   |
| CBKALERT | call back alert tone,                 |
| CONFTN   | conference tone,                      |

## SSC - Special Subscriber (Station) Configuration

### Parameter Description

|          |                                    |
|----------|------------------------------------|
| CONG     | congestion tone,                   |
| DATA     | data tone,                         |
| DND      | do not disturb tone,               |
| EXTDTN   | external dial tone,                |
| EXTDTN2  | secondary CO dial tone,            |
| FRNGBK   | first burst of ringback tone,      |
| HOLDLINE | hold the line please               |
| NOPO     | not possible,                      |
| IMPOSSFM | impossible for the moment,         |
| INTDTN   | internal dial tone,                |
| KNCONF   | camp-on tone for conference,       |
| LOCANN   | local announcement,                |
| MUSIC    | music on hold,                     |
| MWI      | message waiting information,       |
| NACK     | negative acknowledgement tone,     |
| NODIAL   | timeout tone if digits not dialed, |
| NOTALWD  | not allowed,                       |
| NOTREACH | not reachable,                     |
| NU       | number obtainable tone,            |
| OVR      | automatic override tone,           |
| OVRTN    | override tone,                     |
| OVRWARN  | override warning tone,             |
| PACK     | positive acknowledgement tone,     |
| PACKWD   | positive ack. tone with dialing,   |
| REORDER  | reorder tone,                      |
| RNGBK    | ringback tone,                     |
| RTO      | RTO test tone,                     |
| SPEC     | special dial tone,                 |
| TEST     | test tone,                         |
| VOICEMAL | voice mail,                        |
| HOLD     | call waiting tone                  |
| DISCTONE | disconnect tone                    |
| HOLDEXT  | holdtone external                  |
| HOLDH1   | holdtone hold 1                    |
| HOLDH2   | holdtone hold 2                    |
| HOLDINT  | holdtone internal                  |
| HOLDCC   | holdtone for code calling syst.    |
| HOLDHT   | holdtone for hunting group         |
| FCAMP    | first camp on tone                 |

## SSC - Special Subscriber (Station) Configuration

### Parameter Description

|          |                               |
|----------|-------------------------------|
| HOLDHT   | call monitoring alerting tone |
| CCMABSEN | ccm tracer in rack            |

|        |                                                                                                                                                                                                                                                 |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DPLN   | Dial plan group<br>Type of Input : single value, optional<br>Possible values : 0 - 15<br>Default Value : 0                                                                                                                                      |
| INS    | Station in service?<br>(putting the terminal connection into service by means of the centralized device status administration)<br>Type of Input : single value, optional<br>Possible values : Y, N<br>Default Value : Y                         |
| ITR    | Internal traffic restriction group / closed user group<br>Type of Input : single value, mandatory<br>Possible values : 0 - 15                                                                                                                   |
| LCOSV1 | LCR class of service 1<br>Type of Input : single value, mandatory<br>Possible values : 1 - 32                                                                                                                                                   |
| LTU    | LTU Number<br>Type of Input : 1 to 4 single values, concatenated with & or &&, optional<br>Possible values : numeric, 1-15, 17-99                                                                                                               |
| MSGRNO | Messenger station number<br>The MSGRNO must not be assigned yet.<br>The MSGRNO must not be greater than the STNO + the maximum number of executive/secretary systems.<br>Type of Input : single value, mandatory<br>Possible values : 101 - 999 |
| MSTNO  | VMX message waiting information station number<br>Type of Input : single value, mandatory<br>Possible values : 0 - 9                                                                                                                            |

**PEN** Port equipment number of station  
(terminal connection of the special station: LTG-LTU-SLOT-CCT)  
If an entered module is not specified within the "6" grouping, it is automatically corrected to the next lowest permitted trunk number.

|                 |                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------|
| Type of Input   | : single value, optional (g-uu-sss-ccc)                                                               |
| Possible values | : g = LTG Number: 1 (no other value)                                                                  |
|                 | uu = LTU Number: 1-15 in HHS (host Shelf)<br>17-99 in AP (Access Point Shelf)<br>16 not defined       |
|                 | sss = SLOT Number: 1-121; slot in groups of 6<br>except 61 or 25-121 except 73 for compact<br>shelves |
|                 | ccc = Circuit Number: 0-254                                                                           |

A suitable module must be configured to the slot addressed by PEN (AMO BCSU).

The possible LTU and Slot values for PEN depend on the systems architecture and can be found in the BCSU AMO description.

The possible Line values depend on the module type and its functionality.

They can be listed using DISP-BCSU: TYPE=PEN [,LTG=, LTU=, SLOT=, CCT=]; which will also output the actual PEN status (e.g. NOT CONNECTED).

**TYPE** Special station type

|                 |                                                                       |
|-----------------|-----------------------------------------------------------------------|
| Type of Input   | : single value, mandatory                                             |
| Possible values | : MSGR, GENANS, CC, VMXMWI<br>(TYPE=ALL is also possible for DISPLAY) |

**UNANO** Device number of night answer station / bell (STNO of the GENANS terminal connection)  
The UNANO must not be assigned yet. The size of the STNO range depends on the maximum number of answering stations.

|                 |                           |
|-----------------|---------------------------|
| Type of Input   | : single value, mandatory |
| Possible values | : 0 - 15                  |

## 180.4 Error Messages and Advisories

### 180.4.1 Error Messages

F01: NO LOCATIONS ARE FREE.  
F02: ENTERED <MSGRNO/UNANO/CCNO/MWINO> IS NO LONGER FREE.  
F03: THE ENTERED LOCATION <LTG-LTU-SLOT-CIRC> DOES NOT LEAD TO AN SIMA-TYPE MODULE.  
F04: NO DEVICE MEMORIES ARE FREE.  
F05: ENTERED LOCATION <LTG-LTU-SLOT-CIRC> IS NO LONGER FREE.  
F06: INADMISSIBLE <LTG/LTU/SLOT/CIRC> VALUE ENTERED IN LOCATION PARAMETER.

## SSC - Special Subscriber (Station) Configuration

### Error Messages and Advisories

F07: THE <MSGR/GENANS/CC> USER ENTERED CANNOT BE DELETED SINCE HE IS ASSIGNED TO <EXEC-SECRETARY SYSTEM NO./NIGHT VARIANT NO./SINGLE CC WITH ROUTING CODE:> xxxxxx.

F08: THE ENTERED <MSGR/GENANS/CC/VMXMWI> USER CANNOT BE DELETED; FIRST ENTER MANUAL DISABLEMENT.

F10: <LTG/LTU> NOT ADDED TO THE SYSTEM.

F11: ADD/DELETE OF MESSENGER-SUBSCRIBER IS NOT POSSIBLE BECAUSE OF MAXIMUM OF EXECUTIVE/SECRETARY SYSTEM WAS SET TO ZERO (AMO DIMSU).

F12: ENTERED COS NOT AVAILABLE.

F13: VMXMWI-SUBSCRIBER CANNOT BE DELETED BECAUSE IT IS STILL ALLOCATED TO THE SERVER.

F14: WITH CPCALL xxxxxxxx THERE IS NO EXTANN USER CONFIGURATED.

F15: THE CPCALL xxxxxxxx BELONGS ALREADY TO AN EXTANN USER.

F16: ANOTHER CPCALL IS NOT POSSIBLE AT THIS LOCATION.

F17: ENTERED PEN <LTG-LTU-SLOT-CIRC> IS IN THE STATE "SIGNED OFF".  
RELEASE WITH AMO BCSU FIRST, OR ENTER ANOTHER PEN.

F18: THE SUBSCRIBER CANNOT BE ADDED. THE CONTRACTED NUMBER OF FLEX+TDM <xxx> IS REACHED.  
PLEASE USE DISPLAY-CODEW FOR DISPLAY OF THE CONTRACTED FEATURE PACKAGES.  
PLEASE CONTACT YOUR SERVICE CENTER, IF YOU WANT TO USE ONE OF THESE FEATURES.

F19: THE CLASSMRK VALUES 'INIT' OR 'NONE' MAY NOT BE" CONCATENATED.

F20: ENTERED LCOSSL NOT AVAILABLE.

F21 THE ENTERED LTU @@ IS NOT CONFIGURED.

F22 MAX. NUMBER OF EXTERNAL ANNOUNCEMENT DEVÍCES CONFIGURED.

F24: <xxxxxxxxxxxx> PEN ERROR; PERMISSIBLE RANGE FOR LTG: 1-<max>

F25: <xxxxxxxxxxxx> PEN ERROR; PERMISSIBLE RANGE FOR LTU: 1-<xx>, <yy>-<max>

F26: <xxxxxxxxxxxx> PEN ERROR; SLOT FORMALLY INCORRECT

F27: <xxxxxxxxxxxx> PEN ERROR; PERMISSIBLE CIRCUIT NUMBERS: <0-<cct\_max>/<n>, <m>, ...>

F29: <xxxxxxxxxxxx> THE DEVICE CONFIGURATION DVCFIG DOES NOT MATCH THE MODULE OF THE SPECIFIED PEN

F30: <xxxxxxxxxxxx> THE STATION IS CAMP-ON BLOCKED. OPTIONS: - REPEAT COMMAND LATER - REPEAT COMMAND WITH IMMEDIATE DEACTIVATION (OFFTYPE=DI) - FIRST DEACTIVATE BY DEACT-DSSU:OFFTYPE=DI,....; AND REPEAT COMMAND

F32: <xxxxxxxxxxxx> THE STATION MUST BE DEACTIVATED. OPTIONS: - REPEAT COMMAND WITH DEACTIVATION (OFFTYPE=DC/DI) - FIRST DEACTIVATE BY DEACT-DSSU:OFFTYPE=DC/DI,...; AND REPEAT COMMAND

F34: <xxxxxxxxxxxx> NO MODULE HAS BEEN ASSIGNED FOR THE SPECIFIED PEN.

F35: <xxxxxxxxxxxx> IN ADDITION TO THE DVCFIG VALUE <dvcfig>, THE PARAMETER <param> MUST ALSO BE SPECIFIED

F39: <xxxxxxxxxxxx> THE <STATION/NEW STATION|PRIMARY STATION> NUMBER IS AN EXTERNAL STATION NUMBER

F40: <xxxxxxxxxxxx> THE TERMINAL IS NOT PROCESSED BY AMO SSCSU

F41: <xxxxxxxxxxxx> VALUE FOR PARAMETER OPT DOES NOT MATCH THE MODULE OF THE SPECIFIED PEN

F51: THE STATION NUMBER RANGE <xxxxxxxxxxxx> - <yyyyyyyyyyyy> CONTAINS NO VALID STATION NUMBER

F55: <xxxxxxxxxxxx> THIS STATION IS ASSIGNED WITH <OPT>=<HTB/TC>

F57: <xxxxxxxxxxxx> THE ADD-ON DEVICES MAY ONLY BE REMOVED, IF ALL AFFECTED KEY FUNCTIONS ARE SET TO VACANT" (AMO TAPRO)"

F58: <xxxxxxxxxxxx> THIS STATION IS ALREADY ASSIGNED BY AMO <ACSU/RUFUM/SCSU/SBCSU/DNIT>

F60: <xxxxxxxxxxxx> ALARMNO <nnnn> IS NOT YET ASSIGNED (AMO-VADSU).

F71: <xxxxxxxxxxxx> FOR ADDING A DVCFIG=<HTBMNGR> ONLY A SINGLE STATION NUMBER IS ALLOWED.

F72: <xxxxxxxxxxxx> DVCFIG=<HTBMNGR/HTBPHONE>: ONLY A COMBINATION OF VOICE AND DTE DEVICE IS ALLOWED.

# 181 SSCSU - Special Subscriber Terminal Configuration in the SWU

|                                      |                                             |
|--------------------------------------|---------------------------------------------|
| <a href="#">Cross References</a>     | <a href="#">Parameter Description</a>       |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Comments</a> |

The AMO SSCSU configures special subscriber terminals. In addition to *subscriber terminal configuration*, the AMO SSCSU enables the relevant data to be displayed, regenerated and changed and the terminals to be deleted.

Functionalities configured by the AMO SSCSU:

## 4. The following terminals can be configured for the **Hicom Trading Board** (HTB):

- HTBMNGR: HTB manager with S0 adapter
- HTBPHONE: HTB terminals are configured as optisets
- HTBLINE: Logical optisets, represents the lines to which the HTB PHONES connect
- HTBEXT: HTB extension connections are used for communication between remote HTB groups
- DTE: Data terminal equipment, used for non-voice communication between manager and individual devices

Note: HTBMNGR and HTBPHONE must always be added in combination with a DTE, HTBEXT can be configured with or without service DTE.

The devices are configured on the following modules:

- SLMY

## 5. The following terminals can be configured for **Telecommuting functionality** (TC) :

- TCLOG: Only Circuit 0 is possible and exclusively used for control messages to TC-Server for the login method "AUTOSSET RELOCATE". It cannot be used as deputy for the telecommuter in the Hicom node.
- TCEXT: TC extension connection.

The devices are configured on the following modules:

- WAML2

## 181.1 Cross References

- AMO AUN : Call Pickup Groups
- AMO ACDRT : Managing of ACD routing tables
- AMO BCSU : Configuring of plug-in slot (module) in SWU. The AMO BCSU configures the modules SLMO
- AMO COSSU : CLASS OF SERVICE  
The AMO COSSU is used for adding classes of service (for all services) which can be allocated to a subscriber line via the parameters COS1 and COS2.  
  
The same AMO is used for adding LCR classes of service (for the services VOICE and DTE) which can be allocated to a subscriber line via the parameters LCOSV1 and LCOSV2 or LCOSD1 and LCOSD2
- AMO DIMSU : Dimension data in SWU  
The AMO DIMSU administers the database layout for device and add-on memory of switching technology and line technology
- AMO DNIT : Administration of "Directory number identification" table
- AMO DSSU : Device switch of switching unit  
The AMO DSSU can be used for activating or deactivating an S0 bus and corresponding terminals.
- AMO KNDEF : Configure own virtual node numbers
- AMO KNMAT : Configuration Replacement of Extension Number for SSTNO=ONLYEXT:  
  
CHA-KNMAT:NPI=ISDN,ONNOL=OWN,DNNO=...,  
LEVEL=..,MODCON=REPEXT&OUT,NUMEXT=replacement  
number;
- AMO NAVAR : Night variants
- AMO RCSU : Configure recorder in SWU
- AMO SBCSU : Configure S0 bus subscriber terminals  
The AMO SBCSU configures subscriber terminals and S0 bus configuration
- AMO SCSU : Configure subscriber terminals  
The AMO SCSU configures theoretical terminals of association of terminal adapters.
- AMO SA : Collective line groups
- AMO SDAT : Configure ACD and ANI features
- AMO TGER : Subscriber device allocation, incoming
- AMO UCSU : Configure through-connect unit in SWU (LTG and LTU)

- AMO VADSU : Administer NMC alarms in the SWU
- AMO TAPRO : Key programming DIGITE
- AMO WABE : Dialling Plans, Feature Access Code (add code for STN)
- AMO ZIEL : Destination addresses for subscriber

## 181.2 Functions of the AMO

- **ADD SSCSU** : Configure static and dynamic memory in CC and LTG for subscriber lines with the above device constellations and enter static data
- **CHANGE SSCSU** : Change static device data
- **DELETE SSCSU** : Delete the entire subscriber line
- **DISPLAY SSCSU** : Display subscriber lines
- **REGENERATE SSCSU** : Regenerate subscriber lines

### 181.2.1 ADD SSCSU

The action ADD SSCSU is used to configure special subscriber terminals.

This action requires various criteria, incl.: the corresponding numbers in dialling evaluation (DAR=STN), a free set on the corresponding module and installed classes of service.

The parameter PEN defines the location (LTG-LTU-SLOT-CCT) at which the subscribers devices are connected with the number STNO. If this parameter is not used, a search is automatically performed for a free location in the system which matches the other parameter values.

Restrictions with PEN:

- The device HTBMNGR can only be added to set 0
- The device HTBPHONE can only be added to sets 1-30.
- The extension connection HTBEXT can only be added to sets 31-254
- The HTBLINE can only be added to sets 41-254
- The device TCLOG is only configurable at circuit 0. Via circuit 0 the communication with the TC-Server is executed, telecommuters are not configured with TCLOG. This is exclusively done by the "Autoset Relocate" method using AMOs BCSU and SBCSU.

## SSCSU - Special Subscriber Terminal Configuration in the SWU

### Functions of the AMO

- The extension connection TCEXT cannot be added to set 0
- Signed off PENs are not allowed

Special aspect for entering ranges:

STNO parameters can be used for entering ranges and/or several individual values; this is not the case with the PEN parameter. In this case, the one entered PEN value is used as the starting value for the PEN search. Only one single number may be entered for subscribers to whom a partner number has to be allocated.

The device combination to be added at a connection is defined with the DVCFIG parameter. Type branching after OPT must be taken into consideration.

The non-voice device DTE can be used by the STN only if the basic authorization (BASIC) in his class of service ((COS1/COS2) has been entered for the corresponding service (AMO COSSU).

With TCEXT, the specified COS1/2 must contain the class of service SPECAR (Special Arrangement) .

With TCLOG and TCEXT, all parameters apart from PEN and STNO must be identical throughout the system. This cannot be checked by the AMO SSCSU.

If the parameter INS=YES (default setting), the added connection with all voice and any non-voice terminals must be forwarded for further administration to security technology. The corresponding device is put into service when all criteria have been met.

If the parameter INS=NO, the subscriber remains in a status which is not processed for security technology purposes. The device is not put "into operation", and it is only prewired in data terms. " With AMO DSSU, subsequent "ACTIVATE" or "DEACTIVATE" or "LOGON" is possible. AMO SDSU is used for the precise status display.

Partner numbers (PSTNO) must be specified for the device constellation HTBMNGR&DTE. However, the process of adding is only successful if adequate memory has been allocated with the AMO DIMSU (ADD-DIMSU: TEAMCONN=...).

A distinction is made between the following cases:

1. Adding subscribers for Hicom Trading E:
  - Add a manager (OPT=HTB, DVCFIG=HTBMNGR&DTE,PSTNO=...).
  - Add a phone (OPT=HTB, DVCFIG=HTBPHONE&DTE).
  - Add an extension connection with service DTE (OPT=HTB, DVCFIG=HTBEXT&DTE).

- Add an extension connection without service DTE (OPT=HTB, DVCFIG=HTBEXT).
  - Add a line (OPT=HTB, DVCFIG=HTBLINE).
2. Add subscribers for telecommuting:
- Add a logical telecommuter (OPT=TC, DVCFIG=TCLOG).
  - Add an extension connection (OPT=TC, DVCFIG=TCEXT).

### Procedure Overview

| Command code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## SSCSU - Special Subscriber Terminal Configuration in the SWU

### Functions of the AMO

#### Examples

1. Add the subscriber 2161 as HTBPHONE. The location is established by the AMO itself.

Input:

```
ADD-
SSCSU:STNO=2161,OPT=HTB,DVCFIG=HTBPHONE&DTE,COS1=5,COS2=6,LCOSV1
=11,LCOSV2=12
      ,LCOSD1=21,LCOSD2=22;
```

Output:

```
H500: AMO SSCSU STARTED
H05: 2161 THIS STATION IS ASSIGNED AT PEN 1- 6- 55- 1
H08: 2161 STATION RELEASED FOR CALL PROCESSING
AMO-SSCSU-5 SPECIAL SUBSCRIBER CONFIGURATION OF
SWITCHING UNIT
ADD COMPLETED;
```

2. Add subscriber 2168 as TCLOG.

Input:

```
ADD-SSCSU:STNO=2168,OPT=TC,PEN=1-6-115-
0,DVCFIG=TCLOG,COS1=5,COS2=6
      ,LCOSV1=11,LCOSV2=12;
```

Output:

```
H500: AMO SSCSU STARTED
H05: 2168 THIS STATION IS ASSIGNED AT PEN 1- 6-115-0
H08: 2168 STAION RELEASED FOR CALL PROCESSING
H44: 2168 FOR ALL SUBSCRIBERS WITH DVCFIG=TCLOG ALL PARAMETERS
BESIDE
      PEN AND STNO HAVE TO GET THE SAME VALUES.
AMO-SSCSU-5 SPECIAL SUBSCRIBER CONFIGURATION OF
SWITCHING UNIT
ADD COMPLETED;
```

## 181.2.2 CHANGE SSCSU

The parameter STNO is required for identifying the line to be changed. All other parameters are optional, although at least one of the parameters must be entered. The parameter OPT only has to be entered if OPT-specific parameters are to be changed.

A number cannot be changed to another number if the old number is still entered in the ACD routing table or if it possesses an ACD feature.

STNO-Ranges can be changed into new STNO-Ranges. Then the available station numbers beginning with NEWNO are used.

With parameter OFFTYPE you can manage, whether change of parameters ASYNCT and PSTNO will be loaded to the line card by means of deactivation and activation of the circuit.

The parameters are classified in the following groups:

1. General parameters:  
These parameters are used for all device types:  
STNO, NEWNO, COS1, COS2, DPLN, ITR.
2. Parameters which are either device-specific or valid for only specific devices:  
LCOSV1, LCOSV2, LCOSD1, LCOSD2, COSX, PSTNO, SSTNO, PROT, OPTIDX, ALARMNO, SPDI, SPDC1, SPDC2, REP, TRACE, RCBKB, RCBKNA, DSSTNA, DSSTNB, DIGNODIS, HMUSIC, OFFTYPE

### Procedure Overview

| Command code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-SSCSU | STNO=<number>, [NEWNO=<number>]<br>, [COS1=<number>], [COS2=<number>]<br>, [DPLN=<number>], [ITR=<number>]<br><br>  , [OPT=HTB]<br>, [PSTNO=<key-num>], [LCOSV1=<number>], [LCOSV2=<number>]<br>, [LCOSD1=<number>], [LCOSD2=<number>]<br>, [SSTNO=<param>], [COSX=<number>]<br>, [SPDI=<number>], [SPDC1=<number>], [SPDC2=<number>]<br>, [REP=<number>], [PROT=<param>], [OPTIDX=<number>]<br>, [TRACE=<param>], [ALARMNO=<number>]<br>, [RCBKB=<param>], [RCBKNA=<param>]<br>, [DSSTNA=<param>], [DSSTNB=<param>]<br>, [DIGNODIS=<param>], [OFFTYPE=<param>];<br><br>  , [OPT=TC]<br>, [LCOSV1=<number>], [LCOSV2=<number>]<br>, [COSX=<number>], [SPDC1=<number>], [SPDC2=<number>]<br>, [PROT=<param>], [OPTIDX=<number>]<br>, [RCBKB=<param>], [RCBKNA=<param>]<br>, [DSSTNA=<param>], [DSSTNB=<param>], [HMUSIC=<number>]; |

## 181.2.3 DELETE SSCSU

With the action DELETE

- subscribers are deleted on the basis of their number. An individual service (e.g. DTE) cannot be deleted.

## SSCSU - Special Subscriber Terminal Configuration in the SWU

### Functions of the AMO

In all cases, several (max. 10) individual values or ranges can also be entered for the parameter STNO.

#### Note :

With optional parameter OFFTYPE you can control, whether AMO SSCSU itself will execute a soft lock (DC, default!), a hard lock (DI) or no lock (NL) on the subscriber. In the last case the number to be deleted must be locked beforehand with the AMO DSSU!

SSCSU subscribers must not be contained in an executive/secretary configuration. Only HTBLINE may be entered in the other group relations (collective line, call collect group, ...). In this case, HTBLINE cannot be deleted (error message).

Subscribers who are still entered in the ACD routing table or who possess an ACD feature cannot be deleted.

#### Procedure Overview

| Command code | Parameter                         |
|--------------|-----------------------------------|
| DELETE-SSCSU | STNO=<number>, [OFFTYPE=<param>]; |

#### Examples

##### 1. Delete

Input:

```
DELETE-SSCSU:STNO=3427;
```

Output:

```
H06: 3427      STATION DATA DELETED.
```

## 181.2.4 DISPLAY SSCSU

The action DISPLAY can be used to display subscriber data.

The parameter TYPE is used for selecting the required display form:

- TYPE=TERMDATA  
For each number in the specified range, the parameters with which the terminals are added are displayed in table form. If parameters are displayed with the equal symbol (=), they have been added by the AMO SSCSU. Any parameters displayed with the colon have been added by other AMO's.
- TYPE=TRACE  
The system displays all subscribers with change interception authorisation.

- TYPE=DEV

The system displays all subscriber numbers from the specified range to which the terminal type specified in the parameter DEV is allocated in the device constellation.

In all cases several (max. 10) individual values or ranges can also be entered for the parameter STNO.

### Procedure Overview

| Command code  | Parameter                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------|
| DISPLAY-SSCSU | [STNO=<number>]<br> , [TYPE=TERMDATA];<br><br> , [TYPE=TRACE];<br><br> , [TYPE=DEV], DEV=<param>; |

### Examples

1. Display all data of the subscriber 2161.

Input:

DISP-SSCSU:STNO=2161;

Output:

H500: AMO SSCSU STARTED

```

----- USER DATA -----
STNO  =2161    OPT    =HTB   COS1   =5      DPLN   =0      SPDI    =10

AMO-SSCSU-5 SPECIAL SUBSCRIBER CONFIGURATION OF  
SWITCHING UNIT  
DISPLAY COMPLETED;

**181.2.5 REGENERATE SSCSU**

The action REGENERATE outputs the data of a device constellation in the form of one or more position-oriented "ADD" commands for the AMO SSCSU. The system outputs data which are also displayed in the action DISPLAY, TYPE=TERMDATA.

If STNO is missing, "ADD" commands of all SSCSU subscribers of the installation are regenerated.

**Procedure Overview**

| Command code     | Parameter        |
|------------------|------------------|
| REGENERATE-SSCSU | [STNO=<number>]; |

### Examples

#### 1. Regenerate the number 2161

Input:

```
REGEN-SSCSU:2161;
```

Output:

```
ADD-SSCSU:2161,HTB,1-6-55-1,HTBPHONE&DTE,
          5,6,11,12,21,22,0,0,NO,0,
          10,,,,0,SBDSS1,10,YES,0,NO,NO,NO,YES,NO;
AMO-SSCSU-5          SPECIAL SUBSCRIBER CONFIGURATION OF
SWITCHING UNIT
REGENERATE COMPLETED;
```

## 181.3 Parameter Description

Possible Values : SBDSS1 = Protocol DSS1  
SBEDSR1 = EURO-ISDN-Protocol EDSS1 RESERVE 1  
SBEDSR2 = EURO-ISDN-Protocol EDSS1 RESERVE 2  
SBEDSR3 = EURO-ISDN-Protocol EDSS1 RESERVE 3  
SBEDSR4 = EURO-ISDN-Protocol EDSS1 RESERVE 4  
Default Value : SBDSS1

**PSTNO**

Partner station number

\*\*\* only relevant ifor HTBMNGR \*\*\*

Type of input : single value, optional  
mandatory ADD  
optional CHANGE

Possible Values : max. 22 digit number 0-9,\*,# ,A-D

The partner station number must point in digit analysis to a subscriber in another node.

**RCBKB**

Reject call back on busy

\*\*\* only relevant ifor OPT = HTB and DVCFIG = TCLOG \*\*\*

Type of input : single value, optional

Possible Values : YES, Y, NO, N

Default Value : NO

**RCBKNA**

Reject call back on no answer

\*\*\* only relevant ifor OPT = HTB and DVCFIG = TCLOG \*\*\*

Type of input : single value, optional

Possible Values : YES, Y, NO, N

Default Value : NO

**REP**

Number of add-on devices (e.g. repertory dialler)

\*\*\* only relevant ifor HTBLINE \*\*\*

Type of input : single value, optional

Possible Values : 0-4

Default Value : 0

**SPDI**

Station with speed calling individual

\*\*\* only relevant ifor OPT = HTB \*\*\*

Type of input : single value, optional

Possible values : 0, 10, 20, 30 (0 means 'No individual speed dialing')

Default value : 0 ('No individual speed dialing')

## SSCSU - Special Subscriber Terminal Configuration in the SWU

### Parameter Description

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

single value, chained single values, range, optional  
(DISPLAY, REGENERATE)

Possible Values : 0 - 999999999999

The station number must be present in the dialing plan.

When entering ranges, please ensure that the second number is always the higher one and that both numbers have the same length.

A maximum of 600 station numbers may be included in a range

TRACE

Malicious call trace allowed

\*\*\* only relevant for OPT = HTB \*\*\*

Type of input : single value, optional

Possible Values : YES, Y, NO, N

Permitted allocations of device constellation to the modules on which a subscriber has been added (see table).

| OPT | Device constellation                                   | Module | FCT-ID |
|-----|--------------------------------------------------------|--------|--------|
| HTB | HTBMNGR&DTE, HTBPHONE&DTE, HTBEXT, HTBEXT&DTE, HTBLINE | SLMY   | 1      |
| TC  | TCLOG, TCEXT                                           | WAML2  | 2      |

Table 11 Allocation of device constellation to the modules

TYPE

Desired station configuration options

Type of input : single value, optional

Possible Values : TERMDATA

Display all terminal data for terminals assigned with SSCSU

TRACE

Display all terminal data for terminals assigned with SSCSU and TYPE=TRACE

DEV

Output all stations which include a specific device type in the station configuration (specified with parameter DEV)

Default Value : TERMDATA

### 181.4 Error Messages and Comments

#### Explanation concerning error messages and comments:

<xxxxxxxxxxxx> defines the subscriber (number) for which this message is applicable. The number is not output if the AMO is in the parameter pretesting stage. "Variable texts" are enclosed in pointed brackets. One of the text variables separated by obliques are output depending on the cause of the error.

<yyyyyy> refers to a second station number.

# 184 SYNC - Database Synchronization Control

|                      |                               |
|----------------------|-------------------------------|
| Restrictions         | Parameter Description         |
| Functions of the AMO | Error Messages and Advisories |

The AMO SYNC is used for automatically synchronizing service databases with the SWU database (which is defined as a master DB). The following databases are synchronized: ACD (Automatic Call Distribution) and EEA (Enhanced Error Analysis).

Synchronization is carried out by the surveillance entity (SE), a resident task in ADS.

The AMO SYNC can be used to influence the surveillance entity, and thus to control the synchronization process. There are no relations to other AMOs.

## 184.1 Restrictions

This description is valid from Hicom 300 V3.2

## 184.2 Functions of the AMO

- **DISPLAY-SYNC** : Output the version statuses of the SEAT
- **DEACTIVATE-SYNC** : Activate a service for synchronization with SE
- **ACTIVATE-SYNC** : Deactivate a service for synchronization with SE
- **CHANGE-SYNC** : Change an AMO version in a SAT using SE (SAT = ACTUAL status in SEAT)

### 184.2.1 DISPLAY-SYNC

Outputting the version statuses of the SEAT. AMO SYNC reads the version statuses of the SEAT from the file on hard disk which SE uses for restart-proof saving of this data.

#### Procedure Overview

| Command Code | Parameter |
|--------------|-----------|
| DISPLAY-SYNC | ;         |

**Example**

Input:

DISPLAY-SYNC;

Output:

|                             |        |        |        |        |        |        |        |        |  |
|-----------------------------|--------|--------|--------|--------|--------|--------|--------|--------|--|
| SEAT OF SURVEILLANCE ENTITY |        |        |        |        |        |        |        |        |  |
|                             | SWU    |        | ACD    |        | EMML   |        | EEA    |        |  |
| AMO                         | ACTUAL | SHOULD | ACTUAL | SHOULD | ACTUAL | SHOULD | ACTUAL | SHOULD |  |
|                             | 4      | 4      | 0      | 0      | 0      | 0      | 0      | 0      |  |
| SCSU                        | 2      | 2      |        |        |        |        |        |        |  |
| PERSI                       | 4      | 4      |        |        |        |        |        |        |  |

**Note**

The first entry of the seat-table (without AMO-Noun) is the backupentry. The backupentry shows the logbooknumber of the SE (e.g. 4) and the state of the serveral services. If the SHOULD-value of the backupentry of a service is not equal 0 , that means that the service is activated.

**184.2.2 DEACTIVATE-SYNC**

- 1. Deactivation of a service for synchronization with SE.  
If a service is deactivated via AMO-SYNC, it is no longer synchronized and all existing information relating to this service is scrapped. In addition, no more AMO commands will be collected for this AMO, until the service request the synchronisation again.
- 2. Deactivation of synchronization during generation. (In this way, the AMO commands are not forwarded via the SE to the services but suppressed in the MMI).

**Procedure Overview**

| Command Code    | Parameter                     |
|-----------------|-------------------------------|
| DEACTIVATE-SYNC | TYP=SER, SERVICE=<param>; (1) |
|                 | TYP=GEN; (2)                  |

### 184.2.3 ACTIVATE-SYNC

1. Activation of a service for synchronization with SE.  
Upon activation, SE memorizes all AMO commands reported to SE via the support procedure.
2. Activation of synchronization after generation.

#### Procedure Overview

| Command Code  | Parameter                          |
|---------------|------------------------------------|
| ACTIVATE-SYNC | TYP=SER, SERVICE=EMLL/DIR/ACD; (a) |
|               | TYP=GEN; (b)                       |

### 184.2.4 CHANGE-SYNC

Changing an AMO version in a SAT AMO SYNC can be used to selectively change the contents of a service AMO table (SAT). The new counter value, the AMO name and the SAT name are sent by the AMO to SE without acknowledgement. The user can verify the changes made by action display.

#### Procedure Overview

| Command Code | Parameter                                                |
|--------------|----------------------------------------------------------|
| CHANGE-SYNC  | SERVICE=EMLL/EEA/ACD, AMO=<string>,<br>VERSION=<number>; |

## 184.3 Parameter Description

|         |                   |                           |
|---------|-------------------|---------------------------|
| AMO     | AMO name          |                           |
|         | Type of input     | : Single value, mandatory |
|         | Possible values   | : 1 to 5 digits           |
| SERVICE | Service AMO table |                           |
|         | Type of input     | : Single value, mandatory |
|         | Possible values   | : EMLL, EEA, ACD          |
| TYP     | Branch parameter  |                           |
|         | Type of input     | : Single value, mandatory |

## **SYNC - Database Synchronization Control**

### **Error Messages and Advisories**

Possible values : SER, GEN

VERSION      Current version status in SEAT  
Type of input      : Single value, mandatory  
Possible values      : 1 to 6 digits, even number

## **184.4 Error Messages and Advisories**

### **184.4.1 Error Message**

F01: SEAT TABLE CANNOT BE LOADED FROM HARD DISK  
F02: SYNCHRONIZATION CANNOT BE DEACTIVATED  
F03: SYNCHRONIZATION CANNOT BE ACTIVATED  
F04: AMO @@@@ HAS NOT BEEN ENTERED IN SEAT  
F05: VERSION CANNOT BE CHANGED AT THE MOMENT. PLEASE, REPEAT LAST COMMAND.  
F06: VERSION CANNOT BE CHANGED BECAUSE SERVICE IS INACTIVE  
F07: VERSION CANNOT BE CHANGED BECAUSE SERVICE HAS NOT BEEN ACTIVATED FOR SYNCHRONIZATION  
F08: ONLY EVEN NUMBERS ALLOWED FOR PARAMETER VERSION  
F09: CHANGE NOT POSSIBLE, BECAUSE DBSYNC TASK IS NOT RUNNING

### **184.4.2 Advisories**

H01: NO ENTRY IN SEAT TABLE

## 185 SYNCA - Administration of user-specific announcements

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO SYNCA can be used to set up (i.e. ADD) the announcement type table and the announcement matrices for synchronous announcements. It can also be used to CHANGE, DISPLAY and REGENERATE data, and to DELETE announcement types and matrices.

The following tables and matrices are processed:

- Announcement type table  
For each announcement type, the properties of the announcement are specified in an entry.
- Announcement type table with company indices  
This matrix contains the announcement type as a function of the announcement reason and company index. The entry for the announcement reason reduces to the value WANVPLKM. The company index corresponds to the console code number dialed last. In this case, 10 different announcement types can be assigned to each announcement reason.
- Announcement matrix with ITR group indices  
This matrix contains the announcement type as a function of the announcement reason and the ITR group. In this case, 16 different announcement types can be assigned to each announcement reason.
- Announcement matrix independent of destination  
This matrix contains the announcement type as a function of the announcement reason only.
- Announcement matrix for start and return tone  
This matrix contains one start tone and one return tone as a function of the announcement reason.
- Announcement type / announcement LODEN table  
This table is only output by the AMO SYNCA. It contains the announcement devices assigned to a specific announcement type.

An announcement type must only be used or entered in an announcement matrix if the announcement type has already been described in the announcement type table.

**SYNCA - Administration of user-specific announcements**

Restrictions

When deleting an announcement type from the announcement type table, any remaining cross-references in the announcement matrices will also be deleted upon confirmation by the user.

For all parameters which allow the entry of chained single values and/or value ranges (e.g. ANNTYPE, ANREASON, ITR, etc.) a maximum of 5 values can be entered at present.

The AMO SYNCA allows the entry of all defined tone types. However, the user should check as to whether the selected tone type is actually available in the current system configuration and whether it would make sense!

When using a wildcard ('\*') as part of a search string, it should be noted that the wildcard must be the first and/or last character in the string. If a wildcard is used explicitly as a search string, every announcement name is being searched. This procedure, however, cannot be used to establish an announcement type whose name has not been specified!

**185.1 Restrictions**

This AMO description is valid from Hicom 300 V3.5.

**185.2 Interrelationships**

|           |                                         |
|-----------|-----------------------------------------|
| AMO TSCSU | Configuring special circuits in the SWU |
|-----------|-----------------------------------------|

Order of generation: TSCSU -> SYNCA

**185.3 Functions of the AMO**

- [ADD-SYNCA](#) : Add an entry to an announcement table or matrix
- [CHANGE-SYNCA](#) : Change entries in an announcement table or matrix
- [DELETE-SYNCA](#) : Delete in an announcement table or matrix
- [DIALOG01-SYNCA](#) : Enter confirmation for DELETE operation
- [DISPLAY-SYNCA](#) : Display an announcement table or matrix
- [REGENERATE-SYNCA](#) : Regenerate an announcement table or matrix

## 185.3.1 ADD-SYNCA

This function is used to set up (i.e. ADD) the data for a synchronous announcement in the announcement table and the announcement matrices.

An announcement type can be added in two ways:

- a) by explicitly entering the announcement type

In this case, the parameter ANNTYPE specifies the announcement type and the properties for this type are stored in the announcement table.

- b) by automatically generating the announcement type

In this case, the parameter ANNTYPE is not specified. The AMO SYNCA now scans the announcement type table for the first free entry and assigns this entry as the announcement type. The user is notified of the announcement type by means of advisory H01.

If no announcement type is available, the error message F01 is issued and the job is rejected.

Each announcement type can also be assigned a name, the only restriction being that no wildcard ('\*') must be used.

Each announcement type can be entered in an announcement matrix only if it has previously been set up in the announcement type table. The current status of the announcement type is irrelevant in this context.

Each further job for an announcement type of a matrix entry which has already been set up results in an error message and is rejected.

### Procedure Overview

| Command Code | Parameter                                                    |        |
|--------------|--------------------------------------------------------------|--------|
| ADD-SYNCA    | TABTYPE=ANNTT, [ANNTYPE=<number>], [ANNAME=<string>]         | (1, 2) |
|              | , [ANSTATE=<param>], [ANREP=<number>], [ANNEXT=<number>]     |        |
|              | , [TONETYP1=<param>], [TONTM1=<number>], [TONE1STA=<param>]  |        |
|              | , [TONETYP2=<param>], [TONTM2=<number>], [TONE2STA=<param>]  |        |
|              | , [TONETYP3=<param>], [TONTM3=<number>], [TONE3STA=<param>], |        |
|              | , [OPMODE=STASTO], [DELAYTM=<number>;                        |        |
|              | , [   OPMODE=CONT], [RELLIMIT=<number>;                      |        |
|              | TABTYPE=ANNMCI, [ANREASON=<param>], COMPIDX=<number>         | (3)    |

## SYNCA - Administration of user-specific announcements

### Functions of the AMO

| Command Code | Parameter                                          |     |
|--------------|----------------------------------------------------|-----|
|              | ,ANNTYPE=<number>;                                 |     |
|              |                                                    |     |
|              | TABTYPE=ANNMITR,ANREASON=<param>,ITR=<number>      |     |
|              | ,ANNTYPE=<number>;                                 |     |
|              |                                                    |     |
|              | TABTYPE=ANNMIOD,ANREASON=<param>,ANNTYPE=<number>; |     |
|              |                                                    |     |
|              | TABTYPE=ANNTONE,ANREASON=<param>,[PRETONE=<param>] | (4) |
|              | ,[RETTONE=<param>];                                |     |

### Examples

1. Add announcement type 16 with 'NEWANN-1A', state = OFF, repetition factor = 5, activated tone type 1 = OVR, tone duration 1 = 3 seconds, operation mode = start/stop and delay time = 20 seconds.

Input:

```
ADD-SYNCA:ANNTT,16,NEWANN-1A,,5,,OVR,3,ON,,,,,,,,,STASTO,20;
```

2. Add announcement type 3 with no name, state = ON, repetition factor = 2, tone type 2 = MOH and tone duration 2 = 15 seconds, state of tone 2 = ON.

Input:

```
ADD-SYNCA:ANNTT,3,,ON,2,,,,,MOH,15,ON;
```

3. Add an activated announcement type, endless repetition, activated tone type 1 = FRNGBK, tone duration 1 = 2 sec. and deactivated tone type 2 = HOLDLINE, tone duration 2 = 5 sec.

Input:

```
ADD-SYNCA:ANNTT,,,ON,255,,FRNGBK,2,ON,HOLDLINE;
```

Output:

```
H01: ANNOUNCEMENT TYPE 4 WAS ASSIGNED TO ANNOUNCEMENT
```

This message means that a free entry was found and that announcement type 4 was assigned to the no-name announcement.

4. Add announcement matrix for company index 3 and announcement reason = WANNAOHK with announcement type 16.

Input:

```
ADD-SYNCA:ANNMCI,WANNAOHK,3,16;
```

5. Add the preliminary tone = CAMP and the return tone = PACK for announcement reason = ANNBUSY

Input:

ADD-SYNCA:ANNTONE,ANNBUSY,CAMP,PACK;

## **185.3.2 CHANGE-SYNCA**

This command can be used to change both the existing data of an announcement type and the announcement matrices. The parameter TABTYPE controls the scope of the changes to be made. When executing the change command, only parameters that have been specified explicitly will be taken into account.

When the wildcard symbol ('\*') is used in the announcement name, the data is changed for all announcement types in whose name the specified character string appears. By specifying chained single values and value ranges as parameters for the AMO call the user can change the data of announcement types and announcement matrices in one go.

The wildcard symbol ('\*') must not be used in the new name when changing the announcement name.

If the parameter values are specified explicitly, only the selected entry will be changed each time. If optional parameters are missing, this means that all entries will be changed within the valid index ranges.

Suggested procedure:

- Changing the data in a specific table or matrix

This function is selected by specifying a matrix ID or a table ID. The change becomes effective only in the selected table taking into account the specified indices.

The user can restrict the number of announcement types by means of the parameter ANTYOLD. If this parameter is not specified, the elements will be changed independent of their announcement type.

- Complete change of the announcement type in all announcement matrices

This type of change should be used if an announcement type is to be replaced in a consistent manner in all announcement matrices. In this case the user can place restrictions on which announcement type(s) is/are to be replaced. If this parameter is not specified, all elements will be changed independent of the announcement type. This ensures that the change is not ignored anywhere in the announcement matrices.

## SYNCA - Administration of user-specific announcements

### Functions of the AMO

When an interval has been entered in the parameter ANTYOLD all not existing announcement types of this interval are displayed by error message F08. All existing announcement types will be handled in accordance with the given parameters.

Only entries of the announcement matrices are handled, whose data have been set up with a previous 'ADD'-command. For single entries, who do not exist or do not correspond with the entered parameter values, no message is displayed at the users terminal. When at all no corresponding entry is found for a given 'CHA'-command, the message H03 will be put out.

### Procedure Overview

| Command Code | Parameter                                                    |     |
|--------------|--------------------------------------------------------------|-----|
| CHANGE-SYNCA | TABTYPE=ANNTT,SEL=ANNTYPE,ANNTYPE=<number>,[ANNAME=<string>] | (1) |
|              | ,[ANSTATE=<param>],[ANREP=<number>],[ANNEXT=<number>]        |     |
|              | ,[TONETYP1=<param>],[TONTM1=<number>],[TONE1STA=<param>]     |     |
|              | ,[TONETYP2=<param>],[TONTM2=<number>],[TONE2STA=<param>]     |     |
|              | ,[TONETYP3=<param>],[TONTM3=<number>],[TONE3STA=<param>],    |     |
|              | ,[OPMODE=STASTO],[DELAYTM=<number>;                          |     |
|              | ,[ OPMODE=CONT],[RELLIMIT=<number>;                          |     |
|              | TABTYPE=ANNTT,SEL=ANNAME,ANNAME=<string>,                    |     |
|              | ,[ANSTATE=<param>],[ANREP=<number>],[ANNEXT=<number>]        |     |
|              | ,[TONETYP1=<param>],[TONTM1=<number>],[TONE1STA=<param>]     |     |
|              | ,[TONETYP2=<param>],[TONTM2=<number>],[TONE2STA=<param>]     |     |
|              | ,[TONETYP3=<param>],[TONTM3=<number>],[TONE3STA=<param>;     |     |
|              | ,[OPMODE=STASTO],[DELAYTM=<number>;                          |     |
|              | ,[ OPMODE=CONT],[RELLIMIT=<number>;                          |     |
|              | TABTYPE=ANNMCI,[ANREASON=<param>],[COMPIDX=<number>]         |     |
|              | ,[ANTYOLD=<number>],[ANTYNEW=<number>;                       |     |
|              | TABTYPE=ANNMITR,[ANREASON=<param>],[ITR=<number>]            | (2) |
|              | ,[ANTYOLD=<number>],[ANTYNEW=<number>;                       |     |
|              | TABTYPE=ANNMIOD,[ANREASON=<param>],[ANTYOLD=<number>]        |     |

| Command Code | Parameter                                             |     |
|--------------|-------------------------------------------------------|-----|
|              | ,ANTYNEW=<number>;                                    |     |
|              |                                                       |     |
|              | TABTYPE=ANNTONE,ANREASON=<param>,[PRETONE=<param>]    |     |
|              | ,[RETTONE=<param>;                                    |     |
|              |                                                       |     |
|              |                                                       |     |
| Command Code | Parameter                                             |     |
|              | TABTYPE=ANNMALL,[ANREASON=<param>],[ANTYOLD=<number>] | (3) |
|              | ,ANTYNEW=<number>,[COMPIDX=<number>],[ITR=<number>;   |     |

### Examples

1. Announcement type 4 is to be activated and announcement type 23 to be entered as the follow-up type (next announcement type).

Input:

CHA-SYNCA:ANNTT,ANNTYPE,4,,ON,,23,,,,,CONT,50;

2. Announcement type 19 is to be used throughout for ITR groups 3 and 9 to 11 if the announcement reason is ANNBUSY or WANNHG.

Input:

CHA-SYNCA:ANNMITR,ANNBUSY&WANNHG,3&9&&11,,19;

3. Announcement type 19 is to be changed to 31 in all announcement matrices for company indices 1 and 6, for all ITR groups and for announcement reason DIDSD.

Input:

CHA-SYNCA:ANNMALL,DIDSD,19,31,1&6;

This command changes those entries in the announcement matrix with ITR index for all 16 ITR groups where the announcement reason DIDSD is assigned announcement type 19. Entries with other announcement types remain unchanged! A change in the announcement matrix independent of destination is done only in case of matching announcement reason and old announcement type.

The entry in the announcement matrix with company index remains unchanged because the announcement reason DIDSD is here not valid. Only for announcement reason WANNAOHK a change can be done.

**185.3.3 DELETE-SYNCA**

This command is used to delete entries from the announcement type table and/or the announcement matrices, or even from announcement matrices as a whole. Before deleting an announcement type from the announcement type table, the user must ensure that the entry to be deleted has no interrelationships with an announcement matrix and/or the announcement type table (e.g. chained announcements).

Interrelationships can be resolved either by explicitly deleting the entry from the respective matrix or by concealing the interrelationship when specifying the announcement type table. In this case, the AMO issues an advisory for each matrix which still contains the announcement type in question. It then prompts the user to confirm whether the delete operation should be continued or aborted. If the user chooses to continue the operation, first the matrices and then the announcement type table are purged. If he aborts the delete operation, all entries will be retained while the announcement type itself is deactivated. The entry format SEL=ANNTYPE lends itself very well to this end.

An announcement type cannot be deleted as long as an announcement device is still assigned. All relevant TMOM devices with this announcement type must be deleted first!

If all parameter values are explicitly specified, only the selected entry will be deleted in each case. If optional parameters are missing, this means that all entries within the valid index ranges are to be deleted.

**Procedure Overview**

| Command Code | Parameter                                               |        |
|--------------|---------------------------------------------------------|--------|
| DELETE-SYNCA | SEL=ANNTYPE, ANNTYPE=<number>, TABTYPE=<param>;         | (1, 2) |
|              |                                                         |        |
|              | SEL=ANNAME, ANNAME=<string>, TABTYPE=<param>;           |        |
|              |                                                         |        |
|              | SEL=IDX, [ANREASON=<param>], TABTYPE=ANNMIOD   ANNTONE; | (3)    |
|              |                                                         |        |
|              | TABTYPE=ANNMCI, [COMPIDX=<number>];                     |        |
|              |                                                         |        |
|              | TABTYPE=ANNMITR, [ITR=<number>];                        | (4)    |

**Examples**

1. Delete announcement type 25 from the announcement matrix with company index.  
Input:

DELETE-SYNCA:ANNMCI, 25, ANNCCI;

2. Delete announcement type 47 from all matrices and tables.

a) Input:

DELETE-SYNCA:ANNMCI, 47, ANNTT&ANNMITR&ANNMCI&ANNMIOD;

**Note:** All entries for the specified announcement type are deleted immediately without notifying the user.

O R

b) Input:

DELETE-SYNCA:ANNMCI, 47, ANNTT;

**Note:** In this case, the AMO prompts the user to confirm the delete command if there is still an interrelationship between the announcement type and a matrix.

Output:

H02: ANNOUNCEMENT TYPE 47 ALREADY USED IN MATRIX ANNCCI  
H02: ANNOUNCEMENT TYPE 47 ALREADY USED IN MATRIX ANNMIOD  
H04: DELETE ENTRIES FOR ANNOUNCEMENT TYPE IN ANNOUNCEMENT  
MATRIX: Y/N  
\*Y

First all matrix entries and then the announcement type are deleted.

3. Delete the "announcement matrix independent of destination".

Input:

DELETE-SYNCA:IDX, , ANNMIOD;

4. Delete all announcement types for ITR groups 4 and 10 to 12.

Input:

DELETE-SYNCA:IDX, , ANNMITR, 4&10&&12;

### 185.3.4 DIALOG01-SYNCA

This concealed command can be used to influence the further processing of the DELETE command.

The AMO prompts the user for this input if it finds interrelationships with one or several announcement matrices which were not specified in the parameter TABTYPE while attempting to delete an announcement type. If the user answers with 'Y', both any existing interrelationships

## SYNCA - Administration of user-specific announcements

### Functions of the AMO

and the announcement type itself will be deleted. In the case of 'N', the AMO aborts the delete operation, and both the announcement type and the entries in the unspecified announcement matrices will be retained.

#### Procedure Overview

| Command Code   | Parameter     |
|----------------|---------------|
| DIALOG01-SYNCA | ANSW=<param>; |

#### Examples

See DELETE command: example 2, input option b).

### 185.3.5 DISPLAY-SYNCA

This command can be used to display the contents of the administration tables for synchronized announcements. There are two display options to choose from:

- type-specific

In this case, the announcement type is used as the search criterion. The AMO scans the specified table or matrix for the announcement type and displays the entries that meet the search criterion.

If the table type is unknown, the AMO scans all administration tables and displays all configured entries for this announcement type (high-level output).

- table-specific

In this case, the matrix indices are used as the search criterion. The announcement matrices can be output as a whole or in part.

It should be noted that this command not only displays the administration tables administered by the AMO but also the announcement devices from the announcement type / announcement LODEN table which are assigned to an announcement type. The table is processed by means of the AMO TSCSU.

#### Procedure Overview

| Command Code  | Parameter                                        |        |
|---------------|--------------------------------------------------|--------|
| DISPLAY-SYNCA | SEL=ANNTYPE, ANNTYPE=<number>, [TABTYPE=<param>; | (1)    |
|               |                                                  |        |
|               | SEL=ANNAME, ANNAME=<string>, [TABTYPE=<param>;   |        |
|               |                                                  |        |
|               | SEL=IDX, [ANREASON=<param>], [TABTYPE=<param>;   | (2, 3) |

### Examples

1. Display the administration data for announcement type 16.

Input:

DIS-SYNCA:ANNTYPE,16;

Output:

|                                                           |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|-----------------------------------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|

## 185.3.6 REGENERATE-SYNCA

The verb REGENERATE is used to output the data of the announcement table and the announcement matrices in the form of one or more position-oriented "ADD" commands. The commands can be regenerated for a specific table or a specific type.

### Procedure Overview

| Command Code     | Parameter                                                  |     |
|------------------|------------------------------------------------------------|-----|
| REGENERATE-SYNCA | [SEL=ANNTYPE], [ANNTYPE=<number>], [TABTYPE=<param>];      | (1) |
|                  | [ SEL=ANNAME], ANNAME=<string>, [TABTYPE=<param>];         |     |
|                  | [ SEL=IDX], [ANREASON=<param>], TABTYPE=ANNMIOD   ANNTONE; | (2) |
|                  | TABTYPE=ANNMCI, [COMPIDX=<number>];                        |     |
|                  | TABTYPE=ANNMITR, [ITR=<number>];                           | (3) |

### Examples

1. Regenerate the configuration for announcement type 33.

Input:

```
REGEN-SYNCA:ANNTYPE,33;
```

Output:

```
ADD-SYNCA:ANNTT,33,"ANN-TYPE
33",ON,5,,PACK,2,ON,HOLDLINE,1,ON,,STASTO,3;
ADD-SYNCA:ANNMCI,WANNAOHK,6,33;
ADD-SYNCA:ANNMITR,DIDSD,0,33;
```

**SYNCA - Administration of user-specific announcements**

Parameter Description

```
ADD-SYNCA:ANNMITR,SDOHK,1,33;  
ADD-SYNCA:ANNMITR,ANNBUSY,8,33;  
ADD-SYNCA:ANNMITR,SDBUSY,11,33  
ADD-SYNCA:ANNMITR,SDBUSY,12,33;  
ADD-SYNCA:ANNMIOD,ANNBUSY,33;  
ADD-SYNCA:ANNMIOD,SDBUSY,33;
```

- 2. Regenerate the table for the preliminary tone and the return tone.

Input:

```
REGEN-SYNCA:IDX,,ANNTONE;
```

Output:

```
ADD-SYNCA:ANNTONE,DIDSD,PACK,INTDTN;  
ADD-SYNCA:ANNTONE,ANNBUSY,HOLDLINE,BUSY;  
ADD-SYNCA:ANNTONE,ANNOHK,,RNGBK;  
ADD-SYNCA:ANNTONE,SDBUSY,,;  
ADD-SYNCA:ANNTONE,SDOHK,,REORDER;
```

- 3. Regenerate announcement type for ITR group 11 and announcement reason WANNAOHK.

Input:

```
REGEN-SYNCA:IDX,WANNAOHK,ANNMITR,11;
```

Output:

```
ADD-SYNCA:ANNMITR,WANNAOHK,11,21;
```

**185.4 Parameter Description**

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ANNAME  | Announcement name<br><br>A wildcard (*) must not be used as first and/or last character when the announcement name is added or changed (SEL=ANNTYPE). In this case the command is rejected with message F10.<br><br>Type of Input : Single value<br>optional (ADD, CHANGE)<br>mandatory (DELETE, DISPLAY, REGENERATE)<br><br>Possible Values : Any text string, max. 16 characters<br>(e.g.: "ANNOUNC_001" or "VPL_OUT_INFO")<br><br>Default Value : Deletion of the structure element |
| ANNEXT  | Next announcement type for chained announcements<br><br>Type of Input : Single value, optional<br><br>Possible Values : 0 to 64<br><br>Default Value : 0 (no chained announcement)                                                                                                                                                                                                                                                                                                     |
| ANNTYPE | Announcement type (assigns announcement properties to the table element)                                                                                                                                                                                                                                                                                                                                                                                                               |

|          |                                                |                                                                                                                                                                                                                                         |                                               |

|          | Possible Values                                   | : The definitions correspond to the HICOM TONE TYPE set                                         |

## SYNCA - Administration of user-specific announcements

### Parameter Description

|           |                                            |
|-----------|--------------------------------------------|
| ALERT     | Alert tone (expensive route)               |
| ANNICPT   | Announcement for attendant intercept       |
| BONHK     | B-party on hook                            |
| BUSY      | Busy tone                                  |
| CAMP      | Camp-on/call waiting tone                  |
| CBKALERT  | Callback alert tone                        |
| CMALSTONE | Call monitoring alerting tone              |
| CONFTN    | Conference tone                            |
| CONG      | Network congestion tone                    |
| DATA      | Data call tone for V25                     |
| DISCTONE  | Emergency disconnect tone                  |
| DND       | Do not disturb tone                        |
| EXTDTN    | External dial tone                         |
| EXTDTN2   | Second external dial tone                  |
| FCAMP     | First camp-on tone                         |
| FRNGBK    | First burst of ringback tone               |
| HOLD      | Call waiting tone                          |
| HOLDCCS   | Hold tone code calling system (CCS)        |
| HOLDEXT   | Hold tone external                         |
| HOLDH1    | Hold tone hold 1                           |
| HOLDH2    | Hold tone hold 2                           |
| HOLDHUNT  | Hold tone hunting group                    |
| HOLDINT   | Hold tone internal                         |
| HOLDLINE  | Hold the line please                       |
| HUNTGRUP  | Announcement huntgroup queue               |
| IMPOSSFM  | At the moment not possible                 |
| INTDTN    | Internal dial tone                         |
| KNCONF    | Camp-on tone for conference                |
| LCRET     | LCR expensive tone                         |
| LOCANN    | Local announcement                         |
| MOH       | Music on hold                              |
| MWI       | Message waiting indication                 |
| NACK      | Negative acknowledgement tone              |
| NODIAL    | Dial timeout tone (no digits dialed)       |
| NOPO      | Not possible                               |
| NOTALWD   | Not allowed                                |
| NOTREACH  | Subscriber not reachable                   |
| NU        | Number obtainable tone                     |
| OVR       | Automatic override tone                    |
| OVRTN     | Override tone                              |
| OVRWARN   | Override prewarning tone                   |
| PACK      | Positive acknowledgement tone              |
| PACKWD    | Positive acknowledgement tone with dialing |
| POSTDIAL  | Announcement post dial                     |
| REORDER   | Request of reorder tone                    |
| RNGBK     | Ringback tone                              |
| RTOTON1   | Test for first tone receiver group         |
| RTOTON2   | Test for second tone receiver group        |
| SPEC      | Special dial tone                          |
| TEST      | Test transmitter tone                      |
| VOICEMAL  | VOICE MAIL                                 |

Default Value : MOH

## 185.5 Error Messages and Advisories

### 185.5.1 Error Messages

F01: NO FREE SPACE FOR A NEW ANNOUNCEMENT TYPE AVAILABLE

There is no element available in the announcement type table for configuring the specified announcement properties. The maximum number of announcements has been reached.

This situation can only be remedied by deleting announcement types which are no longer used.

F02: ANNOUNCEMENT TYPE ALREADY ESTABLISHED

The specified announcement type has already been set up. It may only be changed. In order to set up a new announcement, the user must select another announcement type or have it generated automatically by the AMO.

F03: ANNOUNCEMENT TYPE <xx> NOT ESTABLISHED

No announcement of this type has been set up.

F04: LINK TO OWN ANNOUNCEMENT TYPE NOT ALLOWED

In the case of chained announcements, the subsequent announcement type in the parameter ANNEXT must not point to the own announcement type (parameter ANNTYPE).

F05: <xxxxxxx> FOR ANNOUNCEMENT REASON <xxxxxxx> IN MATRIX <xxxx> ALREADY EXISTS

The specified announcement type/pretone/return tone has already been set up in the specified announcement matrix. It can only be processed by means of the verb 'CHANGE'.

F06: TYPE OF TONES FOR ANNOUNCEMENT REASON <xxxxxxxx> ALREADY EXISTS

A valid pretone and return tone exists in the announcement matrix for the specified announcement reason.

F07: ANN. TYPE FOR ANNOUNCEMENT REASON <xxxxxxx> UND <xxxxxxx>=<xx> ALREADY EXISTS

The specified announcement type already exists among the specified values (ITR or company index) and can only be processed by means of the verb 'CHANGE'.

F09: ANNOUNCEMENT TYPE <xx> NOT DELETED

The specified announcement type is contained in an announcement matrix. The announcement type can only be deleted from the announcement type table if all references to the announcement have been removed from the announcement matrices or the announcement table.

Advisory H02 indicates which matrix contains entries for this announcement type.

F10: USAGE OF WILDCARD SYMBOL ('\*') IN ANNOUNCEMENT NAME NOT ALLOWED

The wildcard symbol must not be used in the character string for the announcement name with this AMO command.

F11: THE TABLE IS FULL WITH ENTRIES FROM SYNCA OR VFGKZ

## **185.5.2 Advisories**

H01: ANNOUNCEMENT TYPE <xx> WAS ASSIGNED TO ANNOUNCEMENT

If the user attempts to set up an announcement without explicitly specifying the announcement type, the AMO determines the next free entry in the announcement table. This index corresponds to the announcement type of the specified announcement properties and is reported to the user.

H02: ANNOUNCEMENT TYPE <xx> ALREADY USED IN MATRIX <xxxxxx>

This advisory indicates in which announcement matrix the specified announcement type has been entered.

H03: NO DATA FOUND

This advisory explains why the expected data output fails. No corresponding data exists.

## SYNCA - Administration of user-specific announcements

### Error Messages and Advisories

H04: DELETE ENTRIES FOR ANNOUNCEMENT TYPE IN ANNOUNCEMENT MATRIX: Y/N

This advisory prompts the user to confirm a hidden delete job.

H05: THE ANNOUNCEMENT TYPE <xx> WAS ASSIGNED <xxxx> ANNOUNCEMENT DEVICE

This advisory notifies the AMO user that no/one announcement device has been assigned to the announcement type. The assignment can be processed by means of the AMO TSCSU.

H06: ANNOUNCEMENT TYPE <xx> HAS BEEN DEACTIVATED

This advisory indicates that the request to delete an announcement type was canceled by the user but that the announcement was deactivated automatically. All data and cross-references of the announcement type are retained.

H07: TABLE TYPE: <XXXXXX> - NO DATA FOUND FOR ANNOUNCEMENT TYPE <XX>

For this announcement type no entries in the matrix have been found

H08: THE OPERATION MODE OF ANNOUNCEMENT TYPE HAS BEEN CHANGED.

The operation mode - start/stop or continuous - of the announcement type has been changed.

H09: NO VALID ANNOUNCEMENT REASON HAS BEEN ENTERED FOR MATRIX.

For the specified announcement matrix no valid announcement reason has been entered.

H10: ANNOUNCEMENT TYPE(S) <xx> TO <xx> NOT ESTABLISHED

The specified announcement type(s) of the entered interval (e.g. old announcement type) do(es) not exist in the announcement type table. Therefore it isn't possible to process it as wanted. The command is executed as ordered only for all existing announcement type(s) of the interval.

H11: FOR CHANGE OF OPERATION MODUS THE PARAMETER <xxxxxxxx> HAS TO BE ENTERED.

Although the parameters RELLIMIT resp. DELAYTM are originally optional a value has to be specified when the operation mode is changed.

H12: THE COMPIDX WILL BE DETERMINED FROM THE LAST NUMBER OF ACCESS CODE

# 186 TABT - Administration of the Rate Period Tables

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The task of this AMO is to administer the rate period tables.

The tables contain the rate type per time period.

The day can be divided into a maximal of 24 periods for each customer individually. 25 tables are possible.

## 186.1 Interrelationships

- AMO-TTBL : Administration of rate tables

## 186.2 Functions of the AMO

- [ADD-TABT](#) : Enter rate periods and rate type
- [CHANGE-TABT](#) : Change entries
- [DELETE-TABT](#) : Delete entries
- [DISPLAY-TABT / REGENERATE-TABT](#) : Interrogate the rate period table / Regenerate the rate period table

### 186.2.1 ADD-TABT

Enter rate periods and the associated rate types into the rate period table.

A maximum of 24 entries can be made, the limit value for the last entry must be 2400 hrs. During entry, the AMO requests the following parameter sequence: limit value, monday rate type, tuesday rate type, wednesday rate type, thursday rate type, friday rate type, saturday rate type, and sunday rate type.

The AMO requests this parameter sequence until 2400 hrs. is entered as the limit value (maximum of 24 times).

The limit values are entered into the data base in ascending order.

Procedure Overview

| Command Code | Parameter                                                                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-TABT     | LT=<number>, TARTYPMO=<string>, TARTYPTU=<string><br>, TARTYPWE=<string>, TARTYPTH=<string>, TARTYPFR=<string><br>, TARTYPSA=<string>, TARTYPSU=<string><br>, SEGTBLNO=<number>; |

Example

1. Creation of a rate period table number 1.

Input:

```
ADD-TABT:06-00,NTAR1,NTAR1,NTAR1,NTAR1,NTAR1,NTAR1,NTAR1,1;  
ADD-TABT:08-00,NTAR2,NTAR2,NTAR2,NTAR2,NTAR2,NTAR2,NTAR2,1;  
ADD-TABT:18-00,DTAR,DTAR,DTAR,DTAR,DTAR,DTAR,DTAR,1;  
ADD-TABT:22-00,NTAR3,NTAR3,NTAR3,NTAR3,NTAR3,NTAR3,NTAR3,1;  
ADD-TABT:23-00,NTAR4,NTAR4,NTAR4,NTAR4,NTAR4,NTAR4,NTAR4,1;
```

186.2.2 CHANGE-TABT

Change entries in the rate period table. The limit value as well as the rate type of an entry can be changed. In this case, the limit values are resorted in ascending order.

If the limit value 2400 hrs. is changed and if it was not the last entry in the table, the next limit value is set to 2400 hrs. and the rate types are set to NTAR2.

If a limit value is changed to 12:00 a.m., all subsequent entries are deleted.

Procedure Overview

| Command Code | Parameters                                                                                                                                                                                                             |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-TABT  | SEGTABLNO=<number>, TBLENTY=<number><br>, {(min 1) GREWERT=<number>, TARTYPMO=<string><br>, TARTYPTU=<string>, TARTYPWE=<string><br>, TARTYPTH=<string>, TARTYPFR=<string><br>, TARTYPSA=<string>, TARTYPSU=<string>}; |

Examples

1. Changing the second entry to the limit value 0900 hrs. with night rate 1 for monday to friday. Rate type for saturday and rate type for sunday remain unchanged.

Input:

CHANGE-TABT:1,2,09-00,NTAR1,NTAR1;

2. In the fourth entry, the rate type for sunday is to be changed to night rate 2.

Input:

CHANGE-TABT:1,4,,,,,,,,,NTAR2;

### 186.2.3 DELETE-TABT

Delete an entry in the rate period table or delete the entire table.  
If the entry with the limit value 2400 hrs. is deleted, the preceding limit value in the table is set to 2400 hrs.

#### Procedure Overview

#### Command Code

DELETE-TABT

#### Parameters

[SEGTBLNO=<number>], [TBLENTY=<number>];

#### Example

1. Deleting table entry 1.

Input:

DELETE-TABT:1,1;

### 186.2.4 DISPLAY-TABT / REGENERATE-TABT

1. Interrogate the entries of the rate period table with output in  
Either one or all tables can be displayed. tabular form.
2. Interrogate the entries of the rate period table with output in  
position-oriented commands for regeneration.  
Either one or all tables can be output.

#### Procedure Overview

#### Command Code

DISPLAY-TABT

REGENERATE-TABT

#### Parameters

[SEGTBLNO=<number>];

[SEGTBLNO=<number>];

**TABT - Administration of the Rate Period Tables**  
Parameter Description

**Examples**

1. Display of time section table number 1

Input:

DISP-TABT:1;

Output:

| TIME SECTION TABLE NO.: 1 |               |        |        |        |        |        |        |        |
|---------------------------|---------------|--------|--------|--------|--------|--------|--------|--------|
| ENTRY.NO.                 | TIME          | TYP-MO | TYP-TU | TYP-WE | TYP-TH | TYP-FR | TYP-SA | TYP-SU |
| 1                         | 00:00 - 06:00 | NTAR1  | NTAR1  | NTAR1  | NTAR1  | NTAR1  | NTAR1  | NTAR1  |
| 2                         | 06:00 - 09:00 | NTAR1  | NTAR1  | NTAR2  | NTAR2  | NTAR2  | NTAR2  | NTAR2  |
| 3                         | 09:00 - 18:00 | DTAR   | DTAR   | DTAR   | DTAR   | DTAR   | DTAR   | DTAR   |
| 4                         | 18:00 - 22:00 | NTAR3  | NTAR3  | NTAR3  | NTAR3  | NTAR3  | NTAR2  | NTAR3  |
| 5                         | 22:00 - 23:00 | NTAR4  | NTAR4  | NTAR4  | NTAR4  | NTAR4  | NTAR4  | NTAR4  |
| 6                         | 23:00 - 24:00 | NTAR2  | NTAR2  | NTAR2  | NTAR2  | NTAR2  | NTAR2  | NTAR2  |

2. Regenerate the rate period table of time section table number 1

Input:

REG-TABT:1;

Output:

CHANGE-TABT:1,1,06-00,NTAR1,NTAR1,NTAR1,NTAR1,NTAR1,NTAR1,NTAR1;  
CHANGE-TABT:1,2,09-00,NTAR1,NTAR1,NTAR2,NTAR2,NTAR2,NTAR2,NTAR2;  
CHANGE-TABT:1,3,18-00,DTAR,DTAR,DTAR,DTAR,DTAR,DTAR,DTAR;  
CHANGE-TABT:1,4,22-00,NTAR3,NTAR3,NTAR3,NTAR3,NTAR3,NTAR2,NTAR3;  
CHANGE-TABT:1,5,23-00,NTAR4,NTAR4,NTAR4,NTAR4,NTAR4,NTAR4,NTAR4;  
CHANGE-TABT:1,6,24-00,NTAR2,NTAR2,NTAR2,NTAR2,NTAR2,NTAR2,NTAR2;

**186.3 Parameter Description**

|          |                                                        |                                                                                                                         |

|----------|----------------------|
| TARTYPFR | Rate type for friday |
|----------|----------------------|

## TABT - Administration of the Rate Period Tables

### Parameter Description

|                 |                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------|
| Type of Input   | : single value, mandatory (ADD)<br>single value, optional, 6. parameter of min-1-group (CHANGE)                   |
| Possible Values | : DTAR = day rate<br>NTAR1 = night rate 1<br>NTAR2 = night rate 2<br>NTAR3 = night rate 3<br>NTAR4 = night rate 4 |

#### TARTYPSA Rate type for saturday

|                 |                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------|
| Type of Input   | : single value, mandatory (ADD)<br>single value, optional, 7. parameter of min-1-group (CHANGE)                   |
| Possible Values | : DTAR = day rate<br>NTAR1 = night rate 1<br>NTAR2 = night rate 2<br>NTAR3 = night rate 3<br>NTAR4 = night rate 4 |

#### TARTYPSU Rate type for sunday

|                 |                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------|
| Type of Input   | : single value, mandatory (ADD)<br>single value, optional, 8. parameter of min-1-group (CHANGE)                   |
| Possible Values | : DTAR = day rate<br>NTAR1 = night rate 1<br>NTAR2 = night rate 2<br>NTAR3 = night rate 3<br>NTAR4 = night rate 4 |

#### TBLEENTRY Number of entry into the rate period table (maximum of 24 entries)

|                 |                           |
|-----------------|---------------------------|
| Type of Input   | : single value, mandatory |
| Possible Values | : 1 to 24                 |

The parameters LT and TARTYPMO to TARTYPSU are a min-1-group for the CHANGE action.

At least one parameter must be declared.

## **186.4 Error Messages and Advisories**

### **186.4.1 Error Messages**

F01: LIMIT VALUE HAS ALREADY BEEN ENTERED  
F02: CHANGING A DELETED ENTRY IS NOT POSSIBLE  
F03: LIMIT VALUE MUST BE BETWEEN @@ AND @@  
F04: DELETING THE LAST ENTRY IS NOT POSSIBLE  
F05: ENTRY HAS ALREADY BEEN DELETED  
F06: INVALID SPECIFICATION OF TIME  
F07: THE TABLE IS FULL. MAX. 24 LINES.

### **186.4.2 Advisories**

H01: LAST LIMIT VALUE MUST BE 24; WAS CHANGED TO 24  
H02: not used  
H03: LAST ENTRY DELETED; NEXT TO LAST LIMIT VALUE IS SET TO 24

Error Messages and Advisories

## **187 TACSU - Configuration of analog trunk circuits in the SWU**

The description of this AMO is only available in html format!

## 188 TAPRO - Key Programming

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The AMO TAPRO is used for loading the programmable key functions of digital and IP voice terminals.

Various standard or individual key assignments can be loaded. The AMO TAPRO also allows individual key functions to be changed. Furthermore, the AMO is used for the administration of the standard key assignments.

As Spirit IP Phones will be configured using the already existing opti-IP device configuration, the required TAPRO functionality to allow administration of Key Layouts for Spirit IP Phones (with or without Key System Functionality) is already present. TAPRO is extended to delete information on which type of Electronic Key Label shall be used and which individual text shall be used for the Electronic Key Label

In the generation sequence, AMO TAPRO is called at two points in the batch: before AMO SBSCSU to change standard key assignments, and after AMO SBSCSU/SSCSU to change individual keys.

### Functions

The AMO TAPRO can be used for the following terminal types:

- optipoint 500 T8
- optipoint 500 T12
- optipoint 500 T19
- optipoint 600 T19
- optipoint 400 T12
- optipoint 410
- optipoint 420
- optipoint WL 2 professional
- openstage 10
- openstage 15
- openstage 20
- openstage 30
- openstage 40

## TAPRO - Key Programming

### Interrelationships

- openstage 60
- openstage 80
- desk phone IP35G
- desk phone IP55G
- desk phone CP100
- desk phone CP110
- desk phone CP200
- desk phone CP210
- desk phone CP400
- desk phone CP410
- desk phone CP600
- desk phone CP700
- desk phone CP710
- as well as the various add-on terminal types for optipoint 500 and openstage.

With the AMO TAPRO, it is not necessary to set up the standard key assignments, since all 127 valid standard assignments for each terminal type are already stored in the database. All terminals are allocated one of these standard assignments when they are first configured.

## 188.1 Interrelationships

- AMO KCSU : Keysystem Configuration of Switching Unit
- AMO SBSCSU : Station and S0-bus Configuration of Switching Unit
- AMO SSSCSU : Special Subscriber Configuration of Switching Unit
- AMO ZIEL : Destinations for Station Features

## 188.2 Functions of the AMO

- [CHANGE-TAPRO](#) : Change a standard key layout  
Change freely-programmable key layout

- **DISPLAY-TAPRO** : Display standard and freely-programmable key layouts  
Display standard key layouts  
Display freely-programmable key layouts
- **REGENERATE-TAPRO** : Regenerate standard and freely-programmable key layouts  
Regenerate standard key layouts  
Regenerate freely-programmable key layouts

## **188.2.1 CHANGE-TAPRO**

Change the standard key layout or change the freely-programmable key layout for one or more stations.

The changes are carried out as follows:

- Changing a standard key layout.

For this, the number of the standard key layout must be specified instead of a station number. Changing a standard key layout has no direct effect on the key layouts already loaded at the various terminals.

Hints for changing the standard key layouts:

- Max. 4 RNGXFER keys and max. 4 PUS keys.
- The remaining functions (except VACANT, LINE, NAME and DSS) may only be assigned once. When allocating an existing key function to a different key during a standard key layout change, the old key allocation is canceled automatically.

- Assigning the key functions

For this, at least one station number must be specified. If a standard key layout number is also specified, a standard key layout is assigned. If no standard key layout is specified, the AMO assumes that only the functions of the freely-programmable keys are to be loaded. Only one command is necessary to change the standard key layout and assign new functions to the freely-programmable keys of the specified station(s).

Hints for assigning the key functions

- Max. 4 RNGXFER keys (except subscriber is executive) and max. 4 PUS keys.
- Max. 1 RNGXFER key if subscriber is executive  
A standard with more than 1 RNGXFER key can be assigned to a executive, but the executive can only use the first RNGXFER

## TAPRO - Key Programming

### Functions of the AMO

key and the others are only allocated with this function. If one RNGXFER key is individual changed, all other RNGXFER keys are deleted.

- The remaining functions (except VACANT, LINE, NAME and DSS) may only be assigned once. When allocating an existing key function to a different key during a standard key layout change, the old key allocation is canceled automatically.
- The MB key function cannot be re-assigned if the user's "mailbox" contains new (i.e. unheard) messages.
- The following keys must not be deleted while in the active state: FWD key, REP key, KNOVR key, DND key and HT key.

---

**NOTE:** The terminal will be not deactivated from the AMO TAPRO, exeption deletion of DSS keys.

If the terminal was deactivated before the processing, it remains deactivated.

---

A standard key layout with add-on terminal can be assigned to a subscriber without add-on terminal, but only the key functions of the basic terminal are accepted.

|                      | Type of digital terminal                                                                                                    |                                                                                      |                                                                                         |                            |

Table 12 Possible parameters and their significance

## Procedure Overview

| Command Code | Parameter                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------|
| CHANGE-TAPRO | {STNO=<number>,STD=<number>},[DIGTYP=<param>]<br>,[KY01=<param>],...,[KY32=<param>],[INFO=<string>]; |

### Examples

1. Change the standard key layout 5 for all Standard Device terminals.  
Change KY01 to call forwarding and KY02 - KY04 to name keys.

Input:

```
CHANGE-
TAPRO:STD=5,DIGTYP=STDDEV,KY01=FWD,KY02=NAME,KY03=NAME,KY04=NAME;
```

Output:

```
H04: STANDARD 5 CHANGED FOR STDDEV.
```

2. Load the new standard 5 at the optiset terminal of station 3154,  
and change the function of key 12 to TIME.

Input:

```
CHANGE-TAPRO:STNO=3154,STD=5,DIGTYP=STDDEV,KY12=TIME;
```

Output:

```
H03: FUNCTION KEY LAYOUT CHANGED FOR STATION 3154.
```

## 188.2.2 DISPLAY-TAPRO

This function is used to output the following information:

1. all valid standard key layouts and all loaded key layouts for all stations with digital terminals.
2. specific standard key layouts in a specific output format.  
Patternsearch in info service field.
3. key layouts loaded at specific stations.

### Procedure Overview

## TAPRO - Key Programming

### Functions of the AMO

| Command Code | Parameter                                                                |
|--------------|--------------------------------------------------------------------------|
|              | [TYPE=STN], [STNO=<number>], [STD=<number>] (3)<br>  , [DIGTYP=<param>]; |

### Examples

1. Display the key layout of standard 7, standards 38 to 40 and standard 61 for Standard Device.

Input:

DISPLAY-TAPRO:TYPE=STD,STD=7&38&39&40&61,DIGTYP=STDDEV;

Output:

H04: STANDARD 5 CHANGED FOR STDDEV.

| STD | DIGTYP  | "SERVICE INFORMATION"                             | KEY LAYOUT |

2. Display the program key layout for stations 2190 to 2194.

Input:

DISPLAY-TAPRO:TYPE=STN,STNO=2190&&2194;

Output:

| STATION | STD | DIGTYP | FUNCTION KEYS WHICH DIFFER FROM STANDARD |         |         |          |
|---------|-----|--------|------------------------------------------|---------|---------|----------|
| 2190    | 0   | STDDEV | 4 VACANT                                 | 10 DOOR | 11 SPKR |          |
| 2191    | 1   | STDDEV | 1 MB                                     | 2 ST    | 3 SNR   | 5 VACANT |
| 2193    | 1   | STDDEV | 2 CONS                                   | 8 MB    |         |          |
|         |     | OPTIA1 | 12 WW                                    |         |         |          |
| 2194    | 1   | STDDEV | 2 CONS                                   | 8 MB    |         |          |
|         |     | OPTIA2 | 9 DR                                     |         |         |          |
|         |     | OPTIA4 | 8 DOOR                                   | 12 SNR  |         |          |

The key layout is displayed for all terminals whose station numbers lie within the specified range of 2190 to 2191, regardless of the terminal type.

3. Display the key layout for all stations with Standard Device terminals and the standard key layout 0.

Input:

DISPLAY-TAPRO:TYPE=STN,STD=0,DIGTYP=STDDEV;

Output:

| STATION | STD | DIGTYP | FUNCTION KEYS WHICH DIFFER FROM STANDARD |      |       |          |
|---------|-----|--------|------------------------------------------|------|-------|----------|
| 2191    | 0   | STDDEV | 1 MB                                     | 2 ST | 3 SNR | 5 VACANT |
| 3500    | 0   | STDDEV |                                          |      |       |          |
|         |     | OPTIA2 | 1 RR                                     |      |       |          |

All digital optiset terminals with the specified standard key layout are output according to station number.

4. Display service Information for key standards with "12 keys".

Input:

DISPLAY-TAPRO:TYPE=STD,FORMAT=S,INFOPAT="12 KEYS";

Output:

| STD | DIGTYP  | "SERVICE INFORMATION"                                | KEY LAYOUT |
|-----|---------|------------------------------------------------------|------------|
| 8   | OPTIT12 | "12 KEYS I.M. STD 0: BASIC12 /SPEAKER12"             |            |
| 9   | OPTIT12 | "12 KEYS I.M. STD 1: BASIC12 /SPEAKER12 ALTERNATIVE" |            |
| 10  | OPTIT12 | "12 KEYS I.M. STD 2: 4 PERSON TEAM"                  |            |

## TAPRO - Key Programming

### Functions of the AMO

#### 5. Display service Information for "OPENSTAGE" key standards.

Input:

```
DISPLAY-TAPRO:TYPE=STD,FORMAT=S,INFOPAT="OPENSTAGE";
```

Output:

| STD | DIGTYP   | "SERVICE INFORMATION" | KEY LAYOUT |
|-----|----------|-----------------------|------------|
| 55  | OPENST20 | "OPENSTAGE - OS20     | "          |
| 56  | OPENST40 | "OPENSTAGE - OS40     | "          |
| 57  | OPENST60 | "OPENSTAGE - OS60     | "          |
| 58  | OPENST80 | "OPENSTAGE - OS80     | "          |
| 59  | OPENST10 | "OPENSTAGE - OS10     | "          |
| 60  | OPENST15 | "OPENSTAGE OS15       | "          |
| 61  | OPENST30 | "OPENSTAGE - OS30     | "          |

#### 6. Display service Information for "DESKPHONE" key standards.

Input:

```
DISPLAY-TAPRO:TYPE=STD,FORMAT=S,INFOPAT="DESKPHONE";
```

Output:

| STD | DIGTYP | "SERVICE INFORMATION"                     | KEY LAYOUT |
|-----|--------|-------------------------------------------|------------|
| 62  | DPIP35 | "DESKPHONE IP35G                          | "          |
| 63  | DPIP55 | "DESKPHONE IP55G                          | "          |
| 109 | CP200  | "DESKPHONE CP200/CP210                    | "          |
| 110 | CP400  | "DESKPHONE CP400                          | "          |
| 111 | CP600  | "DESKPHONE CP600                          | "          |
| 112 | CP100  | "DESKPHONE CP100                          | "          |
| 113 | CP700  | "DESKPHONE CP700/CP710/CP410 (WITH KM710) | "          |
| 114 | CP110  | "DESKPHONE CP110                          | "          |
| 115 | CP410  | "DESKPHONE CP410/CP710 (WITH KM410)       | "          |

## TAPRO - Key Programming

### Parameter Description

2. Regenerate the functions which differ from standard for stations 2190 to 2200.

Input:

```
REGENERATE-TAPRO:TYPE=STN,STNO=2190&&2200;
```

Output :

```
CHANGE-TAPRO:2190,,STDDEV,,,VACANT,,,,,DOOR,SPKR,,,,,,,,;
CHANGE-TAPRO:2191,,STDDEV,MB,ST,SNR,,VACANT,,,,,,,,,,,,;
CHANGE-TAPRO:2193,,STDDEV,,CONS,,,,,MB,,,,,,,,,,,,;
CHANGE-TAPRO:2193,,OPTIA3,,,,,,,,,SNR,,,,,,,,;
CHANGE-TAPRO:2194,,STDDEV,,CONS,,,,,MB,,,,,,,,,,,,;
CHANGE-TAPRO:2194,,OPTIA2,,,,,,,,,DR,,,,,,,,;
CHANGE-TAPRO:2194,,OPTIA4,,,,,,,,,DOOR,,,SNR,,,,,,,,;
```

The key layout is regenerated for all terminals whose station numbers lie within the specified range of 2190 to 2200, regardless of the terminal type, and whose key layout differs from standard.

3. Regenerate the key layouts which differ from standard for all Standard Device terminals with standard 0.

Input:

```
REGENERATE-TAPRO:TYPE=STN,STD=0,DIGTYP=STDDEV;
```

Output:

```
CHANGE-TAPRO:2191,,STDDEV,MB,ST,SNR,,VACANT,,,,,,,,,,,,;
CHANGE-TAPRO:3500,,OPTIA2,CBK,,,,,,,,,,,,,,,,;
```

All digital Standard Device terminals with the specified standard key layout, and whose key layout differs from standard, are output according to station number.

## 188.3 Parameter Description

|                 |                                                         |
|-----------------|---------------------------------------------------------|
| DIGTYP          | Type of Hicom set                                       |
| Type of Input   | : Single value or linked single values                  |
| Possible Values | : STDDEV = standard device                              |
|                 | OPTIT19 = optipoint T19                                 |
|                 | OPTIA1 = 1st auxiliary unit for optiset E and optipoint |
|                 | OPTIA2 = 2nd auxiliary unit for optiset E and optipoint |
|                 | OPTIA3 = 3rd auxiliary unit for optiset E               |

| CP200    | = Desk Phone CP200/CP210                    |
| CP400    | = Desk Phone CP400                          |
| CP410    | = Desk Phone CP410/CP710 (with KM410)       |
| CP600    | = Desk Phone CP600                          |
| CP700    | = Desk Phone CP700/CP710/CP410 (with KM710) |

Default Value : basic terminal is changed

When CHANGING a STATION layout, the AMO does not differentiate between STDDEV, OPTIT3, OPTIT8, OPTIT12 and OPTIT19.

When CHANGING a standard key layout the values OPTIT3, OPTIT8, OPTIT12 and OPTIT19 will be evaluated.

**CP410** standard key layout should be used for OpenScape Desk Phone CP410 or CP710 with KM410 (Key module with 16 free programmable function keys) connected.

**CP700** standard key layout should be used for OpenScape Desk Phone CP410 or CP710 with KM710 (Key module with 12 free programmable function keys) connected.

## TAPRO - Key Programming

### Parameter Description

|                 |                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STD             | Number of key layout/map standard                                                                                                                                      |
| Type of Input   | : Single value, mandatory (CHANGE standard)<br>Single value, optional (CHANGE station)<br>Single value, linked single values, range,<br>optional (DISPLAY, REGENERATE) |
| Possible Values | : 0 to 127 for STDDEV                                                                                                                                                  |
| Default Value   | : no new standard is loaded (CHANGE station)<br>all standards (DISPLAY, REGENERATE)                                                                                    |

#### Caution !

When a key mapping standard for OPTIT3, OPTIT8, OPTIT12 or OPTIT19 is modified, new standard numbers (STDNO) must be allocated, or else the standards will be overwritten.

When a STD is changed for a station, please pay attention at changes from a standard with maximum 19 keys on maindev to/from a standard with 32 keys on maindev (CP400/CP600/CP410/CP700 key layout). The add-on key mapping is different.

For CP400/CP600/CP410/CP700 key layouts:

- main device keys are 1-32
- add-on keys start with 33.

For all other key layouts:

- main device keys are 1-19
- add-on keys start with 20.

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| SPKR      | LOUDSPEAKER                               |
| SPLT      | TWO-WAY SPLITTING (FLIP-FLOP, TOGGLING)   |

## TAPRO - Key Programming

### Parameter Description

|          |                                             |
|----------|---------------------------------------------|
| MENU     | MAIN MENU KEY (OPTISET E)                   |
| MONSLNTL | SILENT MONITORING/BRIDGE OF LINE            |
| MONTONE  | TONE MONITORING                             |
| MUTE     | MUTE KEY                                    |
| NAME     | NAME KEY                                    |
| NV       | NON-VOICE KEY                               |
| PARK     | PARK KEY                                    |
| PHML     | PHONEMAIL                                   |
| PREVIEW  | PREVIEW KEY                                 |
| PRIVAT   | PRIVACY                                     |
| CC       | CODE CALLING KEY                            |
| RPTID    | REPEAT ID KEY                               |
| CONS     | CONSULTATION HOLD                           |
| CBK      | CALLBACK                                    |
| RNGXFER  | RING TRANSFER (FOR EXECUTIVE/SECRETARY) KEY |
| RNGXFERL | RING TRANSFER FOR LINE                      |
| RCUTOFF  | RINGER CUTOFF                               |
| HT       | HUNT GROUP KEY                              |
| SCROL    | SCROLL MESSAGE                              |
| SPARK    | SYSTEM CALL PARK KEY                        |
| SPDI     | SPEED DIAL (STATION SPEED) KEY              |
| HS       | HEADSET                                     |
| SPKRCALL | SPEAKER CALL - ONE WAY                      |
| LANSEL   | LANGUAGESELECTION FOR DISPLAY TEXT          |
| ST       | START KEY                                   |
| SYSSP1   | SYSTEM SPEED KEY # 1                        |
| SYSSP2   | SYSTEM SPEED KEY # 2                        |
| REMIND   | REMINDER KEY                                |
| RLS      | RELEASE                                     |
| DOOR     | DOOR                                        |
| TRNS     | CALL TRANSFER (PASS OVER AND TAKE OVER)     |
| TIME     | DATE/TIME KEY                               |
| REP      | REPRESENTATIVE FOR SECRETARY/DEPUTY KEY     |
| LNR      | LAST NUMBER REDIAL                          |
| WHISANN  | WHISPER ANNOUNCEMENT                        |
| SNR      | STORED NUMBER REDIAL                        |
| ADDON    | ADD-ON / WITNESS                            |
| BUSYDSS  | BUSY DIRECT STATION SELECTION KEY           |
| SHIFT    | SHIFT                                       |

LOCAL APPLICATION KEY  
SECURE SECURITY LEVEL OF AN ACTIVE CALL  
Default Value : Key function is not changed

Key numbering :

Depending on the DIGTYP, the following 'KYxx' parameters may be declared:

|          |                                  |                    |
|----------|----------------------------------|--------------------|
| OPTIT19  | KY01 to KY19                     | *                  |
| OPTIA1   | KY01 to KY15                     |                    |
| OPTIA2   | KY01 to KY15                     |                    |
| OPTIA3   | KY01 to KY15                     |                    |
| OPTIA4   | KY01 to KY15                     |                    |
| OPENST10 | KY09 to KY11                     |                    |
| OPENST15 | KY09 to KY16                     |                    |
| OPENST20 | KY00 to KY00                     | all 8 keys are fix |
| OPENST30 | KY09 to KY16                     |                    |
| OPENST40 | KY09 to KY14                     |                    |
| OPENST60 | KY09 to KY16                     |                    |
| OPENST80 | KY09 to KY17                     |                    |
| DPIP55   | KY09 to KY16                     |                    |
| DPIP35   | KY09 to KY11                     |                    |
| CP100    | KY09 to KY11                     |                    |
| CP110    | KY09 to KY11                     |                    |
| CP200    | KY09 to KY12                     |                    |
| CP400    | KY09 to KY16 and<br>KY25 to KY32 |                    |
| CP410    | KY09 to KY16 and<br>KY25 to KY32 |                    |
| CP600    | KY09 to KY16 and<br>KY25 to KY32 |                    |
| CP700    | KY09 to KY16 and<br>KY25 to KY32 |                    |

\* use only to change a standard key layout

KEY FUNCTION FOR BUTTON 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32

Type of Input single value, optional

|                 |         |                       |
|-----------------|---------|-----------------------|
| Possible Values | ACC     | ACCOUNT CODE          |
|                 | ACDAGTM | SEND MESSAGE TO AGENT |
|                 | ACDWORK | AGENT WORK            |
|                 | ACDLOG  | AGENT LOGON/LOGOFF    |

## TAPRO - Key Programming

### Parameter Description

|           |                                           |
|-----------|-------------------------------------------|
| ACDEMMSG  | EMERGENCY MESSAGE                         |
| ACDNAV    | AGENT NOT AVAILABLE                       |
| ACDPGS    | PRIMARY GROUP STATUS                      |
| ACDPQS    | PRIMARY QUEUE STATUS                      |
| ACDSGS    | SECONDARY GROUP STATUS                    |
| ACDSPVM   | SEND MESSAGE TO SUPERVISOR                |
| ACDSQS    | SECONDARY QUEUE STATUS                    |
| ACDAV     | AGENT AVAILABLE                           |
| ACK       | MESSAGE ACKNOWLEDGMENT                    |
| IUSE      | DISPLAY ACTUAL USED LINE                  |
| DND       | DO NOT DISTURB KEY                        |
| BROADCAST | SPEAKER CALL - ONE WAY BROADCAST          |
| KNOVR     | KNOCKING OVERRIDE KEY                     |
| VCR       | VOICE CALL REJECT KEY                     |
| FWD       | FORWARDING KEY                            |
| PU        | CALL PICKUP                               |
| PUS       | CALL PICKUP (FOR EXECUTIVE/SECRETARY) KEY |
| AUTOM     | AUTOMATIC CALL ACCEPTANCE                 |
| MB        | MAILBOX KEY                               |
| MBLINE    | MAILBOX KEY FOR LINE                      |
| MSGR      | MESSENGER KEY                             |
| BUSYLAMP  | BUSY LAMP                                 |
| BUZZ      | BUZZ A PREDETERMINED NUMBER               |
| CALOG     | CALL LOG                                  |
| CDRACC    | CDR ACCOUNT CODE KEY                      |
| CH        | CHECK                                     |
| CL        | CLEAR                                     |
| CNCT      | CONNECT TO CALL ON HOLD                   |
| COMGRP    | COM GROUP CALL                            |
| COMSPK    | COM GROUP SPEAKER CALL - TWO WAY          |
| VC        | VOICE CALL KEY - TWO WAY                  |
| DCPA      | DIRECTED CALL PARK                        |
| DOORPEN   | DOOR OPENER                               |
| DSS       | DIRECT STATION SELECTION KEY              |
| STO       | DATA TRANSFER (STORE)                     |
| EXCLHOLD  | EXCLUSIVE HOLD                            |
| VACANT    | NOT IN USE                                |
| HOLD      | HOLD                                      |
| CONF      | CONFERENCE KEY                            |

|          |                                             |
|----------|---------------------------------------------|
| LINE     | LINE KEY                                    |
| SPKR     | LOUDSPEAKER                                 |
| SPLT     | TWO-WAY SPLITTING (FLIP-FLOP, TOGGLING)     |
| MENU     | MAIN MENU KEY (OPTISET E)                   |
| MONSLNTL | SILENT MONITORING/BRIDGE OF LINE            |
| MONTONE  | TONE MONITORING                             |
| MUTE     | MUTE KEY                                    |
| NAME     | NAME KEY                                    |
| NV       | NON-VOICE KEY                               |
| PARK     | PARK KEY                                    |
| PHML     | PHONEMAIL                                   |
| PREVIEW  | PREVIEW KEY                                 |
| PRIVAT   | PRIVACY                                     |
| CC       | CODE CALLING KEY                            |
| RPTID    | REPEAT ID KEY                               |
| CONS     | CONSULTATION HOLD                           |
| CBK      | CALLBACK                                    |
| RNGXFER  | RING TRANSFER (FOR EXECUTIVE/SECRETARY) KEY |
| RNGXFERL | RING TRANSFER FOR LINE                      |
| RCUTOFF  | RINGER CUTOFF                               |
| HT       | HUNT GROUP KEY                              |
| SCROL    | SCROLL MESSAGE                              |

## 188.4 Error Messages and Advisories

### 188.4.1 Error Messages

- F01: STANDARD ^zahl^ FOR ^digtyp^ CANNOT BE CHANGED , SINCE IT IS CURRENTLY IN USE. PLEASE ENTER A NEW STANDARD NUMBER.
- F02: IF A STANDARD NUMBER HAS BEEN SPECIFIED, THE PARAMETER DIGTYP MUST ALSO BE SPECIFIED.
- F03: NO ASSOCIATED VALUES MAY BE ENTERED FOR PARAMETER DIGTYP.  
<digtyp> IGNORED.

F04: STANDARDS CANNOT BE LOADED AT AN ADD-ON TERMINAL.

F05: KEY<xx> DOES NOT EXIST ON <digtyp>.

F06: ^tln^ INDIVIDUAL KEY FUNCTION ASSIGNMENT NOT PERMITTED FOR  
<xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx>

F06: INDIVIDUAL KEY FUNCTION ASSIGNMENT NOT PERMITTED FOR ^digtyp^.

F07: THE KEY FUNCTION ^code^ IS NOT ALLOWED FOR ^digtyp^.

F08: MORE THAN ONE <funct> KEY ASSIGNED.

F09: <place>: MORE THAN <number> <funct> KEYS ASSIGNED.

F09: AT DIGTYP ^digtyp^ MORE THAN ^number^ ^funct^ KEYS ASSIGNED.

F09: AT STNO ^tln^^bis^^tln2^ MORE THAN ^number^ ^funct^ KEYS ASSIGNED.

F10: LOWER RANGE LIMIT <stno1> OF PARAMETER STNO IS HIGHER THAN UPPER LIMIT  
<stno2>.  
(Example: 900&&799 is wrong, 799&&900 is correct)

F11: STATION <stno> IS NOT CONFIGURED.  
is not output if more than one single value entered for STNO

F12: STATION <stno> IS NOT CONFIGURED IN "HOME" NODE.  
is not output if more than one single value entered for STNO

F13: STATION ^tln^ DOES NOT HAVE TERMINAL TYPE SPECIFIED.

F14: AT STATION <stno> THE ADD-ON TERMINAL <number> IS NOT CONFIGURED.

F15: STATION <stno>: <funct> IS ACTIVE.

F16: <funct> KEY OF STATION <stno> CANNOT BE RE-ALLOCATED, SINCE  
NEW MESSAGES STILL EXIST IN THE USER'S MAILBOX.

F18: STNO <stno> IS INVALID.

F19: STNO <stno> ONLY PERMITTED AS SINGLE VALUE.

F22: STN <stn> IS NOT OPTISET.

F23: NO FREE DESTINATION MEMORY FOR DSS/NAME KEYS AT STN <stn>.

F24: THE KEY ^zahl^ FOR A ^digtyp^ MAY NOT BE CHANGED.

F25: FOR STATION <stn> WITH COM-MANAGER THE ADD-ON TERMINALS 3 AND 4  
ARE NOT AVAILABLE.

F26: FOR <digtyp>, NOT MORE THAN <n> <funct> FUNCTION ALLOWED.

F27: <(FOR DIGTYP=<digtyp>/STN <tln> WITH DIGTYP=<digtyp>,)> STD > <snu> IS NOT  
ALLOWED.

F28: FOR STN <stno> THE FUNCTION LINE ON KEY <n> CANNOT BE  
RE-ALLOCATED, SINCE IT IS USED AS PRIMELINE RESP. SECONDARYLINE.  
(DISP-KCSU:STNO=<stno>;)

F29: PATTERN SEARCH CAN ONLY BE SPECIFIED FOR DIGTYP=STDDEV.

F29 SERVICE INFO CAN ONLY BE SPECIFIED FOR DIGTYP=STDDEV.  
INFO:

F30: THE KEY FUNCTION <funct> IS NOT ALLOWED FOR EXECUTIVE TEAMMEMBER.

## TAPRO - Key Programming

### Error Messages and Advisories

F32: TEAMMEMBER <tln> IS A SIGNED OFF KEYSSET. CHANGE NOT ALLOWED.

F33: THE KEY <N> WITH FUNCTION <funkt> FOR A KEYSSET TEAMMEMBER <stno> MAY NOT BE CHANGED.

F34: THE KEY FUNCTION <funkt> (KEY <N>) FOR STN <stno> HAS WRITE PROTECTION. DELETE DESTINATION ENTRY FIRST WITH AMO ZIELN.

F35: THE KEY FUNCTIONS BUSYLAMP AND DOOROPEN CAN ONLY BE SET ALTERNATIVELY.

F36: THE KEY FUNCTION MBLINE IS ALLOWED WHEN THE FEATURE AND THE NECESSARY PATCHES ARE ACTIVATED.

F37: A CHANGE OF DIGTYP IS ONLY POSSIBLE WHEN SIMULTANEOUS A KEY FUNCTION IS CHANGED.

F38: FOR OPENSTAGE AND DPIP PHONES, POSITION OF FUNCTIONS LOCATED AT 1ST - 8TH KEYS ARE FIXED.

F39: THE KEY FUNCTION ^code^ HAS FIXED POSITION ON THIS PHONES TYPE THEREFORE CAN NOT BE MOVED TO ANOTHER POSITION.

F43: SHIFT KEY IS NOT ALLOWED FOR OPENST15, OPENST30, OST30BLF AND OPTIBLF.

F44: ONLY TWO LINE KEYS ARE ALLOWED WHEN TWINNING IS ACTIVE.

F45: FOR STN ^tln^ THE FUNCTION RNGXFER ON KEY ^zahl^ CANNOT BE OVERWRITTEN, SINCE IT IS ASSIGNED IN A CHESE GROUP. (DISP-CHESE:STN,^tln^;)

F46: AD5 CAN ONLY BE CONFIGURED FOR STANDARDS WITH BLF."

F47: THE KEY FUNCTION SHIFT IS NOT ALLOWED ON BLF ADDON.

F48: FOR DPIP55 PHONES, POSITION OF FUNCTIONS LOCATED AT 1ST - 8TH AND 17TH - 19TH KEYS ARE FIXED.

F49: THE KEY FUNCTION SNR/LNR HAS FIXED POSITION ON THIS PHONES TYPE THEREFORE IT CAN NOT BE ADDED.

F50: FOR CP400/ CP600/ CP700 PHONES, POSITION OF FUNCTIONS LOCATED AT 1ST - 8TH AND 17TH - 24TH KEYS ARE FIXED.

F51: STN @@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@ IS UFIP.

## 188.4.2 Advisories

H01: NO ENTRY FOR SPECIFIED PARAMETERS.

H02: AT STNO <place>: <funct> KEY DELETED FROM FORMER POSITION.

H02: <funct> KEY DELETED FROM FORMER POSITION.

H03: FUNCTION KEY LAYOUT CHANGED FOR STATION <stno>.

H04: STANDARD <std> CHANGED FOR <digtyp>.

H05: STANDARD <std> LOADED AT STATION <stno>.

H06: STN <stn> ACTIVATED.

H07: THE STANDARD STDNO <std> WAS ALLOCATED DIGTYP <digtyp>. THIS DIGTYP WAS OVERWRITTEN WITH DIGTYP <digtyp>.

- (AT DIGTYPES OF OPTIT3, OPTIT8, OPTIT12 AND OPTIT19 THE STNO MUST NOT BE IDENTICAL !)
- H08: SERVICE INFO CAN NOT BE SPECIFIED FOR STATIONS. PARAMETER INFO IGNORED.
- H09: THE SERVICE INFO: " " MAY BE UPDATED. (CHANGE-TAPRO:STD=<std>,DIGTYP=<digtyp>,INFO= )
- H10: No MATCHING PATTERN FOUND IN INFO FIELDS.
- H11: DISPLAY WITH FORMAT=S FOR DIGTYP=STDDEV NOT POSSIBLE.
- H12: MIN 1 KEY FUNCTION <funct> HAS TO BE EXIST FOR SECRETARY TEAMMEMBER.
- H13: STN <tln> IS <A/NO> TEAMMEMBER (AMO SDAT, TEAMEXEC/TEAMSECR). THE ADDITIONAL DSSNA MEMORY FOR KEY FUNCTION <funct> (KEY <N>) WAS DELETED.
- H14: STN <tln> IS A TEAMMEMBER (AMO SDAT, TEAMEXEC/TEAMSECR). THE ADDITIONAL DSSNA MEMORY FOR KEY FUNCTION <funct> (KEY <N>) WAS ADDED.
- H15: THE KEY FUNCTIONS BUSYLAMP AND DOOROPEN CAN ONLY BE SET ALTERNATIVELY. AT STNO <tln>: <funct> KEY DELETED.
- H16: <tln> DEFAULT VALUE SLKTYPE=SLKSTNO HAS BEEN SET FOR ANY PUS RESP. RNGXFER KEY. AND CAN BE MODIFIED BY CHANGE-CHESE:GRNO=<number>,TYPE=EXECCLK,... RESP.
- H17: <tln><bis><tln2>DEFAULT VALUE SLKTYPE=SLKSTNO HAS BEEN SET FOR ANY PUS AND RNGXFER KEY.AND CAN BE MODIFIED BY CHANGE-CHESE:GRNO=^zahl^,TYPE=SECRSLK,..."
- H18: FIXED FUNCTIONS CANNOT BE OVERWRITTEN AND FUNCTIONS ON FIXED KEYS CANNOT BE ASSIGNED TO ANOTHER KEY. CHANGES WHICH CONTRADICT THESE RULES COULD NOT BE PERFORMED.
- H19: STD OF STATION ^tln^ IS CHANGED FROM NON-OPENSTAGE/DPIP, DPCP TO OPENSTAGE/DPIP/DPCP KEY LAYOUT. SO, THE INVALID NAME ENTRIES (DEFINED AT LEVEL 3,4 AND/OR ADD-ON 3,4) IN AMO-ZIEL ARE DELETED.
- H20: CHANGE OF KEY 17 AND 18 ONLY TAKES PLACE IF PLUGGED ADD-ON IS LOW-COST ADD-ON.
- H21: STD OF STATION ^tln^ IS CHANGED FROM OPENSTAGE/DPIP/DPCP TO NON-OPENSTAGE/DPIP KEY LAYOUT.
- H22: SHIFT-KEY HAS NO FUNCTION IN CASE A LOW-COST ADD-ON IS USED
- H23: THE ENTERED KEY MODULE IS NOT SUPPORTED FOR THIS LAYOUT TYPE, MODIFIED KEY WILL NOT BE FUNCTIONAL.

## 190 TEST - Regression tests, AMC,UT,TT

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The AMO TEST makes available to the system specialist a tool with which he can check the functions of the A&M organization through defined test steps. The results of the test steps are output by the AMO on the service terminal.

The AMO is an online testing tool for system testing and field and customer application. It can run in all processors in which an administration and maintenance system is present.

### Overview of Functions

The following functions are implemented in the AMO:

1. ENDWRITE only
2. WRITE on DIALOG DEVICE
3. WRITE ON ERROR DEVICE
4. WRITE ON RESULT DEVICE
5. RESERVATION/RELEASE of ERROR DEVICE
6. Only RESERVATION of ERROR DEVICE
7. RESERVATION/RELEASE of DIALOG DEVICE
8. Only RESERVATION of DIALOG DEVICE
9. PROMPT message
- 10.DIALOG message
- 11.WRITE/READ message
- 12.TIMER with 15 seconds
- 13.LOGON INTERNAL
- 14.INTERNAL START (call function 15)
- 15.for function 14
- 16.Message to a task
- 17.Order to carry out functions 1..14

This description is valid from HiPath 4000 V1.0.

In function 16, the AMO TEST also communicates with a task which is specified by the basic mailbox index and processor identification or by the mailbox name via processors.

- EXEC-TEST : Starting the test run
- DIALOG01-TEST : Auto-dialog input request for functions 10 and 11
- DIALOG02-TEST : Auto-dialog input request for function 16

1. In functions 1..14, the AMO TEST operates in the polling mode. The AMO terminates after the function has been carried out.
2. In function 16, the AMO remains in the dialog mode for several minutes; if no input is made, it is terminated from A&M ORG. In the dialog mode, the user terminates the AMO by entering E.

| Command Code | Parameter                                                |
|--------------|----------------------------------------------------------|
| EXEC-TEST    | UNIT=<param><br>, FUNCT=1&&15&99, [PROMPT=<number>]; (1) |
|              | , FUNCT=16, CATALOG=<param> (2)                          |
|              | , CATTYPE=INDEX, MBXIDX=<param>, DESTPROC=<param> (3)    |
|              | , [MSGSIZE=<number>], [IB=<number>]                      |
|              | , [PAUSE=<number>];                                      |
|              | , CATTYPE=NAME, MBXNAME<name> (4)                        |
|              | , [MSGSIZE=<number>], [IB=<number>]                      |

| Command Code | Parameter           |
|--------------|---------------------|
|              | , [PAUSE=<number>]; |

**Example**

To show the functions, a complete command batch run for the AMO is played back in the administration and data server.

Test step 1 : ENDWRITE only.

Input:

```
EXEC-TEST:A1,1,0;
```

Output:

```
EXEC-TEST:A1,1,0;
H500:  AMO TEST  STARTED
M1: ENDWRITE-MESSAGE AT  "DIALOG"
AMO-TEST-...      REGRESSION TESTS, AMC,UT,TT
EXEC COMPLETED;
```

Test step 2 : WRITE on DIALOG

Input:

```
EXEC-TEST:A1,2;
```

Output:

```
EXEC-TEST:A1,2;
H500:  AMO TEST  STARTED
M2: WRITE-MESSAGE AT  "DIALOG"
M1: ENDWRITE-MESSAGE AT  "DIALOG"
AMO-TEST-...      REGRESSION TESTS, AMC,UT,TT
EXEC COMPLETED;
```

Test step 3 : WRITE on ERROR

Input:

```
EXEC-TEST:A1,3;
```

Output:

```
EXEC-TEST:A1,3;
H500:  AMO TEST  STARTED
M2: WRITE-MESSAGE AT  "ERROR"
M1: ENDWRITE-MESSAGE AT  "DIALOG"
AMO-TEST-...      REGRESSION TESTS, AMC,UT,TT
EXEC COMPLETED;
```

## TEST - Regression tests, AMC,UT,TT

### Functions of the AMO

#### Test step 4 : WRITE on RESULT

##### Input:

EXEC-TEST:A1,4;

##### Output:

EXEC-TEST:A1,4;

H500: AMO TEST STARTED

M2: WRITE-MESSAGE AT "RESULT"

M1: ENDWRITE-MESSAGE AT "DIALOG"

AMO-TEST-... REGRESSION TESTS, AMC,UT,TT  
EXEC COMPLETED;

#### Test step 5 : RESERVATION/REL. of ERROR

##### Input:

EXEC-TEST:A1,5;

##### Output:

EXEC-TEST:A1,5;

H500: AMO TEST STARTED

M3: RESERVE SYMBOLIC DEVICE "ERROR"

M2: WRITE-MESSAGE AT "ERROR" - (ERROR RESERVED)

M2: WRITE-MESSAGE AT "ERROR" - (RESERVATION RELEASED)

M1: ENDWRITE-MESSAGE AT "ERROR"

AMO-TEST-... REGRESSION TESTS, AMC,UT,TT  
EXEC COMPLETED;

#### Test step 6 : Only RESERVATION of ERROR

##### Input:

EXEC-TEST:A1,6;

##### Output:

EXEC-TEST:A1,6;

H500: AMO TEST STARTED

M3: RESERVE SYMBOLIC DEVICE "ERROR"

M1: ENDWRITE-MESSAGE AT "ERROR"

AMO-TEST-... REGRESSION TESTS, AMC,UT,TT  
EXEC COMPLETED;

#### Test step 7 : RESERVATION/REL. of DIALOG

**Input:**

EXEC-TEST:A1,7;

**Output:**

EXEC-TEST:A1,7;

H500: AMO TEST STARTED

M3: RESERVE SYMBOLIC DEVICE "DIALOG"

M2: WRITE-MESSAGE AT "DIALOG" - (DIALOG RESERVED)

M2: WRITE-MESSAGE AT "DIALOG" - (RESERVATION RELEASED)

M1: ENDWRITE-MESSAGE AT "DIALOG"

AMO-TEST-... REGRESSION TESTS, AMC,UT,TT  
EXEC COMPLETED;

**Test step 8 : Only RESERVATION of DIALOG****Input:**

EXEC-TEST:A1,8;

**Output:**

EXEC-TEST:A1,8;

H500: AMO TEST STARTED

M3: RESERVE SYMBOLIC DEVICE "DIALOG"

M1: ENDWRITE-MESSAGE AT "DIALOG"

AMO-TEST-... REGRESSION TESTS, AMC,UT,TT  
EXEC COMPLETED;

**Test step 9 : PROMPT message****Input:**

EXEC-TEST:A1,9;

**Output:**

EXEC-TEST:A1,9;

H500: AMO TEST STARTED

M4: PROMPT-MESSAGE

M5: PLEASE INPUT A DIGIT FROM 0 TO 9

PROMPT =

**Input:**

0

**Output:**

## TEST - Regression tests, AMC,UT,TT

### Functions of the AMO

M10: 0 HAS BEEN ENTERED

M1: ENDWRITE-MESSAGE AT "DIALOG"

AMO-TEST-... REGRESSION TESTS, AMC,UT,TT  
EXEC COMPLETED;

#### Test step 10: DIALOG message

##### Input:

EXEC-TEST:A1,10;

##### Output:

EXEC-TEST:A1,10;

H500: AMO TEST STARTED

M6: DIALOG-MESSAGE

M7: TERMINATE WITH ";" OR INPUT A DIGIT FROM 0 TO 9

<DIALOG01-TEST:

##### Input:

5

##### Output:

M10: 5 HAS BEEN ENTERED

M1: ENDWRITE-MESSAGE AT "DIALOG"

AMO-TEST-... REGRESSION TESTS, AMC,UT,TT  
EXEC COMPLETED;

#### Test step 11: WRITE/READ message

##### Input:

EXEC-TEST:A1,11;

##### Output:

EXEC-TEST:A1,11;

H500: AMO TEST STARTED

M8: WRITE/READ-MESSAGE

M9: PLEASE INPUT A DIGIT FROM 0 TO 9

DIGIT =

##### Input:

1;

##### Output:

M10: 1 HAS BEEN ENTERED

M1: ENDWRITE-MESSAGE AT "DIALOG"

AMO-TEST-... REGRESSION TESTS, AMC,UT,TT  
EXEC COMPLETED;

**Test step 12: Timer with 15 seconds****Input:**

EXEC-TEST:A1,12;

**Output:**

EXEC-TEST:A1,12;

H500: AMO TEST STARTED

M13: CALL TIMER WITH 15 SEC

M2: WRITE-MESSAGE AT "DIALOG" - (TIMER TIMEOUT)

M1: ENDWRITE-MESSAGE AT "DIALOG"

AMO-TEST-... REGRESSION TESTS, AMC,UT,TT  
EXEC COMPLETED;

**Test step 13: LOGON INTERNAL****Input:**

EXEC-TEST:A1,13;

**Output:**

EXEC-TEST:A1,13;

H500: AMO TEST STARTED

M14: PERFORM LOGON-INTERN

M2: WRITE-MESSAGE AT "RESULT"

M1: ENDWRITE-MESSAGE AT "DIALOG"

AMO-TEST-... REGRESSION TESTS, AMC,UT,TT  
EXEC COMPLETED;

**Test step 14: INTERNAL START****Input:**

EXEC-TEST:A1,14;

**Output:**

EXEC-TEST:A1,14;

H500: AMO TEST STARTED

M15: INTERNAL START EXECUTED BY USER TASK

## TEST - Regression tests, AMC,UT,TT

### Functions of the AMO

```
EXEC-TEST:"A1",15;

H500:  AMO TEST  STARTED

M2: WRITE-MESSAGE AT  "DIALOG" - (BY USER-TASK)

M1: ENDWRITE-MESSAGE AT  "DIALOG" - (BY USER-TASK)

AMO-TEST-...      REGRESSION TESTS, AMC,UT,TT
EXEC COMPLETED;

M1: ENDWRITE-MESSAGE AT  "DIALOG"

AMO-TEST-...      REGRESSION TESTS, AMC,UT,TT
EXEC COMPLETED;
```

Test step 15: Functions for internal start are not necessary in batch

Test step 16: Send message to a task.

The task, which shall get the message, has to be specified by:

- the identifier of the catalog (CATALOG), in which the mailbox of the task is catalogued.
- the name of the task mailbox (MBXNAME) or the value of the task element from DB\_M\_BASIC\_MBX\_IDX\_SET (MBXIDX) and the identifier of the destination processor (DESTPROC).

#### Note:

The mailbox of the Signaling Task, which will be used for this example, is cataloged by name and by index in the System Catalog.

#### Input:

```
EXEC-TEST:A1,16,SYSTEM,INDEX,01,A1,FF,00;
or
EXEC-TEST:A1,16,SYSTEM,NAME,SITMBOX,FF,00;
```

#### Output:

```
EXEC-TEST:A1,16,SYSTEM,INDEX,01,A1,FF,00;
or
EXEC-TEST:A1,16,SYSTEM,NAME,SITMBOX,FF,00;

H500:  AMO TEST  STARTED

M17: PLEASE INPUT MESSAGE
      (CONCATENATE MESSAGES WITH "&" AT THE END)
      (TERMINATE AMO WITH "E")
```

\*

#### INPUT:

```
"3A,54,00,00&"
```

#### Output:

M18: MESSAGES WILL BE CONCATENATED - NEXT PART OF MESSAGE  
PLEASE

(CONCATENATE MESSAGES WITH "&" AT THE END)  
(TERMINATE AMO WITH "E")

\*

INPUT:

"11,14,01"

Output:

F4421 M4 N0387 NO ACT BPA VECO STATISTIC CC  
00-00-00 00:00:00  
DEV CLASS:00000000 0000 0000000000000000  
0000000000000000 000000  
FORMAT:0

M17: PLEASE INPUT MESSAGE  
(CONCATENATE MESSAGES WITH "&" AT THE END)  
(TERMINATE AMO WITH "E")

\*

Input:

E

Output:

AMO-TEST-... REGRESSION TESTS, AMC,UT,TT  
EXEC COMPLETED;

## 190.3.2 DIALOG01-TEST

### Procedure run

The verb DIALOG01 is only used for DIALOG for function 10 and WRITE-READ for function 11, and can not be entered on the service terminal (AMT). On the AMT, the user only sees DIALOG01-TEST (during DIALOG) or "\*" (during WRITE-READ), which represents the prompt for the user.

## 190.3.3 DIALOG02-TEST

### Procedure run

The verb DIALOG02 is only used for a WRITE-READ for function 16, and can not be entered on the service terminal (AMT). On the AMT, the user sees only the asterisk, which is the prompt for the user.

## 190.4 Parameter Description

|                 |                                                                 |                                               |
|-----------------|-----------------------------------------------------------------|-----------------------------------------------|
| CATALOG         | Catalog in which the mailbox of the receiver task is catalogued |                                               |
| Type of Input   | : Single value, mandatory                                       |                                               |
| Possible Values | : MODUL                                                         | The mailbox is catalogued in modul catalog.   |
|                 | SYSTEM                                                          | the mailbox ist catalogued in system catalog. |
| CATTYPE         | How is the mailbox of the receiver task catalogued              |                                               |
| Type of Input   | : Single value, mandatory                                       |                                               |
| Possible Values | : NAME                                                          | The mailbox is catalogued by name.            |
|                 | INDEX                                                           | The mailbox is catalogued by index.           |
| DESTPROC        | Identification of the destination processor                     |                                               |
| Type of Input   | : Single value, mandatory                                       |                                               |
| Possible Values | : A1                                                            | ADS                                           |

# 191 TEXT - Administration of Output Text Tables

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The task of the AMO TEXT is to administrate the output text tables for call detail recording. These tables contain the ASCII strings which are used for output. The symbolic names used by call charge registration are replaced by these entered names in the output.

The field **speed** can have further values, which cannot be configured within AMO TEXT.

The following table shows the possible values:

|    | DB_M_CP_TRANS_SPEED_SET            |
|----|------------------------------------|
| 0  | DB_CP_TS_NULL, /* DEFAULT SPEED */ |
| 4  | DB_CP_TS_WITHOUT,                  |
| 11 | DB_CP_TS_VARIABEL,                 |
| 12 | DB_CP_TS_2400_X25,                 |
| 13 | DB_CP_TS_4800_X25,                 |
| 14 | DB_CP_TS_9600_X25,                 |
| 15 | DB_CP_TS_48000_X25,                |
| 16 | DB_CP_TS_64000_X25,                |
| 17 | DB_CP_TS_VARIABEL_X25,             |
| 24 | DB_CP_TS_300,                      |
| 25 | DB_CP_TS_3600,                     |
| 26 | DB_CP_TS_12000,                    |

## 191.1 Interrelationships

- AMO-FTBL : Administration of the Output Format Tables

## 191.2 Functions of the AMO

- [ADD-TEXT](#) : Entry of Texts
- [DELETE-TEXT](#) : Deletion of table entries
- [DISPLAY-TEXT / REGENERATE-TEXT](#) : Interrogation of table entries / Regeneration of table entries

### 191.2.1 ADD-TEXT

The user enters the table and the symbolic name, as well as the character string to be used for this name.

#### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

TEXT - Administration of Output Text Tables

Functions of the AMO

| Command Code | Parameter                                  |
|--------------|--------------------------------------------|
|              | TBL=SUBSID,ENTRY=<number>,NAME=<string>;   |
|              | TBL=SIGDATA,ENTRY=<number>,NAME=<string>;  |
|              | TBL=ROUTCC,ENTRY=<number>,NAME=<string>;   |
|              | TBL=IDPP,ENTRY=<param>,NAME=<string>;      |
|              | TBL=UNITERAS,ENTRY=<param>,NAME=<string>;  |
|              | TBL=LISTTYPE,ENTRY=<param>,NAME=<string>;  |
|              | TBL=EXPENS,ENTRY=<number>,NAME=<string>;   |
|              | TBL=CONNTYPE,ENTRY=<param>,NAME=<string>;  |
|              | TBL=SUPLSERV,ENTRY=<number>,NAME=<string>; |
|              | TBL=ZONE,ENTRY=<param>,NAME=<string>;      |
|              | TBL=CARRIER,ENTRY=<number>,NAME=<string>;  |
|              | TBL=COPIN,ENTRY=<number>,NAME=<string>;    |
|              | TBL=UNANS,ENTRY=<param>,NAME=<string>;     |
|              | TBL=RURAL,ENTRY=<number>,NAME=<string>;    |
|              | TBL=AOCTYPE,ENTRY=<number>,NAME=<string>;  |
|              | TBL=CALCTYPE,ENTRY=<param>,NAME=<string>;  |
|              | TBL=INFOTYPE,ENTRY=<param>,NAME=<string>;  |

Example

Entry 6 in the 'Outdayc' tables is to be assigned the name 'Saturday':

TBL=OUTDAYC  
ENTRY=6  
NAME=SATURDAY

Input:

ADD-TEXT:TBL=OUTDAYC,ENTRY=6,NAME=SATURDAY;

## 191.2.2 DELETE-TEXT

Delete an entry in the output text tables or an entire table by overwriting the original characters with blanks. The tables can only be deleted one at a time.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

TEXT - Administration of Output Text Tables

Functions of the AMO

| Command Code | Parameter                      |
|--------------|--------------------------------|
|              | TBL=COPIN, [ENTRY=<number>];   |
|              | TBL=UNANS, [ENTRY=<number>];   |
|              | TBL=RURAL, [ENTRY=<number>];   |
|              | TBL=AOCTYPE, [ENTRY=<number>]; |
|              | TBL=CALCTYPE, [ENTRY=<param>]; |
|              | TBL=INFOTYPE, [ENTRY=<param>]; |

Example

Deleting a text string in entry 1 of the 'Outdayc' table:

TBL=OUTDAYC  
ENTRY=1

Input:

DELETE-TEXT:TBL=OUTDAYC,ENTRY=1;

191.2.3 DISPLAY-TEXT / REGENERATE-TEXT

- 1. Display the entries of all output text tables or of only one output text table, with output in list form (DISPLAY)
- 2. Display the entries of all output text tables or of only one output text table, with output in position-oriented commands for regeneration (REGENERATE).

Procedure Overview

| Command Code    | Parameter      |     |
|-----------------|----------------|-----|
| DISPLAY-TEXT    | [TBL=<param>]; | (1) |
| REGENERATE-TEXT | [TBL=<param>]; | (2) |

Examples

- 1. Displaying the 'Outdayc' table.

TBL=OUTDAYC

Input:

DISPLAY-TEXT:TBL=OUTDAYC;

**Output:**

OUTPUT TEXTS FOR NAMES OF THE DAYS

| SYMBOLIC NAME | OUTPUT TEXT |
|---------------|-------------|
| 1             | MONDAY      |
| 2             | TUESDAY     |
| 3             | WEDNESDAY   |
| 4             | THURSDAY    |
| 5             | FRIDAY      |
| 6             | SATURDAY    |
| 7             | SUNDAY      |

**2. Regenerating the output text tables for the day names**

TBL=OUTDAYC

**Input:**

REGENERATE-TEXT:TBL=OUTDAYC;

**Output:**

```
ADD-TEXT:OUTDAYC,1,"MONDAY    ";
ADD-TEXT:OUTDAYC,1,"TUESDAY   ";
ADD-TEXT:OUTDAYC,1,"WEDNESDAY ";
ADD-TEXT:OUTDAYC,1,"THURSDAY  ";
ADD-TEXT:OUTDAYC,1,"FRIDAY    ";
ADD-TEXT:OUTDAYC,1,"SATURDAY  ";
ADD-TEXT:OUTDAYC,1,"SUNDAY    ";
```

## 191.3 Parameter Description

ENTRY                      Table element for names of days                      (OUTDAYC)

Type of Input                      : Single value  
                                          mandatory (ADD)  
                                          optional (DELETE, DISPLAY, REGENERATE)

Possible Values                      : 1                      = Monday  
                                          2                      = Tuesday  
                                          3                      = Wednesday  
                                          4                      = Thursday  
                                          5                      = Friday  
                                          6                      = Saturday  
                                          7                      = Sunday

ENTRY                      Table element for names of months                      (OUTMONC)

Type of Input                      : Single value

## TEXT - Administration of Output Text Tables

### Parameter Description

|       |                                                           |                                                                                                                                                                             |           |

## TEXT - Administration of Output Text Tables

### Parameter Description

|    |                                                                     |
|----|---------------------------------------------------------------------|
| 5  | = Service module (for field paying party id only)                   |
| 6  | = Special charging (for field paying party id only)                 |
| 7  | = Maintenance equipment (for field paying party id only)            |
| 8  | = Public phone via SLMAR to system (for field paying party id only) |
| 9  | = Mobile user                                                       |
| 10 | = Number of the other line (keyset)                                 |

ENTRY Table element for faulty data sets (SIGDATA)

Type of Input : Single value  
mandatory (ADD)  
optional (DELETE, DISPLAY, REGENERATE)

Possible Values : 0 = incorrect or double data set  
1 = correct data set

ENTRY Table element for routing code (ROUTCC)

Type of Input : Single value  
mandatory (ADD)  
optional (DELETE, DISPLAY, REGENERATE)

Possible Values : 0 to 9999

ENTRY Table element for station CDR - chargees (IDPP)

Type of Input : Single value  
mandatory (ADD)  
optional (DELETE, DISPLAY, REGENERATE)

Possible Values : ATND = Attendant console  
MTLC = PBX tie-line circuit  
STN = Station  
TC = CDR per trunk

ENTRY Table element for station CDR resettable counter delete (UNITERAS)

Type of Input : Single value  
mandatory (ADD)  
optional (DELETE, DISPLAY, REGENERATE)

Possible Values : Y = Resettable counter deleted or through connected  
N = Resettable counter not deleted or not through connected

ENTRY Table element for station CDR list type (LISTTYPE)

Type of Input : Single value  
mandatory (ADD)  
optional (DELETE, DISPLAY, REGENERATE)

Possible Values : IND = Individual call charge calculation  
SUM = Sum call charge calculation (part calc.)  
TOTAL = Total call charge calculation

ENTRY Table element for expensive connections (EXPENS)

Type of Input : Single value  
mandatory (ADD)  
optional (DELETE, DISPLAY, REGENERATE)

Possible Values : 0 = Inexpensive connections  
1 = Expensive connections  
2 = Free of charge A-party  
3 = Free of charge B-party

ENTRY Table element for type of connection (CONNTYPE)

Type of Input : Single value  
mandatory (ADD)  
optional (DELETE, DISPLAY, REGENERATE)

Possible Values : INTERN = Internal connections  
INCO = Incoming connections  
OUTGO = Outgoing connections

ENTRY Table element for supplement services (SUPLSERV)

Type of Input : Single value  
mandatory (ADD)  
optional (DELETE, DISPLAY, REGENERATE)

Possible Values : 0 = Not defined  
1 = Normal call  
2 = Consultation call  
3 = Call transfer  
4 = Call back  
5 = Call fwd busy  
6 = Call fwd unconditional  
7 = Call fwd noreply  
8 = Call pickup

## 192 TGER - Allocation of Subscriber Devices for Incoming Calls

|                      |                               |
|----------------------|-------------------------------|
| Interrelationships   | Parameter Description         |
| Functions of the AMO | Error Messages and Advisories |

The AMO TGER allocates non-voice devices, which are configured byres for AMO SCSU/SBCSU, for incoming seizures. Thus one device can be called by more than one directory number.

Example

Figure 65 Assignment of non-voice devices to own or external lines

A non-voice device can be seized incoming on another line, as well as both incoming and outgoing on its own line (see example):

- The FAX device at line 2000 is reached incoming via STNO 2001 because STNO 2001 is allocated the FAX having line number 2000 in the FAX column.

## TGER - Allocation of Subscriber Devices for Incoming Calls

### Interrelationships

- The FAX device at line 2002 can be reached incoming via its own line (under STNO 2002) as well as via an external line (under STNO 2000, in accordance with the allocation).
- The DTE device at line 2000 can be reached incoming via its own line (under STNO 2000) as well as via an external line (under STNO 2002).

Following own or external lines may not be changed or regenerated by AMO TGER:

- the allocation at the own line for ANATE&FAX, ANATE&DTEA
- the allocation at the own line for a hunting group master
- the allocation at the own line for S0
- the association of a DCI (which is done by AMO DCIC)
- the allocation of a SCSU special subscriber (e.g. extension lines) as a station or device number.

## 192.1 Interrelationships

- AMO SCSU/SBCSU : Configure subscribers in the SWU
- AMO SCSU : Configure special subscribers in the SWU

## 192.2 Functions of the AMO

- [ADD-TGER](#) : Assign the allocation of subscriber devices for incoming calls
- [DELETE-TGER](#) : Cancel the allocation of subscriber devices for incoming calls
- [DISPLAY-TGER](#) : Display the allocation of subscriber devices for incoming calls
- [REGENERATE-TGER](#) : Regenerate the allocation of subscriber devices for incoming calls

### 192.2.1 ADD-TGER

For each service the non-voice device line can be allocated to the STNO to be dialed. If a device STNO is already allocated for this service, advisory H1 is output and the device allocation is overwritten.

**Procedure Overview**

| Command Code | Parameter                                        |
|--------------|--------------------------------------------------|
| ADD-TGER     | STNO=<number>, {FAXNO=<number>, DTENO=<number>}; |

**Example**

Allocate the following non-voice devices to STNO 2142: a DTE device with line number 2112 and a FAX machine with line number 3104.

Input:

```
ADD-TGER:STNO=2142,FAXNO=3104,DTENO=2112;
```

**192.2.2 DELETE-TGER**

1. Delete all the allocations in the system for the specified subscribers for all (or the specified) services, or
2. Delete the allocations of the specified device STNOs for the corresponding services.

**Procedure Overview**

| Command Code | Parameter                                      |
|--------------|------------------------------------------------|
| DELETE-TGER  | TYPE=STNO, STNO=<number>, [SVC=<param>]; (1)   |
|              | TYPE=DEVNO, NVSTNNO=<number>, SVC=<param>; (2) |

**Examples**

1. Delete the allocation of the DTE and FAX devices to the to-be-dialed station number 2101.

Input:

```
DELETE-TGER:TYPE=STNO,STNO=2101,SVC=DTE&FAX;
```

2. Delete the allocation of the DTE line number 2000 to the STNOs to which it is now allocated. (the allocations to STNO 2001 and 2002 will be deleted)

Input:

```
DELETE-TGER:TYPE=DEVNO,NVSTNNO=2000,SVC=DTE;
```

192.2.3 DISPLAY-TGER

The following information is displayed:

- 1. STNO to be dialed (with the allocated non-voice device STNOs), Associated non-voice devices are recognized by the same station number as that shown in the first column of the DISPLAY output (i.e if "NOS.DIALLED" = "TERMINAL NOS. OF NON-VOICE DEVICES").
- 2. Non-voice device STNOs (with the STNOs to be dialed to which they are allocated).

If no parameters are entered, all non-voice device STNOs are displayed. If a route number is allocated, the STNO of the associated hunting group master is displayed.  
If a hunting group master is assigned, this STNO will be displayed. The terminal number of associated non-voice devices will only be displayed if they have been assigned at least one STNO which must be dialed. If none of the specified non-voice devices are assigned to a STNO, an advisory message is output. If an NV device is assigned to a sequence of STNOs in uninterrupted numerical order, these STNOs are output as a 'rauge'.

Procedure Overview

| Command Code | Parameter                                           |
|--------------|-----------------------------------------------------|
| DISPLAY-TGER | TYPE=STNO, [STNO=<number>]; (1)                     |
|              | TYPE=DEVNO, [FAXNO=<number>], [DTENO=<number>]; (2) |

Examples

- 1. Display the non-voice device line numbers allocated to the to-be-dialed STNOs 2142 to 2145.

Input:

DISPLAY-TGER:TYPE=STNO,STNO=2142&&2145;

Output:

| NOS. DIALLED | TERMINAL FAX | NOS. OF NON-VOICE DTE DEVICES |
|--------------|--------------|-------------------------------|
| 2142         | 2142         | 2114                          |
| 2143         | 3104         |                               |
| 2144         |              | 4144                          |
| 2145         |              | 2145                          |

## TGER - Allocation of Subscriber Devices for Incoming Calls

### Parameter Description

2. Display the to-be-dialed station STNO allocated for the data-device line numbers: FAXNO=3104 and DTENO=2112.

Input:

DISPLAY-TGER:TYPE=DEVNO,FAXNO=3104,DTENO=2112;

Output:

| SERVICE<br>FAX | TERMINAL NO. OF<br>NON-VOICE DEVICE | CALL NOS. TO<br>BE DIALED  |
|----------------|-------------------------------------|----------------------------|
|                | 3104                                | 2110<br>2142- 2143<br>3104 |
| SERVICE<br>DTE | TERMINAL NO. OF<br>NON-VOICE DEVICE | CALL NOS. TO<br>BE DIALED  |
|                | 2112                                | 2100<br>2112<br>2142       |

### 192.2.4 REGENERATE-TGER

Only allocations to external lines will be regenerated.

#### Procedure Overview

| Command Code    | Parameter        |
|-----------------|------------------|
| REGENERATE-TGER | [STNO=<number>]; |

### 192.3 Parameter Description

FAXNO            STNO of the line on which the device (FAX or DTE) is  
DTENO           assigned and to which the call is being set up.  
Type of Input        : single value, optional  
Possible Values      : 1 - 6 positions, decimal

Note:            Parameters FAXNO and DTENO form a group for ADD.  
At least one group parameter must be entered.

## **TGER - Allocation of Subscriber Devices for Incoming Calls**

Error Messages and Advisories

## 193 TINFO - Technical Information Data

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error messages and advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO TINFO can be used to administer additional technical information data.

These TINFO - data are necessary for the configuration and extension of customer systems and up to now they are not available via AMOs. Additional a notepad - feature is included.

All data tabulated are kept on the hard disk, formed up like data sets. Maximal 900 data sets can be entered in the table for the TINFO - data. 30 records can be entered into the notepad.

### 193.1 Restrictions

This description is valid from HiPath 4000 V1.0 onward.

### 193.2 Interrelationships

None

### 193.3 Functions of the AMO

- [ADD-TINFO](#) : Adds TINFO - data or entries for the notepad
- [DELETE-TINFO](#) : Deletes data sets from the table for TINFO - data or from the notepad .
- [DISPLAY-TINFO](#) : Displays the contents of the TINFO - data table or of the notepad .
- [REGENERATE-TINFO](#) : Regenerates entries in the table for the TINFO - data or for the notepad .

#### 193.3.1 ADD-TINFO

By this command TINFO - data or entries in the notepad can be added. The branch parameter DATTYPE determines the kind of input.

- Input of TINFO - data

## TINFO - Technical Information Data

### Functions of the AMO

The value T is to set for DATTYPE.

Single entries are accessed via the TINFO Nr. If an entry is added, at first its TINFO-Nr is searched in the table. If the TINFO-Nr is a new one the entry will be appended. If the entry is to add under an existing TINFO-Nr its contents will be overridden by new data. The max. number of entries of the TINFO - data table is 900.

Format of TINFO - data

| TINFO Nr<br>7 digit | Date<br>8 digit | Description (TEXTT) = Text-String<br>max. 40 Chars | Amount<br>5 digit | Addition<br>10 digit |
|---------------------|-----------------|----------------------------------------------------|-------------------|----------------------|
|---------------------|-----------------|----------------------------------------------------|-------------------|----------------------|

- Entries into the notepad :

The entries are numbered in ascending order. If the command is an add command this NOTE-Nr is automatically created by the AMO and must be entered only for a delete command.

The max. number of entries of the Notepad table is 30.

Format of Notepad entries

| NOTIZNR<br>3 digit | Date<br>8 digit | Text (TEXTN) = Text-String<br>max. 77 Chars |
|--------------------|-----------------|---------------------------------------------|
|--------------------|-----------------|---------------------------------------------|

### Procedure overview

| Command code | Parameter                                                                                                                                             |     |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| ADD-TINFO    | DAY=<number>, MONTH=<number>, YEAR=<number><br>, DATTYPE=T, TINFONR=<textstring>, [TEXTT=<textstring>]<br>, AMOUNT=<number>, [ADDITION=<textstring>]; | (1) |
|              | , DATTYPE=N, TEXTN=<textstring>;                                                                                                                      | (2) |

### Examples

1. Add a TINFO - data.

Input:

```
ADD-TINFO:15,12,96,T,"604P963","power supply modul, 60  
V",3,"overload";
```

2. Add an entry into the notepad.

Input:

```
ADD-TINFO:15,12,96,N,"on 12.5.96 6 SLMA, 4 SLMB and 2 further  
LINUX terminals wer  
e equipped;
```

## 193.3.2 DELETE-TINFO

TINFO - data and Notepad - entries can be deleted from the hard disk. The command deletes one or several entries. For deleting a set there must be entered the entry number, and max. 10 TINFONR or max. 10 NOTIZNR can be chained.

The branch parameter DATTYPE determinates which kind of data set will be deleted.

- **Deleting TINFO - data:**  
The value T is to set for DATTYPE  
The entry, which is to be deleted, is to be addressed by the TINFO Nr. Gaps in the table, which are caused by deleting of entries, will be closed. That means, that an entry with a new TINFO -Nr will be appended.  
It is also possible to delete a range of entries from the TINFO - data table by providing the starting and the end TINFONR's.
- **Deleting of Notepad - entries:**  
The value N selects for DATTYPE  
The entry, which is to be deleted, is to be addressed by the NOTIZNR. Gaps in the table, which are caused by deleting of entries, will be closed. That means, that all numbers greater than the deleted NOTIZNR will be decremented. It is not possible to delete a range of entries from the Notepad table.  
If an add command follows a delete process the new entry is assigned to the highest NOTIZNR.
- **Hint:** The delete of notepad-entries changes the table numbers of the remaining data sets. Therefore it is advisable to display the entries before deleting the next entries to obtain an overview of its contents.

### Procedure overview

#### Command code

```
DELETE-TINFO
```

#### Parameter

```
DATTYPE=T, TINFONR=<textstring>;
```

(1)

```
| DATTYPE=N, NOTIZNR=<number>;
```

(2)

### Examples

1. Delete the data set with the TINFONR 604P963

Input:

```
DEL-TINFO:T, "604P963";
```

2. Delete two data sets by chaining their TINFONR

Input:

```
DEL-TINFO:T,"604P979"&"604P983";
```

3. Delete a range of TINFO - table entries:

Input:

```
DEL-TINFO:T,"902PS79"&"623PE89";
```

4. Delete the Notepad - entry with the NOTIZNR 2

Input:

```
DEL-TINFO:N,2;
```

5. Delete three Notepad - entries by chaining their NOTIZNR

Input:

```
DEL-TINFO:N,3&10&17;
```

**193.3.3 DISPLAY-TINFO**

In case of the Notepad table it is only possible to display the content of the whole Notepad table.

In case of the TINFO table it is possible to display

- a single entry
- a range of entries by providing the start and end TINFONR
- a number of entries ( the number being entered by the user ) starting from an entered TINFONR.

If the branch parameter DATTYPE is not declared in a display-command, both tables will be displayed, at first the TINFO-table then the Notepad-table.  
For displaying only the TINFO-data alone the value of DATTYPE must be set to T. The value N is to be entered for displaying the Notepad-data alone.

**Procedure overview**

| Command code  | Parameter              |     |
|---------------|------------------------|-----|
| DISPLAY-TINFO | ;                      | (1) |
|               | [DATTYPE=T];           | (2) |
|               | ,TINFONR=<textstring>; | (3) |

**Command code**
**Parameter**

| TINFO NR=&lt;textstring&gt;, AMOUNT=&lt;number&gt;;

(4)

| [DATATYPE=N];

(5)

**Examples**
**1. Display both tables (Default)**

Input:

DISP-TINFO;;

Output:

| TINFO-NR | DATE     | DESCRIPTION                        | QUANT |
|----------|----------|------------------------------------|-------|
| REMARK   |          |                                    |       |
| 604P963  | 15.12.96 | power supply modul overload        | 3     |
| 604P979  | 03.01.97 | number of old RMS-Shelfs           | 10    |
| 604P983  | 17.02.97 | Pentium-processor instead of DP468 | 1     |

| NR  | DATE     | TEXT                                                                      |
|-----|----------|---------------------------------------------------------------------------|
| 001 | 05.12.96 | on the 12.5.96 6 SLMA, 4 SLMB and 2 further LINUX terminals were equipped |
| 002 | 13.12.96 | Notepad-text 2                                                            |
| 003 | 07.01.97 | Notepad-text 3                                                            |

**2. Display the TINFO-table**

Input:

DISP-TINFO:T;

Output:

| TINFO-NR | DATE     | DESCRIPTION                        | QUANT |
|----------|----------|------------------------------------|-------|
| REMARK   |          |                                    |       |
| 604P963  | 15.12.96 | power supply modul overload        | 3     |
| 604P979  | 03.01.97 | number of old RMS-Shelfs           | 10    |
| 604P983  | 17.02.97 | Pentium-processor instead of DP468 | 1     |

**3. Display a range of entries from the TINFO-table.**

Input:

DISP-TINFO:T;"902PS79"&amp;&amp;"623PE89";

4. Display of a number of entries starting with an entered TINFONR.

Input:

```
DISP-tinfo:T,"902PS79",35;
```

Output:

Starting with the TINFONR 902PS79 35 entries of the TINFO-table will be displayed.

5. Display the Notepad - entries.

Input:

```
DISP-TINFO:N;
```

Output:

| NR  | DATE     | TEXT                                                                      |
|-----|----------|---------------------------------------------------------------------------|
| 001 | 05.12.96 | on the 12.5.96 6 SLMA, 4 SLMB and 2 further LINUX terminals were equipped |
| 002 | 13.12.96 | Notepad-text 2                                                            |
| 003 | 07.01.97 | Notepad-text 3                                                            |

6. Display a range of entries from the TINFO-table.

Input:

```
DISP-TINFO:T,"902PS79"&&"623PE89";
```

7. Display of a number of entries starting with an entered TINFONR.

Input:

```
DISP-tinfo:T,"902PS79",35;
```

Output:

Starting with the TINFONR 902PS79 35 entries of the TINFO-table will be displayed.

## 193.3.4 REGENERATE-TINFO

This function regenerates all add-commands. The branch parameter DATTYPE determinates, if entries of TINFO - data or inputs into the notepade are to be reproduced. The default value of DATTYPE regenerates the add-commands into both tables. If the value of DATTYPE is set on T, only the add-commands concerning the TINFO-table are reproduced.

For the regeneration of the add-commands of Notepade - entries the

value of DATTYPE must be set to N.

If the contents of a TINFO - data set are overridden by using the same TINFO-Nr for each add-command, the historically last add-command will be reproduced.

### Procedure overview

| Command code     | Parameter    |     |
|------------------|--------------|-----|
| REGENERATE-TINFO | ;            | (1) |
|                  | [DATTYPE=T]; | (2) |
|                  | [DATTYPE=N]; | (3) |

### Examples

#### 1. Regenerate add-commands into both tables (Default)

Input:

```
REG-TINFO;;
```

Output:

```
ADD-TINFO:15,12,96,T,"604P963","power supply modul, 60 V",
3,"overload";
```

```
ADD-TINFO:03,01,97,T,"604P979","number of old RMS-Shelfs",
10;
```

```
ADD-TINFO:17,02,97,T,"604P983","Pentium-processor instead of
DP468",
```

```
1;
```

```
ADD-TINFO:05,12,96,N,
```

```
"on the 12.5.96 6 SLMA, 4 SLMB and 2 further LINUX terminals
were equiped"
```

```
ADD-TINFO:13,12,97,N,
```

```
"Notepad-text 2";
```

```
ADD-TINFO:07,01,97,N,
```

```
"Notepad-text 3";
```

#### 2. Regenerate entries into TINFO-table.

Input:

```
REG-TINFO:T;
```

Output:

```
ADD-TINFO:15,12,96,T,"604P963","power supply modul, 60 V",
3,"overload";
```

TINFO - Technical Information Data

Parameter Description

```
ADD-TINFO:03,01,97,T,"604P979","number of old RMS-Shelfs",
10;
ADD-TINFO:17,02,97,T,"604P983","Pentium-processor instead of
DP468",
1;
```

3. Regenerate entries into Notepad.

Input:

```
REG-TINFO:N;
```

Output:

```
ADD-TINFO:05,12,96,N,
"on the 12.5.96 6 SLMA, 4 SLMB and 2 further LINUX terminals
were equiped"
ADD-TINFO:13,12,97,N,
"Notepad-text 2";
ADD-TINFO:07,01,97,N,
"Notepad-text 3";
```

193.4 Parameter Description

|          |                                      |                                                                                   |
|----------|--------------------------------------|-----------------------------------------------------------------------------------|
| ADDITION | additional text                      |                                                                                   |
|          | Type of input                        | : Textstring, place between quotation marks ("...") optional (ADD)                |
|          | Possible values                      | : 0-10 characters (letter, number, special character)                             |
|          | Default value                        | : -                                                                               |
| AMOUNT   | amount of articles (e.g. 5 printers) |                                                                                   |
|          | Type of input                        | : Single value,mandatory (ADD)                                                    |
|          | Possible values                      | : 1-65535                                                                         |
|          | Default values                       | : -                                                                               |
| DATTYPE  | Type of data (branch parameter)      |                                                                                   |
|          | Type of input                        | : Single value, mandatory (ADD, DELETE) optional (DISPLAY, REGENERATE)            |
|          | Possible values                      | : T                      Technical data<br>N                      Notepad-entries |
|          | Default value                        | : both values (T,N) valid for DISPLAY, REGENERATE                                 |
| DAY      | Day of the date                      |                                                                                   |

|         |                                                                    |                                                                                                                                                                                           |

## 194 TLZO - Administration of the Station Assignment Table

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The AMO administers the station assignment tables.

These consist of 5 tables:

1. the attendant number assignment table with a maximum of 41 entries
2. the PBX trunk number assignment table with a maximum of 349 entries
3. imaginary number for incoming calls with one entry

By assigning an imaginary number to a circuit, it is possible to select these specific circuits for CDR (call detail recording) output; e.g. for CDR output of traffic from the satellite PBX to the CO via the PBX. An imaginary number can be assigned to incoming calls without transmission of the paying party in networking environment.

For the transformation of incoming trunks at first the trunk number table (TBL=MTLC) will be searched. If the number is not found, the general entry (TBL=INC) will be used. If no entry exists for TBL=INC and STNO=< >, the default entry of STNO = 999999.

If an attendant telephone number (see AMO-ACSU) is specified as a criterion for call detail record output, then the 'imaginary station number' and the 'attendant telephone number' must be identical.

4. imaginary number for outgoing calls

If no station number can be supplied by the call processing, the imaginary number for outgoing calls is consulted.

There is a general entry (TBL=OUTG) for going lines. The default entry of STNO = 999999.

5. imaginary number for internal calls

If no station number can be supplied by the call processing, the imaginary number for internal calls is consulted.

There is a general entry (TBL=INT) for internal lines. The default entry of STNO = 999999.

194.1 Interrelationships

- AMO-SELG : Administration of selection groups and tables
- AMO-ACSU : Configuration of attendant consoles in the SWU

194.2 Functions of the AMO

- ADD-TLZO : Enter station assignments
- CHANGE-TLZO : Change station assignment entries
- DELETE-TLZO : Cancel station assignment entries
- DISPLAY-TLZO / REGENERATE-TLZO : Interrogate the station assignment tables / Regenerate the station assignment tables

194.2.1 ADD-TLZO

Enter station assignments.

An entry consists of either an attendant number with its associated imaginary station number, or a circuit number (line number of the PBX trunk circuit) with its associated imaginary station number.

If an entry already exists, an error message is output to the user.

1. Enter attendant number assignments
2. Enter PBX trunk number assignments
3. Enter imaginary number for incoming calls
4. Enter imaginary number for outgoing calls
5. Enter imaginary number for internal calls

Procedure Overview

| Command Code | Parameter                                                                                      |     |
|--------------|------------------------------------------------------------------------------------------------|-----|
| ADD-TLZO     | TBL=ATND,ATNDNO=<string>,STNO=<string>;                                                        | (1) |
|              | TBL=MTLC,LTG=<number>,LTU=<number>,SLOT=<number><br>,CCT=<number>,BCHL=<number>,STNO=<string>; | (2) |
|              | TBL=INC,STNO=<number>;                                                                         | (3) |

| Command Code | Parameter                |     |
|--------------|--------------------------|-----|
|              | TBL=OUTG, STNO=<number>; | (4) |
|              | TBL=INT, STNO=<number>;  | (5) |

### Examples

1. The attendant console with the attendant telephone number 9 is to receive the imaginary station number 10.

Input :

```
ADD-TLZO:TBL=ATND,ATNDNO=9,STNO=10;
```

2. The PBX trunk with the circuit number 1-1-19-3 and B-Channel #1 is to receive the imaginary station number 11111. The main PABX trunk number is composed of: LTG=1, LTU=1, SLOT=19, CCT=3.

Input :

```
ADD-
TLZO:TBL=MTLC,LTG=1,LTU=1,SLOT=19,CCT=3,BCHL=1,STNO=11111
;
```

3. The PBX trunk with the circuit number 1-1-19-3 and B-Channels in the range from 2 to 7 is to receive the imaginary station number 222777.

Input :

```
ADD-
TLZO:TBL=MTLC,LTG=1,LTU=1,SLOT=19,CCT=3,BCHL=2&&7,STNO=222
777;
```

4. For incoming trunk calls which have no entry in the MTLC table the imaginary number 331 will be assigned.

Input :

```
ADD-TLZO:TBL=INC,STNO=331;
```

5. For outgoing trunk calls which have no entry in the MTLC table the imaginary number 442 will be assigned.

Input :

```
ADD-TLZO:TBL=OUTG,STNO=442;
```

6. For internal calls which have no entry in the MTLC table the imaginary number 553 will be assigned.

Input :

```
ADD-TLZO:TBL=INT,STNO=553;
```

**194.2.2 CHANGE-TLZO**

A new imaginary station number is assigned to the number of an attendant console or to a PBX trunk if the station assignments are changed.

If the entry to be changed is not contained in the table, an error message is output.

- 1. Change an attendant number assignment
- 2. Change a PBX trunk number assignment
- 3. Change the imaginary number for incoming trunk calls.
- 4. Change the imaginary number for outgoing trunk calls.
- 5. Change the imaginary number for internal calls.

**Procedure Overview**

| Command Code | Parameter                                                                                            |     |
|--------------|------------------------------------------------------------------------------------------------------|-----|
| CHANGE-TLZO  | TBL=ATND, ATNDNO=<string>, STNO=<string>;                                                            | (1) |
|              | TBL=MTLC, LTG=<number>, LTU=<number>, SLOT=<number><br>, CCT=<number>, BCHL=<number>, STNO=<string>; | (2) |
|              | TBL=INC, STNO=<string>;                                                                              | (3) |
|              | TBL=OUTG, STNO=<string>;                                                                             | (4) |
|              | TBL=INT, STNO=<string>;                                                                              | (5) |

**Examples**

- 1. The imaginary station number of the attendant console with the attendant telephone number 9 is to be changed to 15.  
Input:  
CHANGE-TLZO:TBL=ATND, ATNDNO=9, STNO=15;
- 2. The imaginary station number of the PBX trunk with the circuit number 1-1-19-3 and B-channel 1 is to be changed to 122.  
Input :  
CHANGE-TLZO:TBL=MTLC, LTG=1, LTU=1, SLOT=19, CCT=3, BCHL=1, STNO=122;  
**Note:** The B-Channel (single value or range) must be fully ident to the existing entry.

3. The imaginary station number for incoming trunk calls is to be changed to 336.

Input :

```
CHANGE-TLZO:TBL=INC,STNO=336;
```

4. The imaginary station number for outgoing trunk calls is to be changed to 446.

Input :

```
CHANGE-TLZO:TBL=OUTG,STNO=446;
```

5. The imaginary station number for internal calls is to be changed to 556.

Input :

```
CHANGE-TLZO:TBL=INT,STNO=556;
```

## 194.2.3 DELETE-TLZO

When cancelling the entries of the station assignment tables, the user can choose between cancelling a single entry, a table, or all tables.

1. Cancel an attendant number assignment
2. Cancel a PBX trunk number assignment

The assignment table for imaginary number for incoming, outgoing and internal calls can't be deleted.

### Procedure Overview

#### Command Code

```
DELETE-TLZO
```

#### Parameter

```
[TBL=ATND, [ATNDNO=<string>], [STNO=<string>]];
```

(1)

```
[TBL=MTLC, [LTG=<number>, LTU=<number>, SLOT=<number>, CCT=<number>, BCHL=<number>, [STNO=<string>]]];
```

(2)

### Examples

1. The attendant number assignment table is to be cancelled.

Input:

```
DELETE-TLZO:TBL=ATND;
```

2. The imaginary station number of the PBX trunk with the circuit number 1-1-19-3 and B-channel 1 is to be cancelled.

Input:

```
DELETE-TLZO:TBL=MTLC,LTG=1,LTU=1,SLOT=19,CCT=3,BCHL=1;
```

## 194.2.4 DISPLAY-TLZO / REGENERATE-TLZO

1. Interrogate one or both station assignment tables with output on screen in tabular form (DISPLAY).
2. Interrogate one or both station assignment tables with generation of a command listing for the action ADD-TLZO (REGENERATE).
3. Interrogate the imaginary number for incoming trunk calls in tabular form (DISPLAY) or with generating of a command listing (REGENERATE).
4. Interrogate the imaginary number for outgoing trunk calls in tabular form (DISPLAY) or with generating of a command listing (REGENERATE).
5. Interrogate the imaginary number for internal calls in tabular form (DISPLAY) or with generating of a command listing (REGENERATE).

### Procedure Overview

| Command Code    | Parameter                                                                                 |      |
|-----------------|-------------------------------------------------------------------------------------------|------|
| DISPLAY-TLZO    | [TBL=ATND, [ATNDNO=<string>], [STNO=<string>]];                                           | (1)  |
|                 | [TBL=MTLC, LTG=<number>, LTU=<number><br>, SLOT=<number>, CCT=<number>], [STNO=<string>]; | (2)  |
|                 | [TBL=INC];                                                                                | (3)  |
|                 | [TBL=OUTG];                                                                               | (4)  |
|                 | [TBL=INT];                                                                                | (5)  |
| REGENERATE-TLZO | [TBL=ATND, [ATNDNO=<string>], [STNO=<string>]];                                           | (6)  |
|                 | [TBL=MTLC, LTG=<number>, LTU=<number><br>, SLOT=<number>, CCT=<number>], [STNO=<string>]; | (7)  |
|                 | [TBL=INC];                                                                                | (8)  |
|                 | [TBL=OUTG];                                                                               | (9)  |
|                 | [TBL=INT];                                                                                | (10) |

### Examples

1. Display the attendant number assignment table.

Input:

DISPLAY-TLZO:TBL=ATND;

Output:

| STATION ASSIGNMENT TABLE |               |  | : | ATND                     |
|--------------------------|---------------|--|---|--------------------------|
| ENTRY NUMBER             | ATND - NUMBER |  |   | IMAGINARY STATION NUMBER |
| 1                        | 9             |  |   | 15                       |

2. Display the PBX trunk number assignment table

Input:

DISPLAY-TLZO:TBL=MTLC;

Output:

| STATION ASSIGNMENT TABLE |     |     |      |     |        |  | : | MTLC                     |
|--------------------------|-----|-----|------|-----|--------|--|---|--------------------------|
| NUMBER                   | LTG | LTU | SLOT | CCT | BCHNL  |  |   | IMAGINARY STATION NUMBER |
| 1                        | 1   | 1   | 19   | 3   | 01     |  |   | 122                      |
| 2                        | 1   | 1   | 19   | 3   | 02&&07 |  |   | 222777                   |

3. Display the imaginary number for incoming trunk calls in tabular form

Input:

DISPLAY-TLZO:TBL=INC;

Output:

| STATION ASSIGNMENT TABLE |                          | : | INCOMING CALLS |
|--------------------------|--------------------------|---|----------------|
|                          | IMAGINARY STATION NUMBER |   |                |
|                          | 336                      |   |                |

4. Display the imaginary number for outgoing trunk calls in tabular form

Input:

DISPLAY-TLZO:TBL=OUTG;

Output:

| STATION ASSIGNMENT TABLE |                          | : | OUTGOING CALLS |
|--------------------------|--------------------------|---|----------------|
|                          | IMAGINARY STATION NUMBER |   |                |

446

5. Display the imaginary number for internal calls in tabular form

Input:

DISPLAY-TLZO:TBL=INT;

Output:

| STATION ASSIGNMENT TABLE | : | INTERNAL CALLS |
|--------------------------|---|----------------|
| IMAGINARY STATION NUMBER |   |                |

556

6. Regenerate the attendant number assignment table. (Generation of a command listing for the action ADD-TLZO).

Input:

REG-TLZO:TBL=ATND;

Output:

ADD-TLZO:ATND, 9, 15;

7. Regenerate the PBX trunk number assignment table. (Generation of a command listing for the action ADD-TLZO).

Input:

REG-TLZO:TBL=MTLC;

Output:

ADD-TLZO:MTLC, 1, 1, 19, 3, 1, 122;  
ADD-TLZO:MTLC, 1, 1, 19, 3, 2&& 7, 222777;

8. Regenerate the imaginary number (for incoming trunk calls) assignment table. (Generation of a command listing for the action ADD-TLZO).

Input:

REG-TLZO:TBL=INC;

Output:

ADD-TLZO:INC, 336;

9. Regenerate the imaginary number (for outgoing trunk calls) assignment table. (Generation of a command listing for the action ADD-TLZO).

Input:

REG-TLZO:TBL=OUTG;

Output:

ADD-TLZO:OUTG, 446;

10. Regenerate the imaginary number (for internal calls) assignment table. (Generation of a command listing for the action ADD-TLZO).

Input:

REG-TLZO:TBL=INT;

Output:

ADD-TLZO:INT, 556;

## 194.3 Parameter Description

|                 |                                                            |
|-----------------|------------------------------------------------------------|
| ATNDNO          | Attendant telephone number (see AMO ACSU)                  |
| Type of Input   | : single value, optional<br>mandatory (ADD, CHANGE)        |
| Possible Values | : maximum of 6 digits<br>0 to 999999                       |
| BCHL            | Number of the ISDN B-channel                               |
| Type of Input   | : single value, range, optional<br>mandatory (ADD, CHANGE) |
| Possible Values | : 0 to 30                                                  |
| CCT             | Circuit number                                             |
| Type of Input   | : single value, optional<br>mandatory (ADD, CHANGE)        |
| Possible Values | : 0 to 121                                                 |
| LTG             | Line trunk group                                           |
| Type of Input   | : single value, optional<br>mandatory (ADD, CHANGE)        |
| Possible Values | : 1                                                        |
| LTU             | Line trunk unit                                            |
| Type of Input   | : single Value, optional<br>mandatory (ADD, CHANGE)        |
| Possible Values | : 1 to 99                                                  |
| Note            | : LTU 16 is used Hicom internal.                           |

## TLZO - Administration of the Station Assignment Table

### Error Messages and Advisories

**SLOT**                    Specification of the mounting pitch in the LTU  
Type of Input            : single value, optional  
                             mandatory (ADD, CHANGE)  
Possible Values        : 1 to 121

A suitable module must be configured for the slot addressed by PEN (AMO BCSU).

The possible Slot values depend on the systems architecture and can be found in the BCSU AMO description.

**STNO**                    Imaginary station number  
Type of Input            : single value, optional  
                             mandatory (ADD, CHANGE)  
Possible Values        : maximum of 22 digits (ATND, INC, INT, MTLC, OUTG)

**TBL**                    Name of table required  
Type of Input            : single value, optional  
                             mandatory (ADD, CHANGE)  
Possible Values        : ATND = Attendant number table  
                             INC = Incoming calls  
                             INT = Internal calls  
                             MTLC = PBX trunk number table  
                             OUTG = Outgoing calls

## 194.4 Error Messages and Advisories

| <a href="#">General</a>            | <a href="#">Examples</a>                |                                               |

### 195.1 Restrictions

none

### 195.2 Interrelationships

AMO TRACA communicates with the resident tracer in the specified module (processor).

Direct interrelationships exist to the trace points in the OS and LAN.

### 195.3 General

The Hicom tracer provides the system specialist with a tool by means of which **message traffic** between the individual program complexes of the Hicom system and **LAN objects** can be conveniently traced. Therefore the Tracer is an important on-line test aid for use in the field and at customers' premises.

Communication with the terminal is handled by AMO TRACA. Although the tracer can select internal messages and other trace objects and write them into the buffer without this AMO, the AMO is essential for changing the selection and for outputting the trace objects.

#### Note

For the SWU, a similar tracer tool is available which is controlled with the AMO TRACS. The AMO offers a slightly more extensive range of trace options (see AMO description of [TRACS - Operation of the System Tracer \(SWU\)](#)).

#### 195.3.1 Definition of Terms

**Trace objects** are:

- a) Messages that are exchanged between tasks
- b) LAN data of the various LAN layers

**Trace points** are locations in the Hicom software at which the tracer is called.

The tracer offers extensive options for selection criteria. There is a **selection table** for each trace point.

The selection table for a trace point contains the conditions which must be fulfilled by a message in order to be stored in the trace buffer by the tracer.

Typical, most frequently-used selection criteria in a message are for example:

- Byte 0 destination task
- Byte 1 source task
- Byte 4 event code

The selection table contains also "conditional conditions". During the trace process these conditions control a specific manipulation of the selections which depends on the content of the message.

## 195.3.2 Functional Overview

The following functions are implemented in the AMO:

- a) Storing the trace buffer in a file and store or restore tracer selection tables in or from a file with the command **COPY** see [Section 195.4.2.5, "Displaying and Storing of Trace-Data \(DISPLAY, DA, DB, DF, DL, DN, COPY\)"](#)
- b) Assignment of a file to the output by command **DISPLAY** see [Section 195.4.2.5, "Displaying and Storing of Trace-Data \(DISPLAY, DA, DB, DF, DL, DN, COPY\)"](#)
- c) Output of trace objects with **DA, DB, DF, DL** and **DN**  
Output of trace objects without time stamps with **DA-T, DB-T, DF-T, DL-T** and **DN-T**  
see [Section 195.4.2.5, "Displaying and Storing of Trace-Data \(DISPLAY, DA, DB, DF, DL, DN, COPY\)"](#)
- d) Termination of the AMO with **END**
- e) Important: The tracer itself remains unaffected !
- f) Definition of the maximum number of trace objects which are to be entered in the buffer, with **MAXNO**

- g) Definition of the maximum entry length for messages entered in the buffer, with **MSGLEN** (message length)  
see [Section 195.4.2.3, "MSGLEN"](#)
- h) Activation of the tracer with **ON**  
see [Section 195.4.2.4, "Activation and Deactivation of the Tracer \(ON, OFF\)"](#)
- i) Deactivation of the tracer with **OFF**  
see [Section 195.4.2.4, "Activation and Deactivation of the Tracer \(ON, OFF\)"](#)
- j) Change the processor, which controls the Tracer with **P** (processor)
- k) Resetting a trace buffer, the trace buffer pool and selection tables with **RES** (RESet)
- l) Definition of the restart stability of the tracer with **RST**
- m) Selection of messages or LAN objects with **SELMSG** (select message)  
see [Section 195.4.2.2, "SELMSG"](#)
- n) Selection of the serialization mechanism for the tracer with the command **SELSTOP** (stop selection in the event of a conflict)
- o) Selection of the LAN object types with **SETLAN**  
see [Section 195.5.1, "Activating of a LAN Tracepoint"](#)
- p) Output of the tracer status with **STA** (STatus)  
see [Section 195.4.2.6, "Displaying the Status of the Tracer \(STA\)"](#)
- q) Input of an advisory for other users of the tracer with command **USER**

In general the Hicom-tracer is not used by just one user. Therefore it is sometimes difficult to check who made the possibly existing tracer-settings and to check if they are still needed.

For assigning the tracer-settings to an user the user can enter any comment (e.g. name, telephone number,...). This comment will be displayed in connection with middle and long status displays (STA,M; or STA,L;).

## 195.4 Functions of the AMO

- EXEC-TRACA : Start of AMO TRACA
- INPUT-TRACA : Data input request in dialog mode

### 195.4.1 EXEC-TRACA

#### Procedure Overview

| Command Code | Parameter      |
|--------------|----------------|
| EXEC-TRACA   | [UNIT=<param>; |

#### Note

The AMO remains in the dialog mode for several minutes; if no input is made within this period, it terminates automatically.

#### Example

Input:

```
<EXEC-TRACA:A1 ;
```

Output:

```
AMO TRACA VARIANT/VERSION L2/001 OF 2001-04-18
TRACER    VARIANT/VERSION L2/007 OF 2001-04-18
TRACER INPUT IN A1 PLEASE:
```

Input:

```
*END;                                * = command input prompt
```

### 195.4.2 INPUT-TRACA

#### 195.4.2.1 General

The action INPUT-TRACA is only used for WRITE-READ access and cannot be entered by the operator at the administration and maintenance terminal (AMT). Only the text shown below is displayed at the AMT as an input request to the operator (the asterisk which follows the text indicates the ready state):

```
TRACER INPUT IN <processor name> PLEASE:
*
```

This output text also indicates that the AMO has successfully executed the previous command.

The following commands (CMD) are possible:

```

CMD= COPY,AREA=<string>-<param>,FILE=<string>;
CMD= DISPLAY,FILETYPE=<param>;
CMD= DISPLAY,FILETYPE=FILE,FILE=<string>;
CMD= DA,[CNT=<number>],[LEN=<number>],TYPE=ALL;
      (Subsequent parameter entries are disregarded by the AMO)
CMD= DA,[CNT=<number>],[LEN=<number>],[TYPE=<param>],,,TEST=SELMSG;
      (Other parameter entries are disregarded by the AMO)
CMD= DA,[CNT=<number>],[LEN=<number>],[TYPE=<param>]
      ,[DISPLACE=<param>,VAL=<hex>,TEST=<param>];
CMD= DB,[CNT=<number>],[LEN=<number>],TYPE=ALL;
      (Subsequent parameter entries are disregarded by the AMO)
CMD= DB,[CNT=<number>],[LEN=<number>],[TYPE=<param>],,,TEST=SELMSG;
      (Other parameter entries are disregarded by the AMO)
CMD= DB,[CNT=<number>],[LEN=<number>],[TYPE=<param>]
      ,[DISPLACE=<param>,VAL=<hex>,TEST=<param>];
CMD= DF,[CNT=<number>],[LEN=<number>],TYPE=ALL;
      (Subsequent parameter entries are disregarded by the AMO)
CMD= DF,[CNT=<number>],[LEN=<number>],[TYPE=<param>],,,TEST=SELMSG;
      (Other parameter entries are disregarded by the AMO)
CMD= DF,[CNT=<number>],[LEN=<number>],[TYPE=<param>]
      ,[DISPLACE=<param>,VAL=<hex>,TEST=<param>];
CMD= DL,[CNT=<number>],[LEN=<number>],TYPE=ALL;
      (Subsequent parameter entries are disregarded by the AMO)
CMD= DL,[CNT=<number>],[LEN=<number>],[TYPE=<param>],,,TEST=SELMSG;
      (Other parameter entries are disregarded by the AMO)
CMD= DL,[CNT=<number>],[LEN=<number>],[TYPE=<param>],
      ,[DISPLACE=<param>,VAL=<hex>,TEST=<param>];
CMD= DN,NO=<number>,[LEN=<number>],TYPE=ALL;
      (Subsequent parameter entries are disregarded by the AMO)
CMD= DN,NO=<number>,[LEN=<number>],[TYPE=<param>],,,TEST=SELMSG;
      (Other parameter entries are disregarded by the AMO)
CMD= DN,NO=<number>,[LEN=<number>],[TYPE=<param>]
      ,[DISPLACE=<param>,VAL=<hex>,TEST=<param>];

```

## TRACA - System Message Tracer (IS)

CMD= SELSTOP, STYPE=<param>;  
CMD= SETLAN, CONDGRP=<param>, TYPE=<param>;  
CMD= STA, [INFO=<param>];  
CMD= USER, [TEXT=<string>];

Before the Tracer is started a selection of the tracepoints and traceobjects, which shall be recorded, has to be made. This is done with the command SELMSG.

### **195.4.2.2 SELMSG**

The first parameter TRACEPT determines whether OS-messages (SD, RCV or OS in general) or LAN-data (to have a more specific selection at the LAN-tracepoint the command SETLAN is used: Section 195.5.1) are selected or whether Start- and Stopconditions should be set.

The following functions are possible:

1. All messages and trace objects can be selected for each trace point
2. Only those messages or LAN objects are selected, which fulfill one of the 4 groups with up to 8 conditions
3. No message or no LAN object is selected
4. Only those messages which fulfill one of the 4 groups with up to 8 conditions result in start or stop or stopall of tracing
5. Messages or LAN objects, which fulfill one of the 4 groups with up to 8 conditions, result during tracing in the specific message dependent change of selection conditions, which were defined in the "conditional conditions" .
6. The start, stop, stopall condition is deactivated
7. Up to 8 conditions can be formulated for post-selection
8. The conditions formulated for post-selection are deleted
9. The conditions for a group or for a tracepoint are deleted.

#### **Note**

Be aware of the fact, that if the parameters CONDGRP and COND are ignored (both are optional !), nothing will be traced at this tracepoint, because the defaultvalue is OFF.

Selection of Messages and LAN Objects

By setting conditions it is possible to select only those traceobjects which are of interest for the user. The tracer is able to make the valuation of messages in 2 different ways:

- The input of byte values as comparison data result in a tracer, which o n l y enters the message into the trace buffer, when the addressed byte is exactly equal to o n e of this byte values. It is possible to enter multiple values (up to 50) for each byte. It is also possible, to specify several conditions (up to 8) for one group, which must be performed all for a selection of a message.
- At mask comparison (parameter FLDTYPE = PST), the position of one or more bits (= mask) which must be contained in the desired message byte, have to be entered as trace data. If these bit(s) occur in the message byte, the message is taken into the trace buffer. Are there, additional to the mask-bit(s), also other bits which are set in the certain message byte, then the message is also taken into the buffer, because it corresponds likewise to the given bit mask. With this method, it is possible now, to watch powersets or variable byte values contained in a message byte, on bit level.

Example:

|        |                 |            |      |
|--------|-----------------|------------|------|
| BITPOS | BIT1&BIT4&&BIT7 | B'01111010 | H'7A |
|        | or              | B'01111011 | H'7B |
|        | or generally    | B'x1111x1x |      |

These two comparison methods may be combined, if needed, in any sequence for each condition group.

If several condition groups are defined the sequence of the groups has to be considered, because tracing works in following way:

The tracer checks the first group. If the conditions for the message are fulfilled, the message will be copied into the trace buffer corresponding to the definitions for that group (length, conditional conditions). Further groups will not be checked. If the conditions are not fulfilled the same procedure is repeated with the next group.

The user has the possibility to control the tracing himself by assigning in case of overlapping selections a lower groupnumber to the group which contains the more important definitions (that is: length, conditional conditions,...).

Rule of thumb: the more restrictive a condition is the lower its group number should be.

Generally: if the condition of a group is a subset of another one it must have the smaller groupnumber

### Conditional Conditions

The byte values defined for selections can also be set, changed and deleted automatically during the tracing dependent of message contents. That happens according to the defined conditional conditions (parameter COND=CCD1/..CCD8).

That means: from the message which matches the selection conditions are used up to eight bytes as condition for a future message.

A larger example for the usage of this function is given in the AMO Description of the TRACS, chapter Examples.

### Start, Stop and Stopall Conditions

The start condition describes the properties of a message or a LAN object which activates tracing (start object).

#### Example:

|                                        |                                                                     |
|----------------------------------------|---------------------------------------------------------------------|
| SELMSG, START, G1, CD1, SRC, 34&57, e; | the Tracer is started if a message                                  |
| SELMSG, START, G1, CD2, EV, 3E, e;     | occurs, which 4th Byte is 3E and its first Byte is either 34 or 57. |

The stop condition describes the properties of a message or a LAN object which deactivates tracing (stop object).

The stopall condition describes the properties of a message or a LAN object which deactivates tracing (stopall object) for all configured processors in a HICOM system (including the IS).

If STOP and STOPALL conditions are defined together, the tracer checks at first the STOP conditions and then the STOPALL conditions. If there are identically conditions defined on both trace points, then the tracer only checks the STOP conditions and at positive result, only the tracer in the current processor will be stopped. In this case the STOPALL conditions will be ignored, i.e. they have no effect!

### Note

A special case occurs, when messages or LAN objects with time selection should be taken into the trace buffer and a system restart happens (restart stability is on). When serializing with OS resources (SELSTOP, OS) no time and date information can be requested during a short period. The cause is, that the time data of the operation system (OS) are not valid, and DUMMY values are returned by the access routine of the OS.

## TRACA - System Message Tracer (IS)

### Functions of the AMO

In order to give the user sufficient time to define all the individual conditions required, the execution of the control condition is temporarily suspended until all conditions have been entered.

When a start condition is entered, the tracer is also deactivated. (When a stop or stopall condition is entered, this would not be practical, because the tracer should not be deactivated before the stop resp. stopall object has been received).

The definition status for the defined control conditions is terminated by the activation of the tracer (command ON); these control conditions are then placed in the waiting state.

At this stage each message and each LAN object is checked by the activated trace points to determine whether it meets the defined control conditions.

After the start object has been received, tracing is activated and the start message is entered in the buffer. (If no start condition is defined, tracing had been in effect from the activation of the tracer onward).

Further messages or LAN objects are then entered in the buffer according to the trace point selections.

When the stop object is received, tracing is deactivated. The stop object is the last object to be entered in the buffer.

When the stopall object is received, tracing is deactivated in all processors in which a tracer is active. The last object to be entered in the buffer is the stopall object.

The defined control conditions remain available (status = R for start, stop and stopall conditions) and come into effect again with the next ON command.

The STATUS command shows the states of the control conditions:

- D (definition status)
- R (reached)
- W (waiting status)

### 195.4.2.3 MSGLEN

The messages which have to be recorded might be very long and most of the times only the first part of it is of interest for the user. Therefore it is useful (especially with high data traffic) to determine a maximum length of the recorded messages with the command MSGLEN in order to prevent a possible loss of data.

This command just makes sense in connection with a SELMSG-input. The defaultvalue is 16, which is also used if this command is not executed.

**Example:**

```
'SELMSG,OS,G1,ALL;' the first 20 Bytes of all OS-messages are
'MSGLEN,OS,G1,20;' recorded
```

#### 195.4.2.4 Activation and Deactivation of the Tracer (ON, OFF)

If no startcondition has been set, the Tracer starts to work immediately after entering the command ON and to write the data into the trace buffer. Any start, stop or stopall condition defined is placed in the waiting state.

While harddisk tracing is activated ("ON,HD,filename,..") every time the tracebuffer is full, the whole content is written into the tracefile. If there is already a tracefile with the same name on HD, it is possible to overwrite this file with OVERWRT: yes (default). If there is no tracefile on hd, the parameter OVERWRT is careless.

Operating mode in principle: As soon as the tracer buffer is full, the HD-writing tracer task store this buffer to the harddisk. While this is in progress tracing will be continued in another trace buffer.

The parameter MAXBLOCK determines the size of the tracefile and therefore also the number of tracebuffers which can be stored in this file (defaultvalue: 10). If WRAP is set to yes, elder data will be overwritten as soon as the file is full. 'WRAP: no' prevents this. The Tracer keeps on working but the tracebuffer is not copied to the file anymore. The current status of the StandardTrace file can be displayed with "STA,HD;".

If tracing of the StandardTracer to buffer is activated ("ON,BUF" or just "ON;") elder data will be overwritten in case of a full tracebuffer. In other words the wrapping-function is always activated.

If tracing of the StandardTracer to HD is on ("ON,HD,FILENAME,...") a trace buffer pool may be used for temporary storage of tracebuffer (HD-cache).

The command OFF deactivates the StandardTracer. The start, stop, stopall conditions are set to the definition state. When tracing to harddisk was activated also the only partially filled tracebuffer will be, if possible, copied into the trace file.

### 195.4.2.5 Displaying and Storing of Trace-Data (DISPLAY, DA, DB, DF, DL, DN, COPY)

Data stored in the tracebuffer can be displayed at any time (also while the Tracer is still running) with the following commands: DF, DL, DA, DB and DN. If data without time stamps will be displayed, the commands DF-T, DL-T, DA-T, DB-T, and DN-T are available.

In order to display data from a Harddisk-Tracing-Session it is necessary to assign the file to the output with **DISPLAY,STDTR** or **DISPLAY,FILE,"filename"**. The status of the trace file listed in detail. The status of the trace file listed in detail. From now the whole trace file is handled with regard to the output commands (DA, DB, DF, DL, DN, DF-T, DL-T, DA-T, DB-T, DN-T) like a huge single trace buffer. If "\*" is entered instead of the file name, the last filename, which has been used in the command ON or DISPLAY, will be inserted. The assignment of the file for output is detached through the command **DISPLAY,OFF**.

Output of trace objects

1. from the position of the read pointer, with **DA** (or **DA-T**) (display after read pointer)
2. up to the position of the read pointer, with **DB** (or **DB-T**) (display before read pointer)
3. the first <n> trace objects, with **DF** (or **DF-T**) (display first)
4. the last <n> trace objects, with **DL** (or **DL-T**) (display last)
5. from one specific object number to another or the next 10 objects starting with a specific object number, with **DN** (or **DN-T**) (display from number)

After each display command is executed, the read pointer points refers to the trace object following the last displayed trace object. If there are no more trace objects, it stops at the position of the write pointer.

Following the output of a brief status report with command STA, the read pointer is at the first available data record in the trace buffer if the pointer was previously invalid.

Figure 66

*Options for reading out the trace buffer*

A post-selection is provided for all the above display commands:

1. If requested, only certain types of trace objects are output. Note that the default value of the parameter TYPE is OS and not ALL.
2. In addition, by specifying values for any byte the output of trace objects can be restricted.  
As an alternative to the specification of values for a single byte directly in the display command, up to 8 selection conditions can be defined (command SELMSG,BUF,..?), which can be applied to the current display command by specifying value SELMSG for parameter TEST. (Since these selection conditions are stored in the AMO data, they are only available until termination of the AMO). With the command copy the selection criterions can be stored in a file.
3. The post-selection is not put into effect when reading out a I I trace buffer entries (TYPE=ALL).

The parameter LAE determines a maximum output length for all trace objects to be displayed.

#### Example:

```
SELMSG,BUF,G1,CD1,SRC,34;
SELMSG,BUF,G1,CD2,DEST,E5;
```

every single object betw. nr. 100 and 200,  
which meets the conditions CD1 and CD2 is

## TRACA - System Message Tracer (IS)

### Functions of the AMO

DN,100-200,10,ALL,, ,SELMSG;                      going to be displayed

It is also possible to store tracedata, which has been traced to the tracebuffer. This is done with the command **COPY,STDTR,"filename"**. To display a file you can use the command **DISPLAY**.

### 195.4.2.6 Displaying the Status of the Tracer (STA)

By executing the command STA it is possible to display the status of Tracer at any given time. RES enables the user to put the settings to the standard values again and to clear the trace buffer.

1. Brief status report of the StandardTracer by entering **INFO=S**:
  - a) Maximum number of trace objects to be entered in the buffer
  - b) Number of selected trace objects
  - c) Number of trace objects in the buffer
  - d) Indication if the tracer is activated
  - e) Status of start and stop conditions
2. Medium-size status report of the StandardTracer by entering **INFO=M**:
  - a) Brief status report
  - b) Indication if the tracer has restart stability
  - c) StandardTracer file
  - d) Common information (user information, indication of the serialization mechanism which has been selected, number and size of buffers of resident tracer, number and size of buffers of trace buffer pool, information about Read Buffer and Read File).
3. Long status report of the StandardTracer by entering **INFO=L** or **INFO=STDTR**:
  - a) brief status report
  - b) Indication if the tracer has restart stability
  - c) Status report for the selection data
  - d) Standard tracer file (its name and status)
  - e) Common Information (user information, indication of the serialization mechanism which has been selected, number and size of buffers of resident tracer for each tracer type, number

and size of buffers of trace buffer pool for each tracer type, information about Read Buffer and Read File (name and status)).

4. Status report for selection data by entering INFO=**C**:
  - a) All set groups and set selection conditions for messages and LAN objects
  - b) All conditional conditions for the message dependent manipulation of the selection conditions during tracing
  - c) Condition bits for post-selection (if set)
  - d) Start, stop, stopall conditions (if set)
5. Status report for the trace file by entering INFO=**HD**:
  - a) Brief status report
  - b) Trace file and its status
  - c) Brief info about the content of the trace file (the detailed summary can be displayed by the command DISPLAY)

## 195.5 Technical Clarification

The following standard trace points and their corresponding trace object types are defined for message tracing:

- a) OS calls ON\_P\_SEND\_MESSAGE\_N, ON\_P\_SEND\_MESSAGE\_I, ON\_P\_SEND\_MESSAGE\_P, ON\_P\_SEND\_MSG\_N\_NO\_FREE, ON\_P\_SEND\_MSG\_I\_NO\_FREE, ON\_P\_SEND\_MSG\_P\_NO\_FREE with object type SD
- b) OS calls ON\_P\_RECEIVE\_MESSAGE and ON\_P\_ACCEPT\_MESSAGE, with object type RCV
- c) LAN trace point in the trace interface procedure in LAN subsystem. This LAN trace interface procedure is called by the various LAN layers with corresponding object types: ETHRV, ETHSD, TCP, TPI, IPDSD, IPDRV

If an error is detected during tracing, the tracer enters in the trace buffer a data record with an **error indication**. In the case of the display commands with TYPE=ALL these error indications are visible; they are indicated by the fact that a hexadecimal number is specified as the object type.

This hexadecimal number consists of 2 bytes:

- **first Byte** indicates the **type of Error**

## The LAN Tracepoints (Application Description)

### Technical Clarification

- **first hexadecimal digit** indicates **Group of conditions**, which is affected

| 1st digit of 1st byte | meaning          |
|-----------------------|------------------|
| 0                     | insignificant    |
| 1                     | Error in Group 1 |
| 2                     | Error in Group 2 |
| 3                     | Error in Group 3 |
| 4                     | Error in Group 4 |

- **second hexadecimal digit** is an **Error code**

| 2nd digit of 1st byte | meaning                               | comment                                                                                                  |
|-----------------------|---------------------------------------|----------------------------------------------------------------------------------------------------------|
| 1                     | nr. of comparison positions incorrect | the tracer administration variables have been destroyed                                                  |
| 5                     | Message length incorrect              | an inadmissible message token was transferred to the tracer                                              |
| 6                     | Offset incorrect for token            | an inadmissible message token was transferred to the tracer                                              |
| 8                     | Trace point inadmissible              | the tracing routine was branched to from a point which does not coincide with the scheduled trace points |
| A                     | Number of condition groups incorrect  | the tracer's administration data has been (number of condition groups implausible) destroyed             |

- **second Byte** indicates involved **Object type**

| errorcode 2nd byte | object type | comment                                                                                                 |
|--------------------|-------------|---------------------------------------------------------------------------------------------------------|
| 00                 | SD          | an attempt was made to trace the message contents for a SEND_MESSAGE call                               |
| 01                 | RCV         | an attempt was made to trace the message contents for a RECEIVE_MESSAGE call                            |
| 07                 | TIME        | an attempt was made to trace time information                                                           |
| 16                 | TPI         | an attempt was made to trace the data of the TPI LAN layer                                              |
| 17                 | TCP         | an attempt was made to trace the data of the TCP LAN layer                                              |
| 1A                 | IPDSD       | an attempt was made to trace the data of IP Dual Port Ram Send                                          |
| 1B                 | IPDRV       | an attempt was made to trace the data of IP Dual Port Ram Receive                                       |
| 1C                 | ETHSD       | an attempt was made to trace the data of a protocol header of the outgoing frame in the ethernet driver |
| 1D                 | ETHRV       | an attempt was made to trace the data of a protocol header of the incoming frame in the ethernet driver |

In the subsystem LAN there are 4 tracepoints:

- TPI:** This tracepoint makes it possible for the user to protocol and analyze connection specific one ( the relevant) part of the interface between the LAN subsystem and its users (OS,CMS) . The activation of this tracepoint supplies instructive informations for clearing if an error occurs inside or outside of the LAN subsystem.
- TCP:** Via this tracepoint, again connection specifically, the calls to the protocol layer TCP itself and their processing can be watched. This tracepoint will supply necessary advisories for analyzing lost connections or problems concerning the build up of connections, keepalive functions, resource problems and so on.
- ETHSD, ETHRV:** For analyzing protocol data (Ethernet, IP, TCP, ICMP, ARP) the tracepoint ETHSD can be used for outgoing packages and the ETHRV for incoming packages. Both tracepoints provide exactly these (protocol) data, which were sent to or received from LAN. The Ethernet driver has no memory for connections, therefore the tracepoints are not connection specific. Further the protocolling of user data at this points it does not make sense, because TCP does **NOT** work message oriented.

## 195.5.1 Activating of a LAN Tracepoint

For activating the tracepoints ETHSD and ETHRV the commands

- selmsg,lan,g1,cd1..;
- setlan,g1,ethsd&ethrv;
- on;

## The LAN Tracepoints (Application Description)

### Technical Clarification

at the HICOM tracer will be sufficient. Additionally for the tracepoints TPI and TCP the connection must be selected, which is to be protocolled. Therefore the user must execute following steps:

1. Determine the data segment of OLTSTRX
2. Start the Debugger
3. Display the data segment of OLTSTRX

```
DEBUG INPUT FOR A1      :
    *`d c318:0(400)!` /* data segment of OLTSTRX */

0614T DISPLAY :DISPLAY EXECUTED
0000
C318:0000 = 53 74 61 72 74 20 6F 66 20 65 43 43 4F 4E 4E 00  Start of eCONN.
C318:0010 = 66 49 50 3A 20 00 00 00 00 66 50 6F 3A 20 00 00  fIP: ....fPo: ..
C318:0020 = 66 49 50 3A 20 00 00 00 00 66 50 6F 3A 20 00 00  fIP: ....fPo: ..
C318:0030 = 66 49 50 3A 20 00 00 00 00 66 50 6F 3A 20 00 00  fIP: ....fPo: ..
C318:0040 = 66 49 50 3A 20 00 00 00 00 66 50 6F 3A 20 00 00  fIP: ....fPo: ..
C318:0050 = 45 6E 64 20 6F 66 20 65 43 43 4F 4E 4E 20 20 00  End of eCONN  .
C318:0060 = 00 00 53 74 61 72 74 20 6F 66 20 53 74 61 62 6C  ..Start of Stabl
C318:0070 = 65 00 02 00 00 00 80 03 00 00 00 00 02 64 00 00  e.....d..
C318:0080 = 01 00 67 00 00 00 82 03 C0 00 02 01 02 64 02 80  ..g.....d..
C318:0090 = 01 00 05 00 00 00 80 03 00 00 00 00 00 66 00 00  .....f..
C318:00A0 = 00 00 0B 00 00 00 82 03 C0 00 02 02 02 64 02 80  .....d..
C318:00B0 = 00 00 08 00 00 00 82 03 C0 00 02 10 00 66 07 DA  .....f..
.....
```

4. The trace output shows 4 character strings. "Start of eCONN" and "End of eCONN" are enclosing the table „expected client connections“, "Start of Stable" and "End of Stable " the table „trace sockets“.
5. Both tables make it possible for the user to select the connections, which are to be protocolled.

**195.5.1.1 Expected Client Connection**

|                                                 |                        |
|-------------------------------------------------|------------------------|
| 53 74 61 72 74 20 6F 66 20 65 43 43 4F 4E 4E 00 | Start of eCCONN.       |
| 66 49 50 3A 20 00 00 00 00 66 50 6F 3A 20 00 00 | fIP: ....fPo: ..       |
| 66 49 50 3A 20 00 00 00 00 66 50 6F 3A 20 00 00 | fIP: ....fPo: ..       |
| 66 49 50 3A 20 00 00 00 00 66 50 6F 3A 20 00 00 | fIP: ....fPo: ..       |
| 66 49 50 3A 20 00 00 00 00 66 50 6F 3A 20 00 00 | fIP: ....fPo: ..       |
| 45 6E 64 20 6F 66 20 65 43 43 4F 4E 4E 20 20 00 | End of eCCONN .        |
| ..                                              |                        |
| IP address of<br>far end host                   | far end port<br>number |

Figure 67 OLTSTRX.CC trace\_client\_conn\_tbl

This table enables the user to set the trace-option for connections, which are not yet built up and where the station has the part of the client. Therefore the user enters the IP address of the partner processor and the portnumber of the partner in this table. Byte order: BIG ENDIAN (corresponds Network byte order). If a TCP user tries to establish a client- connection, the TCP is checking this table and if necessary will switch on the trace option for this socket.

Example:

For unknown reasons CCB can not establish a connection to CCB. By entering the IP address (192.0.2.1) and the portnumber (T'612) of the CCA in this table

```
>> 66 49 50 3A 20 C0 00 02 01 66 50 6F 3A 20 02 64 fIP:
....fPo: .d
```

and by switching on the tracepoints TCP and TPI with the HICOM tracer, the tester can watch the TCP during the buildup of the connection.

195.5.1.2 Trace Socket Table

example of trace socket table in ADP:

|                |    |        |    |               |    |       |    |        |    |              |    |    |    |    |    |                  |
|----------------|----|--------|----|---------------|----|-------|----|--------|----|--------------|----|----|----|----|----|------------------|
| 53             | 74 | 61     | 72 | 74            | 20 | 6F    | 66 | 20     | 53 | 74           | 61 | 62 | 6C | 65 | 00 | Start of Stable. |
| 02             | 00 | 00     | 00 | 80            | 03 | 00    | 00 | 00     | 00 | 02           | 64 | 00 | 00 | 01 | 00 | .....d....       |
| 67             | 00 | 00     | 00 | 82            | 03 | C0    | 00 | 02     | 01 | 02           | 64 | 02 | 80 | 01 | 00 | g.....d....      |
| 05             | 00 | 00     | 00 | 80            | 03 | 00    | 00 | 00     | 00 | 00           | 66 | 00 | 00 | 00 | 00 | .....f....       |
| 0B             | 00 | 00     | 00 | 82            | 03 | C0    | 00 | 02     | 02 | 02           | 64 | 02 | 80 | 00 | 00 | .....d....       |
| 08             | 00 | 00     | 00 | 82            | 03 | C0    | 00 | 02     | 10 | 00           | 66 | 07 | DA | 00 | 00 | .....f....       |
| .....          |    |        |    |               |    |       |    |        |    |              |    |    |    |    |    |                  |
| socket         |    | socket |    | IP address of |    | local |    | remote |    | trace_toggle |    |    |    |    |    |                  |
| identification |    | state  |    | remote host   |    | port  |    | port   |    | trace_state  |    |    |    |    |    |                  |
|                |    | lo hi  |    |               |    | hi lo |    | hi lo  |    |              |    |    |    |    |    |                  |
| .....          |    |        |    |               |    |       |    |        |    |              |    |    |    |    |    |                  |
| 45             | 6E | 64     | 20 | 6F            | 66 | 20    | 53 | 74     | 61 | 62           | 6C | 65 | 20 | 20 | 00 | End of Stable    |

Figure 68 OLTSTRX.CC trace\_socket\_tbl

The only task of this table is to simplify the selection of TCP sockets/connections for protocolling. Therefore TCP enters every two seconds all valid sockets or connections respectively in the table and shows their state as well as their trace-option. By means of the last column of this table the user can switch over connection specifically the trace option by setting the "trace\_toggle" byte to a value unequal 0. In case of the next update of this table TCP checks the "trace\_toggle" column and switches over the trace option (ON->OFF resp. OFF->ON; ON=01, OFF=00). Then TCP sets the "trace\_toggle" byte again to 00.

Note

If the IP address and the remote port are 0, it is a listener port. If a partner wants a connection to this port, then a copy of the socket is made for the new connection and the listener port remains unchanged. Making the copy also the trace option is taken over, so that the buildup of the connection can also be protocolled at the server.

### Example

The user wants to watch the OS-message transfer between ADP and CCB and has already prepared the HICOM tracer appropriately. For the selection of the connection he has activated the HICOM debugger, has determined the beginning of the trace socket table and displayed the following table.

```
C318:0062 = 53 74 61 72 74 20 6F 66 20 53 74 61 62 6C 65
00 Start of Stable.

C318:0072 = 02 00 00 00 80 03 00 00 00 00 02 64 00 00 01
00 .....d....

C318:0082 = 67 00 00 00 82 03 C0 00 02 01 02 64 02 80 00
00 g.....d....

C318:0092 = 05 00 00 00 80 03 00 00 00 00 00 66 00 00 00
00 .....f....

C318:00A2 = 0B 00 00 00 82 03 C0 00 02 02 02 64 02 80 00
00 .....d....

C318:00B2 = 08 00 00 00 82 03 C0 00 02 10 00 66 07 DA 00
00 .....f....

C318:00C2 = 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00 .....

C318:00D2 = 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00 .....

.....
.....
```

Using the following "SET" command the trace option for the connection ADP<->CCB is switched on, as it is shown by the following command "DISPLAY".

```
* "set c318:C1(1)=5!"
* "d c318:b2(10)!"
```

```
C318:00B2 = 08 00 00 00 82 03 C0 00 02 10 00 66 07 DA 01
00 .....f....
```

Repeating the above command "SET" the trace option for the connection ADP<->CCB is switched off.

```
* "set c318:C1(1)=5!"
* "d c318:b2(10)!"
```

```
C318:00B2 = 08 00 00 00 82 03 C0 00 02 10 00 66 07 DA 00
00 .....f....
```

## 195.5.2 Format and Interpretation of the Trace Data

Remark: If the specified data doesn't exist, the corresponding component of the trace record is set to 0.

### 195.5.2.1 Tracepoint TPI

| Offset | Data item                             | Size          | Comment                                                   |
|--------|---------------------------------------|---------------|-----------------------------------------------------------|
| 0      | <b>IP address of remote host</b>      | 4 Bytes       | Byte order is BIG ENDIAN                                  |
| 4      | <b>local port</b>                     | 2 Bytes       |                                                           |

| 03 00          | TA_INPUT       | TCP-Flags + length of user data in WORDS | the TCP-Flags (see <a href="#">Table 28 on page 2548</a> ) of received TCP packet will be saved into the Intel bits 0 - 5 of byte 0 in TCP event, the length of user data -counted in words- will be saved into the bits 6,7 of byte 0 and bits 0 - 7 of byte 1 (most significant byte) |
| 04 00          | TA_DROP        | TCP-Flags + cause for dropping           | analogous to TA_INPUT; the possible values of cause for dropping are listed in <a href="#">Table 25 on page 2547</a>                                                                                                                                                                    |

Table 24 trace locations and their possible TCP events

| Value<br>lo,hi | trace location  | TCP events                     | comment                                                                                                                 |
|----------------|-----------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>05 00</b>   | TA_DROPAFTERACK | TCP-Flags + cause for dropping | analogous to TA_INPUT;<br>the possible values of cause for dropping are listed in <a href="#">Table 25 on page 2547</a> |
| <b>06 00</b>   | TA_DROPWITHRST  | TCP-Flags + cause for dropping | analogous to TA_INPUT;<br>the possible values of cause for dropping are listed in <a href="#">Table 25 on page 2547</a> |

Table 24 trace locations and their possible TCP events

| Value | Literal        | Comment                                              |
|-------|----------------|------------------------------------------------------|
| 1     | TD_NOBUF       | required memory resources not available              |
| 2     | TD_NEWSOFAILED | creation of new socket failed due to no socket space |
| 3     | TD_TCPFLAG     | unexpected flag received                             |
| 4     | TD_PCBFAILED   | call of in_pcbconnect failed                         |
| 5     | TD_SEQFAIL     | unexpected sequence number received                  |
| 6     | TD_CONNCLOSED  | connection already closed                            |
| 7     | TD_WAITFIN     | TCP waits for the FIN of communication partner       |

Table 25 Reasons for dropping a TCP packet and/or connection

| Intel-Bit | Value<br>lo, hi | Name               | Comment                           |
|-----------|-----------------|--------------------|-----------------------------------|
| 0         | 01 00           | SS_NOFDREF         | no file table ref any more        |
| 1         | 02 00           | SS_ISCONNECTED     | socket connected to a peer        |
| 2         | 04 00           | SS_ISCONNECTING    | in process of connecting to peer  |
| 3         | 08 00           | SS_ISDISCONNECTING | in process of disconnecting       |
| 4         | 10 00           | SS_CANTSENDMORE    | can't send more data to peer      |
| 5         | 20 00           | SS_CANTRCVMORE     | can't receive more data from peer |
| 6         | 40 00           | SS_RCVATMARK       | at mark on input                  |
| 7         | 80 00           | SS_PRIV            | privileged for broadcast          |
| 8         | 00 01           | SS_NBIO            | non-blocking ops                  |
| 9         | 00 02           | SS_ASYNC           | async i/o notify                  |
| 10        | 00 04           | SS_ISCONFIRMING    | deciding to accept connection req |

Table 26 Socket state bits

| Value<br>lo, hi | Name        | Comment           |
|-----------------|-------------|-------------------|
| 00 00           | TCPS_CLOSED | connection closed |

| Description:         | "Urgent Pointer"- field is significant | Acknowledgment field is significant | Push Function | Reset (Close) the connection | Synchr. sequence numbers; start connection | No more data from sender; connection close |

Table 28 TCP flags and their meaning

1 numbering in Intel-format (numbers in brackets correspond to network-numbering)

Figure 69 Trace example for trace point TCP

### 195.5.2.3 Tracepoint ETHSD, ETHRV

As already noticed at the beginning of Section 195.5 on page 195-2536, the trace points ETHSD and ETHRV have to be used if protocol data is needed. The structure of trace data is the same for the trace points ETHSD and ETHRV. This structure - for TCP communication - is shown and shortly commented in [Figure 71 on page 2551](#). For more details or other protocols, please look up to RFC791(IP), RFC792(ICMP), RFC793(TCP) and RFC826(ARP).

**Note:** for all protocol data the byte and bit order is BIG ENDIAN which is equal to the "network byte order" (this means: bits and bytes with lower position number have more significance).

**195.5.2.5 Tracepoints IPDSD, IPDRV**

These are the LAN tracepoints in the dual-port-ram for unixware 7. This are the IP-SEND and IP-Receive

**195.6 Examples**

Start AMO TRACA (in ADS), control of tracer in A1

Input:

<EXEC-TRACA:A1;

Output:

AMO TRACA VARIANT/VERSION L2/001 OF 2001-04-18  
TRACER VARIANT/VERSION L2/007 OF 2001-04-18  
TRACER INPUT IN A1 PLEASE:

**Note**

The user input request is followed by an asterisk to indicate that the user may now enter the next command.

**Example 1: basic example**

The buffer and all the selection tables of the StandardTracer must be reset.

Input:

```
*RES, STDTR;
```

Output:

```
TRACER INPUT IN A1 PLEASE:
```

Only the first 14 bytes of the OS\_SEND and OS\_RECEIVE messages are stored in the memory.

Input:

```
*MSGLEN, OS, G1, 14;
```

Output:

```
TRACER INPUT IN A1 PLEASE:
```

A maximum of 100 objects are entered in the trace buffer of the StandardTracer:

Input:

```
*MAXNO, 100;
```

Output:

```
TRACER INPUT IN A1 PLEASE:
```

Only the messages received by the AMC (task set value = H'33) or by an AMO (task set value = H'34) are to be selected:

Input:

```
*SELMSG, RCV, G1, CD1, DEST, 33&34;
```

Output:

```
TRACER INPUT IN A1 PLEASE:
```

The StandardTracer is activated:

Input:

```
*ON;
```

Output:

```
TRACER INPUT IN A1 PLEASE:
```

Get long information of StandardTracer:

Input:

```
*STA, STDTR;
```

Output:

```
*****
* STANDARD TRACER
*****
MAX:100      SELOBJ:34      ACTOBJ:34      TRC:ON      STARTCD:D      STOPCD:D
```

**195.7 Parameter Description**

|        |                                                                                                                                                                                                                        |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AKTPOS | Used in command: SELMSG;<br>specifies the position of the byte in current message (setting conditionals conditions)<br>Type of Input : Single value, mandatory<br>Possible Values : 0 - 12000                          |
| ANS    | Used in command: COPY, ON;<br>specifies if copy is to continue<br>Type of Input : Single value, mandatory<br>Possible Values : Y Yes<br>N No                                                                           |
| AREA   | Used in command: COPY;<br>areas for which the command is valid<br>Type of Input : single Value, mandatory<br>Possible Values STDTR StandardTracer buffer<br>TAB-HD save selection table<br>HD-TAB read selection table |
| BITPOS | Used in command: SELMSG;                                                                                                                                                                                               |

Bitpositions which may be used for building a byte mask for mask comparison

|                 |                                                                                         |                              |
|-----------------|-----------------------------------------------------------------------------------------|------------------------------|
| Type of Input   | : Single value, mandatory or<br>linked Single values and/or range entries,<br>mandatory |                              |
| Possible Values | : BIT1                                                                                  | Setting the 1. bit of a byte |
|                 | : BIT2                                                                                  | Setting the 2. bit of a byte |
|                 | : BIT3                                                                                  | Setting the 3. bit of a byte |
|                 | : BIT4                                                                                  | Setting the 4. bit of a byte |
|                 | : BIT5                                                                                  | Setting the 5. bit of a byte |
|                 | : BIT6                                                                                  | Setting the 6. bit of a byte |
|                 | : BIT7                                                                                  | Setting the 7. bit of a byte |
|                 | : BIT8                                                                                  | Setting the 8. bit of a byte |

**BLOCKNO** Used in command: DN, DN-T;  
specifies the block number on the harddisk

|                 |                           |
|-----------------|---------------------------|
| Type of Input   | : Single value, mandatory |
| Possible Values | : 1 - 65535               |

**CMD** Branch parameter,  
indicates the tracer command

|                 |                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type of Input   | : Single value, mandatory                                                                                                                                                                         |
| Type of Input   | : Single value, mandatory                                                                                                                                                                         |
| Possible Values | : OFF, USER, DA, DB, DF, DISPLAY, DL, DN, ON, COPY, END,<br>MAXNO,MSGLEN, P, RES, RST, SELMSG, SELSTOP, SETLAN, STA, DA-T,<br>DB-T, DF-T, DL-T, DN-T<br>(for explanation see Functional Overview) |

**CNT** Used in commands: DA, DB, DF, DL, DA-T, DB-T, DF-T, DL-T, DN-T;  
indicates number of trace objects to be output

|                 |                          |
|-----------------|--------------------------|
| Type of Input   | : Single value, optional |
| Possible Values | : 1 - 65535              |
| Default Value   | : 10                     |

**COND** Used in commands: SELMSG  
branch parameter, specifies which condition is set.

|                 |                          |                                                                                          |
|-----------------|--------------------------|------------------------------------------------------------------------------------------|
| Type of Input   | : Single value, optional |                                                                                          |
| Possible Values | : ALL                    | Select all messages                                                                      |
|                 | : OFF                    | Deactivate message selection for a group<br>or deactivate selection at gate trace points |

## The LAN Tracepoints (Application Description)

### Parameter Description

|                 |                                                                                                                                                                                                                                                                                             |                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|
|                 | CD1                                                                                                                                                                                                                                                                                         | 1st condition                           |
|                 | CD2                                                                                                                                                                                                                                                                                         | 2nd condition                           |
|                 | CD3                                                                                                                                                                                                                                                                                         | 3rd condition                           |
|                 | CD4                                                                                                                                                                                                                                                                                         | 4th condition                           |
|                 | CD5                                                                                                                                                                                                                                                                                         | 5th condition                           |
|                 | CD6                                                                                                                                                                                                                                                                                         | 6th condition                           |
|                 | CD7                                                                                                                                                                                                                                                                                         | 7th condition                           |
|                 | CD8                                                                                                                                                                                                                                                                                         | 8th condition                           |
|                 | CCD1                                                                                                                                                                                                                                                                                        | 1st conditional condition (SELMSG only) |
|                 | CCD2                                                                                                                                                                                                                                                                                        | 2nd conditional condition (SELMSG only) |
|                 | CCD3                                                                                                                                                                                                                                                                                        | 3rd conditional condition (SELMSG only) |

## The LAN Tracepoints (Application Description)

### Parameter Description

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LEN      | <p>Used in commands: DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T, MSGLEN;<br/>Commands DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T:<br/>maximum output length of a trace object in bytes<br/>Command MSGLEN:<br/>maximum entry length for a message.<br/>The supplementary data, e.g. SDNO, etc., is not included.</p> <p>Type of Input : Single value, optional<br/>Possible Values : 0 - 65535<br/>(may be reduced by the AMO to the maximum value implemented)<br/>Default Values : Commands DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T:<br/>None (full object length is default value)<br/>Command MSGLEN: 16</p> |
| LOCK     | <p>Used in command: SELMSG;<br/>Specifies the lock of dynamic manipulations of conditions</p> <p>Type of Input : Single value, optional<br/>Possible Values : BLOCK blocking execution of conditional conditions<br/>UNBLO unblocking execution of conditional conditions</p>                                                                                                                                                                                                                                                                                                                                                         |
| MAXBLOCK | <p>Used in command: ON;<br/>Specifies the filesize in multiple of trace buffer.</p> <p>Type of Input : Single value, optional<br/>Possible Values : 1 - 99<br/>Default Value : 10</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| MAXNO    | <p>Used in command: MAXNO;<br/>specifies the maximum number of trace objects to be written into the buffer.</p> <p>Type of Input : Single value, optional<br/>Possible Values : 0 to 65535<br/>Default Value : 0 (= unlimited)</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| NO       | <p>Used in command: DN, DN-T;<br/>the objects in the trace buffer are consecutively numbered from 1 to 65535 (0 is 65536).<br/>This consecutive number can be used to specifically address each trace object.</p> <p>Type of Input : Single value, linked Single values mandatory<br/>Possible Values: : 0 - 65535</p>                                                                                                                                                                                                                                                                                                                |
| NUMCD    | <p>Used in command: SELMSG;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Specifies the NUMber of ConDitions which are dynamic to change.

Type of Input : Single value, optional

Possible Values : 1 - 8

Default Value : 1

### OVERWRT

Used in command: ON;

Specifies whether a file is overwritten or not

Type of Input : Single value, optional

Possible Values Y File will be overwritten

N File will be not overwritten

### POOLSIZE

Used in command: ON

specifies the number of trace buffers in the trace buffer pool

Type of Input : Single value, optional

Possible Value : 0 (no trace buffer pool)

7 - 99

Default Value : 20

### RESOBJ

Used in command: RES;

parts of the tracer that are reset.

Type of Input : Single value, optional

Possible Values : BUF Trace buffer, i.e. the buffer contents are deleted.

TBL All selection tables, i.e. no message is selected, no dynamic memory is selected, no control condition is set. All the length fields are set to 16 bytes. (The condition bits for post-selection remain unchanged).

ALL The trace buffer and all selection tables are reset.

Default Value : BUF

### STYPE

Used in commands: ON, RST, SELMSG, SELSTOP;

specifies how the criterion for restart stability (RST)

and/or the serialization mechanism is to be set (SELSTOP)

and/or what action is to execute (SELMSG)

and/or if the trace result is also to store on harddisk (ON)

Type of Input : Single value, optional in ON  
Single value, mandatory in RST, SELMSG, SELSTOP

Possible Values : For ON:

BUF Tracing only in trace buffer (Default Value)

## The LAN Tracepoints (Application Description)

### Parameter Description

|              |                                                   |
|--------------|---------------------------------------------------|
| HD           | the full trace buffer is to store in a file on HD |
| For RST:     |                                                   |
| OFF          | Tracer is not to have restart stability           |
| ON           | Tracer is to have restart stability               |
| For SELMSG:  |                                                   |
| ADD          | adding of a selection value                       |
| DEL          | deleting of selection values of a condition       |
| SET          | setting of a selection value                      |
| SUB          | deleting of a selection value                     |
| For SELSTOP: |                                                   |
| OS           | Serialization with OS resources                   |
| LOCK         | Serialization with interrupt disable              |

|          |                                                  |                               |
|----------|--------------------------------------------------|-------------------------------|
| TARGETCD | Used in commands: SELMSG;                        |                               |
|          | indicates whether dynamic condition is to be set |                               |
|          | Type of Input                                    | : Single value, optional      |
|          | Possible Values                                  | : CD1 first condition         |
|          |                                                  | CD2 second condition          |
|          |                                                  | CD3 third condition           |
|          |                                                  | CD4 fourth condition          |
|          |                                                  | CD5 fifth condition           |
|          |                                                  | CD6 sixth condition           |
|          |                                                  | CD7 seventh condition         |
|          |                                                  | CD8 eighth condition          |
|          | Default Value                                    | : Value of the parameter COND |

|           |                                                           |                                  |
|-----------|-----------------------------------------------------------|----------------------------------|
| TARGETGRP | Used in commands: SELMSG;                                 |                                  |
|           | indicates for what group a dynamic condition is to be set |                                  |
|           | Type of Input                                             | : Single value, optional         |
|           | Possible Values                                           | : G1 condition group 1           |
|           |                                                           | G2 condition group 2             |
|           |                                                           | G3 condition group 3             |
|           |                                                           | G4 condition group 4             |
|           | Default Value                                             | : Value of the parameter CONDGRP |

|          |                                                                                        |                           |
|----------|----------------------------------------------------------------------------------------|---------------------------|
| TARGETPO | Used in commands: SELMSG;                                                              |                           |
|          | indicates the byte position in the target message (for setting conditional conditions) |                           |
|          | Type of Input                                                                          | : Single value, mandatory |

F28: CREATION OF SEGMENT FAILED WITH STATUS @@@@H

F29: FILE DOES NOT CONTAIN TRACE DATA

F30: FILE CONTAINS SWU TRACE DATA. USE AMO TRACS

F32: LAN SELECTION COULD NOT BE SET FOR: @@@@

F33: TRACEPOINT <xxxxxxx> NOT DEFINED

F34: CAN NOT PERFORM CONVERSATION

F35: PROTOCOL OF THIS CIRCUIT CURRENTLY NOT SUPPORTED

F36: FEATURE NOT SUPPORTED BY CURRENT APS

F37: DELETING OF FILE FAILED WITH STATUS @H

F39: RECORD WITH INCONSISTENT DATA

F40: FILE CONTAINS NO TRACER SELECTION TABLES

F41: NOT ENOUGH MEMORY FOR A TRACE BUFFER POOL WITH @@@@ kB

F42: TRACE FILE IS USED BY ANOTHER TRACER

F43: NO VALID TRACE BUFFER POOL

F44: NOT ALL BUFFER WERE WRITTEN IN OLD FILE

F45: READ BUFFER DOES NOT EXIST

F46: TRACE BUFFER POOL NOT CREATED

F48: A ERROR OCCUR DURING RELEASE OF TRACEBUFFERPOOL

## 195.8.2 Advisories

H01: NO FURTHER OBJECT IS IN THE BUFFER

H02: PROCEEDING FROM THE DESIRED START THERE ARE ONLY <xxxxx> ENTRIES

H03: AMO TRACA NOT AVAILABLE ON A MONOPROCESSOR SYSTEM, USE AMO TRACS

H04: THIS SELECTION OCCUPIES CONDITION XX AND XX

H05: IN THIS CONTEXT THE VALUE MEANS THE ABSENCE OF A LIMIT

H06: DESIRED FUNCTION NOT AVAILABLE

H07: THE NUMBER OF (CYCLICALLY) ENTERED OBJECTS IS UNLIMITED NOW

H08: TRACE BUFFER IS EMPTY

H09: OBJECT COULD NOT BE OUTPUT COMPLETELY

H10: TRACEPOINTS SET: XXXXX XXXXX XXXXX

H11: TRACEPOINTS POSSIBLE AT MOST: CP DH PP

H12: LENGTH HAS BEEN REDUCED TO ITS ALLOWED MAXIMUM

H13: NO GROUPS FOR POSTSELECTION. INPUT INSIGNIFICANT

H14: NOT EXECUTED FOR TPT @@, NO SELECTION DEFINED FOR G@

H15: WRITING OF TRACE BUFFER COMPLETED

H17: FILE ALREADY EXISTS. OVERWRITE? (Y/N)

H18: TRACE BUFFER NOT EMPTY. OVERWRITE? (Y/N)

H19: '<xxxxxxxxxxxxxxxxxxxxxx>' WITH <xxxxxx> KB CREATED

H20: NUMBER EXISTS IN BLOCKS <xxx> <xxx> <xxx> <xxx> <xxx> <xxx>

H23: WRITING TRACER SELECTION TABLES FINISHED

H24: READING TRACER SELECTION TABLES FINISHED

H26: IRREGULAR INPUT

H27: TRACE BUFFER POOL RELEASED

H28: TRACE BUFFER POOL WITH @@@@ KB CREATED

H33: TIME IS ALWAYS RECORDED. INPUT IS IGNORED.

H34: TRACE FILE IS EMPTY

H35: RELEASE OF BUFFER POOL IS STARTED

H36: AMO-TRACA IS USED BY ANOTHER USER

OR

AMO-TRACA WAS ABORTED RESET WITH 'RELOVL;'

| <a href="#">General</a>            | <a href="#">The LAN Tracepoints (Application Description)</a> | <a href="#">Error Messages and Advisories</a> |

## 196.1 Restrictions

This AMO Description is valid from HiPath 4000 V1.0 on.

## 196.2 Interrelationships

AMO TRACS communicates with the tracer resident in the specified module (processor).

Direct interrelationships exist only to subsystems, containing trace points.

## 196.3 General

The tracer provides the system specialist with a tool by means of which **message traffic** between the individual program complexes of the system and **LAN objects** can be conveniently traced.

Further it is possible to record the most important **dynamic memories** of call processing, depending on line-addresses either referenced in messages or user-defined on CALL-gates of GDT.

Therefore the Tracer is an important on-line test aid for use in the field and at customers' premises.

Communication with the terminal is handled by AMO TRACS. Although the tracer can select internal messages and other trace objects and write them into the buffer without this AMO, the AMO is essential for changing the selection and for outputting the trace objects.

### Note

For the IS, a similar tracer tool is available, which is controlled with the AMO TRACA (see AMO description of [TRACA - System Message Tracer \(IS\)](#)).

## **196.3.1 Definition of Terms**

**Trace objects are:**

- Messages that are exchanged between tasks
- LAN data of the various LAN layers
- Dynamic memories addressable on a message-dependent basis
- Dynamic memories at call gates, addressable on a user-dependent basis.

**Trace points are** locations in the software at which the tracer is called.

The tracer offers extensive options for selection criteria. There is a **selection table** for each trace point.

The selection table for a trace point contains the conditions which must be fulfilled by a message or a LAN object in order to be stored in the trace buffer by the tracer.

Typical, most frequently used selection criteria in a message are for example:

- Byte 0 destination task
- Byte 1 source task
- Byte 4 event code

The selection table contains also "conditional conditions". During the trace process these conditions control a specific manipulation of the selections which depends on the content of the message.

## **196.3.2 Functional Overview**

The following functions are implemented in the AMO:

- a) Activation / Deactivation of AutoTracer, storing an AutoTracer file with the command **AUTOTR**
- b) Storing a trace buffer of a specified tracer in a file and store or restore tracer selection tables in or from a file with the command **COPY**  
see [Section 196.4.2.6, "Displaying Trace-Data \(DISPLAY, DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T\)"](#)
- c) Assignment of a file to the output with command **DISPLAY**  
see [Section 196.4.2.6, "Displaying Trace-Data \(DISPLAY, DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T\)"](#)

- d) Output of trace objects with **DA**, **DB**, **DF**, **DL** and **DN** or with **DA-T**, **DB-T**, **DF-T**, **DL-T** and **DN-T** (output without time stamps)  
see [Section 196.4.2.6, "Displaying Trace-Data \(DISPLAY, DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T\)"](#)
- e) Termination of the AMO with **END**.  
Important: The tracer itself remains unaffected !
- f) Activation / Deactivation and definition of the Flagtrace selections with **FLAGTR**  
see [Section 196.4.2.3, "FlagTracer \(FLAGTR\)"](#)
- g) Definition of the maximum number of trace objects which are to be entered in the buffer, with **MAXNO**.
- h) Definition of the maximum entry length for messages entered in the buffer, with **MSGLEN** (message length)  
see [Section 196.4.2.4, "MSGLEN"](#)
- i) Definition of selections for a netwide trace-stop with the command **NETSTOP**.
- j) Deactivation of the StandardTracer with **OFF**  
see [Section 196.4.2.5, "Activation and Deactivation of the StandardTracer \(ON, OFF\)"](#)
- k) Activation of the StandardTracer, determination of poolsize and tracing to hard disk with command **ON**  
see [Section 196.4.2.5, "Activation and Deactivation of the StandardTracer \(ON, OFF\)"](#)
- l) Change the processor, which controls the Tracer with command **P** (processor)
- m) Activation / Deactivation and definition of selections for RDSTracer with the command **RDSTR**
- n) Resetting a trace buffer, the trace buffer pool and selection tables with **RES** (RESet)
- o) Definition of the restart stability of the tracer with **RST**
- p) Selection of dynamic device memories by means of the command **SELDYN** (SElect DYNamic memory)  
see [Section 196.4.2.2, "Selection of dynamic memory \(SELDYN\)"](#)
- q) Selection of messages or LAN objects with **SELMSG** (select message)  
see [Section 196.4.2.1, "SELMSG"](#)

## TRACS - Operation of the System Tracer (SWU)

### Functions of the AMO

- r) Selection of the serialization mechanism for the tracer with the command **SELSTOP** (stop selection in the event of a conflict)
- s) Selection of the LAN object types with **SETLAN**  
see [Section 196.6.1, "Activating of a LAN Tracepoint"](#)
- t) Output of the tracer status with **STA** (STatus)  
see [Section 196.4.2.7, "Save the Trace data \(COPY\)"](#)
- u) Megatrace with **MAXBLKFL**  
see [Section 196.4.2.11, "Megatrace"](#)
- v) Input of an advisory for other users of the tracer with command **USER**

In general the Hicom-tracer is not used by just one user. Therefore it is sometimes difficult to check who made the possibly existing tracer-settings and to check if they are still needed.

For assigning the tracer-settings to an user the user can enter any comment (e.g. name, telephone number,...). This comment will be displayed in connection with status displays (STA,...;).

## 196.4 Functions of the AMO

- [EXEC-TRACS](#) : Start of AMO TRACS
- [INPUT-TRACS](#) : Data input request in dialog mode

### 196.4.1 EXEC-TRACS

#### Procedure Overview

| Command Code | Parameter     |
|--------------|---------------|
| EXEC-TRACS   | UNIT=<param>; |

#### Notes

- a) AMO TRACS primarily controls the tracer in the SWU processor specified. The AMO itself is run in the ADS.
- b) The AMO remains in the dialog mode for several minutes; if no input is made within this period, it terminates automatically.

#### Example

Input:

<EXEC-TRACS:BPA;

Output:

```
AMO TRACS VARIANT/VERSION L2/001 OF 2001-04-18
TRACER    VARIANT/VERSION L2/007 OF 2001-04-18
TRACER INPUT IN BPA PLEASE:
```

Input:

```
*END;
prompt
```

\* = command input

## 196.4.2 INPUT-TRACS

The action INPUT-TRACS is only used for WRITE-READ access and cannot be entered by the user at the administration and maintenance terminal (AMT). Only the text shown below is displayed at the AMT as an input request to the user (the asterisk which follows the text indicates the ready state):

```
TRACER INPUT IN <processor name> PLEASE:
*
```

This output text also indicates that the AMO has successfully executed the previous command.

The following commands (CMD) are defined:

```
CMD= AUTOTR, AUTOTR=OFF;
CMD= AUTOTR, AUTOTR=ON;
CMD= AUTOTR, AUTOTR=FILE, [MAXBLOCK=<number>], ARCHIVE=<string>;
CMD= COPY, AREA=<string>, FILE=<string>;
CMD= DISPLAY, FILETYPE=<param>;
CMD= DISPLAY, FILETYPE=FILE, FILE=<string>;
CMD= DA, [CNT=<number>], [LEN=<number>], TYPE=ALL;
    (Subsequent parameters are disregarded by AMO)
CMD= DA, [CNT=<number>], [LEN=<number>], [TYPE=<param>],,,,TEST=SELMSG;
    (Other parameters are disregarded by AMO)
CMD= DA, [CNT=<number>], [LEN=<number>], [TYPE=<param>]
    , [DISPLACE=<param>, VAL=<hex>, TEST=<param>];

| SELFLAG, STYPE=STOPALL;                                                                                            | FLAGTR, STYPE=STOPALL;                                                                                            |
|                                                                                                                    | FLAGTR, STYPE=FILE, MAXBLOCK=<number>,<br>ARCHIVE=<string>;                                                       |
| SELNET, NETPROT=CORNET, SELLINE=L1 ... L8,<br>[NODEACC=<number>];                                                  | NETSTOP, NETPROT=CORNET, SELLINE=L1 ... L8,<br>[NODEACC=<number>];                                                |
| SELNET, NETPROT=CORNET, SELLINE=OFF;                                                                               | NETSTOP, NETPROT=CORNET, SELLINE=OFF;                                                                             |

Before the StandardTracer is started a selection of the tracepoints and traceobjects, which shall be recorded, has to be made. This is done with the commands SELMSG and SELDYN.

Note: Flagtrace and Autotrace are activated and standard-selections are set as default.

### 196.4.2.1 SELMSG

The first parameter TRACEPT determines whether switching-processing-messages (PP, CP or SW in general), OS-messages (SD, RCV or OS in general) or LAN-data (to have a more specific selection

## TRACS - Operation of the System Tracer (SWU)

### Functions of the AMO

at the LAN-tracepoint the command SETLAN is used, see Section 196.6.1) are selected or whether Start- and Stopconditions should be set.

The following functions are possible for the StandardTracer:

1. All messages and trace objects can be selected for the corresponding trace points
2. Only those messages are selected, which fulfill one of the 4 groups with up to 8 conditions
3. No message or no LAN object is selected
4. Only those messages or LAN objects which fulfill one of the 4 groups with up to 8 conditions result in start or stop or stopall of tracing or in stop of PETRA
5. Messages or LAN objects, which fulfill one of the 4 groups with up to 8 conditions, result during tracing in the specific message dependent change of selection conditions, which were defined in the "conditional conditions".
6. The start, stop, stopall, PETRA condition is deactivated
7. Up to 8 conditions can be formulated for post-selection (Attention: no condition groups valid for this function !!)
8. The conditions formulated for post-selection are deleted
9. The conditions for a group or for a trace point are deleted.

The following functions are possible for the FlagTracer:

1. CP and PP messages can be selected for FlagTracer

The following functions are possible for the AutoTracer:

1. CP and PP messages can be selected for AutoTracer

The following functions are possible for the RDSTracer:

1. CP and PP messages of set monitors
2. PP messages for RDS ISDN Tracer.

---

**NOTE:** Be aware of the fact, that if the parameters CONDGRP and COND are ignored (both are optional !), the selection criteria will be reset, because the default value is OFF.

---

### Selection of Messages and LAN Objects

By setting conditions it is possible to select only those traceobjects which are of interest for the user. The tracer is able to make the valuation of messages in 2 different ways:

- The input of byte values as comparison data result in a tracer, which *o n l y* enters the message into the trace buffer, when the addressed byte is exactly equal to *o n e* of this byte values. It is possible to enter multiple values (up to 50) for each byte. It is also possible, to specify several conditions (up to 8) for one group, which must be performed all for a selection of a message. In the case of SELMSG with FLDTYPE = SDNO, please note that the state diagram number in the display commands is represented as a word, with the result that byte 0 in the state diagram number consists of the last two digits in the state diagram number.
- At mask comparison (parameter FLDTYPE = PST), the position of one or more bits (= mask) which must be contained in the desired message byte, have to be entered as trace data. If these bit(s) occur in the message byte, the message is taken into the trace buffer. Are there, additional to the mask-bit(s), also other bits which are set in the certain message byte, then the message is also taken into the buffer, because it corresponds likewise to the given bit mask. With this method, it is possible now, to watch powersets or variable byte values contained in a message byte, on bit level.

Example:

|        |                 |            |      |
|--------|-----------------|------------|------|
| BITPOS | BIT1&BIT4&&BIT7 | B'01111010 | H'7A |
|        | or              | B'01111011 | H'7B |
|        | or generally    | B'x1111x1x |      |

These two comparison methods may be combined, if needed, in any sequence for each condition group.

If several condition groups are defined the sequence of the groups has to be considered, because tracing works in following way:

The tracer checks the first group. If the conditions for the message are fulfilled, the message will be copied into the trace buffer corresponding to the definitions for that group (length, conditional conditions). Further groups will not be checked. If the conditions are not fulfilled the same procedure is repeated with the next group.

The user has the possibility to control the tracing himself by assigning in case of overlapping selections a lower groupnumber to the group which contains the more important definitions (that is: length, dynamic memories, conditional conditions,..).

## TRACS - Operation of the System Tracer (SWU)

### Functions of the AMO

Rule of thumb: the more restrictive a condition is the lower its group number should be.

Generally: if the condition of a group is a subset of another one it must have the smaller groupnumber

### Conditional Conditions

The byte values defined for selections can also be set, changed and deleted automatically during the tracing dependent of message contents. That happens according to the defined conditional conditions (parameter COND=CCD1/..CCD8).

That means: from the message which matches the selection conditions are used up to eight bytes as condition for a future message. E.g. a LINE from the current message can be used as condition for a next message. Following conversions are made: LODAD, LODADP, LODEN, DTI, LTGLINE, LINE

### Start, Stop, Stopall, PETRA Conditions and Trace Stop Netwide

The start condition describes the properties of a message or a LAN object which activates tracing (start object).

### Example

SELMSG,START,G1,CD1,SRC,34&57,e;

SELMSG,START,G1,CD2,EV,3E,e;

the Tracer is started if a message

occurs, which 4th Byte is 3E *and* its first Byte is either 34 *or* 57.

The stop condition describes the properties of a message or a LAN object which deactivates tracing (stop object).

The stopall condition describes the properties of a message or a LAN object which deactivates the StandardTracer for all configured processors in a system (including the IS) and StandardTracer in partner systems if a netwide trace stop is defined (stopall object). If FLAGTR, STOPALL have been selected, the FlagTracer blocking is set, see Section 196.4.2.3 on page 196-2591.

The PETRA-condition describes the properties of a message, which switches off the PETRA (PERipheral TRacing) in the actual processor (PETRA-message). The message, provided with the object type PT, will be entered into the trace buffer. In this way it is easy to find the message within the trace buffer (using the commands DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T and type=PT).

IF STOP, STOPALL and / or PETRA conditions are defined at the same time, the tracer checks the STOP conditions first, then the STOPALL conditions and at last the PETRA conditions. If there are identically conditions defined on more trace points, then the tracer only checks

the STOP conditions and if it is fulfilled, just the tracer in the current processor will be stopped. In this case the STOPALL conditions and PETRA conditions will be ignored, i.e. they have no effect!

In order to give the user sufficient time to define all the individual conditions required, the execution of the control condition is temporarily suspended until all conditions have been entered.

When a start condition is entered, the StandardTracer is also deactivated. (When a stop or stopall condition is entered, this would not be practical, because the StandardTracer should not be deactivated before the stop resp. stopall object has been received).

The definition status for the defined control conditions is terminated by the activation of the StandardTracer (command ON); these control conditions are then placed in the waiting state.

At this stage each message and each LAN object is checked by the activated trace points to determine whether it meets the defined control conditions.

After the start object has been received, tracing of the StandardTracer is activated and the start object entered in the buffer. (If no start condition is defined, tracing had been in effect from the activation of the tracer onward).

Further messages or LAN objects are then entered in the buffer according to the trace point selections.

When the stop object is received, tracing of the StandardTracer is deactivated and stopping is signaled at the console. The stop object is the last object to be entered in the trace buffer of the StandardTracer.

When the stopall object is received, tracing of the StandardTracer is deactivated in all processors in which a tracer is active and stopping is signaled at the console. The last object to be entered in the buffer is the stopall object. If FLAGTR, STOPALL have been selected, the tracing of the FlagTracer is stopped too, see Section 196.4.2.3 on page 196-2591. If in a processor a **netwide trace stop** has been defined with the **NETSTOP** command, stop-instructions will be sent to the selected partner switches. In the partner switches the StandardTracer in all configured processors are stopped and in case of a defined netwide trace stop the stop instruction will be also forwarded to partner switches.

The defined control conditions remain available (status = R) and come into effect again with the next ON command.

The STATUS command indicates the states of the control conditions:

- D (definition status)

## TRACS - Operation of the System Tracer (SWU)

### Functions of the AMO

- R (reached)
- W (waiting status)

Stop condition with station selection can be made using the following command:

```
SELMSG,SW,G1,CD1,STN,<stno>;
```

Example of trace selection for station number:

```
SELMSG,SW,G1,CD1,STN,<stno>;
```

Example of trace selection for circuit number:

```
SELMSG,SW,G1,CD1,PEN,<pen_number>;
```

### TRCCONF – Trace profiles settings

- Overview for TRACS/DIAGS improvements

The new feature allows storing / restoring DIAGS switches into / from specified file. The file is the one used for storing / restoring trace selection table.

New parameters were introduced on COPY,TAB-HD/HD-TAB branches in AMO TRACS.

- following commands can be used to store in file <file\_name> the currently DIAGS switches set to on:

```
COPY,TAB-HD,<file_name>,<description>,,DIAGSON;           // SAVE  
ONLY DIAGS SWITCHES THAT ARE ON  
  
COPY,TAB-HD,<file_name>,<description>,,DIAGSALL;          // SAVE ALL  
DIAGS SWITCHES THAT ARE ON OR OFF  
  
COPY,TAB-HD,<file_name>,<description>,ALLSTD,DIAGSON;
```

- following commands can be used to restore (save to database) the DIAGS switches from specified file:

```
COPY,HD-TAB,<file_name>,NO,LIST;  
COPY,HD-TAB,<file_name>,NO,Y;  
COPY,HD-TAB,<file_name>,ALLSTD,Y;
```

Command DISPLAY,TRCCONF,<directory\_name>; outputs the files created with command "COPY,TAB-HD...".

RES,DIAGS; resets the DIAGS switches to the default values:

for ZAND/ALLDATA/CNTRYCD = 0 (IM) defaults are

CP complex: S15 = ON

CP2 complex: S04 = ON

for ZAND/ALLDATA/CNTRYCD = K (USA) defaults are

CP complex: S15 = ON

CP2 complex: S04 = ON

DB complex: S00,S01 = ON

---

**NOTE:** The user can save existing trace settings and DIAGS switches values into a file on HD and import them afterwards.

---

### Example of saving the DIAGS switches and trace settings into a file:

```
<CHANGE-DIAGS:COMP=DH,S03=ON;
CHANGE-DIAGS:COMP=DH,S03=ON;
H500: AMO DIAGS STARTED
H03: S03 OF COMPLEX DH IN LTG HAS BEEN CHANGED TO 'ON'
AMO-DIAGS-111      ADMINISTRATION OF DIAGNOSTIC SWITCHES,
SWITCHING UNIT
CHANGE COMPLETED;

<exe-tracs:bp;
EXE-TRACS:BP;

TRACER INPUT IN BPA (STANDARD TRACER ) PLEASE:
```

To activate such a trace profile execute the following command:

COPY,HD-TAB,<trace\_name>,ALLSTD,Y;

#### 196.4.2.2 Selection of dynamic memory (SELDYN)

Device memories can be selected either through Lodad-Packed in the selected messages, or through user dependent line address at the trace point call-gate. Be aware that the associated database access functions may adversely affect the dynamic properties of the overall system.

If you want to trace dynamic memories with a message-dependent address (SELDYN,SW/CP/PP/FLAGTR,..), you also have to select the corresponding message itself (SELMSG,SW/CP/PP/FLAGTR,..).

For CP the tracer can only CP-memories and for PP only PP-memories output.

#### 196.4.2.3 FlagTracer (FLAGTR)

With the FlagTracer it is possible to trace a call or a connection in CP and PP. The FlagTracer is switched on as default.

FlagTracer is activated and standard-selections for FlagTracer are set as default.

The FlagTracer Data are written in a separate trace buffer. Each time a FlagTracer buffer is full it is stored into the FlagTracer file (in case of duplex systems there are two FlagTracer files: one for BPA and one for BPB).

There are two possibilities to get the messages:

##### Dynamic flagtrace with digit analysis result (DAR)

A subscriber (all system devices) can activate the flagtrace by dialing a sign. This means that the messages at the tracepoints of SW are caught by the tracer and can then be interpreted.

For dynamic flagtracing it is possible to add a DAR from the HICOM for FlagTracer with AMO WABE.

```
ADD-WABE:xxx,,FLTRACE;
```

If subscriber A calls subscriber B and dials the flagtrace-sign, all messages sent from subscriber A are caught by FlagTracer. The FlagTrace data can be displayed with the display commands (DA, DB, DF, DL, DN or DA-T, DB-T, DF-T, DL-T, DN-T) and type FLAGTR. The value FLAGTR for parameter type in combination with one of this commands means, that all messages of the flagtracepoint are displayed.

Note: If the type is CP, PP, SW or MSG (default value), the messages at the flagtrace point will not be displayed.

**Flagtracing of a static marked device (FLAGTR)**

A device (subscriber or trunk) can be marked with the AMO TRACS. Each connection made from this device (subscriber or trunk) will be checked in the same way, like the subscriber has dialed the flagtrace sign.

Set the traceflag in the static device memory:

```
FLAGTR,ADD,STNO,34567,VCE;
```

The traceflag will be transferred in the dynamic device table by each connection and also to the dynamic device table of all call members. The tracing of the user will be finished with the command

```
FLAGTR,DEL,STNO,34567,VCE;
```

**FlagTracer blocking (FLAGTR)**

The flagtracing of a connection can be activated by the user of a device and need not be started or stopped with ON or OFF.

FlagTrace is active on all systems as default. It is possible to switch off this feature with the AMO TRACS (Setting the FlagTracer blocking).

```
FLAGTR,OFF;
```

To reset the FlagTracer blocking use one of these tracer commands:

```
FLAGTR,ON;  
RES,FLAGTR;
```

The FlagTracer blocking stops writing messages in the FlagTracer buffer, but further the CP-advisory messages will be displayed on the terminal. To avoid displaying CP-advisory messages of subscribers who are marked with a traceflag, you must reset the traceflag:

```
FLAGTR,DEL,STNO,34567,VCE;
```

The activation of FlagTracer by dialing a digit analysis result (DAR) for the HICOM can be deactivated with the AMO-WABE.

```
DEL-WABE:STNO,xxx,,FLTRACE;
```

The FlagTracer blocking is also set by getting a stopall-tracepoint, if FLAGTR, STOPALL was selected.

**Changing the FlagTracer filesize**

The full buffers of Flagtracer are always written into the same file. The filename (:AMD:ACTF/FT/A or B) could not be changed.

```
FLAGTR,FILE,60,":PAS:TEST";
```

60 is the size of file (no. of block), default is 20

Through this command the FlagTracer filesize could be changed.

Additional the FlagTracer file is saved with another filename.

The old FlagTracer file is deleted and a new (empty) FlagTracer file is created.

To save the FlagTracer file without losing the data in the file use the AMO COPY.

#### 196.4.2.4 MSGLEN

The messages which have to be recorded might be very long and most of the times only the first part of it is of interest for the user. Therefore it is useful (especially with high data traffic) to determine a maximum length of the recorded messages with the command MSGLEN in order to prevent a possible loss of data.

This command just makes sense in connection with a SELMSG-input. The default value is 16, which is also used if this command is not executed.

#### Example

```
'SELMSG,OS,G1,ALL;'  
'MSGLEN,OS,G1,20;'
```

the first 20 Bytes of all OS-messages are  
recorded

For AutoTracer the default value is 48 bytes. Another length (e.g. 64 bytes) can be selected with

```
MSGLEN,AUTOTR,G1,64;
```

#### 196.4.2.5 Activation and Deactivation of the StandardTracer (ON, OFF)

If no startcondition has been set, the StandardTracer starts to work immediately after entering the command ON and to write the data into the StandardTrace buffer. Any start, stop, stopall or PETRA condition defined is placed in the waiting state.

While harddisk tracing is activated ("ON,HD,filename,..") every time the tracebuffer is full, the whole content is written into the tracefile. If there is already a tracefile with the same name on HD, it is possible to overwrite this file with OVERWRT: yes (default). If there is no tracefile on hd, the parameter OVERWRT is careless.

Operating mode in principle: As soon as the tracer buffer is full, the HD-writing tracer task store this buffer to the harddisk. While this is in progress tracing will be continued in another trace buffer.

The parameter MAXBLOCK determines the size of the tracefile and therefor also the number of tracebuffers which can be stored in this file (defaultvalue: 10). If WRAP is set to yes, elder data will be overwritten as soon as the file is full. 'WRAP: no' prevents this. The Tracer keeps

on working but the tracebuffer is not copied to the file anymore. The current status of the StandardTrace file can be displayed with "STA,HD;".

The size of a StandardTracer file can be up to 2000 Block (122 MB). If the file size of the tracefile is greater than 99 Block the content of this file can not be displayed with the AMO - TRACS. To display the file content use COOL.

If tracing of the StandardTracer to buffer is activated ("ON,BUF" or just "ON;") elder data will be overwritten in case of a full tracebuffer. In other words the wrapping-function is always activated.

If tracing of the StandardTracer to HD is on ("ON,HD,FILENAME,...") a trace buffer pool may be used for temporary storage of tracebuffer (HD-cache).

The command OFF deactivates the StandardTracer. The start, stop, stopall and PETRA conditions are set to the definition state. When tracing to harddisk was activated also the only partially filled tracebuffer will be, if possible, copied into the trace file.

### 196.4.2.6 Displaying Trace-Data (DISPLAY, DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T)

Data stored in a tracebuffer can be displayed at any time (also while tracing or HD-tracing is on) with the following commands: DF, DL, DA, DB and DN. If data with time stamps will be displayed, the commands DF-T, DL-T, DA-T, DB-T, and DN-T are available.

In order to display data from a tracer file it is necessary to assign the file to the output with **DISPLAY**. The status of the trace file is listed in detail, except the file size of a StandardTracer file is greater than 99 Block. From now the whole trace file is handled with regard to the output commands (DA, DB, DF, DL, DN) like a huge single trace buffer. If "\*" is entered instead of the file name, the last filename of the StandardTracer will be inserted.

The assignment of the file for output is detached through the command **DISPLAY,OFF**.

Output of trace objects

1. from the position of the read pointer, with **DA** (or **DA-T**) (display after read pointer)
2. up to the position of the read pointer, with **DB** (or **DB-T**) (display before read pointer)
3. the first <n> trace objects, with **DF** (or **DF-T**) (display first)
4. the last <n> trace objects, with **DL** (or **DL-T**) (display last)

## TRACS - Operation of the System Tracer (SWU)

### Functions of the AMO

5. from one specific object number to another or the next 10 objects starting with a specific object number, with **DN** (or **DN-T**) (display from number)

After each display command is executed, the read pointer points refers to the trace object following the last displayed trace object. If there are no more trace objects, it stops at the position of the write pointer.

Figure 72

Options for reading out the trace buffer

A post-selection is provided for all the above display commands:

1. If requested, only certain types of trace objects are output. Note that the default value of the parameter TYPE is MSG (that is OS and SW) and not FLAGTR and not AUTOTR and not ALL.
2. In addition, by specifying values for any byte the output of trace objects can be restricted.

3. As an alternative to the specification of values for a single byte directly in the display command, up to 8 selection conditions can be defined (command SELMSG,BUF,..?), which can be applied to the current display command by specifying value SELMSG for parameter TEST. (Since these selection conditions are stored in the AMO data, they are only available until termination of the AMO). With the command copy the selection criterions can be stored in a file.

The post-selection is not put into effect when reading out a I I trace buffer entries (TYPE=ALL).

The parameter LAE determines a maximum output length for all trace objects to be displayed.

For call processing messages the output can be requested with or without state diagram information. Standard is the output without state diagram information.

### **Example**

```
SELMSG,BUF,G1,CD1,SRC,34;
SELMSG,BUF,G1,CD2,DEST,E5;
DN,100-200,10,OS,,,SELMSG;
```

every single object betw. nr. 100 and 200,  
which meets the conditions CD1 and CD2 is  
going to be displayed

### **196.4.2.7 Save the Trace data (COPY)**

The trace data which are actually in the trace buffer could be saved with the command COPY,<TRTYPE>,<FILENAME> in a file.

COPY,FLAGTR,":PDS:TRACER/COPY-FLAGTR"; Copy the data which are actually in the FlagTracer

Buffer in the file :PDS:TRACE:COPY-FLAGTR

### **196.4.2.8 Displaying the Status of a Tracer (STA)**

By executing the command STA it is possible to display the status of a Tracer.

1. Brief status report of the StandardTracer by entering INFO=**S**:
  - a) Maximum number of trace objects to be entered in the buffer
  - b) Number of selected trace objects
  - c) Number of trace objects in the buffer
  - d) Indication if the tracer is activated

## TRACS - Operation of the System Tracer (SWU)

### Functions of the AMO

- e) Status of start and stop conditions
- 2. Medium-size status report of the StandardTracer by entering INFO=**M**:
  - a) Brief status report
  - b) Indication if the tracer has restart stability
  - c) Status of stopall and PETRA
  - d) StandardTracer file
  - e) Common information (user information, indication of the serialization mechanism which has been selected, number and size of buffers of resident tracer, number and size of buffers of trace buffer pool, information about Read Buffer and Read File).
- 3. Long status report of the StandardTracer by entering INFO=**L** or INFO=**STDTR**:
  - a) brief status report
  - b) Indication if the tracer has restart stability
  - c) Status of stopall and PETRA
  - d) Status report for the selection data
  - e) Standard tracer file (its name and status)
  - f) Common Information (user information, indication of the serialization mechanism which has been selected, number and size of buffers of resident tracer for each tracer type, number and size of buffers of trace buffer pool for each tracer type, information about Read Buffer and Read File (name and status)).
- 4. Status report for selection data of the StandardTracer by entering INFO=**C**:
  - a) All set groups and set selection conditions for messages and LAN objects
  - b) All conditional conditions for the message dependent manipulation of the selection conditions during tracing
  - c) All dynamic memories for a call processing trace point
  - d) Markings for flagtrace
  - e) Condition bits for post-selection (if set)
  - f) Start, stop, stopall and PETRA conditions (if set)
  - g) Gate specifications and all dynamic memories requested therein

- h) Selections for a netwide trace stop
- 5. Status report for the trace file of the StandardTracer by entering **INFO=HD:**
  - a) Brief status report
  - b) Trace file and its status
  - c) Brief info about the content of the trace file (the detailed summary can be displayed by the command **DISPLAY**)
- 6. Status report of the FlagTracer **INFO=FLAGTR:**
  - a) Number of selected trace objects of the FlagTracer
  - b) Number of trace objects in the buffer of the FlagTracer
  - c) Indication if the FlagTracer is activated
  - d) Status report for the selection data of the FlagTracer
  - e) FlagTrace marker
  - f) FlagTracer file (name and status)
  - g) Common information (like **INFO=L**)
- 7. Status report of the AutoTracer **INFO=AUTOTR:**
  - a) Number of selected trace objects of the AutoTracer
  - b) Number of trace objects in the buffer of the AutoTracer
  - c) Indication if the AutoTracer is activated
  - d) Status report for the selection data of the AutoTracer
  - e) AutoTracer file
  - f) Common information (like **INFO=L**)
- 8. Status report for RDSTracer **INFO=RDSTR.**
- 9. Status report for all tracer **INFO=ALL:**  
long information about all tracer type

**Note**

When selection conditions are displayed a selection based on bytes 0 and 1 of the state diagram number is symbolized by byte positions 65000 and 65001 in the message.

#### 196.4.2.9 Resetting with RES

RES enables the user to put the settings to the default values again and to clear the trace buffer and trace buffer pool:

1. Release StandardTracer buffer, switch the StandardTracer off and reset selection tables
2. Release FlagTracer buffer, switch FlagTracer on and set selection table to default
3. Release the trace buffer pool
4. Reset selection table of AutoTracer to default and switch the AutoTracer on
5. Reset selection table and buffer of RDSTR, switch the RDSTR off.

#### 196.4.2.10 AutoTracer (AUTOTR)

An automatic Tracer function (AutoTracer) is implemented in SWU-Tracer. If the AutoTracer is not deactivated by the user it starts automatically after every restart and the AutoTracer **buffers (up to 7 buffers if there is no other trace active and at least 2 buffers if other trace is active) are written to the AutoTrace file.** The AutoTracer message selection can be displayed using `STA,AUTOTR;`. Below you can find the default settings (which are set after every reload or if the selections are reset):

CONDITIONS GROUPS FOR CP/PP MESSAGES :

CONDITIONGROUP 1 ( MAX. MESSAGE LENGTH = 280 BYTES ) : /\*  
Standard PP networking

CONDITION 1: BYTE 4 = 74 97 BA

CONDITION 2: BYTE 15 = 8

CONDITION 3: BYTE 0 = 6F 71

CONDITIONGROUP 2 ( MAX. MESSAGE LENGTH = 500 BYTES ) : /\*  
UMI Connect & Disconnect Req

CONDITION 1: BYTE 4 = EF

CONDITION 2: BYTE 5 = 0 8

CONDITION 3: BYTE 0 = 6C

CONDITIONGROUP 3 ( MAX. MESSAGE LENGTH = 48 BYTES ) : /\* All other  
SW messages

ALL MESSAGES ARE ENTERED INTO THE TRACE BUFFER

CONDITIONS GROUPS FOR RCV MESSAGES :

```

CONDITIONGROUP 5 ( MAX. MESSAGE LENGTH = 16 BYTES ) :      /*
External messages received by FA
CONDITION 1: BYTE      0  = 40
CONDITION 2: BYTE      1  /= 40
    
```

The default message selection from AutoTracer can be changed by the usual `SELMSG, AUTOTR;` command. The current group selections are:

- Group 1 to 4 select record-type SW (CP and PP);
- Group 5 and 6 select record-type RCV.

---

**IMPORTANT:** It is not recommended to change the default AUTOTR trace message selection!

---

Please refer to command `RES, AUTOTR;` for resetting the **AutoTracer selection settings**.

In case of a standard trace buffer (`ON, BUF;`) the used buffers (by standard trace) are kept for two hours after the "OFF" command and afterwards those buffers are released to be available for AutoTracer again. In case of standard trace to HD the buffers are immediately released after "OFF" command, so they can be available for AutoTracer.

### Activation and Deactivation of AutoTracer

With the commands

```
AUTOTR, ON;
```

and

```
AUTOTR, OFF;
```

it is possible to switch on and off the AutoTracer by the user.

Note: at a reload the AutoTracer is switched on automatically.

### Changing the AutoTracer file size

After a restart the buffer of AutoTracer is always written into the same file. The filename (`:AMD:ACTF/AT/A` or `B`) could not be changed.

```
AUTOTR, FILE, 60, ":PAS:TEST";
```

60 is the size of file (no. of block), default is 20

Through this command the AutoTracer file size could be changed. Additional the AutoTracer file is saved with another filename. The old AutoTracer file is deleted and a new (empty) AutoTracer file is created.

To save the AutoTracer file without losing the data in the file use the AMO COPY.

#### 196.4.2.11 Megatrace

The feature **Megatrace** offers the possibility to save trace data in multiple files (up to 100).

##### Service Information

- The feature is activated if AMO TRACS parameter **MAXBLKFL** in the branch **CMD=ON, STYPE=HD** contains two values connected by "-".
- The file names are constructed by parameter **FILE** plus a number starting with 00 up to 99 (e.g.: :DIAG:TRACE00, :DIAG:TRACE01, etc.).
- The other parameters of the branch **CMD=ON, STYPE=HD** work as usual; e.g. in case of **WRAP=Y** trace data saving continues after the last specified file again with the first file.

**Note:** As soon as some files are full, copy them to an external server. If later these files will be overwritten by wrapping the data are already saved. Therefore you have a real endless trace protocol, limited only by capacity of your external server.

- In case of too less space on the hard disk, trace files are reduced automatically according to the existing rules (occupy half of the available space) respectively, if there is no space anymore, the number of files is reduced.

**Note:** Calculate maximum number of blocks per file according to available space divided by the number of specified files (e.g. 100).

- Outputs of **STA,L DISPLAY,\*** etc. are adapted to the extended trace file environment.
- If you don't specify in **MAXBLKFL** the second value, only one trace file will be generated with the specified size.

##### Generation (Example)

```
INPUT-TRACS:CMD=ON,STYPE=HD,FILE="DIAG:TRACE",MAXBLKFL=200-50;
```

This command starts saving trace data into file **:DIAG:TRACE00**. As soon as this file is full with 200 blocks saving data continues using **:DIAG:TRACE01** and so on up to **:DIAG:TRACE49**.

**Important:** Traces should be **always** activated to diag area of the hard disk. Always verify whether disk space is sufficient with **DIS-DDSM:A1,HD,1**; before activation and rectify as necessary.

Input:

```
*STA,L;
```

Output:

#### TRACE FILE SIZE CALCULATION:

Traces files should be made to the :DIAG: partition only. A block is about 62.5K (62,500) bytes. For a 200 block file, it will be  $200 \times 62,500 = 12.5 \text{ MB}$  (12,500,000).

You should never use all of the free blocks, so it is recommend to calculate trace file size based on a maximum of 580 MB free space, even though the partition size is actually 616 MB from V6 (this allows space for the other functions that use it e.g. Standard Trace files and RMX Hotfix activation, backup of previous AMOs to the RV directory).

As an example (using 580 MB as a guideline), 580 MB divided by 12.5 MB would allow just over 46 files 200 with blocks ( $580/12.5=46.4$ ).

## 196.5 Technical Clarification

The following standard trace points and their corresponding trace object types are defined for **message tracing**:

- a) OS calls ON\_P\_SEND\_MESSAGE\_I, ON\_P\_SEND\_MESSAGE\_N, ON\_P\_SEND\_MESSAGE\_P, ON\_P\_SEND\_MSG\_I\_NO\_FREE, ON\_P\_SEND\_MSG\_N\_NO\_FREE, ON\_P\_SEND\_MSG\_P\_NO\_FREE with object type SD
- b) OS calls ON\_P\_RECEIVE\_MESSAGE and ON\_P\_ACCEPT\_MESSAGE, with object type RCV

- c) LAN trace point in the trace interface procedure in LAN subsystem. This LAN trace interface procedure is called by the various LAN layers with corresponding object types: ETHRV, ETHSD, TCP, TPI, IPDSD, IPDRV
- d) CP trace point in the trace interface procedure in call processing, with object type CP (used in StandardTracer and AutoTracer)
- e) PP trace point in the trace interface procedure in peripheral processing, with object type PP (used in StandardTracer and AutoTracer)
- f) FLAGTR-tracepoint in trace interface procedure of CP and PP
- g) Monitorpoints for the Realtime Diagnostic System (RDS) in CP and PP

### Note

Since the call processing complexes DH (device handler) and PP (peripheral processor) are produced as a single memory-resident subsystem, only the PP has a trace point. This point is used to trace both the DH messages and the PP messages. It is possible to limit the trace objects to either DH messages or PP messages by defining selection criteria before the trace run.

The user may select any of the **CALL gates** of the GDT as trace point CALL-GATE by specifying the SELECTOR. Memory selections can be defined and activated for up to 8 gates. Prior to definition, the tracer simply checks to make sure that the selector belongs to a call gate. Before using this function, the user should therefore consider whether specification of the desired selector might affect the dynamic properties of the overall system.

Special care should be taken when using OS or DB call gates since some of them are also used by the tracer to enter the dynamic memories in the trace buffer (e.g. ON\_P\_RECEIVE\_UNITS, ON\_P\_SEND\_UNITS); such a case would result in a deadlock in the processor.

For call processing trace points and for the trace point 'Call Gate', the contents of the following memories can be entered in the trace buffer:

1. CPB : Element of DB\_D\_CPB\_TBL for the associated CPB index.  
(if != 0) and, if necessary, CPB extension (object type CB)
2. DCLD : 1st line: Element of DB\_D\_CP\_DEV\_STATE, DB\_D\_CP\_DEV\_STATUS  
and DB\_D\_QC\_DEV\_STATUS (object type CT)  
2nd line: Element of DB\_D\_CP\_DEV\_TYP (CPDT) and  
DB\_D\_CP\_LOGICAL\_DEV\_TBL (object type CT)  
In addition, one element of the following is taken  
depending on the device type:  
DB\_D\_CP\_DD\_EXT\_G\_ATND (object type DCDEGA)  
DB\_D\_CP\_DEV\_TBL\_EXT\_ATND (object type DCDTEA)  
DB\_D\_TM\_M\_ATND\_TIME\_I\_SERV (object type DCTMATIS)

## TRACS - Operation of the System Tracer (SWU)

### Technical Clarification

DB\_D\_CP\_DEV\_TBL\_TRUNK (object type DCDTT)

3. DCLT : One Element of the following is taken depending on the line type:  
DB\_D\_TLN\_DATA\_TBL (subscriber table, object type DCST)  
DB\_D\_TRUNK\_DATA\_TBL (trunk table, object type DCTT)
4. CPCRF : Element of DB\_D\_CP\_NW\_CR\_TBL (object type CPCRF)
5. DDHD : Element of DB\_D\_DH\_DEV\_TBL (object type DT)
6. DHCRF : Element of DB\_D\_DH\_NW\_CR\_TBL (object type DHCRF)

If an error is detected during tracing, the tracer enters in the trace buffer a data record with an **error indication**. The user may encounter this procedure if he selects a dynamic memory in a processor in which this dynamic memory is not located (e.g. SELDYN, CP, ALL as a command in the BPA for Hicom 3000; DB\_D\_DH\_DEV\_TBL is in the LTG). In the case of the display commands with TYPE=ALL these error indications are visible; they are indicated by the fact that "ER" is specified as the object type, and a 4 digit hexadecimal number is specified as the code (in this specific case the code "070A" indicating error type "No table" for object type "DT").

This hexadecimal number consists of 2 bytes:

- **first Byte** indicates the **type of Error**

- **first hexadecimal digit** indicates **Group of conditions**, which is affected

| 1st digit of 1st byte | meaning          |
|-----------------------|------------------|
| 0                     | insignificant    |
| 1                     | Error in Group 1 |
| 2                     | Error in Group 2 |
| 3                     | Error in Group 3 |
| 4                     | Error in Group 4 |

- **second hexadecimal digit** is an **Error code**

| 2nd digit of 1st byte | meaning                               | comment                                                                                                                                                                                                                    |
|-----------------------|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1                     | nr. of comparison positions incorrect | the tracer administration variables have been destroyed                                                                                                                                                                    |
| 2                     | Index for extended CPB incorrect      | it was not possible to read the extended CPB with the established extended index because the index limits were found to show implausibilities during database access                                                       |
| 3                     | Index for the table incorrect         | this occurs if the Lodad-Packed in the message results in Loden = 0 or DTI = 0 or if there is a conflict between the Loden or DTI obtained from the Lodad-Packed and the corresponding memory index limits in the database |

| 2nd digit of 1st byte | meaning                              | comment                                                                                                                                                                                                                                                                                             |
|-----------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4                     | Lodad-Packed incorrect               | it is not possible to derive the loden from the Lodad-Packed contained in a call processing message; An example for this is the tracing at trace point PP for S0 bus messages. TSI = 0 is applicable in the DH, in the CP it would result in Loden = NULL. The same applies to the trace point GATE |
| 5                     | Message length incorrect             | an inadmissible message token was transferred to the tracer                                                                                                                                                                                                                                         |
| 6                     | Offset incorrect for token           | an inadmissible message token was transferred to the tracer                                                                                                                                                                                                                                         |
| 7                     | No table                             | the relevant database table is not present in the processor in which the tracer is running                                                                                                                                                                                                          |
| 8                     | Trace point inadmissible             | the tracing routine was branched to from a point which does not coincide with the scheduled trace points                                                                                                                                                                                            |
| 9                     | Gate not assigned as trace point     | the CALL gate tracing routine was activated from a code point that does not coincide with the assigned administration data                                                                                                                                                                          |
| A                     | Number of condition groups incorrect | the tracer's administration data has been (number of condition groups implausible) destroyed                                                                                                                                                                                                        |

• **second Byte** indicates involved **Object type**

| errorcode 2nd byte | object type | comment                                                                                                                                           |
|--------------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 00                 | SD          | an attempt was made to trace the message contents for a SEND_MESSAGE call                                                                         |
| 01                 | RCV         | an attempt was made to trace the message contents for a RECEIVE_MESSAGE call                                                                      |
| 02                 | PT          | an attempt was made to trace the message contents at the logical PETRA tracepoint                                                                 |
| 03                 | CP          | an attempt was made to trace the message contents at the CP trace point                                                                           |
| 04                 | PP          | an attempt was made to trace the message contents at the PP trace point                                                                           |
| 07                 | TIME        | an attempt was made to trace time information                                                                                                     |
| 08                 | CB          | an attempt was made to trace the contents of an element of DB_D_CPB_TBL                                                                           |
| 09                 | CT          | an attempt was made to trace the contents of an element of DB_D_CP_LOGICAL_DEV_TBL or DB_S_CP_DEV_TYPE or DB_D_CP_DEV_STATE or DB_D_CP_DEV_STATUS |
| 0A                 | DT          | an attempt was made to trace the contents of an element of DB_D_DH_DEV_TBL                                                                        |
| 0B                 | DCST        | an attempt was made to trace the contents of an element of the dynamic subscriber table DB_D_TLN_DATA_TBL                                         |

## TRACS - Operation of the System Tracer (SWU)

### The LAN Tracepoints (Application Description)

| errorcode<br>2nd byte | object type          | comment                                                                                                 |

## 196.6 The LAN Tracepoints (Application Description)

In the subsystem LAN there are 4 tracepoints:

- TPI:** This tracepoint makes it possible for the user to protocol and analyze connection specific one ( the relevant) part of the interface between the LAN subsystem and its users (OS,CMS) . The activation of this tracepoint supplies instructive informations for clearing if an error occurs inside or outside of the LAN subsystem.
- TCP:** Via this tracepoint, again connection specifically, the calls to the protocol layer TCP itself and their processing can be watched. This tracepoint will supply necessary advisories for analyzing lost connections or problems concerning the build up of connections, keepalive functions, resource problems and so on.
- ETHSD, ETHRV:** For analyzing protocol data (Ethernet, IP, TCP, ICMP, ARP) the tracepoint ETHSD can be used for outgoing packages and the ETHRV for incoming packages. Both tracepoints provide exactly these (protocol) data, which were sent to or received from LAN. The Ethernet driver has no memory for connections, therefore the tracepoints are not connection specific. Further the protocolling of user data at this points it does not make sense, because TCP does **NOT** work message oriented.

## 196.6.1 Activating of a LAN Tracepoint

For activating the tracepoints ETHSD and ETHRV the commands

```
selmsg,lan,g1,cd1..;
setlan,g1,ethsd&ethrv;
on;
```

at the HICOM tracer will be sufficient. Additionally for the tracepoints TPI and TCP the connection must be selected, which is to be protocolled. Therefore the user must execute following steps:

**TRACS - Operation of the System Tracer (SWU)**  
The LAN Tracepoints (Application Description)

- 1. Determine the data segment of OLTSTRX
- 2. Start the Debugger
- 3. Display the data segment of OLTSTRX

```
DEBUG INPUT FOR BPA      :
  *`d c318:0(400)!` /* data segment of OLTSTRX */

0614T DISPLAY :DISPLAY EXECUTED
0000
C318:0000 = 53 74 61 72 74 20 6F 66 20 65 43 43 4F 4E 4E 00  Start of eCONN.
C318:0010 = 66 49 50 3A 20 00 00 00 00 66 50 6F 3A 20 00 00  fIP: ....fPo: ..
C318:0020 = 66 49 50 3A 20 00 00 00 00 66 50 6F 3A 20 00 00  fIP: ....fPo: ..
C318:0030 = 66 49 50 3A 20 00 00 00 00 66 50 6F 3A 20 00 00  fIP: ....fPo: ..
C318:0040 = 66 49 50 3A 20 00 00 00 00 66 50 6F 3A 20 00 00  fIP: ....fPo: ..
C318:0050 = 45 6E 64 20 6F 66 20 65 43 43 4F 4E 4E 20 20 00  End of eCONN  .
C318:0060 = 00 00 53 74 61 72 74 20 6F 66 20 53 74 61 62 6C  ..Start of Stabl
C318:0070 = 65 00 02 00 00 00 80 03 00 00 00 00 02 64 00 00  e.....d..
C318:0080 = 01 00 67 00 00 00 82 03 C0 00 02 01 02 64 02 80  ..g.....d..
C318:0090 = 01 00 05 00 00 00 80 03 00 00 00 00 00 66 00 00  .....f..
C318:00A0 = 00 00 0B 00 00 00 82 03 C0 00 02 02 02 64 02 80  .....d..
C318:00B0 = 00 00 08 00 00 00 82 03 C0 00 02 10 00 66 07 DA  .....f..
  .....
  .....
  .....
```

- 4. The trace output shows 4 character strings. "Start of eCONN" and "End of eCONN" are enclosing the table „expected client connections“, "Start of Stable" and "End of Stable " the table „trace sockets“.
- 5. Both tables make it possible for the user to select the connections, which are to be protocolled.

## 196.6.2 Expected Client Connection

|                            |    |    |    |    |    |    |    |    |                    |    |    |    |    |    |    |                  |
|----------------------------|----|----|----|----|----|----|----|----|--------------------|----|----|----|----|----|----|------------------|
| 53                         | 74 | 61 | 72 | 74 | 20 | 6F | 66 | 20 | 65                 | 43 | 43 | 4F | 4E | 4E | 00 | Start of eCONN.  |
| 66                         | 49 | 50 | 3A | 20 | 00 | 00 | 00 | 00 | 66                 | 50 | 6F | 3A | 20 | 00 | 00 | fIP: ....fPo: .. |
| 66                         | 49 | 50 | 3A | 20 | 00 | 00 | 00 | 00 | 66                 | 50 | 6F | 3A | 20 | 00 | 00 | fIP: ....fPo: .. |
| 66                         | 49 | 50 | 3A | 20 | 00 | 00 | 00 | 00 | 66                 | 50 | 6F | 3A | 20 | 00 | 00 | fIP: ....fPo: .. |
| 66                         | 49 | 50 | 3A | 20 | 00 | 00 | 00 | 00 | 66                 | 50 | 6F | 3A | 20 | 00 | 00 | fIP: ....fPo: .. |
| 45                         | 6E | 64 | 20 | 6F | 66 | 20 | 65 | 43 | 43                 | 4F | 4E | 4E | 20 | 20 | 00 | End of eCONN .   |
| IP address of far end port |    |    |    |    |    |    |    |    | far end hostnumber |    |    |    |    |    |    |                  |

Figure 73 OLTSTRX.CC trace\_client\_conn\_tbl

This table enables the user to set the trace-option for connections, which are not yet built up and where the station has the part of the client. Therefore the user enters the IP address of the partner processor and the portnumber of the partner in this table. Byte order: BIG ENDIAN (corresponds Network byte order). If a TCP user tries to establish a client- connection, the TCP is checking this table and if necessary will switch on the trace option for this socket.

### Example

For unknown reasons CCB can not establish a connection to CCB. By entering the IP address (192.0.2.1) and the portnumber (T'612) of the CCA in this table

```
>> 66 49 50 3A 20 C0 00 02 01 66 50 6F 3A 20 02 64 fIP:
....fPo: .d
```

and by switching on the tracepoints TCP and TPI with the HICOM tracer, the tester can watch the TCP during the buildup of the connection.

196.6.3 Trace Socket Table

example of trace socket table in ADP:

|                |    |        |    |               |    |             |    |       |    |        |    |              |    |             |    |                  |
|----------------|----|--------|----|---------------|----|-------------|----|-------|----|--------|----|--------------|----|-------------|----|------------------|
| 53             | 74 | 61     | 72 | 74            | 20 | 6F          | 66 | 20    | 53 | 74     | 61 | 62           | 6C | 65          | 00 | Start of Stable. |
| 02             | 00 | 00     | 00 | 80            | 03 | 00          | 00 | 00    | 00 | 02     | 64 | 00           | 00 | 01          | 00 | .....d....       |
| 67             | 00 | 00     | 00 | 82            | 03 | C0          | 00 | 02    | 01 | 02     | 64 | 02           | 80 | 01          | 00 | g.....d....      |
| 05             | 00 | 00     | 00 | 80            | 03 | 00          | 00 | 00    | 00 | 00     | 66 | 00           | 00 | 00          | 00 | .....f....       |
| 0B             | 00 | 00     | 00 | 82            | 03 | C0          | 00 | 02    | 02 | 02     | 64 | 02           | 80 | 00          | 00 | .....d....       |
| 08             | 00 | 00     | 00 | 82            | 03 | C0          | 00 | 02    | 10 | 00     | 66 | 07           | DA | 00          | 00 | .....f....       |
| .....          |    |        |    |               |    |             |    |       |    |        |    |              |    |             |    |                  |
| socket         |    | socket |    | IP address of |    |             |    | local |    | remote |    | trace_toggle |    |             |    |                  |
| identification |    |        |    | state         |    | remote host |    |       |    | port   |    | port         |    | trace_state |    |                  |
|                |    |        |    | lo hi         |    |             |    |       |    | hi lo  |    | hi lo        |    |             |    |                  |
| .....          |    |        |    |               |    |             |    |       |    |        |    |              |    |             |    |                  |
| 45             | 6E | 64     | 20 | 6F            | 66 | 20          | 53 | 74    | 61 | 62     | 6C | 65           | 20 | 20          | 00 | End of Stable .  |

Figure 74 OLTSTRX.CC trace\_socket\_tbl

The only task of this table is to simplify the selection of TCP sockets/connections for protocolling. Therefore TCP enters every two seconds all valid sockets or connections respectively in the table and shows their state as well as their trace-option. By means of the last column of this table the user can switch over connection specifically the trace option by setting the "trace\_toggle" byte to a value unequal 0. In case of the next update of this table TCP checks the "trace\_toggle" column and switches over the trace option (ON->OFF resp. OFF->ON; ON=01,OFF=00). Then TCP sets the "trace\_toggle" byte again to 00.

Note

If the IP address and the remote port are 0, it is a listener port. If a partner wants a connection to this port, then a copy of the socket is made for the new connection and the listener port remains unchanged. Making the copy also the trace option is taken over, so that the buildup of the connection can also be protocolled at the server.

### Example

The user wants to watch the OS-message transfer between ADP and CCB and has already prepared the HICOM tracer appropriately. For the selection of the connection he has activated the HICOM debugger, has determined the beginning of the trace socket table and displayed the following table.

```
C318:0062 = 53 74 61 72 74 20 6F 66 20 53 74 61 62 6C 65 00 Start of Stable.
C318:0072 = 02 00 00 00 80 03 00 00 00 00 02 64 00 00 01 00 .....d....
C318:0082 = 67 00 00 00 82 03 C0 00 02 01 02 64 02 80 00 00 g.....d....
C318:0092 = 05 00 00 00 80 03 00 00 00 00 00 66 00 00 00 00 .....f....
C318:00A2 = 0B 00 00 00 82 03 C0 00 02 02 02 64 02 80 00 00 .....d....
C318:00B2 = 08 00 00 00 82 03 C0 00 02 10 00 66 07 DA 00 00 .....f....
C318:00C2 = 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 .....
C318:00D2 = 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 .....
.....
.....
```

Using the following "SET" command the trace option for the connection ADP<->CCB is switched on, as it is shown by the following command "DISPLAY".

```
* "set c318:C1(1)=5!"
* "d c318:b2(10)!"
```

```
C318:00B2 = 08 00 00 00 82 03 C0 00 02 10 00 66 07 DA 01 00 .....f....
```

Repeating the above command "SET" the trace option for the connection ADP<->CCB is switched off.

```
* "set c318:C1(1)=5!"
* "d c318:b2(10)!"
```

```
C318:00B2 = 08 00 00 00 82 03 C0 00 02 10 00 66 07 DA 00 00 .....f....
```

## 196.6.4 Format and Interpretation of the Trace Data

Remark: If the specified data doesn't exist, the corresponding component of the trace record is set to 0.

## TRACS - Operation of the System Tracer (SWU)

The LAN Tracepoints (Application Description)

### 196.6.4.1 Tracepoint TPI

| Offset | Data item                      | Size          | Comment                                                                   |

| 02 00          | TA_OUTPUT       | TCP-Flags + length of user data in WORDS | see TA_INPUT                                                                                                                                                                                                                                                                            |
| 03 00          | TA_INPUT        | TCP-Flags + length of user data in WORDS | the TCP-Flags (see <a href="#">Table 37 on page 2618</a> ) of received TCP packet will be saved into the Intel bits 0 - 5 of byte 0 in TCP event, the length of user data -counted in words- will be saved into the bits 6,7 of byte 0 and bits 0 - 7 of byte 1 (most significant byte) |
| 04 00          | TA_DROP         | TCP-Flags + cause for dropping           | analogous to TA_INPUT; the possible values of cause for dropping are listed in <a href="#">Table 34 on page 2616</a>                                                                                                                                                                    |
| 05 00          | TA_DROPAFTERACK | TCP-Flags + cause for dropping           | analogous to TA_INPUT; the possible values of cause for dropping are listed in <a href="#">Table 34 on page 2616</a>                                                                                                                                                                    |
| 06 00          | TA_DROPWITHRST  | TCP-Flags + cause for dropping           | analogous to TA_INPUT; the possible values of cause for dropping are listed in <a href="#">Table 34 on page 2616</a>                                                                                                                                                                    |

Table 33      *trace locations and their possible TCP events*

| Value | Literal        | comment                                              |
|-------|----------------|------------------------------------------------------|
| 1     | TD_NOBUF       | required memory resources not available              |
| 2     | TD_NEWSOFAILED | creation of new socket failed due to no socket space |
| 3     | TD_TCPFLAG     | unexpected flag received                             |

Table 34      *Reasons for dropping a TCP packet and/or connection*

## TRACS - Operation of the System Tracer (SWU)

### The LAN Tracepoints (Application Description)

| Value | Literal       | comment                                        |
|-------|---------------|------------------------------------------------|
| 4     | TD_PCBFAILED  | call of in_pcbconnect failed                   |
| 5     | TD_SEQFAIL    | unexpected sequence number received            |
| 6     | TD_CONNCLOSED | connection already closed                      |
| 7     | TD_WAITFIN    | TCP waits for the FIN of communication partner |

Table 34 Reasons for dropping a TCP packet and/or connection

| Intel-Bit | Value lo, hi | Name               | Comment                           |
|-----------|--------------|--------------------|-----------------------------------|
| 0         | 01 00        | SS_NOFDREF         | no file table ref any more        |
| 1         | 02 00        | SS_ISCONNECTED     | socket connected to a peer        |
| 2         | 04 00        | SS_ISCONNECTING    | in process of connecting to peer  |
| 3         | 08 00        | SS_ISDISCONNECTING | in process of disconnecting       |
| 4         | 10 00        | SS_CANTSENDMORE    | can't send more data to peer      |
| 5         | 20 00        | SS_CANTRCVMORE     | can't receive more data from peer |
| 6         | 40 00        | SS_RCVATMARK       | at mark on input                  |
| 7         | 80 00        | SS_PRIV            | privileged for broadcast          |
| 8         | 00 01        | SS_NBLOCK          | non-blocking ops                  |
| 9         | 00 02        | SS_ASYNC           | async i/o notify                  |
| 10        | 00 04        | SS_ISCONFIRMING    | deciding to accept connection req |

Table 35 Socket state bits

| Value lo, hi | Name              | Comment                                 |
|--------------|-------------------|-----------------------------------------|
| 00 00        | TCPS_CLOSED       | connection closed                       |
| 01 00        | TCPS_LISTEN       | listening for connection                |
| 02 00        | TCPS_SYN_SENT     | active - have sent SYN                  |
| 03 00        | TCPS_SYN_RECEIVED | has send and received SYN               |
| 04 00        | TCPS_ESTABLISHED  | connection established                  |
| 05 00        | TCPS_CLOSE_WAIT   | received FIN - waiting for close        |
| 06 00        | TCPS_FIN_WAIT_1   | has closed - sent FIN                   |
| 07 00        | TCPS_CLOSING      | closed an FIN exchanged - await FIN ACK |
| 08 00        | TCPS_LAST_ACK     | had FIN and close - await FIN ACK       |
| 09 00        | TCPS_FIN_WAIT_2   | has closed - FIN is acked               |
| 0A 00        | TCPS_TIME_WAIT    | quiet wait after close                  |

Table 36 TCP FSM state definitions. Per RFC793, September, 1981.

TRACS - Operation of the System Tracer (SWU)

The LAN Tracepoints (Application Description)

| Bit nr: <sup>1</sup> | Bit 5 (10)                             | Bit 4 (11)                          | Bit 3 (12)    | Bit 2 (13)                   | Bit 1 (14)                                 | Bit 0 (15)                                 |
|----------------------|----------------------------------------|-------------------------------------|---------------|------------------------------|--------------------------------------------|--------------------------------------------|
| Value:               | H'20                                   | H'10                                | H'08          | H'04                         | H'02'                                      | H'01                                       |
| Name:                | URG                                    | ACK                                 | PUSH          | RST                          | SYN                                        | FIN                                        |
| Description:         | "Urgent Pointer"- field is significant | Acknowledgment field is significant | Push Function | Reset (Close) the connection | Synchr. sequence numbers; start connection | No more data from sender; connection close |

Table 37 TCP flags and their meaning  
1 numbering in Intel-format (numbers in brackets correspond to network-numbering)

Figure 75 Trace example for trace point TCP

## 196.6.5 Tracepoint ETHSD, ETHRV

As already noticed at the beginning of Section 196.6 on page 196-2606, the trace points ETHSD and ETHRV have to be used if protocol data is needed. The structure of trace data is the same for the trace points ETHSD and ETHRV. This structure - for TCP communication - is shown and shortly commented in [Figure 77 on page 2620](#). For more details or other protocols, please look up to RFC791(IP), RFC792(ICMP), RFC793(TCP) and RFC826(ARP).

Note: for all protocol data the byte and bit order is BIG ENDIAN which is equal to the "network byte order". (this means: bits and bytes with lower position number have more significance)

|      |     |                           |                        |                                           |                             |

### 196.6.5.2 Tracepoints IPDSD, IPDRV

This are the LAN tracepoints in dual-port-ram for UNIXWARE 7. These are IP-Send and IP-Receive. The two tracepoints are available in mono processor systems.

## 196.7 Examples

Start AMO TRACS (in ADS), control of tracer in BPA

Input:

```
<EXEC-TRACS:BPA;
```

Output:

```
AMO TRACS VARIANT/VERSION L2/001 OF 2001-04-18
TRACER    VARIANT/VERSION L2/007 OF 2001-04-18
TRACER INPUT IN BPA    PLEASE:
```

#### Note

The user input request is followed by an asterisk to indicate that the user may now enter the next command.

## TRACS - Operation of the System Tracer (SWU)

### Examples

#### Example 1: Basic Example (StandardTracer)

The buffer and all the selection tables of the StandardTracer must be reset.

Input:

```
*RES,STDTR;
```

Output:

```
TRACER INPUT IN BPA PLEASE:
```

Only the first 14 bytes of the OS\_SEND and OS\_RECEIVE messages are stored in the memory.

Input:

```
*MSGLEN, OS, G1, 14;
```

Output:

```
TRACER INPUT IN BPA PLEASE:
```

A maximum of 100 objects are entered in the trace buffer of the StandardTracer:

Input:

```
*MAXNO, 100;
```

Output:

```
TRACER INPUT IN BPA PLEASE:
```

Only the messages received by the AMC (task set value = H'33) or by an AMO (task set value = H'34) are to be selected:

Input:

```
*SELMSG, RCV, G1, CD1, DEST, 33&34;
```

Output:

```
TRACER INPUT IN BPA PLEASE:
```

The StandardTracer is activated:

Input:

```
*ON;
```

Output:

```
TRACER INPUT IN BPA PLEASE:
```

Get long information of StandardTracer:

Input:

```
*STA,STDTR;
```

### Output:

```
*****
* STANDARD TRACER
*****
MAX:100      SELOBJ:34      ACTOBJ:34      TRC:ON      STARTCD:D      STOPCD:D
RST:OFF      PETRACD:D      STOPALLCD:D

SELECTIONS AT TRACEPOINT RCV :
CONDITIONGROUP 1 ( MAX. MESSAGE LENGTH = 14 BYTES ) :
CONDITION 1: BYTE      0 = 33 34
*****
* COMMON INFORMATION
*****

BUFFERS OF THE RESIDENT TRACER:  7 BUFFERS AT 64000 BYTE
STDTR:1  FLAGTR:2  AUTOTR:1  RDSTR:0  FREE:3
TRACER INPUT IN BPA  PLEASE:
```

### Deactivation of StandardTracer:

#### Input:

```
*OFF;
```

#### Output:

```
TRACER INPUT IN BPA PLEASE:
```

### Interrogate number of trace objects in StandardTrace buffer:

#### Input:

```
*STA,S;
```

#### Output:

```
*****
* STANDARD TRACER
*****
MAX:100      SELOBJ:91      ACTOBJ:91      TRC:OFF      STARTCD:D      STOPCD:D
TRACER INPUT IN BPA  PLEASE:
```

Output of the first 100 trace objects of the StandardTracer. Since there are only 91 objects in the buffer of the StandardTracer, only 91 objects are output.

### The abbreviations in the header are defined as follows:

```
CURNO      =   Object number
SDNO       =   SD number for CP and DH, or type of task in the
case of PP
TY         =   Type of object
DE         =   Destination task
SC         =   Source task
PR         =   Processor in sequence no.
EV         =   Event code
```

#### Input:

```
*DF-T,100;
```

**TRACS - Operation of the System Tracer (SWU)**

```

**Example 2: Tracing of dynamic memory**

The buffer and all selection tables of the StandardTracer are reset.

Input:

\*RES, ALL;

Output:

```
TRACER INPUT IN BPA PLEASE:
```

By means of the previous RESET, the maximum number of entries was set to 'unlimited'.  
The length of the messages at trace point CP is limited to 50 bytes.

Input:

\*MSGLEN, CP, G2, 50;

Output:

```
TRACER INPUT IN BPA PLEASE:
```

All the messages received in the top task of the call processing in the trace interface are selected.

Input:

```
*SELMSG, CP, G2, ALL;
```

Output:

```
TRACER INPUT IN BPA PLEASE:
```

In addition, the dynamic memories DB\_D\_CPB\_TBL and DB\_D\_CP\_LOGICAL\_DEV\_TBL associated with the message (LODAD\_PACKED) are to be selected.

Input:

```
*SELDYN, CP, G2, CPB & DCLD;
```

Output:

```
TRACER INPUT IN BPA PLEASE:
```

The StandardTracer is activated.

Input:

```

## TRACS - Operation of the System Tracer (SWU)

### Parameter Description

Default Value : 10

#### COND

Used in commands: SELMSG, SELDYN;  
branch parameter, specifies which condition is set.

Type of Input : Single value, optional in SELMSG

: Single value, mandatory in SELDYN

Possible Values : ALL Select all messages (SELMSG only)  
OFF Deactivate message selection for a group  
or deactivate selection at gate trace points  
CD1 1st condition  
CD2 2nd condition  
CD3 3rd condition  
CD4 4th condition  
CD5 5th condition  
CD6 6th condition  
CD7 7th condition  
CD8 8th condition  
CCD1 1st conditional condition (SELMSG only)  
CCD2 2nd conditional condition (SELMSG only)  
CCD3 3rd conditional condition (SELMSG only)  
CCD4 4th conditional condition (SELMSG only)  
CCD5 5th conditional condition (SELMSG only)  
CCD6 6th conditional condition (SELMSG only)  
CCD7 7th conditional condition (SELMSG only)  
CCD8 8th conditional condition (SELMSG only)

Default Value : OFF

#### CONDGRP

Used in commands: MSGLEN, SELDYN, SELMSG, SETLAN;  
specifies group for which conditions are to be set

Type of Input : Single value, optional (SELDYN, SELMSG)

: Single value, mandatory (MSGLEN, SETLAN)

Possible Values : For MSGLEN, SETLAN:

G1 Condition group 1  
G2 Condition group 2  
G3 Condition group 3  
G4 Condition group 4

For SELDYN, SELMSG:

G1 Condition group 1  
G2 Condition group 2

|                 |                                                                                                                                                                                                                                         |                                               |

| Default Value   | : OFF                                                                                                                                                                                                                                   |                                               |
| CPPNT           | Used in command: SELDYN;<br>specifies the trace point at a call processing trace interface or the GATE trace point for<br>which a dynamic memory is to be output (message-dependent address for SW trace points,<br>explicit for GATEs) |                                               |

## TRACS - Operation of the System Tracer (SWU)

### Parameter Description

|                 |                                                        |
|-----------------|--------------------------------------------------------|
| Type of Input   | : Single value, mandatory                              |
| Possible Values | : CP                      call processing              |
|                 | FLAGTR                CP and PP messages with set flag |
|                 | PP                      peripheral processing          |
|                 | SW                     CP and PP                       |
|                 | START                start condition                   |
|                 | GATE                 gate trace point                  |
|                 | AUTOTR              CP and PP of AutoTracer            |

DI                      Used in command: SELDYN, FLAGTR and RDSTR;  
device indicator

|                 |                          |
|-----------------|--------------------------|
| Type of Input   | : Single value, optional |
| Possible Values | : 0 - 255                |

DISPLACE            Used in commands: DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T, SELMSG;  
indicates the displacement of the byte in the trace object which is to be compared  
with the values of parameter VAL

|                 |                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type of Input   | : Single value,<br>mandatory in SELMSG<br>optional in DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T                                                  |
| Possible Values | : For DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T<br>and SELMSG with FLDTYPE = BYTE, PST:<br>0 - 12000<br>For SELMSG with FLDTYPE = SDNO:<br>0 - 1 |

FILE                      Used in command: COPY, DISPLAY, ON, RDSTR;  
defines the file name of a file for storing the trace buffer on hard disk.

|                 |                                                     |
|-----------------|-----------------------------------------------------|
| Type of Input   | : Single value, mandatory                           |
| Possible Values | : valid file name (e.g. ":PAS:TEST" or ":DBD:TEST") |

FLDTYPE                Used in command: SELMSG;  
branch parameter, specifies the field in the trace  
object on the basis of which selection is to be made.

|                 |                                                           |
|-----------------|-----------------------------------------------------------|
| Type of Input   | : Single value, mandatory                                 |
| Possible Values | : BYTE                      next defined byte             |
|                 | DEST                      destination task                |
|                 | EV                         event code                     |
|                 | PST                        powerset resp. mask comparison |

|          |                                                                                           |                           |                                                    |
|----------|-------------------------------------------------------------------------------------------|---------------------------|----------------------------------------------------|
|          |                                                                                           | SRC                       | source task                                        |
|          |                                                                                           | SEVT                      | subevent code                                      |
|          |                                                                                           | SU                        | subunit                                            |
|          |                                                                                           | SDNO                      | status diagram number                              |
| FILETYPE | Used in command: DISPLAY;<br>defined from which tracer type the file is displayed         |                           |                                                    |
|          | Type of Input                                                                             | : Single value, mandatory |                                                    |
|          | Possible Value                                                                            | : STDTR                   | StandardTracer file                                |
|          |                                                                                           | FLAGTR                    | FlagTracer file                                    |
|          |                                                                                           | AUTOTR                    | AutoTracer file                                    |
|          |                                                                                           | RDSTR                     | RDSTracer file                                     |
|          |                                                                                           | OFF                       | Stop read from file                                |
|          |                                                                                           | FILE                      | User defined file name                             |
|          |                                                                                           | *                         | synonym for the file name of StandardTracer        |
| FLAGTR   | Used in command: FLAGTR<br>type of flagtrace selection                                    |                           |                                                    |
|          | Type of Input                                                                             | : Single value, mandatory |                                                    |
|          | Possible Values                                                                           | : ADD                     | add tracing flag for a line or add selection value |

## TRACS - Operation of the System Tracer (SWU)

### Parameter Description

Default Value : S

**LEN**            Used in commands: DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T, MSGLEN;  
For DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T:  
Maximum output length of a trace object in bytes  
For MSGLEN:  
Maximum entry length for a message  
The supplementary data, e.g. SDNO, etc., is not included.  
Type of Input        : Single value, optional  
Possible Values      : 0 - 65535  
                         (may be reduced by the AMO to the maximum value implemented)  
Default Values       : For DA, DB, DF, DL, DN, DA-T, DB-T, DF-T, DL-T, DN-T:  
                         None (full object length is default value)  
                         For MSGLEN:  
                         16

**LN**            Used in command: SELDYN, FLAGTR and RDSTR;  
Specifies the line number  
Type of Input        : Single value, in FLAGTR also range entries, mandatory  
Possible Values      : 1 - 65535

**LOCK**           Used in command: SELMSG;  
Specifies the lock of dynamic manipulations of conditions  
Type of Input        : Single value, optional  
Possible Values      : BLOCK                blocking execution of conditional conditions  
                         UNBLO                unblocking execution of conditional conditions

**LTU**            Used in command: SELDYN, FLAGTR and RDSTR;  
Specifies the LTU number  
Type of Input        : Single value, mandatory  
Possible Values      : 1 - 15 and 17 - 99

**MAXBLOCK**      Used in command: AUTOTR, FLAGTR, RDSTR, ON;  
Specifies the filesize in multiple of trace buffer.  
Type of Input        : Single value, optional  
Possible Values      : For AUTOTR, FLAGTR  
                         10 - 99  
Default Value        : 20  
Possible Values      : For ON

|         |                                                                                                                                                                                                    |                                                                                                        |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
|         |                                                                                                                                                                                                    | 1 - 2000                                                                                               |
|         | Default Value                                                                                                                                                                                      | : 10                                                                                                   |

|          | Possible Values                                                | : BUF                                | Trace buffer of the StandardTracer, i.e. the buffer contents are deleted.                                                                                                                                                                                  |
|          |                                                                | TBL                                  | All selection tables, i.e.:<br>No message is selected.<br>No dynamic memory addressed by a message is selected.<br>No control condition is set.<br>All the length fields are set to 16 bytes.<br>(The condition bits for post-selection remain unchanged). |
|          |                                                                | GATE                                 | Gate trace point.<br>No dynamic memory is selected at gate.                                                                                                                                                                                                |
|          |                                                                | STDTR                                | The trace buffer and all selection tables of the StandardTracer are reset. StandardTracer is switched off.                                                                                                                                                 |
|          |                                                                | ALL                                  | Like STDTR: The trace buffer and all selection tables of StandardTracer are reset.                                                                                                                                                                         |
|          |                                                                | FLAGTR                               | The trace buffers of FlagTracer are reset; Selection table is reset to default. FlagTracer is switched on.                                                                                                                                                 |
|          |                                                                | AUTOTR                               | Selection table of AutoTracer is reseted to default, AutoTracer is switched on.                                                                                                                                                                            |
|          |                                                                | RDSTR                                | The trace buffer and all selection tables of the RDSTracer are reset. RDSTracer is switched off.                                                                                                                                                           |
|          |                                                                | TRPOOL                               | Release the trace buffer pool. The buffers of the resident tracer are not affected.                                                                                                                                                                        |

Default Value : BUF

**SELADR**      Used in command: SELDYN, FLAGTR and RDSTR;  
 Specifies the type of address of dynamic memory at call gate.  
 Type of Input : Single value, mandatory  
 Possible Values : CIR                      Circuit address  
                          LN                      Line address  
                          STNO                      Input of station number (only in FLAGTR)

**SELLINE**      Used in command: NETSTOP;  
 Specifies the selection of the CORNET - Line (switch networking).  
 Type of Input : Single value, mandatory  
 Possible Values : OFF                      delete all NETSTOP conditions  
                          L1                      Line of 1st partner switch  
                          L2                      Line of 2nd partner switch  
                          L3                      Line of 3rd partner switch  
                          L4                      Line of 4th partner switch  
                          L5                      Line of 5th partner switch  
                          L6                      Line of 6th partner switch  
                          L7                      Line of 7th partner switch  
                          L8                      Line of 8th partner switch

**SLOT**            Used in command: SELDYN, FLAGTR and RDSTR;  
 Specifies the slot number  
 Type of Input : Single value, mandatory  
 Possible Values : 1 - 121

A suitable module must be configured for the slot addressed by PEN (AMO BCSU).  
 The possible Slot values depend on the systems architecture and can be found in the BCSU AMO description.

**STNO**            Used in command: FLAGTR, RDSTR  
 specifies the station number  
 Type of Input:            Single value, mandatory  
 Possible values:            Letter A-D, digit, "#" and "\*"

**STYPE**            Used in commands: ON, RST, SELMSG, SELSTOP;  
 specifies how the criterion for restart stability (RST)  
 and/or the serialization mechanism is to be set (SELSTOP)  
 and/or what action is to execute (SELMSG)

## TRACS - Operation of the System Tracer (SWU)

### Parameter Description

and/or if the trace result is also to store on harddisk (ON)

|                 |                                                                                   |                                                   |
|-----------------|-----------------------------------------------------------------------------------|---------------------------------------------------|
| Type of Input   | : Single value, optional in ON<br>Single value, mandatory in RST, SELMSG, SELSTOP |                                                   |
| Possible Values | : For ON:                                                                         |                                                   |
|                 | BUF                                                                               | Tracing only in trace buffer (Default Value)      |
|                 | HD                                                                                | the full trace buffer is to store in a file on HD |
|                 | For RST:                                                                          |                                                   |
|                 | OFF                                                                               | Tracer is not to have restart stability           |
|                 | ON                                                                                | Tracer is to have restart stability               |
|                 | For SELMSG:                                                                       |                                                   |
|                 | ADD                                                                               | adding of a selection value                       |
|                 | DEL                                                                               | deleting of selection values of a condition       |
|                 | SET                                                                               | setting of a selection value                      |
|                 | SUB                                                                               | deleting of a selection value                     |
|                 | For SELSTOP:                                                                      |                                                   |
|                 | OS                                                                                | Serialization with OS resources                   |
|                 | LOCK                                                                              | Serialization with interrupt disable              |

SU            Used in command: SELDYN, FLAGTR, RDSTR;  
specifies the sub-unit

|                 |                          |  |
|-----------------|--------------------------|--|
| Type of Input   | : Single value, optional |  |
| Possible Values | : 0 - 16                 |  |
| Default Value   | : 0                      |  |

SVC            Used in command        FLAGTR, RDSTR;  
specifies the service identifier (SerViCe)

|                 |                         |           |
|-----------------|-------------------------|-----------|
| Type of Input:  | Single Value, mandatory |           |
| Possible Values | : VTX                   | videotext |
|                 | DTE                     | data      |
|                 | FAX                     | fax       |
|                 | TTX                     | teletext  |
|                 | VCE                     | voice     |

TARGETCD    Used in commands: SELMSG;  
indicates weather dynamic condition is to be set

|                 |                          |                  |
|-----------------|--------------------------|------------------|
| Type of Input   | : Single value, optional |                  |
| Possible Values | : CD1                    | first condition  |
|                 | CD2                      | second condition |
|                 | CD3                      | third condition  |

|                 |                                                                                                                     |                                              |
|-----------------|---------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
|                 | CD4                                                                                                                 | fourth condition                             |
|                 | CD5                                                                                                                 | fifth condition                              |
|                 | CD6                                                                                                                 | sixth condition                              |
|                 | CD7                                                                                                                 | seventh condition                            |
|                 | CD8                                                                                                                 | eighth condition                             |
| Default Value   | : Value of the parameter COND                                                                                       |                                              |
| TARGETGRP       | Used in commands: SELMSG;<br>indicates for what group a dynamic condition is to be set                              |                                              |
| Type of Input   | : Single value, optional                                                                                            |                                              |
| Possible Values | G1                                                                                                                  | condition group 1                            |
|                 | G2                                                                                                                  | condition group 2                            |
|                 | G3                                                                                                                  | condition group 3                            |
|                 | G4                                                                                                                  | condition group 4                            |
| Default Value   | : Value of the parameter CONDGRP                                                                                    |                                              |
| TARGETPO        | Used in commands: SELMSG;<br>indicates the byte position in the target message (for setting conditional conditions) |                                              |
| Type of Input   | : Single value, mandatory                                                                                           |                                              |
| Possible Values | : 0 - 12000                                                                                                         |                                              |
| TARGETTP        | Used in commands: SELMSG;<br>indicates the target trace point for conditionals conditions                           |                                              |
| Type of Input   | : Single value, optional                                                                                            |                                              |
| Possible Values | AUTOTR                                                                                                              | automatic restart tracer                     |
|                 | CP                                                                                                                  | call processing in switching software module |

### Error Messages and Advisories

## 197 TREF - T-Reference point matrix

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

'T-Reference point' indicates a defined interface between a PABX and the public ISDN-Network, where a specified attenuation level has to be reached. For stable voice quality not depending on connection type and network size, these T-Reference point conditions are not only for digital interfaces but for analog interfaces, too. The attenuation values used for reaching the levels are stored, country specific, on HD in the TREF-TAB file. They will be loaded into the Database by means of AMO TREF. The values stored in Database can be changed by means of AMO TREF.

'T-Reference point' can only be used for compact PABX, where only LTUCE/SCC are assigned and no LTUC.

There is TRTON-TAB file on HD which has country specific db attenuation values corresponding to the matrix of devices versus tone groups . This table is also loaded by means of AMO TREF.

For all countries except USA (CC=K) all tones (see SIU in ZAND and UCSU) are assigned to TONGRP1.

In USA (CC=K) the following assignment is valid:

|    |                             |                        |         |

### 197.3.1 ACTIVATE-TREF

By means of ACTIVATE, country specific TREF and TONE matrixes will be loaded from HD into the Database. If no TREF matrix is available for the entered country code, the error message F04 will be displayed. If no TONE matrix can not be loaded from HD, the error message F01 is displayed.

The system, for which T-Reference will be activated, has to be a compact HW and no LTUC boards have to be assigned. If not, error message F03 will be displayed.

#### Procedure Overview

| Command Code  | Parameter        |
|---------------|------------------|
| ACTIVATE-TREF | TREFCCD=<param>; |

#### Example

1. Activate T-Reference point matrix for Germany:

Input:

```
ACTIVATE-TREF:0;
```

### 197.3.2 DEACTIVATE-TREF

When deactivating T-Reference point, all attenuation values set on LTUCE/SCC will be reset to 0dB. If T-Reference point was already deactivated, the error message F05 will be displayed.

#### Procedure Overview

| Command Code    | Parameter |
|-----------------|-----------|
| DEACTIVATE-TREF | ;         |

#### Example

1. Deactivate T-Reference point matrix

Input:

```
DEACT-TREF;
```

197.3.3 CHANGE-TREF

CHANGE is only possible, if a matrix has been loaded into the database before, by means of ACTIVATE. If not, the error message F02 will be displayed.

Procedure Overview

| Command Code | Parameter                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-TREF  | [TYPE=TREFTAB, ORIGINAT=<param>, DESTINAT=<param>, TREFVAL=<param>];<br><br>OR<br><br>[TYPE=TONETAB, TONEGRP=<param>, DESTINAT<param>, TONEVAL=<param>]; |

Example

1. Change attenuation value for the connection ANATE to SET600 in the T-Reference point matrix to 0dB

Input:

CHANGE-TREF:TREFTAB,ANATE,SET600,0DB;

197.3.4 DISPLAY-TREF

DISPLAY is only possible, if a matrix has been loaded into the database before, by means of ACTIVATE. If not, the message H01 will be displayed.

Procedure Overview

| Command Code | Parameter                                                                           |
|--------------|-------------------------------------------------------------------------------------|
| DISPLAY-TREF | [TYPE=TREFTAB, ORIGINAT=<param>];<br><br>OR<br><br>[TYPE=TONETAB, TONEGRP=<param>]; |

Examples

1. Display T-Reference point matrix for ANATE

Input:

DISPLAY-TREF:ANATE;

Output:

T-REFERENCE POINT MATRIX

=====

```

COUNTRY CODE: 0
ORIGINATOR: ANATE
DESTINATION ATTENUATION
-----
UNDEFDEV      0DB
ANATE         8DB
SET600        8DB
OPTISET       0DB
DMAU          0DB
TMACO         1DB
TMDCO         4DB
TMA2WINT      2DB
TMA2WEXT      1DB
TMATIE4W      4DB
TMDTIE        4DB
TMDIUCAS      0DB

```

### 197.3.5 REGENERATE-TREF

If T-Reference point is activated, the ACTIVATE command will be regenerated. After comparing the T-Reference point and Tone table matrix stored in Database with the one on HD, all differences will be regenerated as CHANGE commands.

#### Procedure Overview

| Command Code    | Parameter |
|-----------------|-----------|
| REGENERATE-TREF | ;         |

#### Example

1. Regenerate T-Reference point matrix

Input:

```
REG-TREF;;
```

Output:

```

ACTIVATE-TREF:0;
CHANGE-TREF:TREFTAB,ANATE,SET600,0DB;
CHANGE-TREF:TONETAB,TONGRP1,SET600,0DB;

```

## 198 TSCSU - Configuration of Special Circuits in the SWU

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The AMO TSCSU is used to assign trunks to the TCOMs (trunk circuit outgoing multi-purpose) lines. The AMO allows the operator to activate trunks in conjunction with the action ADD-TSCSU only. Trunks already configured are activated or deactivated using the AMO DSSU.

Trunks can be added to trunk groups, provided that the new trunks have identical parameter specifications, with the exception of the parameters CCT (trunk circuit number) and INS (activate trunk circuit), as the trunks already in the group. It is possible to assign up to 2000 trunks to one trunk group (see AMO BUEND, parameter NO).

| DEV= | DH device type | CP device type | Board | Service | Operating mode |
|------|----------------|----------------|-------|---------|----------------|
| DICT | APSE_DE        | APSE_DE        | TMOM2 | VOICE   | PSE_3ADR       |
| CC   | APSE_PSE       | APSE_PSE       | TMOM2 | VOICE   | PSE_2ADR       |
| CCM  | APSE_PSM       | APSE_PSM       | TMOM2 | VOICE   | PSE_2ADR       |
| ANS  | APSE_ANSE_M    | APSE_ANSE_M    | TMOM2 | VOICE   | ANSE           |

Table 38 Device types of AMO TSCSU

In conjunction with TCOM's, the class of parameters (COP) have the following meaning:

|      |                                                                                                                                                                      |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CCR  | for CCMs which are to be released after each individual job.                                                                                                         |
| CCM  | for CCs with 'Meet Me' operation (i.e. all CCs which a voice connection directly is possible via the search frame)                                                   |
| CCTN | for CCs and for some CCMs, an audible tone must be awaited after the A-block has been sent                                                                           |
| SACK | set for all devices for which seize acknowledgements are sent during preprocessing                                                                                   |
| RBLK | set for CCs and CCMs which can transmit remote blocking signals as criteria (short pulses in specific intervals on an otherwise open line)(see also parameter SUPV). |

## TSCSU - Configuration of Special Circuits in the SWU

### Interrelationships

|      |                                                                                                                    |
|------|--------------------------------------------------------------------------------------------------------------------|
| LSUP | if this parameter value is not declared, trunk alarm signaling is suppressed (exception: ANS if time is exceeded). |
|      | After the timeout specified in the parameter SUPV, the TCOM returns to idle state.                                 |
| SDL  | set for CCs and CCMs if it is necessary to wait for an audible signal before dialing.                              |
| EOD  | set for CCM with absence/paging signaling (ESPA signaling, switching of + or - on the line)                        |
| DTMF | set for CC and CCM in case of DTMF signaling; if DEV=DICT, DTMF tones are always signaled directly.                |

## 198.1 Interrelationships

The AMO TSCSU is dependent on data administrated by other AMOs.

- AMO BCSU : Board configuration, switching unit  
The AMO BCSU configures modules for trunks
- AMO BUEND : Trunk group access code  
The AMO BUEND prepares empty trunk groups and administers their memory sizes.
- AMO COP : Class of parameter for device handler  
The AMO COP is used to enter line parameters which can be assigned to trunks using the parameter COPNO.
- AMO COT : Class of trunk for call processing  
The AMO COT is used to enter line parameters which can be assigned to trunks using the parameter COTNO.
- AMO CTIME : Customer-specific timers, switching unit  
Timers assigned by the AMO CTIME are assigned with the parameters WAITT, DELANS and WAIT
- AMO DTIM1 : Device handler timers  
Timers set by the AMO DTIM1 are assigned using the parameters SUPV, STADIAL, EOD and TBT.
- AMO DTIM2 : Device handler timers  
Timers set by the AMO DTIM2 are assigned using the parameter STADIAL.
- AMO RICHT : Routing  
The AMO RICHT is used to assign an route access code to trunk groups for outgoing/incoming traffic
- AMO SYNCA : Synchronized, customer specific announcement  
The AMO SYNCA is used to assign the announcement type which must be allocated to a RAS device by parameter ANNTYPE

- AMO VADSU : Administration of NMC alarms in the SWU  
The AMO VADSU is used to assign alarms, which can be assigned to trunks (see parameter ALARMNO)

Interrelationships to parameters from other AMOs

Interrelationships of COTs to the COPs:

ANS (answer form the line) may only be set if the parameter ANS (line with answer) is set in the COP.

## 198.2 Functions of the AMO

- [ADD-TSCSU](#) : Create special trunk circuits
- [CHANGE-TSCSU](#) : Change data of special trunk circuits
- [DELETE-TSCSU](#) : Delete special trunk circuits
- [DISPLAY-TSCSU](#) : Interrogate special trunk circuits
- [REGENERATE-TSCSU](#) : Regenerate special trunk circuits

### 198.2.1 ADD-TSCSU

The ADD action can be used to assign up to 30 trunks in a single session (parameter NO), provided that the trunks get identical parameter specifications.

The parameter PEN describes the physical port address (port equipment number) of the trunk. The remaining parameters describe the desired configuration of the trunk.

The signaling method used by the CCM is determined by the parameter COP (Class Of Parameter).

The following correlations exist between the parameters PEN and NO in the ADD command of the AMO TSCSU:

- If both PEN and NO are not declared, the AMO searches for an available port which suits the remaining parameters declared by the operator. If a port is available, a trunk is configured at that port and the port equipment number is displayed on the operator's screen.
- Parameter PEN specified but not parameter NO:  
The AMO verifies that the specified port is compatible with the values declared for the remaining parameters. If this is the case, a trunk is configured at that port, and the port equipment number is displayed.

## TSCSU - Configuration of Special Circuits in the SWU

### Functions of the AMO

- Parameter PEN not specified, parameter NO specified:  
The AMO searches for as many suitable available ports as the number of trunks specified in NO requires, and allocates a trunk to each port. All the port equipment numbers which the AMO has assigned are then displayed.
- Parameter PEN specified, parameter NO specified:  
The AMO operates as above. However, the AMO will not assign an available port with a lower PEN than that specified in the parameter, i.e. the parameter PEN specifies the first port required and is used as a starting point for the automatic port allocation. This also applies if NO=1 and the trunk cannot be configured at the port declared in PEN, since the AMO initiates a search for a suitable port in this case, too. Thus, if the operator wishes to configure a particular trunk at a particular port (and at no other port), the parameter NO should not be declared.

The number of trunks that can be created is usually only limited by the capacity of the system (memory capacities, module frame capacities). In addition, the following feature-specific restrictions exist:

- RAS (recorded announcement facility, synchronized)  
Max. 64 devices for each system.
- CCM (code calling equipment)  
Max. two devices for each system and one device per trunk group and route access code.
- CC (code calling, single)  
For operating mode 'meet-me' (AMO COP, PAR=CCM) there is only one device per trunk group and route access code admissible. In the other cases it is possible to assign more than one device per trunk group and trunk access code.
- SPKR (loudspeaker)  
An access code is defined for each loudspeaker area with one device, i.e. for one trunk group and route access code, one device of this type is installed. A maximum of 10 devices of this type can be installed per PABX.
- DOOR (door opener)  
One device per trunk group and route access code

With the aid of the parameter 'INS', the operator can choose to activate a trunk immediately after entering the static data.

If a CCM is assigned with operating mode 'meet-me', a routing access code with the DAR CCMANS (see AMO WABE) must be assigned using the AMO RICHT.

If a trunk is assigned to no or to an empty trunk group and the parameter COPNO or COTNO is omitted, recommended values are retrieved from the DB. According to the number of recommended values the AMO reacts as follows:

1. if exactly one value is found, it is assigned automatically:  
H28: <parameter> <value> HAS BEEN ASSIGNED
2. if more than one value is found, the values and their info fields (help information) are listed and the parameter is prompted:

```
F34: PARAMETER HAS TO BE SPECIFIED
RECOMMENDED VALUES : <value> <description>
<description>
<parameter> = <value>
```

3. if no value is found, the parameter is prompted:

```
F34: PARAMETER HAS TO BE SPECIFIED
<parameter> =
```

If the trunk group is not empty, the parameters of the trunk (except the trunk individual values PEN and INS) are set according to the other trunks of the trunk group. If differing values are specified, the command is rejected.

## Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <pre>, [SRCHORD=,NUMBER&gt;], [SRCHATT=&lt;number&gt;]<br/>, [OPTYPE=&lt;param&gt;], [WAIT=&lt;param&gt;], [SRCHANT=&lt;param&gt;]<br/>, [WAITT=&lt;param&gt;], [CDGT=&lt;dd&gt;]<br/>, [CONV=&lt;param&gt;], [MABLK=&lt;number&gt;];<br/><br/> , DEV=DOOR SPKR ANS RA, [COFIDX=&lt;dd&gt;], COPNO=&lt;number&gt;]<br/>, [SUPV=&lt;param&gt;], [ACKT=&lt;param&gt;];<br/><br/> , DEV=RAS, [COFIDX=&lt;dd&gt;], [COPNO=&lt;number&gt;]<br/>, [SUPV=&lt;param&gt;], [ACKT=&lt;param&gt;], ANNTYPE=&lt;number&gt;;</pre> |

#### Example

Create the 1st trunk with the trunk number 722 (Datex-L, bothway) at pen 5-2-013-1 with the parameters: COT 4, trunk group 17, device type TCX21DTE, LCR class of service 1 and bit rate 2400 bps.

#### Input:

```
ADD-TSCSU: PEN=1-2-013-1, COTNO=4, TGRP=17, CCT="722      DB  1",  
          DEV=ANS, COPNO=2;
```

#### Output:

```
H01: TRUNK ASSIGNED AT PEN 01-02-013-01  
H02: TRUNK RELEASED FOR CALL PROCESSING
```

## 198.2.2 CHANGE-TSCSU

All parameters are optional except for PEN and DEV.

If the trunk to be changed is assigned to a trunk group, all the trunks of that trunk group are changed, unless the operator declares a value for the parameter CCT.

When canceling trunks from a trunk group (by specifying TGRP=0), the operator must ensure that those trunk groups allocated to a route access code always contain at least one device entry.

If the operating mode of a CCM is changed to 'meet-me', an access code with the DAR CCMANS (see AMO WABE) must be assigned using the AMO RICHT. Similarly, if the 'meet-me' operating mode for a CCM is cancelled, the routing access code with DAR CCMANS must also be deleted (with the AMO RICHT).

A trunk to be changed does not have to be deactivated.

However, changes of the data described by the parameters COFIDX, WIRES and DTYPE take effect only after these has been loaded at the trunk. The loading can be done by AMO-TSCSU (OFFTYPE=DC or DI) or explicitly by the user.

1. OFFTYPE=NL:  
Advisory H04 reminds the user to force loading.
2. OFFTYPE=DC:  
The trunk is soft locked. If the lock was successful, the trunk data is changed and the trunk is activated again forcing trunk data loading. If the trunk is busy, trunk data is changed but the user has to force loading explicitly (H04).
3. OFFTYPE=DI:  
The trunk is locked, the trunk data is changed and the trunk is activated again forcing trunk data loading.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Example

Change the parameter 'COPNO' for the trunk at port 1-2-013-1.

Input:

CHANGE-TSCSU: PEN=1-2-013-1, COPNO=4;

Output:

H03: TRUNK AT PEN 01-02-013-01 CHANGED

**198.2.3 DELETE-TSCSU**

When deleting trunks from a trunk group, the operator must ensure that those trunk groups allocated a route code always contain at least one device entry.

When deleting a CCM with 'meet-me' operation, the operator must also delete the routing access code with DAR CCMANS using the AMO RICHT.

When OFFTYPE=NL is specified, active trunks are not deleted. When OFFTYPE=DI od DC is specified, trunks are locked implicitly during DELETE-TSCSU. Busy trunks are not deleted when OFFTYPE=DC is specified.

**Procedure Overview**

| Command Code | Parameter                                                             |
|--------------|-----------------------------------------------------------------------|
| DELETE-TSCSU | [ (min 1) PEN=<gg-uu-bbb-ss>, TRGRP=<number>]<br>, [OFFTYPE=<param>]; |

**198.2.4 DISPLAY-TSCSU**

The action DISPLAY-TSCSU performs the following functions:

- Interrogation of the parameters and parameter values of trunks configured with the AMO TSCSU.
- Output of available PENs for which a module has been configured with the AMO BCSU (see parameter description for parameter TYPE, TYPE=CFIG).

All parameters are optional. If no parameter is specified, all trunks configured with the AMO TSCSU with their parameters and parameter values are output. If parameters are specified, output is restricted to certain trunks.  
If the parameter DEV is specified, only data for the desired device type is output.

Partially qualified input may be given for PEN1 and PEN2, i.e. fewer than four parameter components may be input. Here too, the value entered first is always the LTG number, the value entered second is the LTU number, and the value entered third is the slot. This assures that all trunks of the unit in question are addressed, e.g. by entering two values all trunks of an LTU are addressed.

If PEN1 is specified (even if it is only partially qualified), only those trunks and trunk data identified with PEN1 are output. If PEN1 and PEN2 are specified, all trunks are output which are assigned in the range between PEN1 and PEN2. If only PEN2 is specified all trunks up to PEN2 are output. The output trunks are sorted according to DEV.

FORMAT=L (default value) shows trunk data in table form with up to 4 rows of trunks with the same DEV.

FORMAT=M shows trunk group common data (once per trunk group) and trunk individual data PEN, CCT and INS (one line per trunk) sorted by TRGRP.

FORMAT=S shows a short trunk overview with PEN, DEV and CCT.

### Procedure Overview

| Command Code  | Parameter                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-TSCSU | [PEN1=<gg-uu-sss-cc>], [PEN2=<gg-uu-sss-cc>]<br>, [DEV=<param>], [TYPE=<param>], [TRGRP=<number>]<br>, [FORMAT=<param>]; |

### Examples

1. Interrogate all PENS available for DICT devices between PEN1=1-2-001-1 and PEN2=1-2-121-07 for which modules have been assigned by the AMO BCSU.

Input:

```
DISPLAY-TSCSU: PEN1=1-2-001-1, PEN2=1-2-121-07, DEV=DICT, TYPE=CFG;
```

Output:

```
FREE PENS FOR WHICH A MODULE TO DEVICE DICT      HAS BEEN
CONFIGURED:
    1-2- 13- 2      1-2- 13- 3      1-2- 37- 0      1-2- 37- 1
```

2. Interrogate all trunks between PEN1=1-2-001-1 and PEN2=5-4-121-7 assigned by the AMO TSCSU.

Input:

```
DISPLAY-TSCSU: PEN1=1-2, PEN2=1-4;
```

Output:

TSCSU - Configuration of Special Circuits in the SWU

Parameter Description

|         |            |            |            |            |

198.2.5 REGENERATE-TSCSU

Procedure Overview

| Command Code     | Parameter                                                                        |
|------------------|----------------------------------------------------------------------------------|
| REGENERATE-TSCSU | [PEN1=<gg-uu-sss-cc>], [PEN2=<gg-uu-sss-cc>]<br>, [DEV=<param>], [TYPE=<param>]; |

Example

Regenerate all special trunks assigned by the AMO TSCSU between the  
PENs PEN1=1-2-001-0 and PEN2=1-3-121-7.

Input:

REGENERATE-TSCSU:1-2-001-0,1-3-121-7;

Output:

ADD-TSCSU: 1-2- 67- 0,, 5, 0, 0, 9," ", 15,1, Y,  
                  DICT , 0, 7, SUPV1, SZACK1,2;  
ADD-TSCSU: 1-3- 25- 0,, 5, 0, 0, 14," ", 15,1, Y,  
                  CC , 0, 11,2, SUPV1, SZACK1,STADIAL1, Y, 2;  
ADD-TSCSU: 1-2- 73- 1,, 5, 0, 0, 13," ", 15,1, Y,  
                  RA , 10, SUPV5, SZACK1;  
ADD-TSCSU: 1-3- 31- 1,, 5, 0, 0, 17," ", 15,1, Y,  
                  ANS , 0, 13, SUPV1, SZACK1;

198.3 Parameter Description

ABLK                    Specifies whether the CC or CCM send STNO of calling party

Type of Input : Single value, optional  
 Possible Values : Y(ES), N(O)  
 Default Value : N

ACKT Time for arrival of seizure acknowledgement  
 (only relevant for lines with seizure acknowledgement)  
 Type of Input : Single value, optional  
 Possible Values : SZACK1, SZACK2 (see AMO DTIM1)  
 Default Value : SZACK1

ALARMNO Alarm number of directional, logical alarm  
 Type of Input : Single value, optional  
 Possible Values : 0 no ALARMNO associated  
 8-519 existing directional, logical alarm (AMO VADSU)  
 Default Value : 0  
 The alarm number must be assigned by AMO VADSU

ANNTYPE Announcement type  
 Type of Input : Single value, mandatory  
 Possible Values : 1-64 existing announcement type (AMO SYNCA)

CCT Circuit/trunk number  
 Type of Input : Single value, optional  
 Possible Values : String, 1-12 characters  
 Default Value : None  
 The circuit number can be displayed at the attendant terminal (line number interrogation).  
 The following configuration of parameter CCT is recommended for customer service information:

TSCSU - Configuration of Special Circuits in the SWU

Parameter Description

Figure 78                      Format of the Circuit / Trunk Number

If several trunks are added simultaneously (NO > 1), all trunks get the same trunk number. Using the CHANGE action of the AMO, the trunks can then be allocated their own trunk numbers.

**CDGT**                      Code digits for code caller (CCM)  
Type of Input                : 2 combined single values, optional  
Possible Values             : 0-9  
If no code number or '0' is entered, the CCM is created for a search without a code number. The first value that can be entered is the code number for "normal call", the second value is for "urgent call".

**COFIDX**                   Index of SICOFI data file to be loaded  
Type of Input                : Single value, optional  
Possible Values             : 0-7  
Default Value                : 0

**CONV**                      Dialed number to pager (CC) number conversion  
Type of Input                : Single value, optional  
Possible Values             : Y(ES)                      conversion is wanted  
                                      N(O)                        conversion is not wanted  
Default Value                : N  
If conversion is requested, the corresponding values must be entered in a table with the aid of AMO PERSI.

**COPNO**                    Class of Parameter

|       |                                                                                                                                     |                                                                           |

## Parameter Description

Default Value : CCMEOD1

Type of Input : Single value, optional

Default Value : Y

Type of Input : Single value, optional

Default Value : 0

Type of Input : Single value, optional

Default Value : 0

Type of Input : Single value, optional

Default Value : 1

If parameter NO is specified, parameter PEN can also be specified; it defines the starting port.

Type of Input : Single value, optional

Default Value : DI (DELETE)  
NL (CHANGE)

Type of Input : Maximum of 4 linked single values, optional

|                 |                                   |                                                                                                              |
|-----------------|-----------------------------------|--------------------------------------------------------------------------------------------------------------|
| Possible Values | : MEETME                          | the paged party is connected with the paging party on answering the code call if not specified: display mode |
|                 | DIS                               | display mode                                                                                                 |
|                 | DELANS                            | cancel the job only after answer                                                                             |
|                 | DELSEND                           | cancel the job after sending                                                                                 |
|                 | BLKEND                            | Der Suchblock wird durch "]" abgeschlossen, nur bei MFV                                                      |
|                 | NOBEND                            | No end-of-block identifier                                                                                   |
|                 | BLKSEP                            | A-block, B-block and code number, if applicable, are separated by "*", only for DTMF signaling               |
|                 | NOBSEP                            | no block separators                                                                                          |
| Default Value   | : DIS & DELSEND & NOBEND & NOBSEP |                                                                                                              |

The 10 parameter values listed here form 4 pairs of opposites (see table). If nothing is declared, then the AMO sets the above default value. By entering one or more of the alternative values (opposites) during the actions ADD or CHANGE, the 'opposite' (default) value can be changed.

| Default | Opposite |
|---------|----------|
| DIS     | MEETME   |
| DELSEND | DELANS   |
| NOBEND  | BLKEND   |
| NOBSEP  | BLKSEP   |

Table 39 Opposite Values

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

The possible LTU and Slot values for PEN depend on the systems architecture and can be found in the BCSU AMO description.

## TSCSU - Configuration of Special Circuits in the SWU

### Parameter Description

The possible Line values depend on the module type and its functionality.

They can be listed using DISP-BCSU: TYPE=PEN [,LTG=, LTU=, SLOT=, CCT=]; which will also output the actual PEN status (e.g. NOT CONNECTED).

|         |                                                                                                                                                                                                                                                            |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PEN1    | Port equipment number (start PEN): LTG-LTU-SLOT-CCT                                                                                                                                                                                                        |
| PEN2    | Port equipment number (stop PEN): LTG-LTU-SLOT-CCT                                                                                                                                                                                                         |
|         | Type of Input : 4 combined single values, optional<br>(partially qualified)                                                                                                                                                                                |
|         | Possible Values : see parameter PEN                                                                                                                                                                                                                        |
|         | Default Value : PEN1=1-1-1-0, PEN2=PEN1                                                                                                                                                                                                                    |
|         | The parameters PEN1 and PEN2 delimit the search area for the actions DISPLAY and REGENERATE (PEN1 <= PEN2).                                                                                                                                                |
|         | If neither PEN1 nor PEN2 is specified, all trunks are output. If only PEN2 is specified, all trunks up to PEN2 are output. Even with partially qualified input, the first value always describes the LTG, the second the LTU and the third value the slot. |
|         | See the description of the function DISPLAY for details on how to use the parameters PEN1 and PEN2.                                                                                                                                                        |
| SRCHATT | Maximum of search attempts<br>(for CCMs in 'meet-me' mode)                                                                                                                                                                                                 |
|         | Type of Input : Single value, optional                                                                                                                                                                                                                     |
|         | Possible Values : 1-99                                                                                                                                                                                                                                     |

TSCSU - Configuration of Special Circuits in the SWU

Parameter Description

Default Value : 0

Trunks intended for incoming traffic only should not be assigned to any trunk group.

Trunks assigned to a trunk group can be used for outgoing and bothway traffic.

If no trunk group number or 0 is entered, the trunk is not assigned to any trunk group.

The number of trunks that can be assigned to one trunk group depends of the device (see table) and the capacity of the trunk group (AMO BUEND, parameter NO; maximum 2000).

| DEV  | max. no. of trunks per trunk group | max. no. of trunks per PABX |
|------|------------------------------------|-----------------------------|
| RA   | ∞                                  | ∞                           |
| ANS  | ∞                                  | ∞                           |
| RAS  | ∞                                  | 64                          |
| DICT | ∞                                  | ∞                           |
| SPKR | 1                                  | ∞                           |
| CC   | 1                                  | ∞                           |
| CCM  | 1                                  | 2                           |
| DOOR | 1                                  | ∞                           |

Table 40 Maximum number of trunks per trunk group / per PABX

TYPE Options for trunk data interrogation

Type of Input : Single value, optional

Possible Values : A Activated trunks

D Deactivated trunks

CFIG Trunks not yet assigned (action DISPLAY)  
(trunks for which a module has been configured with AMO BCSU)

This parameter is used to select trunks in the above-mentioned operating states for the actions DISPLAY and REGENERATE.

WAIT Time while search task can be inputted

Time during which the DH can still enter code calls while waiting for "READY" (for CCM)

Type of Input : Single value, optional

Possible Values : NOTRDY1,NOTRDY2 (see AMO CTIME)

Default Value : NOTRDY1

WAITT Time for dummy task for code calling equipment

Type of Input : Single value, optional

Possible Values : WAIT1, WAIT2 (see AMO CTIME)  
 Default Value : WAIT1

WIRES Number of physical wires for code calling devices  
 Type of Input : Single value, optional  
 Possible Values : 2, 3, 4, 6  
 Default Value : 2

## 198.4 Error Messages and Advisories

### 198.4.1 Error Messages

F01: PEN ERROR; PERMISSIBLE RANGE FOR LTG: 1-<ltg\_max>  
 F02: PEN ERROR; PERMISSIBLE RANGE FOR LTU: 1-<ltu\_max>  
 F03: PEN ERROR; SLOT <sss> FORMALLY INCORRECT  
 F04: PEN ERROR; PERMISSIBLE RANGE FOR CIRCUIT NUMBER: 0-<cct\_max>  
 F05: NO FURTHER TRUNKS CAN BE ASSIGNED IN THE PABX  
 F06: LTG <gg> NOT ASSIGNED  
 F07: LTU <uu> NOT ASSIGNED  
 F08: THE TRUNK WITH PEN <pen> IS ACTIVE  
 REPEAT COMMAND WITH OFFTYPE=DI OR OFFTYPE=DC  
 OR DEACTIVATE WITH AMO DSSU  
 F09: THE TRUNK WITH PEN <pen> IS CAMP-ON BLOCKED  
 REPEAT COMMAND LATER OR WITH OFFTYPE=DI  
 OR DEACTIVATE IMMEDIATELY WITH AMO DSSU  
 F10: TRUNK ALREADY ASSIGNED  
 F11: TRUNK NOT ASSIGNED  
 F12: NO FREE PEN FOUND FOR THIS DEVICE  
 F13: REQUIRED MODULE NOT CONFIGURED AT SLOT <sss>  
 F14: NO MODULE CONFIGURED AT SLOT <sss>  
 F15: THE LAST TRUNK OF A TRUNK GROUP WHICH IS ASSIGNED TO AN ACCESS CODE MAY NOT BE  
 DELETED  
 F16: COT (TRUNK PARAMETER) NOT ASSIGNED  
 F17: COP (LINE PARAMETER) NOT ASSIGNED  
 F18: INSUFFICIENT MEMORY SPACE (AMO DIMSU: PARAMETER <param>)  
 F20: <param> <value> NOT ASSIGNED  
 F22: THE PARAMETERS OF THE TRUNK TO BE ASSIGNED DO NOT MATCH THE PARAMETERS OF THE  
 OTHER TRUNKS IN THE TRUNK GROUP  
 F23: TRUNK GROUP NOT YET ASSIGNED  
 F24: TRUNK GROUP ALREADY FULL  
 (Expand trunk group with AMO BUEND or configure new trunk group with the AMO  
 BUEND and assign the identical route access code with the AMO RICHT)  
 F25: TRUNK GROUP CANNOT ACCOMODATE ALL TRUNKS  
 (Expand trunk group with AMO BUEND or configure new trunk group with the AMO  
 BUEND and assign the identical route access code with the AMO RICHT)

## TSCSU - Configuration of Special Circuits in the SWU

### Error Messages and Advisories

F26: DEVICE TYPE MAY NOT BE CHANGED  
F27: DEVICE IS NOT PROCESSED BY AMO TSCSU  
F28: BLOCK SEPARATOR (OPTYPE=BLKSEP) ONLY POSSIBLE WITH DTMF SIGNALING  
F29: END-OF-BLOCK (OPTYPE=BLKEND) SIGNAL ONLY POSSIBLE WITH DTMF SIGNALING  
F30: ONLY TWO CCMS MAY BE ASSIGNED IN THE PABX  
F31: A MAXIMUM OF 8 DICTATION SYSTEMS MAY BE ASSIGNED PER TRUNK GROUP  
F32: ONLY 64 RAS DEVICES MAY BE ASSIGNED IN THE PABX  
F33: THE TRUNK GROUP FOR THE TCOM MAY ONLY CONTAIN ONE DEVICE  
F34: PARAMETER MUST BE SPECIFIED  
(If no default value for COPNO or COTNO can be assigned, it must be entered.)  
F41: PEN1 MAY NOT BE GREATER THAN PEN2  
F43: PEN NOT SPECIFIED AT THE PHYSICAL MODULE LOCATION  
F57: THE LINE CANNOT BE ADDED;  
THE CONTRACTED NUMBER OF FLEX+TDM LINES <number> IS REACHED.  
PLEASE USE DISP-CODEW FOR DISPLAY OF THE CONTRACTED FEATURE PACKAGES.  
PLEASE CONTACT YOUR SERVICE CENTER IF YOU WISH TO ADD MORE LINES.  
F62: THE TRUNK WITH PEN <pen> DOES NOT BELONG TO TRGRP ^tgrp^  
F63: THE TRUNK WITH PEN @@@@@@@@@@ IS BUSY REPEAT COMMAND LATER OR WITH LOCK=DI  
OR DEACTIVATE IMMEDIATELY WITH AMO DSSU  
F99: THE NUMBER OF VARIABLE FIELDS IN THE MASK ABOVE IS EXCEEDED BY @@@@.  
F100 THE GIVEN ALARM NUMBER IS NOT VALID BECAUSE IT DOES NOT LEAD EITHER TO A  
LOGICAL ALARM OR THE ALARM TYPE DOES NOT MATCH DIR.

## 198.4.2 Advisories

H01: TRUNK ASSIGNED AT PEN <gg-u-sss-cc>  
H02: TRUNK RELEASED FOR CALL PROCESSING  
H03: TRUNK AT PEN <gg-u-sss-cc> CHANGED  
H04: CHANGE TAKES EFFECT AFTER "ACTIVATION WITH LOADING" (AMO DSSU)  
H05: TRUNK NOT ASSIGNED  
H06: ASSIGN ROUTING CODE FOR MEET ME WITH AMO RICHT  
H07: DELETE ROUTING CODE FOR MEET ME WITH AMO RICHT  
H11: NO TRUNKS ASSIGNED  
H13: TRUNK PARAMETER ANS (AMO COT) DOES NOT MATCH LINE PARAMETER ANS (AMO COP);  
DEVIATION FROM STANDARD  
H16: PARAMETER KNNR HAS BEEN ADAPTED TO THE OWN NODE NUMBER (AMO ZAND) ADAPTED NNO:  
@@@@@@@@@  
H23: TRKGRP <tgrp> IS EMPTY  
H24: TRKGRP @@@@ DOES NOT CONTAIN ANALOG TRUNKS.  
H28: <param> <value> HAS BEEN ASSINED.  
(The AMO can assign default values for COPNO and COTNO.)  
H29: TRUNK <pen> DELETED  
H34: THE AUTOMATIC SEARCH FOR FREE PENS WILL TAKE PLACE IN THE HHS SHELVES  
AND IN ACCESS POINTS WITH SOURCE GROUP 1.  
THE GIVEN SOURCE GROUP <NUMBER> WILL BE APPLIED TO THE CONFIGURATION.  
H35: The contracted number of TRUNK/NETWORKING lines is exceeded. Trunk has been  
marked as trial entity. Marked entities will be locked at trial mode expiry, if  
sufficient licenses are missing.  
H36: PLEASE ENSURE THE CORRESPONDING WAV FILE FOR THIS ANNOUNCEMENT IS CONFIGURED IN  
THE SOFTGATE.

| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

This AMO enables the operator to test the system units of the Switching Unit.

The AMO tests the peripherals (LTG, LTU, line modules, circuits, terminals, PNT, NT, PCM lines, SIU and CONF), the common control, the LTG switches and highways.

## Warning

Running tests on the entire switch or shelf can take a long time.

## 199.1 Restrictions

This description is valid for HiPath 4000 V1.0

## 199.2 Interrelationships

AMO-FUNSU : Start of routine tests

## 199.3 Functions of the AMO

- [TEST-TSU /](#) : Test the SWU units / Test the SWU units and let FA-RTO treat test  
[DIAGNOSE-TSU](#) errors

### 199.3.1 TEST-TSU / DIAGNOSE-TSU

Test system units in the SWU.

The AMO either starts test jobs for the system units, interrogates the status word of the processors or starts an external loop at a DIUS2 board.

The call of 'DIAGNOSE-TSU' is also possible. With 'DIAGNOSE-TSU' the same tests except T5 and T18 to T21 are run and the same test results are displayed by the AMO as after the call of 'TEST-TSU', but

## TSU - Test of Switching Unit

### Functions of the AMO

additionally test errors are treated by FA (Failure Analysis). The parameter tree is nearly identical in both cases (excluded are only T5 and T18 to T21).

Overview of test orders :

- T1 Test an LTG-active  
including the speech highways to the CSN-active  
Test of the LTG-standby possible from SP300-V3.2 upwards  
This job consists of the linked jobs T3 (for the LTG-active control), T5 and T8 to T11.
- T2 Test the Common Control-active or the Common Control-standby
- T3 Test the Group Control of an LTG-active or LTG-standby
- T4 Test a specific LTU in an LTG-active
- T5 Test the board highways in an LTU shelf
- T6 Test a module in an LTU
- T7 Test a circuit in a module of an LTU
- T8 Test a circuit (as in T6), but using a defined highway and timeslot
- T9 Test the standard SIU in an LTG-active and LTG-standby  
(Test T9 is included in T8 from SP300-V3.2 upwards.)
- T10 Test the MP of the CONF module in an LTG-active and LTG-standby  
(Test T9 is included in T8 from SP300-V3.2 upwards.)
- T11 Test all timeslots on all speech highways between  
an LTU and the group switching network (GSN) of an LTG-active.
- T13 Test a Cornet-T device,  
a whole Workstation,  
a Rolmphone Selftest,  
a DCM Selftest (Data Communication Module),  
a DCM looptest  
an Optiset terminal  
a Check alive test on an Optiset terminal  
or a Linepower test on an Optiset terminal  
Test a PNT (Private Network Terminator) or a  
NT (Network Terminator) on a SLMU board,  
a Cornet-T device,  
all devices of a S0-bus,  
a whole Workstation,  
a Rolmphone Selftest,  
a DCM Selftest (Data Communication Module),  
a DCM looptest.  
an Optiset terminal  
a Check alive test on an Optiset terminal  
a Linepower test on an Optiset terminal  
or all terminals of one circuit (only loop 4)
- T14 Test a specified PCM line
- T16 Start of an external loop at a DIUS2, DIUS7 or SLMN-E1 for jitter measurements  
(used for special admission tests only)
- T17 Test of connection WAML board - ADP
- T18 Line testing on SLMA boards
- T19 IPDA survivability modem

T20 IPDA survivability path  
 T21 Central Byte Manipulation Module test loop

**Note**

T1 to T21 corresponds to the number (1) to (21) in the procedure overview.

| No. | Release |
|-----|---------|

#### Note

T1 to T21 corresponds to the number (1) to (21) in the procedure overview.

## 199.3.2 Notes

- The IPDA test loop for survivability path (UNIT=SURVPATH) will raise costs because the test is done via charged CO connections.
- The status "READY" means that the device is free for call processing and for routine tests. This status also implies the following:
  - device contained in customer's system configuration
  - device is present
  - device plugged into correct slot
  - device is not defective
  - device is not manually blocked for maintenance (via AMO, hardware switch or remote maintenance and administration procedure)
  - device is not hierarchically blocked (by a superordinate device or partner device)

- device is not in transition to or from the ready status
- "READY" defines both busy and idle statuses.
- "BUSY" means the device is seized or blocked by the switching system or by dependability.
- There are two exceptions from Release 6.0 for routine tests.
  1. When a device (A) is configured as a Keysystem, and this Keysystem (A) takes on the appearance of another Keysystem (B) in a 2-way connection, then the routine test for the device (A) will not run, even when the status shows "READY." This is because the status of device (A) should be "BUSY" (not "READY"), and running the routine test will cause the connection to be dropped.
  2. When an ACD agent is auto-logged on, the device status also incorrectly shows "READY" (instead of "BUSY"). In this case, the routine test also will not run so that the ACD connection is not dropped.
- It is not possible to switch a voice channel loopback on RLI board if AMO-TSU is called with UNIT = MDL or UNIT = CCT (see T6, T7.1); this loopback is possible, however, in the terminal attached to RLI board (UNIT = T, TYPE = PEN; see T13).
- Functional terminals can not be tested
- TMDN diagnostic tests are not possible over CorNet-N trunk links to a generic server (feature ACD-IV). In this case AMO-TSU displays 'F57: TMDN DIAGNOSTIC TESTS ARE NOT POSSIBLE OVER CORNET-N TRUNK LINKS TO GENERIC SERVER' and stops.

### 199.3.3 Test orders

#### Test orders:

- T1      Test an LTG-active or LTG-standby including all speech highways to the CSN-active.  
This job consists of the linked jobs T3 (for the LTG-active control), T5 and T8 to T11.
- T2      Test the CC-active or the CC-standby
- T2.1    Test the firmware of the controller area
- T2.1.1   Interrogate the interface processor (IP)
- T2.1.2   Interrogate the cross channel (CCH)
- T2.1.3   Interrogate all message buffer units (MBUs)
- T2.1.4   Interrogate all central input/output controllers (IOCCs)

## TSU - Test of Switching Unit

### Functions of the AMO

- T2.2 Test data processor (DP) module (=base processor)
  - T2.2.1 Release hardware supervision switch for multibus timeout on the DP module.
  - T2.2.2 Release hardware supervision switch for watchdog counter 0 on the DP module.
  - T2.2.3 Release hardware supervision switch for watchdog counter 1 on the DP module.
  - T2.2.4 Interrogate ready line to the partner DP module
- T2.3 Test memories (common memory and local memory)
  - T2.3.1 Test memory allocations in CC-active or CC-standby  
A parity check is carried out by reading all memory cells on all M8M memory modules (MEMs) and on the MDP3DM, MDP486-DYN and MDP486-STA. A READ-WRITE test is carried out on the DPML, MDP386-8M and the MIP.
  - T2.3.2 Interrogate all 1-bit error indicators on all M2M memory modules
- T2.4 Test IEC bus between CCH modules; only for CC-standby
- T3 Test the group control of an LTG-active or LTG-standby  
The test job is rejected, if the LTG specified is not configured or not present.
  - T3.1 Test the firmware of the controller area
    - T3.1.1 Interrogate the input/output controller of the group processor (IOCG)
    - T3.1.2 Interrogate the data communication link (DCL)
  - T3.2 Interrogate the data processor (DP) module (=group processor)
    - T3.2.1 Release hardware supervision switch for multibus timeout on the DP module.
    - T3.2.2 Release hardware supervision switch for watchdog counter 0 on the DP module.
    - T3.2.3 Release hardware supervision switch for watchdog counter 1 on the DP module.
  - T3.3 Test memories (common memory and local memory)
    - T3.3.1 Test memory allocations in an LTG-active or LTG-standby  
The test job is rejected, if the LTG specified is not configured or not present.  
A parity check is carried out by reading all memory cells on all m M8M memory modules (MEMs) and on the MDP3DM, MDP486-DYN and MDP486-STA.  
A READ-WRITE test is carried out on the DPML, MDP386-8M and the MIP.
    - T3.3.2 Interrogate all 1-bit error indicators on all M2M memory modules
- T4 Test a specific LTU in an LTG-active  
The test job is rejected, if the LTU specified is not configured or not present.  
In SP390/391 the test job is also rejected, if the LTG specified is not configured or not present.
  - T4.1 Test a specific LTUC
    - T4.1.1 Test the microprocessor of that LTUC
    - T4.1.2 Test one timeslot on all highways to the specified LTUC  
The timeslot selected will always be in READY status and idle (i.e. not busy)
  - T4.2 Test all modules of the LTU specified (without LTUC)  
This job consists of a multiple callup of the job T6 by the RTO.  
In contrast to an operator callup of the job T6, a specific module is only tested if the module status is "READY".
- T5 Test the board highways on a LTU shelf
- T6 Test a specific line circuit module, SIU periphery module  
All jobs affect modules in LTUs. However, the two modules of a "service unit" (SU) are not tested, although configured at the LTU number 5.

- T6.1 Test a specific line circuit module  
The job is started if the module
- is contained in customer's system configuration
  - is present
  - is plugged into the correct slot
  - is not hierarchically blocked (by a superordinate device),  
e.g. if the LTU is not defective or manually blocked.
- T6.1.1 Interrogate the microprocessor of the line circuit module
- T6.1.2 Test all line circuits of the line circuit module specified  
The line circuit is only tested if the following conditions are met:
- The circuit is ready and not seized (idle).
  - The circuit is in "line alarm" status, e.g. if the circuit is not connected or the connection is faulty.
  - The terminal (which can be directly connected or connected via CTE) is defective or manually blocked.
  - There is no terminal connected (either directly or via CTE).
  - The circuit itself is faulty or manually blocked.
  - The line circuit module is manually blocked.
- T6.2 Test a specific module in the SIU periphery  
The job is started if the module
- is contained in customer's system configuration
  - is present
  - is plugged into the correct slot
  - is not hierarchically blocked (by a superordinate device),  
e.g. if the LTU is not defective or manually blocked.
- T6.2.1 Interrogate the microprocessor of the specified module in the SIU periphery.
- T6.2.2 Echoplex the specified module in the SIU periphery (loopback test from all code transmitters to all code receivers of the module).  
Only those code transmitters and receivers are tested which are tested which are ready and idle.
- T7 Test a line circuit
- P7.1 Test SLMR, SLMR24:  
The possible Loopbacks are as follows:
- interne loopback for voice (SLMRV)
  - interne loopback for data (SLMRD)
- Test TMD24, T1DN, TMDN :  
The Test has to be performed on circuit 1 for both Boards.  
any other circuit will be rejected.  
The possible Loopbacks are as follows:
- TMD24 :
- internal local loopback (ILOC)
  - activate internal remote loopback (IDC)  
this loopback is used in conjunction with EDC only.
  - deactivate internal remote loopback (IDL)  
this loopback is used in conjunction with EDC only.
  - external remote Loopback (EDC)

## TSU - Test of Switching Unit

### Functions of the AMO

This test must be performed in multiple steps.

- a) the circuits of both local and remote Boards must be deactivated via AMO-DSSU.
- b) on The remote T1 the internal remote loopback has to be activated with LOOPBACK = IDC.
- c) Test for EDC (external remote loopback) can be performed now on the local T1 board.
- d) after output of the test result the internal remote loopback on the remote Board has to be released with LOOPBACK = IDL.

TMDN / SLMN-T1 :

- internal local loopback (ILOC)
- activate internal remote loopback (IDC)  
this loopback is used in conjunction with EDC only.
- deactivate internal remote loopback (IDL)  
this loopback is used in conjunction with EDC only.
- external remote Loopback (EDC)  
This test must be performed in multiple steps.
  - a) the circuits of both local and remote Boards must be deactivated via AMO-DSSU.
  - b) on The remote T1 the internal remote loopback has to be activated with LOOPBACK = IDC.
  - c) Test for EDC (external remote loopback) can be performed now on the local T1 board.
  - d) after output of the test result the internal remote loopback on the remote Board has to be released with LOOPBACK = IDL.
- activate internal remote payload loopback (IPON)
- deactivate internal remote payload loopback (IPOFF)

T1DN

- internal local loopback (ILOC)
- activate internal remote loopback (IDC)  
this loopback is used in conjunction with EDC only.
- deactivate internal remote loopback (IDL)  
this loopback is used in conjunction with EDC only.
- external remote loopback (EDC) same process as for the TMD24.
- internal digital loopback (SMIDIG)
- internal analog loopback (SMIANA)

Test RLI

The possible Loopback is as follows:

- data channel loopback (RLITDM)  
(voice channel loopback is not possible here, see Notes)

STMA-TFA / STMA-PSW

- Loop 1

Test of other boards

Loop number is defined by the internal test routines.

T8      Test of circuits (as in T7) but using defined highway and timeslot number

(after the test a 'hanging' timeslot (half path connection) is released)

- T9        Test the standard SIU in an LTG-active
- T9.1     Interrogate the microprocessor of the standard SIU
- T9.2     Echoplex the standard SIU by loopback test from any SIU transmitter to the appropriate receiver.  
The transmitter/receiver pair selected will be in ready status and idle.
- T9.3     Transmit an external dial tone to the standard SIU and echo from any timeslot on any dial tone receiver.  
The timeslot selected will be ready and idle.
- T9.4     Transmit cadenced tones (busy tone and internal dial tone) to the standard SIU and echo from any timeslot on any dial tone receiver.  
The timeslot selected will be ready and idle.
- T9.5     Echo a test signal sent by any code transmitter of an SIU peripheral (SIU Type 2) in any LTU from all code receivers of the standard SIU.  
The code transmitter selected and the receivers tested will be ready and idle.
  
- T10      Test the CONF module in an LTG-active (not possible on 80CMX-LC)
- T10.1    Interrogate the microprocessor of the CONF module
  
- T11      Test all timeslots on all speech highways between an LTU and the GSN of an LTG-active (not possible on 80CMX-DSC)  
Only those timeslots are tested which are in ready status and idle.
  
- T13      Test a Cornet-T device     (STNO, SERVICE and TESTTYPE=SELFTEST),  
          a hole Workstation     (STNO and TESTTYPE=SELFTEST),  
          a Rolmphone Selftest (STNO and SERVICE=VCE and TESTTYPE=SELFTEST),  
          a DCM / Optiset Selftest (STNO and SERVICE=DTE and TESTTYPE=SELFTEST),  
          a DCM / Optiset looptest (STNO and SERVICE=DTE and TESTTYPE=LOOPBACK).  
          a Check alive test on an Optiset terminal  
              (STNO, SERVICE=DTE and TESTTYPE=CHKALIV);  
          or a Linepower test on an Optiset terminal  
              (STNO, SERVICE=DTE and TESTTYPE=LINEPOW);  
  
Test all terminals on a circuit     (OBJECT=ALL),  
Test of one terminal                (OBJECT=SINGLE),  
          a Cornet-T device     (STNO, SERVICE and TESTTYPE=SELFTEST),  
          a hole Workstation     (STNO and TESTTYPE=SELFTEST),  
          a Rolmphone Selftest (STNO and SERVICE=VCE and TESTTYPE=SELFTEST),  
          a DCM / Optiset Selftest  
              (STNO and SERVICE=DTE and TESTTYPE=SELFTEST),  
          a DCM / Optiset looptest  
              (STNO and SERVICE=DTE and TESTTYPE=LOOPBACK).  
          a Check alive test on an Optiset terminal  
              (STNO, SERVICE=DTE and TESTTYPE=CHKALIV);  
          or a Linepower test on an Optiset terminal  
              (STNO, SERVICE=DTE and TESTTYPE=LINEPOW);
  
- T14      Test a specified PCM line

**TSU - Test of Switching Unit**  
Functions of the AMO

- T16 Start of an external loop at DIUS2, DIUS7 or SLMN-E1 board for jitter measurements
- T17 Test of connection between WAML board and ADP
- T18 Line testing on SLMA boards
  - Test loop for subscriber in state onhook (ONHHOOK)
  - Test loop for subscriber in state offhook (OFFHOOK)
- T19 Test the modem for IPDA survivability connections
- T20 Test the IPDA survivability path
- T21 Test the modules on LTUCC board used for central byte manipulation

**199.3.4 Examples for ISDN-terminal connections**

Table 43 List of possible test loops for device test

#### Note

Test loop number will be ignored on testing other modules. The loop number is defined by the internal test routines.

## 199.3.5 Examples of test orders

### 1. Test LTU2 of LTG1

Input:

TEST-TSU:LTU,1,2;

Output:

SWU-LTG (A HALF / ACTIVE)  
TEST : SPEECH HIGHWAYS; ANY TIME SLOT  
ADVISORY: NO IDLE SIU RECEIVER FOUND

```

                HWY:          LTG = 1    LTU = 2    HWY = 27
                TRANSMITTER:LTG = 1    LTU = 7    SLOT = 13
FUNCTION = 2

```

**2. Test the CC-active (active system half of the common control)****Input:**

```
TEST-TSU:CC,ACT;
```

**Output:**

```

SWU-CC (A HALF / ACTIVE)
TEST   : MEMORY; RELEASE 2-BIT ERROR

ERROR   : HARDWARE SUPERVISION CIRCUIT CANNOT BE RELEASED
ADDRESS = 118/32424

```

The address of the defective memory cell is made up of the number of the 64K block in which it is located (in order to determine the module concerned) and the offset within the block. Both are represented as decimal values.

**3. Test of a PNT (Private Network Terminator) of a SLMU16 board with PEN LTG=1, LTU=3, SLOT=61, CCT=2 and LOOPBACK=2****Input:**

```
TEST-TSU:T,PEN,1,3,61,2,2;
```

**Output:**

```
TEST   : SPECIFIED CIRCUIT; SPECIFIED TERMINAL
```

**4. Test of a Cornet-T device of a SLMU16 board with the number STNO=3567 and SERVICE=VCE or with PEN LTG=1, LTU=3, SLOT=61, CCT=2, LOOPBACK=4 (STD) and TSI=1****Input:**

```

TEST-TSU:T,STNO,3567,VCE;
or
TEST-TSU:T,PEN,1,3,61,2,,1;

```

**Output:**

```

SWU-LTG (A HALF / ACTIVE)
TEST   : SPECIFIED CIRCUIT; SPECIFIED TERMINAL

```

**5. Test of all devices of a S0-bus with PEN LTG=1, LTU=3, SLOT=61, CCT=2 and LOOPBACK=4****Input:**

```
TEST-TSU:T,PEN,1,3,61,2,4;
```

**Output:**

```

SWU-LTG (A HALF / ACTIVE)
TEST   : SPECIFIED CIRCUIT; ALL TERMINALS
TEST   : SPECIFIED CIRCUIT; ALL TERMINALS
ADVISORY: TEST IS NOT ALLOWED

```

## TSU - Test of Switching Unit

### Functions of the AMO

```

                TERMINAL :  LTG = 1      LTU = 3   SLOT = 61      NO = 2      TSI = 2
                        TYPE = SIMU16
TEST      : SPECIFIED CIRCUIT; ALL TERMINALS
ADVISORY: TEST IS NOT ALLOWED
                TERMINAL :  LTG = 1      LTU = 3   SLOT = 61      NO = 2      TSI = 3
                        TYPE = SIMU16
                        .
                        .
                        .
                        .
TEST      : SPECIFIED CIRCUIT; ALL TERMINALS
ADVISORY: TEST IS NOT ALLOWED
                TERMINAL :  LTG = 1      LTU = 3   SLOT = 61      NO = 2      TSI = 8
                        TYPE = SLMU16
```

The test for Cornet-T device TSI=1 was successful. The test is not allowed for functional devices TSI=2 to 8.

#### Note

Each test result message consists of at least two parts (A and B) and occasionally three parts (A, B and C). A successful test without errors consists only of one part (A).

|             |   |                                                               |
|-------------|---|---------------------------------------------------------------|
| A) TEST     | : | Detailed test job executed                                    |
| B) ERROR    | : | Negative result from the test A)<br>Object couldn't be tested |
| C) ADVISORY | : | Additional data reported by the RTO                           |

## TSU - Test of Switching Unit

### Functions of the AMO

```
STATUS      :   fffff / fffff / fffff / fffff / fffff
```

```
Value abbreviations:  aa      LTG Number      1-32
                      b       LTU Number      1-99
                      ccc     Slot            1-151
                      d       SIU function    0-3
                      ee      Timeslot       0-255
                      fffff   Status
```

The status of the testobject will be displayed at test result  
'ADVISORY: CANNOT BE TESTED BECAUSE OF BASIC STATUS'

Values for status are

```
NOGEN, AMO, LOCK, HIRAMO, SOFTLOCK, READY, UNACH,
UNACA, DEFECT, NPR, WBT, NL, TRS, WAIT, DEP, CP, CPH
```

If parts A (TEST) and B (ERRORS) cannot be determined within the program and thus no text output is possible, then additional data may be output. Some of this additional data is not pre-initialized by the RTO and may therefore be meaningless.

#### Example:

```
TEST       : 7
ERROR      : 42
OBJECT:     LTG = 1   LTU = 2   PBC = 14
TRANSMITTER:LTG = 1   LTU = 3   SLOT = 13   FUNCTION = 1
RECEIVER:   LTG = 1   LTU = 3   SLOT = 7     FUNCTION = 2
CSN:        MTS = 1   HWY = 3   TIMESLOT = 20
DATA:
CIRCUIT = 4   B-CHANNEL = 1   MODULE TYPE = 14   STATUS = 147
HWY      = 29   TIMESLOT = 21   TIMESLOT INDEX = 189   LOOPB = 3
QUANTITY = 49   ADDRESS = 136/30224
TONE = 12                               PROCESSOR = 5   TSI = 3
```

#### Explanation:

```
TEST       : Detailed test job which led to negative result.
ERROR      : Test result
OBJECT     : Test object (LTG, LTU and PBC number)
TRANSMITTER : Tone transmitter used for echoplexing
RECEIVER    : Tone receiver used for echoplexing
CSN        : Central switching network
LTG        : Line/Trunk Group (1-32)
LTU        : Line/Trunk Unit (1-99)
PBC        : Peripheral Board Controller number (1-25)
SLOT       : Slot (1-151)
FUNCTION    : SIU funktion (0-3)
MTS        : Memory time switch (1-7)
HWY        : Highway number (0-127)
TIMESLOT   : Timeslot (0-31)
CIRCUIT    : Line circuit number (0-63)
B-CHANNEL  : B-channel (0, B, B')
MODULE TYPE : Line circuit module (SLMA, SLMD, OLMD, TMDE,
TMBD...?)
STATUS     : Status (0-255)
TS INDEX   : Timeslot index (0-255)
LOOPB      : Test loop (2A, 2B, 2C, 4, 5, 6)
```

QUANTITY : Number of 1-bit errors which occurred (0-1023)  
 ADDRESS : Memory address (0-255 / 0-65535)  
 TONE : Numerical value of TONE power set (int.dial  
 tone, busy tone, .?)  
 PROCESSOR : Processor (system unit) name (ADS, CM, VM1,  
 TF1, ...?)  
 TSI : Terminal selection identifier (1-8)

If an error message is output during a functional test which includes an echoplexing test step (echoing an external dial tone or a bit sequence), the SIU transmitter and receiver(s) used for echoing are specified in the error message displayed at the administration and maintenance terminal. For each SIU transmitter and receiver, the appropriate LTG number, LTU number, slot number and the SIU function are output. The SIU function is described with the appropriate value received by the RTO from DB\_M\_SIU\_FKT\_RNG (0-3), e.g. "FUNCTION = 1". This value does not usually need to be interpreted by maintenance personnel.

The DB\_M\_SIU\_FKT\_RNG values listed below are attributed to the various SIU transmitters or receivers as follows:

0 = Dial tone receiver (DTR) for external dial tones and cadenced tones.  
 1 = Test receiver (TESTR) for bit sequence echoing.  
 2 = Test transmitter (TESTS) for bit sequence echoing.  
 3 = Dial tone transmitter (DTS) for external dial tones and cadenced tones.

In some country-specific variants, the DTS may be allocated a different value.

## 199.4 Parameter Description

|                 |                                             |
|-----------------|---------------------------------------------|
| BCHAN1          | B CHANNEL 1 (only for JITTERLP )            |
| Type of Input   | : Single Value, optional                    |
| Possible Values | : 1 to 30 or 255 (loop over all b channels) |
| Default Value   | : 255                                       |
| BCHAN2          | B CHANNEL 2 (only for JITTERLP)             |
| Type of Input   | : Single Value, optional                    |
| Possible Values | : 1 to 30                                   |
| Default Value   | : 2                                         |
| CCT             | Circuit/trunk number                        |
| Type of Input   | : Single value, mandatory                   |
| Possible Values | : 0 to 255 (UNIT=CCT / CCTPATH / T / LINE)  |
|                 | 0 to 3 (UNIT=JITTERLP)                      |

## TSU - Test of Switching Unit

### Parameter Description

| SERVICE | Specify the type of service of the terminal to be tested<br>Type of Input : Single value, optional for Workstations<br>: Single value, mandatory<br>Possible Values : DTE, FAX, VCE                                                                                                                                                                                                                                                                                                                                                                                    |
| SLOT    | Slot number in the LTU<br>Slots are numbered from left to right. Always state the lowest slot number for modules<br>which occupy more than one location. (A mounting location is made up of 6 slots ;<br>thus, valid slot numbers are 1, 7, 13, 19 etc.<br>However: some modules - e.g. SLMA - occupy two locations; for this reason the valid<br>slot number must always be the first, or lowest, of the two. LTUC cannot be tested!)<br>Type of Input : Single value, mandatory<br>Possible Values : 1 - 121 (non compact hardware)<br>: 19 - 121 (compact hardware) |

A suitable module must be configured for the slot addressed by PEN (AMO BCSU).

The possible Slot values depend on the systems architecture and can be found in the BCSU AMO description.

|      |                                                                                                                    |
|------|--------------------------------------------------------------------------------------------------------------------|
| STNO | Station number of terminal to be tested<br>Type of Input : Single value, mandatory<br>Possible Values : 0 - 999999 |

F25: SELFTEST NOT ALLOWED FOR <board-type>

F26: LTG1 NOT ASSIGNED

F27: LTG1 NOT PRESENT

## TSU - Test of Switching Unit

### Error Messages and Advisories

- F28: LTG2 NOT ASSIGNED
- F29: LTG2 NOT PRESENT
- F30: LTG1 AND LTG2 ARE EQUAL
- F31: WORKSTATION NOT ASSIGNED
- F32: BOARD NOT LOADED (NL)
- F33: CIRCUIT NOT CONFIGURED
- F34: STATION WITHOUT PHYSICAL DEVICE
- F35: STATION NOT CONFIGURED FOR THIS NUMBER AND THIS SERVICE
- F36: TEST IN PROGRESS - FURTHER START NOT POSSIBLE !
- F37: AT TMD/T1 BOARDS ONLY CIRCUIT = 1 IS ALLOWED
- F38: TEST IS ONLY POSSIBLE AT AN OPTISET E TERMINAL
- F39: TEST IS ONLY POSSIBLE AT AN OPTISET MASTER TERMINAL
- F40: CIRCUIT TEST NOT POSSIBLE ON THIS BOARD
- F41: NO TERMINAL IS ASSIGNED TO THIS STATION NUMBER
- F42: TERMINAL IS SIGNED OFF AND THEREFORE IT CANNOT BE TESTED
- F43: IN THIS SLOT THERE IS NO WAML BOARD !
- F44: TEST ALLOWED ON DIUS2, DIUS7, DIUN2, DIUN4 OR SLMN-E1 ONLY !
- F45: ONLY MDL TEST IS POSSIBLE ON THIS CARD.  
NO CIRCUIT TESTS OR DEVICE (TERMINAL) TESTS ARE ALLOWED.
- F46: TEST OF NAILED CONNECTIONS NOT ALLOWED
- F47: TEST OF LOCAL LOOP (ILOC) ON BOARD SLMN-T1 : THE FIRST 24 CIRCUITS OF A SPAN (1 - 24, 26 - 49, 51 - 74 OR 76 - 99) MUST BE TAKEN OUT OF SERVICE VIA AMO DSSU AND THE LAST CIRCUIT OF A SPAN VIA AMO BSSU ! AMO TSU EXPECTS THE NUMBER OF THE SPAN (1,2,3 OR 4) AS INPUT OF PARAMETER 'CIRCUIT'
- F48: TEST OF REMOTE LOOP (IDC OR EDC) ON BOARD SLMN-T1 : THE LAST CIRCUIT OF A SPAN (25, 50, 75 OR 100) MUST BE IN SERVICE, BUT THE OTHER CIRCUITS (1 -24, 26 - 49, 51 -74, 76 -99) MUST BE BLOCKED VIA AMO DSSU ! AMO TSU EXPECTS THE NUMBER OF THE SPAN (1,2,3 OR 4) AS INPUT OF PARAMETER 'CIRCUIT'
- F49: TEST OF TERMINALS CONNECTED TO SLMO-ROUTING BOARD NOT POSSIBLE
- F50: THIS TEST IS ONLY POSSIBLE IN SUBSCRIBER STATE 'OFFHOOK'. THIS DOES NOT CORRESPOND TO THE CALL PROCESSING STATE AT THE MOMENT. THE TEST CAN BE CARRIED OUT, WHEN THE LINE IS TAKEN OUT OF OPERATION BY CALLING AMO DSSU. AFTER THE TEST THE LINE MUST BE TAKEN BACK TO OPERATION !
- F51: THIS TEST IS ONLY POSSIBLE IN SUBSCRIBER STATE 'ONHOOK' (THIS DOES NOT CORRESPOND TO THE CALL PROCESSING STATE 'IDLE'). AT THE MOMENT THE SUBSCRIBER IS NOT IN STATE 'IDLE'. THE TEST CAN BE CARRIED OUT, WHEN THE LINE IS TAKEN OUT OF OPERATION BY CALLING AMO DSSU. AFTER THE TEST THE LINE MUST BE TAKEN BACK TO OPERATION !
- F52: SUBSCRIBER IS IN STATE 'CONNECTED'. THE TEST CAN ONLY BE STARTED WHEN THE LINE IS TAKEN OUT OF OPERATION BY CALL OF AMO DSSU. AFTER THE TEST THE LINE MUST BE TAKEN BACK TO OPERATION !
- F53: LINETEST IS ONLY POSSIBLE ON SLMA BOARD TYPES Q2141, Q2157, Q2246, ON SLMAR BOARD Q2480-X000 AND ON SLMA3 BOARD Q2191-X
- F54: LINETEST CAN NOT BE CARRIED OUT, BECAUSE NECESSARY SIUX BOARD (Q2233-X, FUNCTION ID 7) IS NOT AVAILABLE IN THE SWITCH
- F55: ON STMA CARD DEVICE (TERMINAL) TEST IS POSSIBLE ONLY IN OPERATION MODES 'TFA' OR 'PSW'
- F56: ON DSC80 CARD CONF, MDL AND HIGHWAY TESTS ARE NOT POSSIBLE.
- F57: TMDN DIAGNOSTIC TESTS ARE NOT POSSIBLE OVER CORNET-N TRUNK LINKS TO GENERIC SERVER.
- F58: ONLY SELFTEST VALID FOR WORKSTATIONS, ROLMPHONES OR DCM (DATA COMMUNICATION MODULE) .
- F59: HIGHWAY NOT ASSIGNED TO THIS BOARD
- F60: LOOP 4 TEST NOT POSSIBLE ON ANALOG TERMINAL ADAPTER.
- F61: TEST OF LTU 1 ON 80CMX-DSC AND 40CMX-DSC SWITCHES IS NOT POSSIBLE .

F62: PCMLINE <number> NOT ALLOWED FOR <boardtype>  
F63: TEST IS ONLY ALLOWED ON LTUC BOARDS WITH CENTRAL BYTE MANIPULATION MODULES  
F64: AP NOT ASSIGNED OR LOCKED  
F65: AP NOT PRESENT  
F66: THIS FUNCTION IS NOT ALLOWED FOR SOFTGATE SHELVES.

## **199.5.2 Advisories**

H01: PLEASE SPECIFY LTG NUMBER  
H02: SYSTEM UNIT NOT DUPLICATED

H28: COMMAND HAS NOT BEEN EXECUTED

## 200 TTBL - Administration of tariff tables

|                                      |                                                       |                                              |
|--------------------------------------|-------------------------------------------------------|----------------------------------------------|
| <a href="#">Cross reference</a>      | <a href="#">Parameter description</a>                 | <a href="#">Error- and Advisory Messages</a> |
| <a href="#">Functions of the AMO</a> | <a href="#">Appendix to the parameter description</a> |                                              |

The task of this AMO is to administer the tariff tables with and without call charge information, and the tariff groups.

There are 9 tariff tables with call charge information, 9 tariff tables without call charge information, 9 tariff tables with clock information and 6 tariff group tables.

**Note:** In the following examples the old european currencies ATS, DEM and LIRE are used.

### Tariff group tables

The tariff group tables contain for each carrier and service and category of calling party a tariff table number. This is valid for connections with and without charge information. Tariff group table 0 is used for the GESP-display.

| Carrier | Catpty | Service |     |     |
|---------|--------|---------|-----|-----|
|         |        | Voice   | Fax | DTE |
| 0       | NORM   |         |     |     |
|         | SCRSPC |         |     |     |
|         | PUPHON |         |     |     |
|         | MTEQ   |         |     |     |
| ...     |        |         |     |     |
| 9       | NORM   |         |     |     |
|         | SCRSPC |         |     |     |
|         | PUPHON |         |     |     |
|         | MTEQ   |         |     |     |

When a tariff group table is created, then a tariff table number is specified for each carrier and service and calling party.

### Tariff tables with charge information

The tariff for connections with tariff information is divided into sub-tariff-intervalls. Each sub-tariff-intervall represents a charge unit limit. The actual tariff-intervall is valid until the charge unit limit. Each table contains 4 intervalls, a minimal charge and a multiplying factor. The multiplying factor is in thousandth. Cost values are in 1/1000ths of

## TTBL - Administration of tariff tables

currency units<sup>1</sup>, if in AMO DAVF the parameter COMPOS's value is 2T or 3T. Cost values are in 1/100ths of currency units, if in AMO DAVF the parameter COMPOS's value is between -3 and +3.

|             |         |
|-------------|---------|
| LIMIT_1     | PRICE_1 |
| LIMIT_2     | PRICE_2 |
| LIMIT_3     | PRICE_3 |
| LIMIT_4     | PRICE_4 |
| MIN_CHRG    |         |
| CHRG_FACTOR |         |

If the parameter METHOD = FACTOR is set in the tariff table with charge information (WCU) and by the network the charge information is supplied in form of (prepared) amounts, then the amounts are multiplied by the value of the FACTOR. The minimum amount is considered, in this case no basic charge is used.

With calculation after time likewise the calculated amount with the multiplication factor (FACTOR) from the WCU table with the same tariff table number, as the used WOCU table, is modified.

The calculated amounts become connection costs.

**Note:** The minimum charge is always indicated in 1/100 currency units, independent from the DAVF settings.

### Tariff tables without call charge information

For connections without charge information, the tariff is calculated according to the actual distance and rate period.

| Zones / Set Value   | Day |    | Night 1 |    | Night 2 |    | Night 3 |    | Night 4 |    | TABT Nr. | Change Period | Min. Charge | Basic Charge | B-CHL Factor |

| NEAR / 31           |     |    |         |    |         |    |         |    |         |    |          |               |             |              |              |
| DIST 01-50 / 51-100 |     |    |         |    |         |    |         |    |         |    |          |               |             |              |              |

1. See explanation of currency units in the parameter description WCU table on page 2757.

| Zones / Set Value   | Day | Night 1 | Night 2 | Night 3 | Night 4 | TABT Nr. | Change Period | Min. Charge | Basic Charge | B-CHL Factor |
|---------------------|-----|---------|---------|---------|---------|----------|---------------|-------------|--------------|--------------|
| ABR 01-99 / 101-199 |     |         |         |         |         |          |               |             |              |              |
| TIE 01-09 / 201-209 |     |         |         |         |         |          |               |             |              |              |

xx: Time unit in 1/100th of seconds

yy: Price for this time unit, in 1/100th, 1/1000th or in 1/100000th of currency units<sup>1</sup> (eg. pfennigs, tenth pfennings or thousandth pfennings. Depending on adjustment of TBL=GEN)

tt: Number of the rate period-table (1-25)

cc: boolean value

(FALSE): the rate period selected at the beginning of the connection start is valid for the whole connection, i. e. a change of the rate period doesn't affect the price.

(TRUE): if the rate period changes, the costs are calculated according to the new rate period.

mm: minimal charge of a connection, in 1/100th of currency units

bb: base charge of a connection, in 1/100th of currency units

ff: Factor for multiplication per used B-Channel ( in percent, 100% means multiplication with 1 )

Each zone has 5 tariff ranges. The costs are calculated in dependence of the actual rate period. It is possible to specify a base- and minimum charge.

In tariff tables without charge information, the tariffs can be specified for each zone. Each zone has a day-, night1-, night2-, night3- and night4-tariff (yy) per time unit (xx). The time unit is in 1/100th of seconds, the day and night tariffs are in 1/100th, in 1/1000th or 1/100000th of currency units, depending on settings in branch GEN and parameter COMPOS.

The base charge (bb) can be negative and positiv as well. Negative base charge makes it possible to make a call free for the first n seconds. Negative costs are displayed as zero (0).

1. See explanation of currency units in the parameter description WOCU table on page 2758.

## TTBL - Administration of tariff tables

A connection is divided into rate periods, with the help of rate period tables. The number of the rate period-table (tt) that should be applied, must be entered (see AMO-TABT). The sign for change period (cc) shows if a change of rate period affects the charge calculation or not.

The charge calculation is performed the following way: the connection time is divided into time units, according to the zone and the rate period, then the time units are multiplied by the actual tariff (cost), and added. If the rate period changes during the connection, it affects the charge calculation only if (bb) is set. After this, the base charge is added or subtracted. If the costs are more than zero and less than the minimum charge, the minimum charge is valid.

If several B-Channels (n) are used the costs will be calculated by using following formula:

$$\text{Costs per Channel} \times n \text{ B-Channels} \times \text{B-Channel factor}$$

### Tariff Tables with clock information

There are 9 tariff tables with clock information which serve to set the charge pulses of analogue subscriber or public telephone

| Zones     | DAY |       |        | NIGHT1 |       |        | NIGHT2 |       |        |
|-----------|-----|-------|--------|--------|-------|--------|--------|-------|--------|
|           | Fix | First | Period | Fix    | First | Period | Fix    | First | Period |
| LOC       | xx  | yy    | zz     | xx     | yy    | zz     | xx     | yy    | zz     |
| NEAR      |     |       |        |        |       |        |        |       |        |
| DIST01-50 |     |       |        |        |       |        |        |       |        |
| ABR01-99  |     |       |        |        |       |        |        |       |        |
| ...       |     |       |        |        |       |        |        |       |        |
| TIE01-09  |     |       |        |        |       |        |        |       |        |

| Zones     | NIGHT3 |       |        | NIGHT4 |       |        | TABTNr. | Change Period |
|-----------|--------|-------|--------|--------|-------|--------|---------|---------------|
|           | Fix    | First | Period | Fix    | First | Period |         |               |
| LOC       | xx     | yy    | zz     | xx     | yy    | zz     | tt      | cc            |
| NEAR      |        |       |        |        |       |        |         |               |
| DIST01-50 |        |       |        |        |       |        |         |               |
| ABR01-99  |        |       |        |        |       |        |         |               |
| ...       |        |       |        |        |       |        |         |               |
| TIE01-09  |        |       |        |        |       |        |         |               |

xx: basic charge: Zero, one or more charge pulses are generated and immediately sent. No periodic emission follows. (0-15)

yy: Time, after that is sent the first impulse (in 10 ms)

- (0): no first charge pulse is sent.
- (>0): a first charge pulse is sent after  $n * 10 \text{ ms}$  (1-9999999).
- (KA) Method Karlsson added: The basic charge (xx) is automatically set to 1. A pulse is sent immediately. The next charge pulse follows after a random delay time which lies between 0 and the regular charge pulse period (zz). Afterwards the pulses are sent periodically with the appropriate time interval (zz).
- (KM) Method Karlsson modified: The basic charge (xx) is automatically set to 1. A pulse is sent immediately. The next charge impulse follows after a random delay time which lies between the regular charge pulse period (zz) and its twofold value ( $2*zz$ ). Afterwards the pulses are sent periodically with the appropriate time interval (zz).
- (K) Method Karlsson: The basic charge (xx) is automatically set to 0. The first pulse is sent after a random delay time which lies between 0 and the regular charge pulse period (zz). Afterwards the pulses are sent periodically with the appropriate time interval (zz).

zz: Period time of the periodic charge pulses (in 10 ms).

tt: Number of the rate period table (1-25)

cc: Identifier for rate period table for connections without charge information

Boolean value:

(FALSE): Segment for time of day is valid for the whole connection (Segment changes will not be considered).

(TRUE): Segment for time of day is not valid for the whole connection (Segment changes will be considered).

### Determination of CCU/COSTS by transmitted or calculated Call Charge Units/Values

Carrier\_1 and Carrier\_2 with different:

- Costs per time unit
- Price per call charge unit

It means:

CCU = **C**all **C**harge **U**nits

CDR = **C**all **D**ata **R**ecord

DISPCCU-A = **CCU** shown at the **DISPLAY** of subscribers on System A

DISPCOST-A = **COSTS** shown at the **DISPLAY** of subscribers on

System A

CHRGUNIT-A = Field **CHRGUNIT** in **CDR** of the System A (Call charge units)

DISPCHRG-A = Field **DISPCHRG** in **CDR** of the System A (output of indicated costs)

CONCHRG-A = Field **CONCHRG** in **CDR** of the System A (in ISp calculated costs for the output)

AOCCCU-AtoB = The **CCU** are sent as **AOC-D** from System A to System B (LTMB = not set)

AOCVAL-AtoB = The **VALUES** are sent as **AOC-D** from System A to System B (LTMB = set)

DISPCCU-B = Indicated **CCU** at the **DISPLAY** of subscribers on System B

DISPCOST-B = Indicated **COSTS** at the **DISPLAY** of subscribers on System B

CHRGUNIT-B = Field **CHRGUNIT** in **CDR** of System B (call charge units)

DISPCHRG-B = Field **DISPCHRG** in **CDR** of System B (output of indicated costs)

CONCHRG-B = Field **CONCHRG** in **CDR** of System B (In ISp calculated costs for the output)

TARTBL = **T**ariff**T**able

CCI = **C**all **C**harge **I**nformation

The indicated call charge units DISPCCU or the costs DISPCOST (output in CDR as DISPCHRG) and the possibly calculated CHRGUNIT are continually determined during the connection or at the end of the connection respectively. The tariff group 0 is always taken and parameter CCUC from AMO-ZAND is used. The costs CONCHRG are put out in CDR and are calculated in ISp during the output. For this always the tariff group n from the selection group is used

# TTBL - Administration of tariff tables

| S<br>d<br>i<br>s<br>p<br>l<br>a<br>y<br><br>m<br><br>A | D<br>i<br>s<br>p<br>l<br>a<br>y                                            | DISPGE-A                                                                 | DISPCOST-A / Price from ZAND<br><br>The DISPCCU-A are displayed for the subscribers with a standardized price for a CCU.<br>The CCU with different prices or different values of the carrier or the costs calculated by itself are changed in CCU with standardized prices. This happens because the subscriber normally doesn't know which carrier was used to build up the connection and what is the price for this value.<br>CHRGUNIT-A (CCU in data record A) are possibly different to DISPCCU-A (CCU displayed at the subscriber) because these have possibly different prices. Differences are possibly caused by rounding up the calculation of the DISPCCU-A<br>Therefore always values should be displayed in Hicom from V3.4 |                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                           |

For carrier with MIX (for some connections CCI are received, for otherone not) it is going on as follows:

- if CCI are not received it will be calculated as like by WITHOUT,
- if CCI are received it will be calculated as like by WITH

## 200.1 Cross reference

- AMO-DAVF : Display Characteristics for Call Charge Output
- AMO-FETA : Administration of Holiday Tables
- AMO-GETAB : charge data display from CDRS files
- AMO-SELG : Administration of Selection Groups and Selection Tables
- AMO-TABT : Administration of the Rate Period Tables

## 200.2 Functions of the AMO

- [ADD-TTBL](#) : Add tariff and tariff group tables
- [CHANGE-TTBL](#) : Changing tariff and tariff group tables
- [DELETE-TTBL](#) : Delete tariff group or tariff table entries
- [DISPLAY-TTBL/REGEN-TTBL](#) : Display tariff group or tariff table entries / Regenerate tariff group and tariff table entries

### 200.2.1 ADD-TTBL

Enters tariffs into the tariff tables and tariff group tables.

For tariff tables with charge information, the limit for the last graduated area must be zero. The AMO queries the parameter pair limit and tariff as long as a limit of zero is entered (maximum 4 times). If no zero is entered, then the AMO sets zero for the fourth element automatically.

1. Entering tariffs for connections with charge information
2. Entering tariffs for connections without charge information
3. Creating a tariff group table per Carrier and category of calling party and Service.
4. Creating a table with clock information.

#### Notice

If one of the parameters FPLSDAY, FPLSN1..FPLSN4 in the table with clock information is set to either value K (Karlson random value), KA (Karlson Added random value) or KM (Karlson Modified random value), then the corresponding FIXDAY, FIXN1..FIXN4 is changed too according the following table. Additionally advisory message H11 is printed.

## TTBL - Administration of tariff tables

### Functions of the AMO

| FPLSDAY, FPLSN1..N4   | Corrected FIXDAY, FIXN1..N4 |
|-----------------------|-----------------------------|
| KA (Karlson Added)    | 1                           |
| KM (Karlson Modified) | 1                           |
| K (Karlson)           | 0                           |

### Procedure overview

| Command code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | (1) |

### Examples

1. Creating a tariff without tariff ranges of 0,121 DM per call charge unit in the tariff table 1 with charge information, with minimum call charge of 5,01 DM, and with the cost calculation charge unit. (The comma position per AMO-DAVF must be set on 2T or 3T. The setting in AMO-DAVF works only for the cost calculation on tariff tables with cost informations.)

Input:

```

ADD-
TTBL:TBL=WCU,TARTBLNO=1,TARMIN=501,METHOD=UNITS,LT1=0,TAR1=12
1;

```

## TTBL - Administration of tariff tables

### Functions of the AMO

2. Creating table 2 with charge information, with a minimum charge of 2,00 DM with a cost calculation method FACTOR (=1000‰) and with the following tariff ranges (The comma position in the AMO-DAVF is either -3 or -2, -1,0, +1, +2 or +3. The setting in the AMO-DAVF works only for the cost calculation on tariff tables with cost informations.):

value range 1: from 0 to 25 units, 0,6 DM per unit

value range 2: from 26 to 50 units, 0,5 DM per unit

value range 3: from 51 to 75 units, 0,4 DM per unit

value range 0: 76 to -- units, 0,2 DM per unit

Input:

ADD-

TTBL:TBL=WCU, TARTBLNO=2, TARMIN=200, METHOD=FACTOR, FACTOR=1000, LT1=25, TAR1=60, LT2=50, TAR2=50, LT3=75, TAR3=40, TAR4=20;

3. Adding table 1 (without charge information) with the following values:

Zone LOC

with TARBAS=+50 (0,50 DM) and TARMIN=75 (0,75 DM),  
SEGTBLNO=10, CHPER=Y, BCHLFACT= 100.

| INTDAY<br>(in 1/<br>100<br>Sec) | TARDA<br>Y<br>(in 1/<br>1000<br>CU) | INTNT1<br>(in 1/<br>100<br>Sec) | NTAR1<br>(in 1/<br>1000<br>CU) | INTNT2<br>(in 1/<br>100<br>Sec) | NTAR2<br>(in 1/<br>1000<br>CU) | INTNT3<br>(in 1/<br>100<br>Sec) | NTAR3<br>(in 1/<br>1000<br>CU) | INTNT4<br>(in 1/<br>100<br>Sec) | NTAR4<br>(in 1/<br>1000<br>CU) |
|---------------------------------|-------------------------------------|---------------------------------|--------------------------------|---------------------------------|--------------------------------|---------------------------------|--------------------------------|---------------------------------|--------------------------------|
| 18000                           | 209                                 | 24000                           | 231                            | 28000                           | 232                            | 36000                           | 233                            | 40000                           | 234                            |

The calculation should result in 1/1000th currency units.

Allocation of the comma position: either 2T or 3T

(The price per time clock is given in 1/1000th currency units.)

**Note:** Allocation of the comma position should only result via AMO-TTBL and not by AMO-DAVF.

Input:

CHANGE-TTBL:TBL=GEN, ELEMENT=COMPOS, TARTBLNO=1, COMPOS=2T; or  
CHANGE-TTBL:TBL=GEN, ELEMENT=COMPOS, TARTBLNO=1, COMPOS=3T;

Creating of the tariff table.

Input:

ADD-

TTBL:TBL=WOCU, TARTBLNO=1, ZONE=LOC, INTDAY=18000, TARDA=209, INTNT1=24000, NTAR1=231, INTNT2=28000, NTAR2=232, INTNT3=36000, NTAR3=233, INTNT4=40000, NTAR4=234, TARBAS=+50, TARMIN=75, SEGTBLNO=10, CHPER=Y, BCHLFACT=100;

**Zone DIST01**

with  $TARBAS=+50$  (0,50 DM) and  $TARMIN=75$  (0,75 DM),  
 $SEGTBLNO=11$ ,  $CHPER=N$ ,  $BCHLFACT=100$ .

| INTDAY<br>(in 1/<br>100<br>Sec) | TARDA<br>Y<br>(in 1/<br>100<br>CU) | INTNT1<br>(in 1/<br>100<br>Sec) | NTAR1<br>(in 1/<br>100<br>CU) | INTNT2<br>(in 1/<br>100<br>Sec) | NTAR2<br>(in 1/<br>100<br>CU) | INTNT3<br>(in 1/<br>100<br>Sec) | NTAR3<br>(in 1/<br>100<br>CU) | INTNT4<br>(in 1/<br>100<br>Sec) | NTAR4<br>(in 1/<br>100<br>CU) |
|---------------------------------|------------------------------------|---------------------------------|-------------------------------|---------------------------------|-------------------------------|---------------------------------|-------------------------------|---------------------------------|-------------------------------|
| 3000                            | 25                                 | 3500                            | 25                            | 3800                            | 25                            | 4200                            | 25                            | 4800                            | 25                            |

The calculation should result in 1/100th currency units.

Allocation of the comma position: either -3, -2, -1,0, +1, +2 or +3  
 (The price per time clock is given in 1/100th currency units.)

Input:

CHANGE-TTBL:TBL=GEN,ELEMENT=COMPOS,TARTBLNO=1,COMPOS=+2;

Creating of the tariff table.

Input:

ADD-

TTBL:TBL=WOCU,TARTBLNO=1,ZONE=DIST01,INTDAY=3000,TARDA=25,INTNT1=3500,NTAR1=25,INTNT2=3800,NTAR2=25,INTNT3=4200,NTAR3=25,INTNT4=4800,NTAR4=25,TARBAS=+50,TARMIN=75,SEGTBLNO=11,CHPER=N,BCHLFACT=100;

### Zone ABR01

with  $TARBAS=+100$  (1,00DM) and  $TARMIN=150$  (1,50 DM),  
 $SEGTBLNO=20$ ,  $CHPER=Y$ ,  $BCHLFACT=100$

| INTDAY<br>(in 1/<br>100<br>Sec) | TARDA<br>Y<br>(in 1/<br>1000<br>CU) | INTNT1<br>(in 1/<br>100<br>Sec) | NTAR1<br>(in 1/<br>1000<br>CU) | INTNT2<br>(in 1/<br>100<br>Sec) | NTAR2<br>(in 1/<br>1000<br>CU) | INTNT3<br>(in 1/<br>100<br>Sec) | NTAR3<br>(in 1/<br>1000<br>CU) | INTNT4<br>(in 1/<br>100<br>Sec) | NTAR4<br>(in 1/<br>1000<br>CU) |
|---------------------------------|-------------------------------------|---------------------------------|--------------------------------|---------------------------------|--------------------------------|---------------------------------|--------------------------------|---------------------------------|--------------------------------|
| 1500                            | 28                                  | 1800                            | 28                             | 2100                            | 28                             | 2400                            | 28                             | 3000                            | 28                             |

The calculation should result in 1/100th currency units.

Allocation of the comma position: either -3, -2, -1,0, +1, +2 or +3  
 (The price per time clock is given in 1/100th currency units.)

Input:

CHANGE-TTBL:TBL=GEN,ELEMENT=COMPOS,TARTBLNO=1,COMPOS=+2;

Creating of the tariff table.

Input:

ADD-

TTBL:TBL=WOCU,TARTBLNO=1,ZONE=ABR01,INTDAY=1500,TARDA=28,INTNT1=1800,NTAR1=28,INTNT2=2100,NTAR2=28,INTNT3=2400,NTAR3=28,INTNT4=3000,NTAR4=28,TARBAS=+100,TARMIN=150,SEGTBLNO=20,CHPER=Y,BCHLFACT=100;

## TTBL - Administration of tariff tables

### Functions of the AMO

#### Zone ABR02

with TARBAS=-150 (1,50 DM) and TARMIN=200 (2,00 DM),  
SEGTBLNO=22, CHPER=Y, BCHLFACT= 100.

| INTDAY<br>(in 1/<br>100<br>Sec) | TARDA<br>Y<br>(in 1/<br>100<br>CU) | INTNT1<br>(in 1/<br>100<br>Sec) | NTAR1<br>(in 1/<br>100<br>CU) | INTNT2<br>(in 1/<br>100<br>Sec) | NTAR2<br>(in 1/<br>100<br>CU) | INTNT3<br>(in 1/<br>100<br>Sec) | NTAR3<br>(in 1/<br>100<br>CU) | INTNT4<br>(in 1/<br>100<br>Sec) | NTAR4<br>(in 1/<br>100<br>CU) |
|---------------------------------|------------------------------------|---------------------------------|-------------------------------|---------------------------------|-------------------------------|---------------------------------|-------------------------------|---------------------------------|-------------------------------|
| 1000                            | 30                                 | 1500                            | 30                            | 2000                            | 30                            | 2500                            | 30                            | 3000                            | 30                            |

The calculation should result in 1/100th currency units.

Allocation of the comma position: either -3, -2, -1,0, +1, +2 or +3  
(The price per time clock is given in 1/100th currency units.)

Input:

CHANGE-TTBL:TBL=GEN, ELEMENT=COMPOS, TARTBLNO=1, COMPOS=+2;

Creating of the tariff table.

Input:

ADD-  
TTBL:TBL=WOCU, TARTBLNO=1, ZONE=ABR02, INTDAY=1000, TARDAY=30, INT  
NT1=1500, NTAR1=30, INTNT2=2000, NTAR2=30, INTNT3=2500, NTAR3=30, I  
NTNT4=3000, NTAR4=30, TARBAS=-  
150, TARMIN=200, SEGTBLNO=22, CHPER=Y, BCHLFACT=100;

4. Adding tariff group table 1 for carrier 1 and service VOICE and NORM for category of calling party, with tariff table 1.

Input:

ADD-  
TTBL:TBL=GRP, GROUPNO=1, CARRIER=1, CATPTY=NORM, SERVICE=VOICE, TA  
RTBLNO=1;

5. Adding tariff group 1 for carrier 1 and services VOICE and DTE and SCRSPC for category of calling party, with tariff table 1.

Input:

ADD-  
TTBL:TBL=GRP, GROUPNO=1, CARRIER=1, CATPTY=SCRSPC, SERVICE=VOICE&  
DTE, TARTBLNO=1;

6. Adding tariff group 1 with clock information for zone DIST01,  
FIXDAY=1, FPLSDAY=KA, PPLSDAY=999999, FIXN1=1,  
FPLSN1=KM, PPLSN1=0, FIXN2=12, FPLSN2=999999,  
PPLSN2=10000, FIXN3=12, FPLSN3=0, PPLSN3=0, FIXN4=1,  
FPLSN4=KA, PPLSN4=11111, SEGTBLNO=1, CHPER=Y.

Input:

ADD-

TTBL:TBL=CLK,TARTBLNO=1,ZONE=DIST01,FIXDAY=1,FPLSDAY=KA,PPLSDAY=999999,FIXN1=1,FPLSN1=KM,PPLSN1=0,FIXN2=12,FPLSN2=999999,PPLSN2=10000,FIXN3=12,FPLSN3=0,PPLSN3=0,FIXN4=1,FPLSN4=KA,PPLSN4=11111,SEGTBLNO=1,CHPER=Y;

7. Set up of tariff CITY-CALL for carrier 1, zone INT01 and service VOICE. The category of calling party is NORM. The tariff table 1 should be used for the display and the rate periode table 1. The display should result on 2 positions after comma. In the selection group the tariff group1 should be used with the tariff table 2. The tariff group 1 with the tariff table 2 should be used too for the output on the OPP, where the costs are displayed on 2 comma positions.

In the tariff CITY-CALL one second takes 0,127 Pfennig (WOCU table).

Allocation of tariff group 0 on carrier 1 and entry of tariff table1 for the user category NORM and service VOICE for the display.

Input:

ADD-

TTBL:TBL=GRP,GROUPNO=0,CARRIER=1,CATPTY=NORM,SERVICE=VOICE,TARTBLNO=1;

Allocation of tariff group 1 for carrier 1 and entry of tariff table 2 for the calling party category NORM and service VOICE as base for the cost calculation in data record.

Input:

ADD-

TTBL:TBL=GRP,GROUPNO=1,CARRIER=1,CATPTY=NORM,SERVICE=VOICE,TARTBLNO=2;

Set up of general tariff records for display and data records. The cost calculation should result on 1/100000th currency units, the output on the display and on the operator's position (OPP) on 2 comma positions.

Input:

CHANGE-TTBL:TBL=GEN,ELEMENT=COMPOS,TARTBLNO=1,COMPOS=2HT;  
CHANGE-TTBL:TBL=GEN,ELEMENT=COMPOS,TARTBLNO=2,COMPOS=2HT;

Set up tariff tables 1 and 2 with 0,127 Pfennig per second.

Input:

ADD-

TTBL:TBL=WOCU,TARTBLNO=1,ZONE=INT01,INTDAY=100,TARDAY=127,INTNT1=100,NTAR1=127,INTNT2=100,NTAR2=127,INTNT3=100,NTAR3=127,INTNT4=100,NTAR4=127,TARBAS=+0,TARMIN=0,SEGTBLNO=1,CHPER=Y,BCHLFACT=100;

ADD-

TTBL:TBL=WOCU,TARTBLNO=2,ZONE=INT01,INTDAY=100,TARDAY=127,INT

## TTBL - Administration of tariff tables

### Functions of the AMO

```
NT1=100,NTAR1=127,INTNT2=100,NTAR2=127,INTNT3=100,NTAR3=127,INTNT4=100,NTAR4=127,TARBAS=+0,TARMIN=0,SEGTBLNO=1,CHPER=Y,BCHLFACT=100;
```

To the controlling of the cost calculation still the carrier 1 must be placed on calculation after time.

Input:

```
CHANGE-GEFE:TYPPARAM=CAR,CARRIER=1,TYPE=TIME,CHRGPLS=N;
```

For back calculation of units, a WCU table with number 1 (which is entered in tariff group 0) and with 12,1 Pfennig per second is necessarily.

Input:

```
ADD-TTBL:TBL=WCU,TARTBLNO=1,TARMIN=0,METHOD=FACTOR,FACTOR=1000,LT1=0,TAR1=121;
```

The priority of the unity price of the WCU table must set on 1/1000th.

Input:

```
CHANGE-DAVF:COMPOS=2T;
```

**Attention:** If the comma position in AMO-DAVF is modified e.g. from +2 to 2T (of calculation in 1/100th currencies on calculation in 1/1000th currencies) it influences the calculations of all WCU tables. If the comma position in AMO-DAVF is modified the WCU tables have to be modified too.

Input:

```
ADD-TTBL:TBL=WCU,TARTBLNO=1,TARMIN=0,METHOD=FACTOR,FACTOR=1000,LT1=0,TAR1=12;
```

**Note:** As WCU table, if a CCU table is created instead of a FACTOR table, the field CONCHRG from the backcounted units (see "calculation method" in the table on page 2729) is calculated.

## 200.2.2 CHANGE-TTBL

Changing of tariffs in the tariff table with or without charge information, tariff group tables, clock tables or general charge records.

For tariffs with charge information, the minimum charge, the multiplication factor and entries of the graduation tariffs can be changed. The parameters TARMIN, GRTARRGN, LT, TAR and METHOD are in a min-1-group, at least one parameter must be given.

For changing the contents of a graduated tariff region it is necessary to enter an input for GRTARRGN and at least an input for LT or TAR. Missing inputs are requested by the Advisory Messages (H09, H08).

If for the tariff tables with charging info, the limit 0 is being changed, and it's not the last (fourth) entry in the table, then the next limit is set to zero and a tariff is requested through DIALOG.

If the last value is changed accidentally from 0 to another value, then this input is ignored, and a warning is displayed. The original entry doesn't get changed in this case.

For tariffs for connections with tariff information, the parameters can be changed one by one, together or all of them. For example for a zone, all five tariffs can be changed, together with the pulses (INTDAY, INTNT1 to INTNT4). The parameters INTDAY, INTNT1..INTNT4, NTAR4, TARBAS, TARMIN, SEGTBLNO and CHPER are in a min-1-group, a minimum of one parameter must be given.

1. Changing tariff tables for connections with call charge information
2. Changing tariff tables for connections without call charge information
3. Changing tariff group tables
4. Changing tables with clock information
5. Changing tables with general informations

### Notice

If one of the Parameters FPLSDAY, FPLSN1..FPLSN4 in the tariff tables with clock information is set to either value K (Karlson random value), KA (Karlson Added random value) or KM (Karlson Modified random value), then the corresponding FIXDAY, FIXN1..FIXN4 is changed too according the following table. Additionally advisory message H11 is printed.

| <b>FPLSDAY, FPLSN1..N4</b> | <b>Corrected FIXDAY, FIXN1..N4</b> |
|----------------------------|------------------------------------|
| KA (Karlson Added)         | 1                                  |
| KM (Karlson Modified)      | 1                                  |
| K (Karlson)                | 0                                  |

|              | TBL=GEN<br>,  ELEMENT=COMPOS, TARTBLNO=<number>, COMPOS=<string>;<br><br>,  ELEMENT=VAT, VAT=<number>;                                                                                                                                                                                                                                                                    | (5) |

### Examples

1. In tariff table 1 with call charge information, the minimum charge should be changed to 4,00 DM, and the tariff for the graduated region 1 should be changed to 0,121 DM. (The comma position must be positioned on 2T or 3T per AMO-DAVF. The settings for AMO-DAVF work only for the cost calculation on tariff tables with charge informations.)

Input:

```
CHANGE-TTBL:TBL=WCU, TARTBLNO=1, TARMIN=400, GRTARRGN=1, TAR=121;
```

2. In tariff table 1 without call charge information, for zone LOC, the day tariff should be changed from 0,20 DM to 0,23 DM. AMO-DAVF COMPOS parameter's value is -3, -2, -1, 0, +1, +2 or +3 (The price per time clock is given in 1/100th currency units.).

Input:

```
CHANGE-TTBL:TBL=WOCU, TARTBLNO=1, ZONE=LOC, TARDAY=23;
```

3. In the tariff group table 1, for CARRIER 1 and Service VOICE and NORM for category of calling party, the number of the tariff table should be changed from 1 to 3.

Input:

CHANGE-  
TTBL:TBL=GRP, GROUPNO=1, CARRIER=1, CATPTY=NORM, SERVICE=VOICE, TARTBLNO=3;

4. In the table 1 with clock informations for zone DIST01, the parameter FIXN2 should be changed from 12 to 15.

Input:

CHANGE-TTBL:TBL=CLK, TARTBLNO=1, ZONE=DIST01, FIXN2=15;

5. In the table with general informations the parameter VAT (value added tax in tenth percent to calculate the net fees) will be changed from 60 tenth percent (6%) to 150 tenth percent (15%).

Formula:  $NET = (GROSS / (100 + VAT)) * 1000$

Input:

CHANGE-TTBL:TBL=GEN, ELEMENT=VAT, VAT=150;

6. In the table with general informations the parameter COMPOS in tariff table 3 will be changed to 3HT.

Input:

CHANGE-TTBL:TBL=GEN, ELEMENT=COMPOS, TARTBLNO=3, COMPOS=3HT;

7. In the tariff table 5 with charge information two graduated tariff regions are entered. (Action for entering a tariff value).

Input:

ADD-  
TTBL:TBL=WCU, TARTBLNO=5, TARMIN=200, METHOD=UNITS, LT1=25, TAR1=60, LT2=50, TAR2=50, LT3=0, TAR3=30;

The limit of the graduation range 3 should be set to 75 units, and the tariff to 0.40 DM. The parameter COMPOS from AMO-DAVF is either -3 or -2, -1, 0, +1, +2 or +3.

Input:

CHANGE-TTBL:TBL=WCU, TARTBLNO=5, GRTARRGN=3, LT=75, TAR=40;

Output:

F07: THERE IS NO ENTRY YET FOR AREA LIMIT MORE THAN 75,  
PLEASE INPUT VALUE  
TAR =

Input:

20;

200.2.3 DELETE-TTBL

For deletion, the user can choose if he wants to delete a tariff table with call charge information, a tariff table without call charge information or the entries for a zone in a tariff table.

For tariff group tables, the user can choose if all entries of a carrier and all services, or all entries for a service and all carriers, or all entries for all carriers and services should be deleted.

When a whole table is deleted, the AMO checks, if a selection table uses this table. In this case a message is displayed to the user.

- 1. Deleting a tariff table with call charge information
- 2. Deleting a tariff table without call charge information
- 3. Deleting a tariff group table
- 4. Deleting a table with clock information
- 5. Delete a table with general Informations

For deletion the parameter COMPOS is set to standardvalue +2.

Procedure overview

| Command code | Parameter                                                                            |     |
|--------------|--------------------------------------------------------------------------------------|-----|
| DELETE-TTBL  | TBL=WCU, TARTBLNO=<number>;                                                          | (1) |
|              | TBL=WOCU, TARTBLNO=<number>, [ZONE=<string>;                                         | (2) |
|              | TBL=GRP, GROUPNO=<number>, [CARRIER=<number><br>[CATPTY=<param>], [SERVICE=<string>; | (3) |
|              | TBL=CLK, TARTBLNO=<number>, [ZONE=<string>;                                          | (4) |
|              | TBL=GEN<br>,   ELEMENT=COMPOS, TARTBLNO=<number>;<br><br>,   ELEMENT=VAT;            | (5) |

Examples

- 1. Deleting tariff table 5 with charge information  
Input:  
DEL-TTBL:TBL=WCU, TARTBLNO=5;
- 2. Deleting all entries for ABR02 in table 1 without call charge information.

Input:

DEL-TTBL:TBL=WOCU,TARTBLNO=1,ZONE=ABR02;

3. Deleting all entries for all CARRIERS and for service VOICE and NORM for category of calling party in tariff table 1.

Input:

DEL-TTBL:TBL=GRP,GROUPNO=1,CATPTY=NORM,SERVICE=VOICE;

4. Deleting entries for CARRIER 3 and all services and categories of calling party in tariff group table 2.

Input:

DEL-TTBL:TBL=GRP,GROUPNO=2,CARRIER=3;

5. Deleting the entry CARRIER 4 and service VOICE for all categories of calling party in tariff group table 2.

Input:

DEL-TTBL:TBL=GRP,GROUPNO=2,CARRIER=4,SERVICE=VOICE;

6. Deleting the entry for zone LOC in the table 1 with clock information.

Input:

DEL-TTBL:TBL=CLK,TARTBLNO=1,ZONE=LOC;

7. Deleting the entry for all zones in the table 1 with clock information.

Input:

DEL-TTBL:TBL=CLK,TARTBLNO=1;

8. Deleting of a comma position from tariff table 1 with general informations.

Input:

DEL-TTBL:TBL=GEN,ELEMENT=COMPOS,TARTBLNO=1;

9. Deleting from value added tax from table with general informations.

Input:

DEL-TTBL:TBL=GEN,ELEMENT=VAT;

## **200.2.4 DISPLAY-TTBL/REGEN-TTBL**

1. Display entries of the tariff tables and tariff group tables, in list format (DISPLAY)
2. Display entries of the tariff tables and tariff group tables, in position oriented commands for regeneration (REGEN).

TTBL - Administration of tariff tables

Functions of the AMO

If only ZONE is specified in the WOCU branch, then all entries of the zone in all tariff tables with this zone will be displayed. If ZONE is not entered (only TARTBLNO), then the whole table is displayed. If both zone and table is entered, then only the entry for this zone is displayed.

Procedure overview

| Command code    | Parameter                                       |      |
|-----------------|-------------------------------------------------|------|
| DISPLAY-TTBL    | TBL=WCU, [TARTBLNO=<number>];                   | (1)  |
|                 | TBL=WOCU, [TARTBLNO=<number>], [ZONE=<string>]; | (2)  |
|                 | TBL=CLK, [TARTBLNO=<number>], [ZONE=<string>];  | (3)  |
|                 | TBL=GRP, [GROUPNO=<number>];                    | (4)  |
|                 | TBL=GEN;                                        | (5)  |
| REGENERATE-TTBL | TBL=WCU, [TARTBLNO=<number>];                   | (6)  |
|                 | TBL=WOCU, [TARTBLNO=<number>], [ZONE=<string>]; | (7)  |
|                 | TBL=CLK, [TARTBLNO=<number>], [ZONE=<string>];  | (8)  |
|                 | TBL=GRP, [GROUPNO=<number>];                    | (9)  |
|                 | TBL=GEN;                                        | (10) |

Examples

1. Displaying tariff table 1 with call charge information

Input:

DISP-TTBL:TBL=WCU,TARTBLNO=1;

Output:

```
TAB: 1      TARIFF TABLE WITH CALL CHARGE INFORMATION

MINIMUM CHARGE:  400
COST CALCULATION METHOD: FACTOR
MULTIPL. FACTOR FOR COSTS IN TENTH PERCENT: 1000

AREA LIMIT                PRICE/CALL CHARGE UNIT
MORE THAN      0                121
```

2. Display tariff table 2 with call charge information

Input:

DISP-TTBL:TBL=WCU,TARTBLNO=2;

Output:

TAB: 2      TARIFF TABLE WITH CALL CHARGE INFORMATION

MINIMUM CHARGE: 200  
COST CALCULATION METHOD: FACTOR  
MULTIPL. FACTOR FOR COSTS IN TENTH PERCENT: 1000

| AREA LIMIT   | PRICE/CALL CHARGE UNIT |
|--------------|------------------------|
| 0 - 25       | 60                     |
| 26 - 50      | 50                     |
| 51 - 75      | 40                     |
| MORE THAN 75 | 20                     |

3. If a table with call charge information has no entries at all, the output looks like the following:

Input:

DISP-TTBL:TBL=WCU,TARTBLNO=3;

Output:

H12: THE TARIFF TABLE WITH CALL CHARGE INFORMATION IS EMPTY

4. Displaying tariff table 1 without call charge information

Input:

DISP-TTBL:TBL=WOCU,TARTBLNO=1;

Output:

TAB: 1      TARIFF TABLE WITHOUT CALL CHARGE INFORMATION

|        | DAY   | NIGHT1 | NIGHT2 | NIGHT3 | NIGHT4 | TARBA | TARM  | TB   | TW    | FAC  |      |     |    |       |
|--------|-------|--------|--------|--------|--------|-------|-------|------|-------|------|------|-----|----|-------|
| ZONE   | INTVL | TARF   | INTVL  | TARF   | INTVL  | TARF  | INTVL | TARF | INTVL | TARF | PR   | PR  |    |       |
| LOC    | 18000 | 209    | 24000  | 231    | 28000  | 232   | 36000 | 233  | 40000 | 234  | +50  | 75  | 10 | Y 100 |
| DIST01 | 3000  | 25     | 3500   | 25     | 3800   | 25    | 4200  | 25   | 4800  | 25   | +50  | 75  | 11 | N 100 |
| ABR01  | 1500  | 28     | 1800   | 28     | 2100   | 28    | 2400  | 28   | 3000  | 28   | +100 | 150 | 20 | Y 100 |
| ABR02  | 1000  | 30     | 1500   | 30     | 2000   | 30    | 2500  | 30   | 3000  | 30   | -150 | 200 | 22 | Y 100 |

5. If a table without call charge information has no entries at all, the display looks like the following:

Input:

DISP-TTBL:TBL=WOCU,TARTBLNO=2;

Output:

H13: THE TARIFF TABLE WITHOUT CALL CHARGE INFORMATION IS EMPTY

6. Example of a listing of a tariff group table

## TTBL - Administration of tariff tables

### Functions of the AMO

Input:

DISP-TTBL:TBL=GRP, GROUPNO=1;

Output:

TAB: 1      TARIFF GROUP TABLE

|         |        | TARIFF TABLE FOR SERVICE: |       |     |     |
|---------|--------|---------------------------|-------|-----|-----|
| CARRIER |        | CATPTY                    | VOICE | FAX | DTE |
| 0       | NORM   |                           |       |     |     |

#### 7. Example of a listing of a tariff table with clock information

Input:

DISP-TTBL:TBL=CLK, TARTBLNO=1;

Output:

TAB: 1      TARIFF TABLE WITH CLOCK INFORMATION

| ZONE   | DAY |       |        |     | NIGHT1/NIGHT3 |        |     |        | NIGHT2/NIGHT4 |     |       |        | TABNU | TW |
|--------|-----|-------|--------|-----|---------------|--------|-----|--------|---------------|-----|-------|--------|-------|----|
|        | FIX | FIRST | PERIOD | FIX | FIRST         | PERIOD | FIX | FIRST  | PERIOD        | FIX | FIRST | PERIOD |       |    |
| DIST01 | 1   | KA    | 999999 | 1   | KM            | 0      | 15  | 999999 | 10000         |     |       |        |       |    |
|        |     |       |        | 12  | 0             | 0      | 1   | KA     | 11111         | 1   | Y     |        |       |    |

#### 8. Displaying tariff table 2 with call charge information, regeneration

Input:

REG-TTBL:TBL=WCU, TARTBLNO=2;

Output:

ADD-TTBL:WCU, 2, 200, FACTOR, 1000, 25, 60, 50, 50, 75, 40, 20;

**9. Regenerating tariff table 1 without call charge information:**

**Input:**

REG-TTBL:TBL=WOCU,TARTBLNO=1;

**Output:**

ADD-  
TTBL:WOCU,1,LOC,18000,23,24000,231,28000,232,36000,233,40000,  
234, +50,75,10,Y,100;  
ADD-  
TTBL:WOCU,1,DIST01,3000,25,3500,25,3800,25,4200,25,4800,25,  
+50,75,11,N,100;  
ADD-  
TTBL:WOCU,1,ABR01,1500,28,1800,28,2100,28,2400,28,3000,28,  
+100,150,20,Y,100;  
ADD-  
TTBL:WOCU,1,ABR02,1000,30,1500,30,2000,30,2500,30,3000,30, -  
150,200,22,Y,100;

**10. Regenerating tariff group table 1**

**Input:**

REG-TTBL:TBL=GRP,GROUPNO=1;

**Output:**

ADD-TTBL:GRP,1,1,NORM,VOICE,3;  
ADD-TTBL:GRP,1,1,SCRSPC,VOICE,1;  
ADD-TTBL:GRP,1,1,SCRSPC,DTE,1;

**11. Regenerating tariff table 1 with clock information**

**Input:**

REG-TTBL:TBL=CLK,TARTBLNO=1;

**Output:**

ADD-  
TTBL:CLK,1,DIST01,1,KA,999999,1,KM,0,15,999999,10000,12,0,0,1  
, KA,11111,1,Y;

**12. Regenerating table with general informations (comma position and value added tax).**

**Input:**

REG-TTBL:TBL=GEN;

**Output:**

CHANGE-TTBL:GEN,VAT,150;  
CHANGE-TTBL:GEN,COMPOS,1,2HT;  
CHANGE-TTBL:GEN,COMPOS,2,2HT;  
CHANGE-TTBL:GEN,COMPOS,3,3HT;  
CHANGE-TTBL:GEN,COMPOS,4,+2 ;  
CHANGE-TTBL:GEN,COMPOS,5,+2 ;  
CHANGE-TTBL:GEN,COMPOS,6,+2 ;  
CHANGE-TTBL:GEN,COMPOS,7,+2 ;  
CHANGE-TTBL:GEN,COMPOS,8,+2 ;  
CHANGE-TTBL:GEN,COMPOS,9,+2 ;

## 200.3 Parameter description

|                 |                                                                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| BCHLFACT        | The charge calculation factor for a B-Channel, in percent                                                                                        |
| Type of input   | : Single value,<br>15th parameter of a min-1-Group (TBL=WOCU) (CHANGE)                                                                           |
| Possible values | : 0 to 999                                                                                                                                       |
| Default value   | : 100                                                                                                                                            |
| CARRIER         | Number of the carrier of a connection                                                                                                            |
| Type of input   | : Single value,<br>required (ADD, CHANGE)<br>optional (DELETE)                                                                                   |
| Possible values | : 0 to 9                                                                                                                                         |
| CATPTY          | Category of calling party                                                                                                                        |
| Type of input   | : Single value,<br>required (ADD, CHANGE)                                                                                                        |
| Possible values | : NORM = Normal Subscriber<br>SCRSPC = Subscriber with Special Charging<br>PUPHON = Public Phone<br>MTEQ = Maintenance Equipment                 |
| CHPER           | Mark for changing the period                                                                                                                     |
| Type of input   | : Single value, required (ADD)<br>17th parameter of a min-1-group (TBL=CLK) (CHANGE)                                                             |
| Possible values | : Y = Costs are calculated based on the actual time of day<br>N = Costs are calculated based on connection start time of day (no section change) |
| Default value   | : Y                                                                                                                                              |
| COMPOS          | Position of comma in cdr output at display console                                                                                               |
|                 | Works only on tariff tables without charge information                                                                                           |
| Type of Input   | Single Value, required (CHANGE)                                                                                                                  |
| Possible values | : -3, -2, -1, 0, +1, +2, +3, 2T, 3T, 2HT and 3HT                                                                                                 |
| Default value   | : +2                                                                                                                                             |

## TTBL - Administration of tariff tables

### Parameter description

Possible values : 0 to 15

FPLSDAY Delay time for the first pulse (in 10 ms) for DAY

Type of input : Single value,  
required (ADD)  
2nd parameter of a min-1-group (TBL=CLK) (CHANGE)

Possible values : 0 to 999999 = Static delay in 10 ms  
KA = Karlson added random value  
KM = Karlson modified random value  
K = Karlson random values

FPLSN1 Delay time for the first pulse (in 10 ms) for N1

Type of input : Single value,  
required (ADD)  
5th parameter of a min-1-group (TBL=CLK) (CHANGE)

Possible values : 0 to 999999 = Static delay in 10 ms  
KA = Karlson added random value  
KM = Karlson modified random value  
K = Karlson random values

FPLSN2 Delay time for the first pulse (in 10 ms) for N2

Type of input : Single value,  
required (ADD)  
8th parameter of a min-1-group (TBL=CLK) (CHANGE)

Possible values : 0 to 999999 = Static delay in 10 ms  
KA = Karlson added random value  
KM = Karlson modified random value  
K = Karlson random values

FPLSN3 Delay time for the first pulse (in 10 ms) for N3

Type of input : Single value,  
required (ADD)  
11th parameter of a min-1-group (TBL=CLK) (CHANGE)

Possible values : 0 to 999999 = Static delay in 10 ms  
KA = Karlson added random value  
KM = Karlson modified random value  
K = Karlson random values

|                 |                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| FPLSN4          | Delay time for the first pulse (in 10 ms) for N4                                                                                            |

| Possible values | : maximum 5 digits<br>00001 to 99999 (see Appendix)                                                                                         |

## TTBL - Administration of tariff tables

### Parameter description

|                 |                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------|
| INTNT3          | Time units in 1/100 seconds for night tariff 3                                                      |
| Type of input   | : Single value,<br>required (ADD)<br>7th parameter of a min-1-group (TBL=WOCU) (CHANGE)             |
| Possible values | : maximum 5 digits<br>00001 to 99999 (see Appendix)                                                 |
| INTNT4          | Time units in 1/100 seconds for night tariff 4                                                      |
| Type of input   | : Single value,<br>required (ADD)<br>9th parameter of a min-1-group (TBL=WOCU) (CHANGE)             |
| Possible values | : maximum 5 digits<br>00001 to 99999 (see Appendix)                                                 |
| LT              | Limit value of units, valid until the entered value                                                 |
| Type of input   | : Single value, required (ADD)<br>3rd parameter of a min-1-group (TBL=WCU) (CHANGE)                 |
| Possible values | : 0 to 9999                                                                                         |
| LT1             | Limit value of units, valid until the entered value                                                 |
| Type of input   | : Single value, required (ADD)                                                                      |
| Possible values | : 0 to 9999                                                                                         |
| LT2             | Limit value of units, valid until the entered value                                                 |
| Type of input   | : Single value, required (ADD)                                                                      |
| Possible values | : 0 to 9999                                                                                         |
| LT3             | Limit value of units, valid until the entered value                                                 |
| Type of input   | : Single value, required (ADD)                                                                      |
| Possible values | : 0 to 9999                                                                                         |
| METHOD          | Cost calculation method                                                                             |
| Type of input   | : Single value,<br>required (ADD)<br>5th parameter of a min-1-group (TBL=WCU) (CHANGE)              |
| Possible values | : FACTOR =Costs are multiplied by FACTOR<br>UNITS =Costs are result of back calculated charge units |

|                 |                                                                                          |
|-----------------|------------------------------------------------------------------------------------------|
| NTAR1           | Currency value per Time units (NTAR1)                                                    |
| Type of input   | : Single value,<br>required (ADD)<br>4th parameter of a min-1-group (TBL=WOCU) (CHANGE)  |
| Possible values | : maximum 4 digits<br>0000 to 9999 (see Appendix)                                        |
| NTAR2           | Currency value per Time units (NTAR2)                                                    |
| Type of input   | : Single value,<br>required (ADD)<br>6th parameter of a min-1-group (TBL=WOCU) (CHANGE)  |
| Possible values | : maximum 4 digits<br>0000 to 9999 (see Appendix)                                        |
| NTAR3           | Currency value per Time units (NTAR3 )                                                   |
| Type of input   | : Single value,<br>required (ADD)<br>8th parameter of a min-1-group (TBL=WOCU) (CHANGE)  |
| Possible values | : maximum 4 digits<br>0000 to 9999 (see Appendix)                                        |
| NTAR4           | Currency value per Time units (NTAR4)                                                    |
| Type of input   | : Single value,<br>required (ADD)<br>10th parameter of a min-1-group (TBL=WOCU) (CHANGE) |
| Possible values | : maximum 4 digits<br>0000 to 9999 (see Appendix)                                        |
| PPLSDAY         | Period for the periodic pulses (in 10 ms) for DAY                                        |
| Type of input   | : Single value<br>required (ADD)<br>3rd parameter of a min-1-group (TBL=CLK) (CHANGE)    |
| Possible values | : 0 to 999999                                                                            |
| PPLSN1          | Period for the periodic pulses (in 10 ms) for N1                                         |
| Type of input   | : Single value                                                                           |

## TTBL - Administration of tariff tables

### Parameter description

|          |                                                  |                                                                                                                                                |
|----------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
|          |                                                  | required (ADD)<br>6th parameter of a min-1-group (TBL=CLK) (CHANGE)                                                                            |

|                 | TIE01   | 1st zone for tie connections    |
|                 | TIE0n   | nth zone for tie connections    |
|                 | TIE09   | 9th zone for tie connections    |

## 200.4 Appendix to the parameter description

### Parameterdescription for WCU tables

Supplement of with the parameters TARMIN, TAR, TAR1, TAR2, TAR3, TAR4 possible values:

### Output format

The calculated costs are displayed according to the settings added through the AMO-DAVF. Display settings are:

1. Comma position: the position of the comma (-3 to 3 and 3T, 2T)

Examples:

|                    |              |                 |
|--------------------|--------------|-----------------|
| Comma position: 3  | Value: 30558 | Output: 305,580 |
| Comma position: 2  | Value: 30558 | Output: 305,58  |
| Comma position: 1  | Value: 30558 | Output: 305,6   |
| Comma position: 0  | Value: 30558 | Output: 306     |
| Comma position: -1 | Value: 30558 | Output: 3056    |
| Comma position: -2 | Value: 30558 | Output: 30558   |

## TTBL - Administration of tariff tables

### Appendix to the parameter description

|                              |              |                |
|------------------------------|--------------|----------------|
| Comma position: -3           | Value: 30558 | Output: 305580 |
| Comma position: 2T (Rounded) | Value: 30558 | Output: 30,56  |
| Comma position: 3T           | Value: 30558 | Output: 30,558 |

2. Currency identifier: Character string z.B: DEM, ATS, USD etc.

#### Parameterdescription for WOCU tables

Supplement of with the parameters TARBAS, TARMIN, TARDAY, NTAR1, NTAR2, NTAR3, NTAR4 possible values

#### Output format

The calculated costs are output according to the representation features adjustable by means of branch GEN (appropriately to the respective tariff tables)

1. Comma position: the position of the comma (-3 to 3 and 3T, 2T)

Examples:

|                               |              |                 |
|-------------------------------|--------------|-----------------|
| Comma position: 3             | Value: 30558 | Output: 305,580 |
| Comma position: 2             | Value: 30558 | Output: 305,58  |
| Comma position: 1             | Value: 30558 | Output: 305,6   |
| Comma position: 0             | Value: 30558 | Output: 306     |
| Comma position: -1            | Value: 30558 | Output: 3056    |
| Comma position: -2            | Value: 30558 | Output: 30558   |
| Comma position: -3            | Value: 30558 | Output: 30558   |
| Comma position: 2T (Rounded)  | Value: 30558 | Output: 30,56   |
| Comma position: 3T            | Value: 30558 | Output: 30,558  |
| Comma position: 2HT (Rounded) | Value: 30558 | Output: 0,31    |
| Comma position: 3HT (Rounded) | Value: 30558 | Output: 0,306   |

2. Currency identifier: Character string z.B: DEM, ATS, USD etc.

#### Cost calculation

Cost calculation (with charge information) is performed in 1/100ths of currency units if AMO- DAVF COMPOS parameter's value is 2T or 3T. The currency unit is the one unit with the indicated currency flags. This setting corresponds to comma position 2. For example the calculated amount is equal to 30558, which corresponds to the costs of 305,58 currency units.

If the comma position of AMO-DAVF is equal to 2T or 3T thus in 1/1000th currency units one counts. If the calculated costs amount to 30558, thus the display shows in case COMPOS=2HT the amount 30,56, in case 3HT the amount 30,558. This applies only, if the calculation takes place after the branch WCU of the AMO-TTBL.

The positive comma positions do not influence only the number of places which can be displayed after the comma, the value or amount however. From it results that all tariff specifications must be indicated in 1/100th currencies, if COMPOS is 0 to +3. If COMPOS is 2T or 3T then in 1/1000th.

For tariff values (TARMIN, TARIF1, etc.) the valid range is from 0000 to 9999.

Negative comma positions mean an output without comma position, with a shift of the comma by 1 to 3 positions to the right (this is equivalent to a division by  $10^{\text{Comma position}}$ ). This means that a comma position of -1 and a value of 30558 gives a cost of  $305,58 / 10^{-1} = 3056$ , for comma position -2 a cost of  $305,58 / 10^{-2} = 30558$ , etc.

With calculation after zone the comma position configures tariff tables-non standard. In the branch GEN the comma position administers similar to as by AMO-DAVF. If the comma position is equal to -3, -2, -1, 0, +1, +2 oder +3, the cost calculation takes place in 1/100th currency units. At comma position equal to 2T or 3T the cost calculation takes place in 1/1000th currency units, at comma position 2HT or 3HT the cost calculation takes place in 1/100000th currency units.

The minimum tariff (TARMIN) and the basic tariff (TARBAS) become further 1/100th currency units.

**Attention:** The value of the comma position applies not only for the assigned tariff table! If there are different tariff table numbers used for the display output (tariff table 0) and the data record (tariff table from the selection group) then a comma position is for both tariff tables to set.

Example 1:

A call charge unit costs 12,1 Pfennigs.

Input: TARIF = 0121 (00,121 DEM), comma position 3, currency identifier = 'DEM'. The parameter COMPOS of AMO-TTBL ist 2T or 3T.

Example 2:

90 seconds connection time with day tariff costs 3,6 ATS.

Input: TARDAY = 0360 (03,60 ATS), INTDAY = 9000 (in 1/100ths of seconds), Comma position 1 or 2, Currency identifier = 'ATS'. The parameter COMPOS of AMO-TTBL is +2.

Example 3:

## **TTBL - Administration of tariff tables**

### **Error- and Advisory Messages**

A call charge unit costs 812 Lire. We would have to enter parameter TAR = 81200 (812,00 Liras). But only 4 digits are allowed, so this is not permitted.

Solution: Add comma position -1, then TAR = 8120. That's 81,20 Lire, but due to the negative comma position, the output is multiplied by 100.

#### **Example 4:**

A call charge unit costs 1350 Lire. We would have to enter parameter TAR = 135000 (1350,00 Lire).

Solution: Add comma position -2, then TAR = 1350. That's 13,50 Lire, but due to the negative comma position, the output is multiplied by 100.

#### **Example 5:**

The tariff modell CITY-CALL costs 0,127 Pfennig per second (every daytime).

Input: INTDAY, INTNT1, INTNT2, INTNT3, INTNT4 = 100 (1 second), TARDAY, NTAR1, NTAR2, NTAR3, NTAR4 =127. The used tariff table 2HT or 3HT installes in the branch COMPOS (the calculation in 1/100000th currency units and output on display in 2 or 3 back comma positions)

## **200.5 Error- and Advisory Messages**

### **200.5.1 Error Messages**

F01: ONLY VALUES FROM -9999 TO +9999 ARE ALLOWED  
F02: ONLY VALUES FROM 0 TO 999999 OR K, KA, KM ARE ALLOWED  
F03: SELECTED TABLE WAS ALREADY ONCE CREATED  
F04: FOR THE DECIMAL POINT IS ONLY 2T, 3T, 2HT, 3HT AND THE RANGE FROM -3 TO +3  
VALID  
F05: IT IS NOT POSSIBLE TO CHANGE THE SELECTED FIELD  
F06: NO TABLE ENTRY TO DELETE  
F07: THERE IS NO ENTRY YET FOR AREA LIMIT MORE THAN 0, PLEASE INPUT VALUE  
F08: PLEASE ENTER PARAMETER LT OR TAR  
F09: PLEASE ENTER PARAMETER GRTARRGN  
F10: AREA LIMIT SMALLER THAN PREVIOUS ONE, PLEASE INPUT A NEW ONE  
F11: AREA LIMIT LARGER THAN THE NEXT ONE, PLEASE INPUT A NEW ONE  
F12: VALUE ALL FOR PARAMETER SERVICE CANNOT BE CONCATENATED

## **200.5.2 Advisory Messages**

H01: not in use  
H02: not in use  
H03: TABLE ENTRY DELETED, TABLE WAS STILL USED IN SELECTION GROUP  
H04: not in use  
H05: not in use  
H06: not in use  
H07: TABLE ENTRY DELETED, TABLE IS STILL USED IN TARIFF GROUP TABLE

Error- and Advisory Messages

## 201 TWABE - Partial Dialling Plan for Networking

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

AMO TWABE is used by call processing (CP) to collect dialed digits up to a predefined number in the device handler (DH) and to present them to digit analysis as a unit. This obviates the need to process those messages on the way between the DH and the CP which would otherwise be replaced after each digit dialed.

To set up TWABE, the digit sequence to be translated is specified first (up to 3 digits) followed by the number of digits to be collected before the dialed number is to be passed on to digit analysis.

### Example:

Of the station numbers beginning with 32, there is not single one which has less than 5 digits and leads to a digit analysis result (DAR). To account for this fact, 5 digits are to be collected right as soon as the digit sequence "32" is detected.

It should be noted that unlike WABE (digit analysis) TWABE has no DPLN groups. This is why, for a specific digit sequence, only that value should be entered which corresponds to the shortest length of all station numbers which begin under any DPLN group with this digit sequence.

### Example:

Under 4300, DAR=HUNT is set up in DPLN=1 and under 43 DAR=TIE in DPLN=2. If the value 4 were entered for parameter LEN in TWABE under STNO=43, the system would not be able to identify a situation in which DAR TIE is dialed because it would always expect 4 digits. Only LEN=2 must be entered under STNO=43. This, however, means that there is actually no entry since "43" already consists of 2 digits.

The TWABE is not automatically derived from specific entries in the WABE. AMO TWABE must therefore be used to set up the complete partial DPLN for all internal and external station numbers as well as all codes.

### 201.1 Restrictions

This description is valid from SP300-V3.4

**201.2 Interrelationships**

- AMO WABE : Dialling plans, feature access codes

**201.3 Functions of the AMO**

- ADD-TWABE : Add the partial dialling plan
- DELETE-TWABE : Cancel the partial dialling plan
- DISPLAY-TWABE : Interrogate the partial dialling plan
- REGENERATE-TWABE : Regenerate the partial dialling plan

**201.3.1 AMO-Noun in USA**

If the AMO is run in the US, TWABE is DPLNW

**201.3.2 ADD-TWABE**

Any existing entries will simply be overwritten by the new entries provided this does not give rise to any irregularities. If, for example, the entry LEN=4 is made for STNO=45 and the command "ADD-TWABE:457,6;" entered, LEN=6 will be entered for STNO=457, and LEN=4 (which used to be the entry for STNO=45) will now be entered for the station numbers 450 to 456 and 458 to 459. Advisories will be issued to notify the user of these changes. If, in our example, the old entry were 2, it would be impossible to relocate the entry. The command would be rejected and an error message issued.

**Procedure Overview**

| Command Code | Parameter                     |
|--------------|-------------------------------|
| ADD-TWABE    | STNO=<key-num>, LEN=<number>; |

**Examples**

1. Assign the call number 457 with combined length 6

Input:

ADD-TWABE:STNO=457, LEN=6;

2. Assign the station numbers 45 to 48 with combined length 7

Input:

```
ADD-TWABE:STNO=45&&48,LEN=7;
```

Output:

```
H01: OVERWRITING ENTRY FOR STNO 477
H01: OVERWRITING ENTRY FOR STNO 478
H01: OVERWRITING ENTRY FOR STNO 482
```

### 201.3.3 DELETE-TWABE

Deleting a station number or a range of station numbers means entering a value for each STNO specified which guarantees that the dialed digits are sent to the digit analysis (WABE) one by one. In doing so, a pre-analysis can be avoided. For all digit sequences which have not been entered the AMO will issue suitable advisories.

#### Procedure Overview

| Command Code | Parameter       |
|--------------|-----------------|
| DELETE-TWABE | STNO=<key-num>; |

### 201.3.4 DISPLAY-TWABE

There are two possible ways to interrogate the contents of the TWABE tree. contents of the TWABE tree. If the parameter STNO is given, a line is output for every entry in the specified range. If STNO is not specified, the contents appear in the form of a box table in which every row of entries represents a table of the TWABE tree. In each box is information for a chain (U) or a terminating entry.

For every terminating entry is output that it may be processed by the AMO TWABE (T). Next to this is a length entry (2 to 18 or N for NOGO=1). NOGO means that any digits which would exceed the length of the STNO of the entry will not be collected just as if the length of the STNO had been specified.

#### Example:

We assume that NOGO is entered for STNO=138&139. This corresponds to the value 1 but 3 digits have already been translated before the value is actually recognized. Any further digits will also be forwarded one by one (i.e. they will not be collected).

Note:

If the user wishes to output the complete TWABE in STNO format, the parameter STNO=0&&9 should be specified in the command. By either specifying a small range of STNOs or a single STNO only those entries whose STNO begins with one of the specified digit sequences will be output (see examples).

Procedure Overview

| Command Code  | Parameter         |
|---------------|-------------------|
| DISPLAY-TWABE | [STNO=<key-num>]; |

Examples

1. Interrogate all TWABE tables in block form

Input:

DISPLAY-TWABE;

Output:

|     | 0                                                                             | 1                 | 2                         | 3                             | 4                  | 5     | 6 | 7 | 8 | 9 |
|-----|-------------------------------------------------------------------------------|-------------------|---------------------------|-------------------------------|--------------------|-------|---|---|---|---|
|     | .   T   N   U                                                                 | T   4   T   5   U | U                         | T   3   T   8   T   N   T   N |                    |       |   |   |   |   |
| 1.  | U                                                                             | U                 | T   N   U                 | T   N   U                     | T   5   T   18   U | T   N |   |   |   |   |
| 4.  | T   5   T   5   U                                                             | U                 | T   N   T   4   T   4   U | U                             | T   N              |       |   |   |   |   |

| 47. | T   N   T   N   T   N   T   5   T   N   T   5   T   5   T   5   T   N   T   N |                   |                           |                               |                    |       |   |   |   |   |
| 48. | T   N   T   N   T   7   T   N   T   5   T   5   T   N   T   N   T   5   T   5 |                   |                           |                               |                    |       |   |   |   |   |

The first line contains the entries in the entry-level table (i.e. those under one-digit STNOs. Wherever there is a "U" beneath a digit, a line will be created with this digit in the next block (in our example this is

the case for 1, 4 & 5). This line contains information about the two-digit STNOs. The last of these digits also reappears in the header. For each "U" entry in a line, a line with the configured data will be output in the corresponding block with the STNO at the beginning. No "U" will appear in these lines since the STNO to be entered was limited to three digits.

2. Interrogate the entries for station numbers 5 to 7 and above

Input:

DISPLAY-TWABE:STNO=5&&7;

Output:

| STNO | SOURCE | LEN  |
|------|--------|------|
| 50   | TWABE  | NOGO |
| 51   | TWABE  | 5    |
| 52   | TWABE  | 5    |
| 53   | TWABE  | 5    |
| 54   | TWABE  | NOGO |
| 55   | TWABE  | NOGO |
| 56   | TWABE  | NOGO |
| 57   | TWABE  | NOGO |
| 58   | TWABE  | NOGO |
| 59   | TWABE  | NOGO |
| 6    | TWABE  | 3    |
| 7    | TWABE  | 8    |

3. Interrogate the entries for station numbers 47 and above

Input:

DISPLAY-TWABE:STNO=47;

Output:

| STNO | SOURCE | LEN  |
|------|--------|------|
| 470  | TWABE  | NOGO |
| 471  | TWABE  | NOGO |
| 472  | TWABE  | NOGO |
| 473  | TWABE  | 5    |
| 474  | TWABE  | NOGO |
| 475  | TWABE  | 5    |
| 476  | TWABE  | 5    |
| 477  | TWABE  | 5    |
| 478  | TWABE  | NOGO |
| 479  | TWABE  | NOGO |

**201.3.5 REGENERATE-TWABE**

**Procedure Overview**

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-TWABE | ;         |

**Example**

Regenerate the TWABE tree

Input:

REGENERATE-TWABE;

Output:

ADD-TWABE:           6 , 3 ;  
ADD-TWABE:           7 , 8 ;  
ADD-TWABE: 16 && 17 , 5 ;  
ADD-TWABE: 114 && 130 , 7 ;  
ADD-TWABE: 135 && 139 , 7 ;  
ADD-TWABE: 180 && 430 , 7 ;  
ADD-TWABE: 438 && 482 , 7 ;

**201.4 Parameter Description**

|      |                                                                                                                                                                                                             |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LEN  | Length for entry to table (at end of TWABE tree)<br>Type of Input : Single value, mandatory<br>Possible Values : 2-18, at least length of STNO                                                              |
| STNO | Station number (to be processed)<br>Type of Input : 1-2 single values or 1 range mandatory (ADD, DELETE)optional (DISPLAY)<br>Possible Values : 0-9, up to 3 digits must be equal length within a parameter |

**201.5 Error Messages and Advisories**

**201.5.1 Error Messages**

F01: THE TWO VALUES OF STNO ARE NOT EQUAL IN LENGTH  
F02: THE VALUE FOR LEN IS LESS THAN THE LENGTH OF STNO  
F03: STNO @@@ ALREADY HAS A DPLN ENTRY

F04: ENTRY FOR STNO <stno> CANNOT BE RELOCATED  
F05: UNABLE TO DELETE AN ENTRY  
F06: ENTRY CANNOT BE RELOCATED AFTER STNO <stno>

## **201.5.2 Advisories**

H01: OVERWRITING ENTRY FOR STNO <stno>  
H02: ENTRY FOR STNO <stno> RELOCATED MINUS ONE DIGIT  
H03: NO ENTRY FOUND

Error Messages and Advisories

## 202 UCSU - Unit Configuration of Switching Unit

|                      |                               |
|----------------------|-------------------------------|
| Interrelationships   | Parameter Description         |
| Functions of the AMO | Error messages and advisories |

By means of AMO UCSU the

- Line/Trunk Group (LTG),
- Line/Trunk Unit (LTU) or
- Line/Trunk Units for NBCS access points (AP)

are configured.

The data of the centralized modules is basically initialized in the HW structure memory of the SWU-DB. With the action 'ADD a call processing unit' the status except the central SIU 'not equipped' is cancelled.

### Note

The AMO itself determines in which type of system it is running and reacts accordingly.

### 202.1 Interrelationships

- AMO CONSY : Administration of System Configuration Data
- AMO SIPCO : System IP address configuration
- AMO APRT : Access Point Routing Table
- AMO STMIB : Configuration of NCUI boards
- AMO USSU : Unit Switch of SWU
- AMO LPROF : LCR Profiles for source dependent routing
- AMO LDPLN : LCR Dialing Plan

### 202.2 Functions of the AMO

- [ADD-UCSU](#) : Create LTG and LTU
- [CHANGE-UCSU](#) : Change LTU, SIPARTNO, MTS/CONF-Module and configure overlay-LTUs

## UCSU - Unit Configuration of Switching Unit

### Functions of the AMO

- **DELETE-UCSU** : Cancel LTG, LTU and overlay-LTUs
- **DISPLAY-UCSU** : Interrogate status of LTG, LTU
- **REGENERATE-UCSU** : Regenerate LTG and LTU

## 202.2.1 ADD-UCSU

### Create LTG

With the creation of an LTG the LTG status 'not equipped' is cancelled and the LTG is assigned the status 'not loaded'.

The LTG newly created by AMO UCSU can be placed into service by means of AMO USSU following complete configuration.

Since EV3.0 only one LTG (LTG1) can be configured. The parameter itself will not be canceled for certain reasons.

### Create LTU or AP

The data (module type, identification code) required for the creation of an LTU is read out of the module table (UBGDAT) reloaded by the AMO and entered in the hardware structure memory of the SWU database. Before an LTU is created the associated LTG must be set up.

The LTPARTNO parameter specifies which LTUC board will be added.

If the LTUC board doesn't correspond to the system type the AMO will be aborted.

With parameter FRMTYPE the type of the LTU-shelf can be determined.

### Hint:

- Due to the same hardware assembly, AMO UCSU can not distinguish the new HiPath4000 600 ECS from the old HiPath4000 600 ECX. The different restrictions between the HiPath4000 600 ECX / HiPath4000 600 ECS for configuring certain FRMTYPES at certain LTU-positions (see table above), must be checked by the system administrator.
- The parameters for system wide configurations in AMO-ZAND (SIUANN, SIUC, DTR, CP, SIU) are introduced in AMO-UCSU to have AP-specific configuration. The parameters in ZAND are still used to handle HHS configuration and default values APs.
- Parameters CONNTYPE, LOCID and LOCATION:  
These parameters are used to configure FLEX (Fiber Linked Extension Shelf) and AP LTUs. This are LTUs of one HiPath4000 switch, which i.e. are located in different buildings and are connected to the switch via fiber link or IP . The reason (in case of

FLEX) is, to use a - possibly already existing - fiber link connection between the buildings for connecting the single LTUs to the switch and then connect the subscribers to this FLEX LTUs instead of installing the cables of the single subscribers to the switch room.

- **Parameter CONNTYPE:**

This parameter is used, to determine if the configured LTU is a LOCAL HHS -, a FLEX HHS - or an AP LTU.

- **Parameter LOCID:**

The parameter is used to identify the location of the switch for the system configurator. This parameter may only be changed by the service staff, after consulting the system configurator.

- **Parameter LOCATION:**

The parameter is used, to enter the postal address, where a FLEX LTU or a AP shelf is located.

The additional parameters PHONE and FAX specify a phone number or a fax device at this location.

**Hints/Restrictions for parameters CONNTYPE, LOCID and LOCATION:**

- The parameters are optional in case of a HHS LTU and mandatory in case of an AP LTU.
- Configuration of a HHS LTU and parameters not entered by user:  
In this case, the default values are: parameter CONNTYPE = LOCAL , parameter LOCID = three blanks and parameter LOCATION is an empty (blanks) string with the maximal possible stringlength for this parameter.
- Configuration of a HHS LTU and parameters were entered by user:  
If CONNTYPE = FLEX was entered, the user must enter a value for parameters LOCID and LOCATION. If no values were entered, the AMO will be terminated with an error message.
- Parameter LOCATION: When a LTU is configured, the parameter will not be checked. Any entered string, which does not exceed the maximal length, will be accepted. So the user can enter a blank string with the maximal string length of this parameter.
- If a HHS LTU with CONNTYPE = LOCAL was configured and then the CONNTYPE value is changed to FLEX (with CHANGE-UCSU), a value for parameter LOCID must be entered. A possibly still configured empty (blank) string for parameter LOCATION (default value for CONNTYPE= LOCAL LTU) is counted as a valid location string. If the CONNTYPE is now changed back to LOCAL

again, there is no more possibility, to change the LOCID back to the default value of three blanks (because only numerical values can be entered for parameter LOCID). That means: once a LOCID was entered by the user, this LOCID value can only be set back to blanks by deleting the LTU.

- Parameter CONNTYPE and LOCATION must be entered for configuring an AP/EntGW shelf. The possible values for this configuration are only APNW or APDL.

- Parameters PHONE and FAX:

These parameters are used to give the information under which phone or fax number a crafts person can be reached at the extended shelf location. The configurable numbers are just used as a comment and are not considered AMO internally. The combination '\*\*\*\*\*' (five stars) leads to the configuration of the DB zero initialization values (no number).

- Parameter SRCGRP:

AP shelves have to be pooled within source groups. This source groups provide certain attributes of a location for some CP features like "Emergency Call", "Autoset Relocate", LCR and more.

The source group 1 is also reserved for traditional shelves in the LTU range 1 to platform dependent max value of LTU numbers.

If the LCR dialing plan contains a "source dependent number" instead of a normal route number (see AMO-LPROF, AMO-LDPLN), LCR can investigate different LCR route numbers (according to different locations with different CO area codes) dependent on the source group. This is mostly needed for providing emergency calls for all NBS locations which are not in the same area code as the HiPath4000 host system.

- Parameter LSRTADDR and APRTADDR :

These both IP addresses are needed for TCP/IP signalling connections from the SWU processor to the AP shelf, respectively for TCP/IP payload connection from the AP shelf to the SWU processor.

Before an AP shelf can be configured the IP addresses for the second LAN must be created by means of AMO-SIPCO.

After configuring an AP shelf the AP doesn't get into service automatically. The connection build up for AP shelves has to be done by means of EXEC-USSU after configuring additional data via AMO-STMIB and AMO-APRT.

After the LTU or AP shelf has been created, the LTU modules can be configured by means of AMO BCSU.

When assigning LTG, LTU or AP the CONSY data will be checked and an appropriate advisory message will be displayed if not found.

## Create SIU

The central SIU/LTG can be configured with the branch UNIT=LTG and the parameter SIPARTNO. Thereby those rules are valid:

- SIUCOE for extended compact X systems (ECX)
- SCC 80CMX
- DSCX 80CXE and 40CMX
- RTM 600 cPCI

## Procedure Overview

| Command Code | Parameter                                  |
|--------------|--------------------------------------------|
| ADD-UCSU     | UNIT=LTG, LTG=<number>, SIPARTNO=<string>; |
|              | UNIT=LTU, [LTG=<number>], LTU=<number>,    |

## UCSU - Unit Configuration of Switching Unit

### Functions of the AMO

#### Note

With UNIT=LTU and UNIT=LTU parameter LTG is only a single value.

#### Examples

##### 1. Create LTU=1.

Input:

```
ADD-UCSU:LTU,1,1,,LTUW,LOCAL;
```

Output:

```
LTU 1.1  ADDED - IN OPERATION
```

Possible outputs:

```
LTU 1.1  ADDED - IN OPERATION
LTU 1.1  ADDED - OUT OF OPERATION
LTU 1.1  ADDED - OUT OF OPERATION (NOT PRESENT)
LTU 1.1  NOT ADDED
      |  |
      |  |
      |  +----- LTU
      |
      +----- LTG
```

##### 2. Create LTU 1 to 4 (LTG 1)

Input:

```
ADD-UCSU:LTU,1,1&&4,"Q2248-X  ",LTUW,LOCAL,, "OCEAN DRIVE
17";
```

Output:

```
H01: LTU   1.1    ADDED - IN OPERATION (READY)
H02: LTU   1.2    ADDED - OUT OF OPERATION (DEF)
F14: LTU   1.3    ALREADY ADDED
F02: LTU   1.4    NOT ADDED (ORDER ERROR)
```

##### 3. Create AP 20 (LTG 1)

Input:

```
ADD-UCSU:AP,1,20,"Q2302-X  ",5,INCH19,APDL,,,234,"WILSHIRE
BOULEVARD 123",6338234,6338236,30;
```

Output:

```
H15: PARAMETER APRTADDR CAN NOT BE CHECKED FOR A PLAUSIBLE
VALUE.
      THIS CHECK WILL BE DONE LATER WITHIN AMO-APRT.
H03: ADD DATA FOR LTU  1.20 WITH AMO CONSY
```

##### 4. Create EntGW 70 (LTG 1)

Input:

```
ADD-UCSU:ENTGW,1,70,"Q2347-X",1,AP370013,APDL,,,005,"WILSHIRE
BOULEVARD
123",,,,YES,1,YES,0,0,IPV4,NO,NO,"1","0","0",,, "0",HSRTCP,,;
```

Output:

```
H500: AMO UCSU STARTED
H03: ADD DATA FOR LTU 1.70 WITH AMO CONSY
```

## 202.2.2 CHANGE-UCSU

Modify by means of the action CHANGE:

- type of LTUC module and some other parameters of LTU
- IP address and some other parameters of AP shelves
- PARTNO of central SIU
- part number of the MTS/CONF-Module in cabinet configurations and compact systems (H600C)
- configure an overlay-LTU for an existing standard-LTU

### Hints/Restrictions:

- An overlay configuration is only possible, if the HW platform is a H600ECX/ECS/cPCI or a H80CXE.
- Furthermore, when the LTU was configured, the LTUCX-board (Q2166-X) must have been configured.
- For cPCI platform the LTUCA board (Q2266-X) must be configured, respectively the overlay configuration is not permitted within a 19" shelf.
- When an overlay LTU is configured for a standard LTU and no value was entered for parameter OVERLAY, the number of the overlay LTU will be determined automatically by the AMO whereby the highest allowed free LTU number will be used. Following overlay LTU numbers, depending on the HiPath4000 type and configured SIU board are possible:

H80CXE:

- LTU 7 - LTU 2

H600ECX/ECS:

- Configured SIU board = Q2234-X: LTU 15 - LTU 1
- Configured SIU board = Q2234-X100: LTU 7 - LTU 1

H600EcPCI:

- Configured RTM board = Q2266-X: LTU 15 - LTU 1

The following LTUC/NCUI boards can be modified:

## UCSU - Unit Configuration of Switching Unit

### Functions of the AMO

| LTUC-old | direction | LTUC-new   |
|----------|-----------|------------|
| Q2148-X  | --->      | Q2248-X    |
| Q2248-X  | <--->     | Q2166-X    |
| Q2248-X  | <--->     | Q2189-X?00 |
| Q2166-X  | <--->     | Q2189-X?00 |
| Q23??-X  | <--->     | Q23??-X10  |

- Parameter LTPARTNO:  
Concerns to new LTUC/NCUI board.
- Parameters CONNTYPE, LOCATION, PHONE and FAX:  
See description of this parameters under action ADD.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 202.2.3 DELETE-UCSU

### Delete LTG and LTUs

#### 1. Delete LTG

The associated LTUs and the peripheral modules must be deleted first.

#### 2. Delete LTU or AP/EntGW shelf

The associated peripheral modules must be deleted first (AMOs BSSU and BCSU).

#### 3. Delete Overlay configuration

Before deleting the overlay configuration, it must be ensured, that no board of the standard LTU, to which the overlay LTU to be deleted is assigned, uses the highwaybundle "F" (AMO BCSU).

When deleting LTG or LTU the consy data will be checked and an appropriate advisory message will be output if still assigned.

### Procedure Overview

| Command Code | Parameter                               |
|--------------|-----------------------------------------|
| DELETE-UCSU  | UNIT=LTU, [LTG=<number>], LTU=<number>; |
|              |                                         |
|              | UNIT=AP, [LTG=<number>], LTU=<number>;  |
|              |                                         |

## UCSU - Unit Configuration of Switching Unit

### Functions of the AMO

| Command Code | Parameter                                 |
|--------------|-------------------------------------------|
|              | UNIT=LTG, LTG=<number>;                   |
|              |                                           |
|              | UNIT=ENTGW, [LTG=<number>], LTU=<number>, |

#### Note

For UNIT=LTU parameter LTG is only a single value.

#### Examples

##### 1. Delete LTU 2

Input:

```
DELETE-UCSU:UNIT=LTU,,2;
```

Output:

```
LTU  1.2      DELETED
LTU  1.2      NOT DELETED
|  |
|  +----- LTU no.
+----- LTG no.
```

##### 2. Delete LTU 2 to 4 (LTG 1)

Input:

```
DELETE-UCSU:UNIT=LTU,LTG=1,LTU=1&&4;
```

Output:

```
H10: LTU  1.1      IS ALREADY DELETED
H07: LTU  1.2      DELETED
H07: LTU  1.3      DELETED
F07: LTU  1.4      NOT DELETED (ORDER ERROR)
```

## 202.2.4 DISPLAY-UCSU

The configuration and states of LTG and LTU can be determined by means of the action DISPLAY.

#### Procedure Overview

| Command Code | Parameter                                  |
|--------------|--------------------------------------------|
| DISPLAY-UCSU | [UNIT=LTU], [LTG=<number>], [LTU=<number>; |
|              |                                            |
|              | [UNIT=SRCGRP], [SRCGRP=<number>;           |
|              |                                            |
|              | [UNIT=LTG], [LTG=<number>;                 |
|              |                                            |

| Command Code | Parameter                                    |
|--------------|----------------------------------------------|
|              | [UNIT=AP], [LTG=<number>], LTU=<number> ,    |
|              | [APDATA=<param>];                            |
|              |                                              |
|              | [UNIT=ENTGW], [LTG=<number>], LTU=<number> , |
|              | [APDATA=<param>];                            |

**Note**

If the parameter LTG is not specified for UNIT=LTG, all LTGs are interrogated. In neither parameter LTU nor parameter LTG is specified for UNIT=LTU, all LTUs are interrogated.

**Examples**

1. List all LTGs and LTUs. Overlay LTU 10 is assigned to standard LTU 3.

Input:

DISPLAY-UCSU:LTU;

Output:

|                                       |         |     |                    |       |                   |       |             |         |          |                 |            |          |                  |           |           |                  |           |           |  |
|---------------------------------------|---------|-----|--------------------|-------|-------------------|-------|-------------|---------|----------|-----------------|------------|----------|------------------|-----------|-----------|------------------|-----------|-----------|--|
| +-----+-----+-----+-----+-----+-----+ |         |     |                    |       |                   |       |             |         |          |                 |            |          |                  |           |           |                  |           |           |  |
|                                       | ADDRESS |     | EXPECTED CONFIGUR. |       | STATE OF A/B HALF |       | PARTNO      | SIU     |          |                 |            |          |                  |           |           |                  |           |           |  |

| H22: SPE NOT ACTIVATED, NO SPE RESULT STATE INFORMATION AVAILABLE. |      |                           |                                                        |                           |                  |         |

2. List LTG 1.

Input:

DISPLAY-UCSU:LTG,1;

Output:

|  |         |  |                    |  |                   |  |            |  |
|--|---------|--|--------------------|--|-------------------|--|------------|--|
|  | ADDRESS |  | EXPECTED CONFIGUR. |  | STATE OF A/B HALF |  | PARTNO SIU |  |
|  |         |  |                    |  |                   |  |            |  |
|  | LTG 1   |  | ADDED              |  | READY / READY     |  | Q2234-X    |  |
|  |         |  |                    |  |                   |  |            |  |

Only one status is output for the dependability and AM status, which may consist of a combination of statuses.

Possible outputs:

|        |   |                                   |
|--------|---|-----------------------------------|
| MANAMO | = | disabled by AMO                   |
| UNACH  | = | disabled by hierarchy             |
| UNACA  | = | disabled due to interrelationship |
| DETECT | = | disabled due to error             |

|             |   |                                 |
|-------------|---|---------------------------------|
| NPR         | = | not present                     |
| READY       | = | in operation                    |
| NL          | = | not loaded                      |
| ORDER ERROR | = | order cannot be processed by DC |
| NEQ         | = | not equipped                    |
| WBT         | = | wrong board type                |
| LOCKED      | = | blocked                         |
| BUSY        | = | busy                            |

## 202.2.5 REGENERATE-UCSU

By means of this order, position-oriented commands for the regeneration of MBU, LTG or LTU data are output.

### Procedure Overview

| Command Code    | Parameter                                    |
|-----------------|----------------------------------------------|
| REGENERATE-UCSU | [UNIT=LTU], [LTG=<number>], [LTU=<number>;   |
|                 |                                              |
|                 | [UNIT=AP], [LTG=<number>], [LTU=<number>;    |
|                 | [REGDEF=<param>;                             |
|                 |                                              |
|                 | [UNIT=LTG], [LTG=<number>;                   |
|                 |                                              |
|                 | [UNIT=ENTGW], [LTG=<number>], [LTU=<number>; |
|                 | [REGDEF=<param>;                             |

### Note

If parameter LTG is not specified for UNIT=LTG, regenerate commands are created for all LTGs set up. If neither parameter LTU nor parameter LTG is specified for UNIT=LTU, regenerate commands are created for all LTUs set up.

### Example

Regenerate all

```
REGENERATE-UCSU;
```

Output:

```
REGENERATE-UCSU;
```

```
H500: AMO UCSU  STARTED
```

```
ADD-UCSU:LTG,1,"Q2261-X ";
ADD-UCSU:LTU,1,1,"Q2261-X ",CC80F,LO-
CAL,, " " ,,,,,;
ADD-UCSU:LTU,1,2,"Q2166-X ",L80XF,LO-
CAL,, " " ,,,,,;
ADD-UCSU:LTU,1,3,"Q2166-X ",L80XF,LO-
CAL,, " " ,,,,,;
ADD-UCSU:LTU,1,4,"Q2166-X ",L80XF,LO-
CAL,, " " ,,,,,;
ADD-UCSU:AP,1,20,"Q2324-X10 ",45,AP37009,AP-
NW,167.123.111.12,123.0.111.12,234,"MOOSLACKEN-
GASSE " ,,,NO,120,NO,0,0;
ADD-UCSU:ENTGW,1,68,"Q2347-X",1,AP370013, APDL, 167.123.111.13,
123.0.111.13,005, " MOOSLACKEN-
GASSE",,,YES,1,YES,0,0,IPV4,NO,NO,"1","0","0",,,,"0",HSRTPC;
```

### 202.2.6 Configuration of a second LTU shelf for Enterprise Gateway

Precondition: both shelves are already configured as ENTGW with identical IP addresses and OOS.

```
CHA-UCSU:ENTGW,LTG = 1,LTU=<ap-bearer>,XEGWID=<id !=0 >, XEGWSHLF = 1;
CHA-UCSU:ENTGW,LTG = 1,LTU = <ap-trailer>,XEGWID=<id !=0, same as
above>,XEGWSHLF = 2;
```

---

**NOTE:** Bearer means the shelf to be configured as LTU1 on RTMX. Trailer means the shelf to be configured as LTU2 on RTMX. Configuration for OOS (Out Of Service):

```
DEACTIVATE-USSU:LTU=xx;EXEC-USSU:
```

---

---

**NOTE:** In WBM, the LTU number is presented without LTG and SLOT number.

---

### 202.2.7 Revert configuration of the second LTU shelf for Enterprise Gateway

Precondition: both shelves are already configured as XEGW and OOS. It is important to handle the trailer first.

```
CHA-UCSU:ENTGW,LTG = 1, LTU = <ap-trailer>,XEGWID=0;
CHA-UCSU:ENTGW,LTG = 1, LTU = <ap-bearer>,XEGWID=0;
```

Further to this configuration, the HW and IP addresses must be accordingly adapted in APRT.

## 202.3 Parameter Description

|          |                                                                      |   | CAMPBRK      Ringback tone when camped on           |
|          |                                                                      |   | CBKALERT      Callback alert tone                   |
|          |                                                                      |   | CCMABSEN      CCM tracer in rack                    |
|          |                                                                      |   | CMALTONE      Call monitoring alerting tone         |
|          |                                                                      |   | CONFDISC      Conference disconnect tone            |
|          |                                                                      |   | CONFTN      Conference tone                         |
|          |                                                                      |   | CONG      Congestion tone                           |
|          |                                                                      |   | DATA      Data tone                                 |
|          |                                                                      |   | DISCTONE      Disconnect tone                       |
|          |                                                                      |   | DND      Do not disturb tone                        |
|          |                                                                      |   | EXTDTN      External Dial tone                      |
|          |                                                                      |   | EXTDTN2      Secondary co dial tone                 |
|          |                                                                      |   | FCAMP      first camp-on tone                       |
|          |                                                                      |   | FRNGBK      First burst of ringback tone            |
|          |                                                                      |   | HOLD      Hold tone                                 |
|          |                                                                      |   | HOLDCCS      Hold tone code calling system (ccs)    |
|          |                                                                      |   | HOLDEXT      Hold tone external                     |
|          |                                                                      |   | HOLDH1      Hold tone hold 1                        |

## UCSU - Unit Configuration of Switching Unit

### Parameter Description

|  |  |          |                                               |
|--|--|----------|-----------------------------------------------|
|  |  | HOLDH2   | Hold tone hold 2                              |
|  |  | HOLDHUNT | Hold tone hunting-group                       |
|  |  | HOLDINT  | Hold tone internal                            |
|  |  | HOLDLINE | Hold the line please                          |
|  |  | HOWLTONE | Howltone after busytone timeout               |
|  |  | HUNTGRUP | Announcement huntgroup queue                  |
|  |  | IMPOSSFM | Impossible for the moment                     |
|  |  | INTDTN   | Internal dial tone                            |
|  |  | KNCONF   | Camp-on tone for conference                   |
|  |  | LCRET    | LCR Expensive route tone                      |
|  |  | LOCANN   | Local announcement                            |
|  |  | MOH      | Music on hold                                 |
|  |  | MWI      | Message waiting indication                    |
|  |  | NACK     | Negative acknowledgement tone                 |
|  |  | NODIAL   | Timeout tone if digits not dialed             |
|  |  | NOPO     | Not possible                                  |
|  |  | NOTALWD  | Not allowed                                   |
|  |  | NOTREACH | Not reachable                                 |
|  |  | NU       | Number unobtainable tone                      |
|  |  | OFFHKTRQ | Off hook trunk queueing                       |
|  |  | OVR      | Automatic override tone                       |
|  |  | OVRTN    | Override tone                                 |
|  |  | OVRWARN  | Override warning tone                         |
|  |  | PACK     | Positive acknowledgement tone                 |
|  |  | PACKWD   | Positive acknowledge tone with dialing        |
|  |  | POSTDIAL | Announcement post dial                        |
|  |  | RECDIALT | Recall dial tone                              |
|  |  | REORDER  | Reorder tone (includes BONHK-Tone outside US) |
|  |  | REQDIALT | Request Dial Tone                             |
|  |  | RNGBK    | Ringback tone                                 |
|  |  | ROUTTONE | SCNF France: Connect routing tone             |
|  |  | RTCHKNTF | LCR route check not finished                  |
|  |  | RTOTON1  | Test for first tone receiver group            |
|  |  | RTOTON2  | Test for second tone receiver group           |
|  |  | SECDIALT | Second Dial Tone                              |
|  |  | SPEC     | Special Dial Tone                             |
|  |  | TEST     | Test tone                                     |
|  |  | VOICEMAL | Voice mail                                    |
|  |  | ZIPTONE  | Alerttone for acd-g automatic connection      |

|        |                                                        |    |                                      |
|--------|--------------------------------------------------------|----|--------------------------------------|
|        |                                                        |    |                                      |
| DHCPV4 | DHCP version 4                                         |    |                                      |
|        | Type of Input                                          | :  | single value, optional (ADD)         |
|        | Possible Values                                        | :  | YES, NO                              |
|        |                                                        |    |                                      |
| DHCPV6 | DHCP version 6                                         |    |                                      |
|        | Type of Input                                          | :  | single value, optional (ADD)         |
|        | Possible Values                                        | :  | YES, NO                              |
|        |                                                        |    |                                      |
| DTR    | Selection of country-specific dial tone receiver table |    |                                      |
|        | Type of Input                                          | :  | Single value, optional (ADD, CHANGE) |

## 203 UPDAT - Update Control

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO UPDAT controls the hard disk update procedure (backup of the subsystems of the static customer database). The update is performed automatically each day at twelve freely selectable update times. Only the DB subsystems which were changed since the last update will be saved.

The AMO UPDAT can be used

- to activate or deactivate the automatic update procedure,
- to set (change) the twelve automatic update times,
- to initiate the update procedure manually.

### 203.1 Restrictions

This description is valid from SP300-V3.4.

### 203.2 Interrelationships

- AMO APC : Application Configuration

### 203.3 Functions of the AMO

- [DISPLAY-UPDAT](#) : Displaying update status and times
- [CHANGE-UPDAT](#) : Changing update status and times
- [EXEC-UPDAT](#) : Initiating manual update
- [REGENERATE-UPDAT](#) : Regenerating update status and times

#### 203.3.1 DISPLAY-UPDAT

This function provides the following output on the service terminal:

## UPDAT - Update Control

### Functions of the AMO

- existing DB subsystems, their length in bytes and a statement indicating whether or not any data has been changed since the last update.
- preinitialized update times in hours and minutes  
(The following update times are preinitialized in the SWU DB:  
00:30, 02:30, 04:30, 06:30, 08:30, 10:30 12:30, 14:30, 16:30, 18:30, 20:30, 22:30),
- automatic update status  
(update activated or deactivated, default value of SWU DB: deactivated),
- The cross channel state (free/blocked, only if duplex).

### Procedure Overview

| Command Code  | Parameter      |
|---------------|----------------|
| DISPLAY-UPDAT | UNIT=<string>; |

### Example

Displaying update data of the active base processor of the SWU.

Input:

DISPLAY-UPDAT:BP;

Output:

| SUSY NAME | LENGTH<br>(BYTES) | CHANGE |
|-----------|-------------------|--------|
| ZDBCCDSA  | 8001CH            | NO     |
| ZDBCCDSD  | 1001CH            | NO     |
| ZDBCCDS1  | 10001CH           | NO     |
| ZDBCCDS2  | 10001CH           | NO     |
| ZDACFG00  | 45CH              | YES    |
| ZDBCCDSF  | B706AH            | YES    |
| ZDBCCDS0  | 10001CH           | YES    |

| UPDATE TIMES | H:MIN |
|--------------|-------|
| 1            | 00:30 |
| 2            | 02:30 |
| 3            | 04:30 |
| 4            | 06:30 |
| 5            | 08:30 |
| 6            | 10:30 |
| 7            | 12:30 |
| 8            | 14:30 |
| 9            | 16:30 |
| 10           | 18:30 |
| 11           | 20:30 |

```
|      12              22:30      |
+-----+

+-----+
| AUTOMATIC HD UPDATING :  ON      |
| CROSS CHANNEL BLOCKED :  YES     |
+-----+
```

### 203.3.2 CHANGE-UPDAT

This function is used

- to set the twelve times for automatic update,
- to activate or deactivate the automatic update.

#### Note

- The cross signaling of data changes (if duplex) cannot be deactivated.
- The status and times of the automatic update are stored as data in the database itself so that any change will only be permanent after an automatic or manual update has been performed.
- The automatic update times for the various HW modules should not coincide, or else there will be a HD backup queue.
- If the automatic update is to be performed less than 12 times per day, the same update time should be entered several times (see Example).

#### Procedure Overview

| Command Code | Parameter                                                             |
|--------------|-----------------------------------------------------------------------|
| CHANGE-UPDAT | UNIT=<param>, {STATE=<param><br>,UPDT01=<St-Mi>, ...,UPDT12=<St-Mi>}; |

#### Examples

1. Setting the update times in the SWU to 03:30 and 13:30 (twice a day).

Input:

```
CHANGE-UPDAT:BP,, 03-30,13-30,13-30,13-30,13-30,13-30,13-30,
13-30,13-30,13-30,13-30,13-30,13-30;
```

2. Activating the automatic hard disk update in the SWU.

Input:

```
CHANGE-UPDAT:BP,ON;
```

### 203.3.3 EXEC-UPDAT

This initiates manual updating regardless of routinely executed updates. In this case, a selection can be made whether the entire database (SUSY= ALL) is to be updated or only those DB subsystems that have been changed since the last update (SUSY=DELTA).

#### Note

- Updating the entire database (SUSY=ALL) is only necessary and advisable if the data was changed (patched) manually.
- During the update, the database is write-protected. This does not apply for the duplex SWU if the base processor is in standby mode. In this case, the update invariably takes place in the standby base processor even if the AMO was started in the active base processor (BP, BPA/BPB).
- Since SP300-V3.2 SA07 also the PGLIB loading tables (excepting /L00 of LTGs) are written. Possible changes of applications with AMO APC should be done after EXEC-UPDAT, otherwise the changes will be lost.

#### Procedure Overview

| Command Code | Parameter                      |
|--------------|--------------------------------|
| EXEC-UPDAT   | UNIT=<string>, [SUSY=<param>]; |

#### Example

Initiating the update in the SWU manually.

Input:

```
EXEC-UPDAT:BP;
```

### 203.3.4 REGENERATE-UPDAT

Regenerating the update status and update times.

#### Procedure Overview

| Command Code     | Parameter      |
|------------------|----------------|
| REGENERATE-UPDAT | UNIT=<string>; |

#### Example

Regenerating the update status and update times in the SWU.

Input:

REGENERATE-UPDAT:BP;

Output:

CHANGE-UPDAT:BP , OFF, 00-30, 02-30, 04-30, 06-30, 08-30, 10-30,  
12-30, 14-30, 16-30, 18-30, 20-30, 22-30;

## 203.4 Parameter Description

|                 |                                                                                                                                                                                                                                                                                                                          |

## 204 USER - User Accounts

|                       |                               |
|-----------------------|-------------------------------|
| Functions of the AMO  | Error Messages and Advisories |
| Parameter Description |                               |

The AMO USER is used to create accounts for all users on the system, and to maintain these accounts by changing user passwords, execute permissions, and other account parameters when necessary. It can only process those user accounts whose execute permissions are a subset of the permissions of the account under which the AMO USER is activated.

### 204.1 Functions of the AMO

- [ADD-USER](#) : Add a new user account
- [CHANGE-USER](#) : Change the data of an existing user account
- [DEACTIVATE-USER](#) : Lock a user account
- [ACTIVATE-USER](#) : Unlock a user account
- [DELETE-USER](#) : Delete a user account
- [DISPLAY-USER](#) : Display one or all user accounts
- [REGENERATE-USER](#) : Regenerate all user accounts
- [COPY-USER](#) : Copy user accounts from backup file

#### 204.1.1 ADD-USER

This action can be used to add a new user account to the system. It creates a new entry in the user data table that the system uses to let the user log in and execute MML-commands.

Procedure Overview

| Command Code | Parameter                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------|
| ADD-USER     | NAME=<string>,<br>[AUTH=<number>], [OPTIONS=<param>],<br>[RETRIES=<number>], [LOCKTIME=<number> or *]; |

#### Example

Add user account "SMITH" to the system with execute permissions 0 to 4.

Input:

ADD-USER:NAME=SMITH,AUTH=0&&4;

The newly created user account cannot be used before an initial password is defined with the system command PASSW.

Input:

PASSW:SMITH;  
Output:

---

NEW PASSW = <password>  
PLEASE REENTER NEW PASSWORD  
NEW PASSW = <password>

**204.1.2 CHANGE-USER**

The data of a user account (except the password) can be changed with this action. The user to be changed is identified with his name.

**Procedure Overview**

| Command Code | Parameter                                                                                                          |
|--------------|--------------------------------------------------------------------------------------------------------------------|
| CHANGE-USER  | NAME=<string>, {NEWNAME=<string>,<br>AUTH=<number>, OPTIONS=<param>,<br>RETRIES=<number>, LOCKTIME=<number> or *}; |

**Examples**

1. Grant execute permissions 0-5 to a user account.

Input:

CHANGE-USER:NAME=SMITH,AUTH=0&&5;

2. Systemadministrator allocates a new password to a user account with the PASSW function.

Input:

PASSW:SMITH;

Output:

NEW PASSW = <password>  
PLEASE CREENTER NEW PASSWORD  
NEW PASSW = <password>

Note: When the user logs on, he is compelled to change a password that is allocated by the Systemadministrator.

3. A user changes his own password with the PASSW function.

Input:

PASSW;

Output:

```
OLD PASSW=<old password>
NEW PASSW=<new password>
PLEASE REENTER NEW PASSWORD
NEW PASSW=<new password>
```

### 204.1.3 DEACTIVATE-USER

A user account can be locked with this action.

#### Procedure Overview

| Command Code    | Parameter      |
|-----------------|----------------|
| DEACTIVATE-USER | NAME=<string>; |

### 204.1.4 ACTIVATE-USER

A locked user account can be reactivated again with this action.

#### Procedure Overview

| Command Code  | Parameter      |
|---------------|----------------|
| ACTIVATE-USER | NAME=<string>; |

### 204.1.5 DELETE-USER

This action deletes a user account.

#### Procedure Overview

| Command Code | Parameter      |
|--------------|----------------|
| DELETE-USER  | NAME=<string>; |

The user's own user account and *root* account (UID=1) cannot be deleted.

It is frequently a more sensible solution to lock a user account which is no longer being used. This means that this account can no longer be used, although it is possible to reconstruct the actions the user has carried out on the system if necessary (see AMO LOGBK).

**Example**

Delete a user account.

Input:

```
DEL-USER:SMITH;
```

**204.1.6 DISPLAY-USER**

One or all user accounts can be displayed with this action.

**Procedure Overview**

| Command Code | Parameter       |
|--------------|-----------------|
| DISPLAY-USER | [NAME=<string>; |

**Example**

List all user accounts of the system:

Input:

```
DISPLAY-USER;
```

Output:

| USER TABLE |          |                  |        |                 |       |       |  |  |  |
|------------|----------|------------------|--------|-----------------|-------|-------|--|--|--|
| UID        | NAME     | AUTHORIZATIONS   | STATUS | OPTIONS         | RE-   | LOCK- |  |  |  |
|            |          | 111111           |        |                 | TRIES | TIME  |  |  |  |
|            |          | 5432109876543210 |        | L R C F P E T I |       |       |  |  |  |
| +=====+    |          |                  |        |                 |       |       |  |  |  |
| 1          | ROOT     | .....XXXXXXXXXX  |        | X X X X X X X   |       |       |  |  |  |
| 2          | LROOT    | ..X..XXXXXXXXXX  |        | X X X X X X X   | 3     | 2     |  |  |  |
| 3          | LIADMINI | ...X.....X...X   |        | X X X X X X X   | 1     | *     |  |  |  |
| 4          | SMITH    | .....XXXXX       | INIT.  | X X X X X X X   |       |       |  |  |  |

**204.1.7 REGENERATE-USER**

This action is used for transferring the user accounts to a backup file which can be reloaded with the action COPY-USER. The action creates this inverse copy command. Privileged accounts (with execute permissions higher than 10) are not stored in the backup file.

Procedure Overview

| Command Code    | Parameter |
|-----------------|-----------|
| REGENERATE-USER | ;         |

**Example**

Regenerate normal user accounts.

Input:

REG-USER;

Output:

COPY-USER;

204.1.8 COPY-USER

All user accounts from the backup file are reloaded with this action. The backup file must have been created with the action REGENERATE-USER. This action is possible only if the user data table is still empty, i.e. only the *root* and *lroot* accounts have been initialised.

Procedure Overview

| Command Code | Parameter |
|--------------|-----------|
| COPY-USER    | ;         |

204.2 Parameter Description

|          |                                                                                                                        |                                              |                         |
|----------|------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|-------------------------|
| AUTH     | Execute permissions for the various AMO actions (every verb-noun combination possesses a necessary execute permission) |                                              |                         |
|          | Type of input                                                                                                          | : 1 to 16 single values or a range, optional |                         |
|          | Possible values                                                                                                        | : numeric, 0-15                              |                         |
|          | Default value                                                                                                          | : 0                                          | lowest permission       |
| LOCKTIME | Barring time (in minutes)                                                                                              |                                              |                         |
|          | Type of input                                                                                                          | : Single value, optional                     |                         |
|          | Possible values                                                                                                        | : 0                                          | No barring              |
|          |                                                                                                                        | 1-9999                                       | Barring time in minutes |
|          |                                                                                                                        | *                                            | Permanent barring       |

## USER - User Accounts

### Parameter Description

|         |                                                                                              |                                                                                                                       |
|---------|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
|         | Default value                                                                                | : 0                                                                                                                   |
| NAME    | User name (user account, login name)                                                         |                                                                                                                       |
|         | Type of input                                                                                | : single value, mandatory                                                                                             |
|         | Possible values                                                                              | : text, up to 8 characters                                                                                            |
| NEWNAME | New user name                                                                                |                                                                                                                       |
|         | Type of input                                                                                | : single value, optional                                                                                              |
|         | Possible values                                                                              | : text, up to 8 characters                                                                                            |
| OPTIONS | Options                                                                                      |                                                                                                                       |
|         | Type of input                                                                                | : 1 to 8 single values or a range, optional                                                                           |
|         | Possible values                                                                              | : L ID can be used locally (devices CON1 to CON6)                                                                     |
|         |                                                                                              | R ID can be used remotely (telecontrol, device FAS)                                                                   |
|         |                                                                                              | C Own password can be changed (with PASSW function)                                                                   |
|         |                                                                                              | F Forced password change if default password is still set                                                             |
|         |                                                                                              | P Password required                                                                                                   |
|         |                                                                                              | E ID can be deleted (is erasable)                                                                                     |
|         |                                                                                              | T Session terminated after timeout (1 minute for Comtes, 2 minutes for Telnet, no limit for FAMOS - not configurable) |
|         |                                                                                              | I International session language (English)                                                                            |
|         | Default value                                                                                | : L&&E&I (from session with option I)                                                                                 |
|         |                                                                                              | L&&E (from session without option I)                                                                                  |
| RETRIES | Limit value for unauthorized login attempts                                                  |                                                                                                                       |
|         | Type of input                                                                                | : Single value, optional                                                                                              |
|         | Possible values                                                                              | : 1-99                                                                                                                |
|         | Default value                                                                                | : 99                                                                                                                  |
|         | The barring time (see parameter LOCKTIME) becomes effective when the limit value is reached. |                                                                                                                       |

## **204.3 Error Messages and Advisories**

### **204.3.1 Error Messages**

F01: FOUND NO FREE POSITION IN USER TABLE  
F02: FOUND NO USER ACCOUNT  
F03: USER ACCOUNT <name> ALREADY EXISTS  
F04: USER ACCOUNT <name> DOES NOT EXIST  
F05: USER ACCOUNT <name> IS ALREADY LOCKED  
F06: USER ACCOUNT <name> IS NOT LOCKED  
F07: USER ACCOUNT <name> CAN NOT BE DELETED  
F08: CAN NOT DELETE USER ACCOUNT ROOT (UID 1)  
F09: CAN NOT LOCK USER ACCOUNT ROOT (UID 1)  
F10: CAN NOT DELETE OWN USER ACCOUNT  
F11: CAN NOT LOCK OWN USER ACCOUNT  
F12: CAN NOT EXECUTE, PERMISSION DENIED

F14: <param> <value> INVALID  
F15: <param> INVALID, STRING SHOULD NOT CONTAIN SPACES  
F16: ACCESS ERROR; DMS ERROR CODE: <xxxxx>  
F17: BACKUP FILE FOR USER ACCOUNTS DOES NOT EXIST  
F18: CAN NOT COPY USER ACCOUNTS, USER TABLE IS NOT EMPTY  
F19: CAN NOT CHANGE AUTHORIZATIONS OF OWN USER ACCOUNT  
F20: USER ACCOUNT <name> CAN NOT BE PROCESSED BY AMO USER  
BECAUSE IT IS CONFIGURED AS A LAW USER ACCOUNT (SEE AMO LUSER)  
F21: CAN NOT CHANGE THE LANGUAGE OF USER ACCOUNT <name> (OPTION I);  
PLEASE USE AMO FUNCT (CHANGE-FUNCT:LANG=GER/ENG;)  
F22: OPTION L(OCAL) OR R(EMOTE) MUST BE SET  
F23: CAN NOT CHANGE OPTION=L OF THE LOCALLY LOGGED-IN USER ACCOUNT  
F24: CAN NOT CHANGE OPTION=R OF THE REMOTELY LOGGED-IN USER ACCOUNT  
F25: BACKUP FILE FOR USER ACCOUNTS (:AMD:UDT) INCONSISTENT

### **204.3.2 Advisories**

H01: USER ACCOUNT <name> ADDED  
H02: USER ACCOUNT <name> CHANGED  
H03: USER ACCOUNT <name> DELETED  
H04: USER ACCOUNT <name> LOCKED  
H05: USER ACCOUNT <name> UNLOCKED  
H06: USER ACCOUNT <name> COPIED  
H07: NOTICE!  
THE USER ACCOUNT CAN NOT BE USED BEFORE A PASSWORD IS DEFINED.  
SYSTEM COMMAND: PASSW:<name>;  
H08: @@@@ could not be imported as already existing.

## 205 USSU - Unit Switch of Switching Unit SWU

This AMO is used to process the switching unit system units. The server modules are processed by other AMOs.

LTG, LTUs, central SIUs, RTM and HDLC-DCL highways are activated and LTUs are deactivated. Peripheral SIUs has to be switched by means of AMO BSSU.

### 205.1 Interrelationships

None

### 205.2 Functions of the AMO

- [ACTIVATE-USSU](#) : Activate system units
- [DEACTIVATE-USSU](#) : Deactivate system units
- [EXEC-USSU](#) : AP Shelf configuration and deconfiguration.
- [DISPLAY-USSU](#) : Display Background Loading status of the files ( for AP shelves)
- [RESTART-USSU](#) : Restart of all or individual AP shelves.

#### 205.2.1 ACTIVATE-USSU

Activation of system units in the SWU.

1. Activating an LTU
2. Activating the LTG
3. Activating an central SIU
4. Activating an HDLC-DCL highway
5. Activating RTM board.
6. Download of RTM log files

Activating an LTU involves removing the state "manual blocking". When an LTU is activated, all hierarchically subordinate units are also unblocked by the CDC (Device Configuration, a part of Dependability).

The system units are activated without testing.

## USSU - Unit Switch of Switching Unit SWU

### Functions of the AMO

Before it is activated, the state of the LTU is interrogated. If the LTU is in a state that does not permit activation, the "activate" order is not issued, error message F22 is issued to the operator and the AMO is terminated.

After the "activate" order has been executed, a message is output providing information about the new switching state. No test is made after an LTU has been activated.

If an LTU is not specified, the LTG is activated.

Before activating the LTG, the AMO checks that it is configured. If it is configured, then the presence of the LTG is reported to the operating system. Activating the LTG may take up to several minutes. Thus, the AMO does not wait until the activation job is completed, but terminates immediately issuing advisory message H13. The present loadingstate of the LTG is displayed on DB-board.

When activating an central SIU, the AMO first sends a deactivation command which is immediately followed by the activation command. This ensures that the current circuit data is reloaded. In the case of a duplex LTG, both central SIUs of the LTG are reloaded. In such cases, the operator receives two advisories. Peripheral SIUs has to be switched by means of AMO BSSU.

**WARNING:** If an central SIU is activated on a running switch, DTMF tones will be lost during the deactivation and loading processes. Therefore, it is recommended that central SIU re-activation be done during low traffic periods to avoid any service interruption.

Activating an HDLC-DCL highway may take up to several minutes. Thus, the AMO does not wait until the activation job is completed, but terminates immediately issuing the advisory message H25.

Activation of RTM board has two types : BOARD and DATA. BOARD type activation is handled same as the SIU activation. The error and advisory messages ; F24, F25, F26 , H19 and H28 are used both for SIU and RTM activation.

For AP shelves (LTU from 17 to 99), there is a new mechanism. The AP shelf can not be activated before the connection to the AP shelf is established via EXEC-USSU.

### Procedure Overview

| Command Code  | Parameter                                                                   |
|---------------|-----------------------------------------------------------------------------|
| ACTIVATE-USSU | UNIT=LTG, [LTG=<number>], [LTU=<number>];<br><br> UNIT=SIU, [LTG=<number>]; |

| Command Code | Parameter                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <pre> UNIT=HDL, [LTG=&lt;number&gt;], [HALF=&lt;param&gt;] ,NO=&lt;number&gt;;   UNIT=RTM, TYPE = BOARD;  UNIT=RTM, TYPE = DATA;  UNIT=DLLOGFL;</pre> |

### 1. Activate LTU3 of LTG1

#### Input:

ACTIVATE-USSU:LTG,1,3;

#### Output:

H06: LTU ACTIVATED - NOT OPERATIONAL (NPR)

LTU3 of LTG1 has been manually unblocked. The module does not exist (NPR).

### 2. Activate LTG1

#### Input:

ACTIVATE-USSU:LTG,1;

#### Output:

H13: LTG ACTIVATED

LTG1 has been introduced to the operating system.

### 3. Activate LTU3

#### Input:

ACTIVATE-USSU:LTG,,3;

#### Output:

H06: LTU ACTIVATED - NOT OPERATIONAL (NPR)

LTU3 has been manually unblocked. The module does not exist (NPR).

### 4. Activate the SIU

#### Input:

ACTIVATE-USSU:SIU;

#### Output:

H28: SIU IN A-HALF WILL BE SWITCHED

H19: SIU ACTIVATED

H28: SIU IN B-HALF WILL BE SWITCHED

## USSU - Unit Switch of Switching Unit SWU

### Functions of the AMO

H19: SIU ACTIVATED

#### 5. Activate HDLC-DCL highway #4 in LTG1

Input:

ACTIVATE-USSU:HDLC,1,4;

Output:

H25: HDLC-DCL HIGHWAY ACTIVATED

The HDLC highway is being activated though the process is not yet complete.

#### 6. Activate LTU17

Input:

ACTIVATE-USSU:LTG,1,17;

F30: ACTIVATION OF THE AP SHELF NOT POSSIBLE.FIRST EXECUTE  
'EXEC-USSU:CONFAP' .

#### 7. Activate RTM

Input:

ACTIVATE-USSU:RTM,BOARD;

Output:

H28: RTM IN A-HALF WILL BE SWITCHED

H19: RTM ACTIVATED

H28: RTM IN B-HALF WILL BE SWITCHED

H19: RTM ACTIVATED

#### 8. Download the RTM log files :

Input:

ACTIVATE-USSU:DLLOGFL;

Output:

F50: THIS COMMAND CAN ONLY BE EXECUTED ON CPCI ARCHITECTURE.

## 205.2.2 DEACTIVATE-USSU

Individual LTG or LTUs are deactivated. Deactivation involves setting of state "manual blocking". When the LTG or an LTU is deactivated, all hierarchically subordinate units are also deactivated by the CDC.

Before the LTG or an LTU is deactivated, its state is interrogated. If the LTG or LTU is in a state which does not permit deactivation, no deactivation order is issued and the AMO is terminated after issuing

error message F22 to the operator. After the deactivation order has been successfully executed, the operator receives a positive acknowledgement.

For deactivating the LTG the AMO does not wait until the activation job is completed, but terminates immediately issuing advisory message H26. The present loadingstate of LTG is displayed on DB-board.

The AMO also checks whether the deactivation job involves the current reference clock generator. If the current reference clock generator is on the LTG or LTU to be deactivated, and other reference clock generators are present outside the specified LTG or LTU, the operator is prompted for a value for the optional parameter REFOFF with advisory H22.

Message H23 is issued in the event the job affects all reference clock generators. In this case, the user is also warned if the value Y was entered for parameter REFOFF.

The operator can specify what to do with regard to the reference clock by giving parameter REFOFF the appropriate value. The value Y means that, if applicable, the LTG or LTU with the current reference clock supply may be deactivated. The value N means that the LTU with the current reference clock supply should not be deactivated. In this case, the AMO responds by issuing advisory H24 or H27.

The value PROMPT for parameter REFOFF (the default value) means that, in the event the current reference clock generator is within the specified LTU, the operator will be interrogated as to whether or not the LTU should really be deactivated.

### Procedure Overview

| Command Code    | Parameter                                         |
|-----------------|---------------------------------------------------|
| DEACTIVATE-USSU | [LTG=<number>], [LTU=<number>], [REFOFF=<param>]; |

#### 1. Deactivate LTU3 of LTG1

Input:

DEACTIVATE-USSU:1,3;

Output:

H03: LTU DEACTIVATED

LTU3 of LTG1 was deactivated. Hierarchically subordinate modules were also deactivated.

#### 2. Deactivate LTU1

Input:

DEACTIVATE-USSU:1,1;

Output:

USSU - Unit Switch of Switching Unit SWU

Functions of the AMO

F16: LTU NOT DEACTIVATED (ACTIVATION/DEACTIVATION IN PROGRESS)

LTU1 of LTG1 has not been deactivated, because an order for activation/deactivation of this LTU is currently in progress.

205.2.3 EXEC-USSU

AP shelf configuration concerning establishing and closing of a connection and background loading of LW files.

EXEC-USSU involves 4 modes of operation :

- CONFAP
- DELLAP
- UPDATAP
- NCUILOAD

Procedure Overview

205.2.3.1 CONFAP

Before activating an AP shelf , "startup connection" message is sent to FA by means of CONFAP branch.

Before sending the message to FA , first the LTU status is checked. If the LTU status is not equal to "UNACH" then error message F32 is issued. In case , the LTU status is "UNACH" then the FA flag check is done.

The proper FA flag is either "CONNECTION\_NULL" or "CONNECTION\_DOWN". If the flag value differs from the above two values ,then error message F33 is issued. There is also one more check related with STMIB data. If the data is not valid then the error message F45 is issued.

If all the steps above are passed then the message is sent to FA and the response message is waited for. After receiving the response message the FA flag is set to "CONNECTION\_ALIVE". For the case that the received message is not proper, the error message F38 is issued.

In case the LTU parameter is not specified, then all configured AP shelves are processed.

### **205.2.3.2 DELLAP**

After issuing DEACT-USSU ,an AP (Access Point) shelf deconfiguration requires one more step to release the connection. This is done by sending "stop connection" message to FA. For this purpose the EXEC branch has the DELLAP mode.

Before sending the 'stop message" the DC status and FA control flags of the concerned LTU are checked. ( DC status has to be "MAN\_AMO".)

Improper DC status and FA flags (internal) cause the error message F34.

If the connection is shut down properly the advisory message H30 is issued and the FA flag of the concerned LTU is changed to "CONNECTION\_DOWN" by AMO-USSU.

### **205.2.3.3 UPDATAP**

This branch is used to update particular connection or board data of an NCUI board (e.g. IP routing tables). In order to send "update connection" message to FA, there are some prerequisite status checks; e.g.

-LTU status must be "READY ",

and no background loading is active for the concerned AP Shelf

Above constraints may issue the error messages F37, F36 and F35 respectively.

For parameter LOADTYPE=UL the parameter ANSW is prompted in any case (even if the parameter has already been specified by the user). For ANSW=YES the loading process is initiated even if all LW data on board and DB are equal. This function should only be used in case of changing the NCUI board - more details can be seen in the feature usage examples for IPDA.

If LOADTYPE is not specified or CL the parameter ANSW will be ignored in any case and additionally the loading process will only be initialized if there exist changed LW data.

#### 205.2.3.4 NCUILOAD

This branch is used to initiate the background loading of the NCUI-LW and SIU tone tables.

This can be done only for the LTUs which are in "READY" state. If the LTU status is not "READY" then the error message F39 or F40 is issued.

The loading is supervised by a 10 min. timer. If this timer expires, the error message F42 is displayed.

Advisory messages H31,H32,H33,H34 are issued, if any other value is entered in the combination with the value "ALLSIU" or "ALL".

If no LTU number is entered , then all the configured LTU s which pass the necessary checks are processed.

When the background loading is completed successfully, advisory message H36 is displayed.

#### 205.2.4 DISPLAY-USSU

Background loading status of a specific LTU (valid only for AP shelves) is displayed. It also provides :

- LTU number,
- Source group index,
- Name of the particular LW file or SIU tone files and
- load status

The masks corresponding to each control flag value are as follows :

| FLAG             | MASK         |
|------------------|--------------|
| LOAD_NULL        | NEVER LOADED |
| LOAD_STARTED     | STARTED      |
| LOAD_IN_PROGRESS | IN PROGRESS  |
| LOAD_FINISHED    | FINISHED     |
| LOAD_FAILED      | FAILED       |

#### Procedure Overview

| Command Code | Parameter       |
|--------------|-----------------|
| DISPLAY-USSU | [LTU=<number>]; |

Display mask looks like as follows:

```

+-----+
| LTU:      1          SOURCE GROUP: 3      READY      |
| LW FILE   : XXXXXXXX FINISHED             SIU TONES: XXXXXXXX FAILED |
| SIU RECV  : XXXXXXXX IN PROGRESS          SIU ANN  : XXXXXXXX FAILED |
| SIU MOH   : XXXXXXXX FAILED               SIU TDS   : XXXXXXXX NEVER LOADED|
+-----+

```

## 205.2.5 RESTART-USSU

All or individual AP shelves are restarted. (combination of deactivation and activation with waiting time). Restart action can only be executed for AP shelves (17-99). All possible error and advisory messages those are used for activation and deactivation branches are applied for restart branch , too.

### Procedure Overview

| Command Code | Parameter                                       |
|--------------|-------------------------------------------------|
| RESTART-USSU | RESTYPE = ALL;<br> RESTYPE = LTU, LTU=<number>; |

## 205.3 Parameter Description

|       |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 206 VADSM - Administration of NMC alarms in the SM

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The AMO VADSM is used to administer the validation data of the NMC alarms (NMC = Network Management Center) for the dependability system in the SM.

At a higher level, these alarms are used to indicate global system faults.

At the AMO level, NMC alarms are handled in much the same way as error messages, i.e. they are output to the standard output devices such as printer, PC, RMA (Hicom teleservice or NMC).

### Validation data for an alarm:

- a) THRESHOLD VALUE for major (urgent) and minor (non-urgent) alarms

To indicate the respective alarm level the error counter assigned to the alarm must have reached or exceeded the threshold value within the specified validation time. Both major and minor alarms can also be deactivated.

- b) VALIDATION TIME for major and minor alarms

The validation time, which must be specified for each alarm level (major/minor), ensures that 'sporadic' faults are not indicated immediately. Much rather they are indicated upon expiry of the validation time, i.e. a specified time during which the error was continuously present. Only then will the alarm be indicated. Alternatively, the alarm will only be deactivated if the respective threshold value is not reached during the validation time.

- c) VALIDATION TIME for single device alarm

Failed units or devices below the threshold levels specified for the minor or major alarms are indicated by the single device alarm. The single device alarm is indicated when at least one unit is continuously defect during the validation time for single device alarm. The single device alarm is deactivated when its validation time is set to 0.

- d) PRIORITY

A global filter for alarm messages has been added to the system to prevent not-service-relevant messages. AMO-SIGNL defines the minimum priority of the alarms which are forwarded by SIT. The priority of each single alarm can be changed by AMO-VADSM.

## e) HWCONT

Alarms can also be signalized by LEDs. The parameter 'HWCONT' defines, which LEDs are assigned to which alarm(s). Normally HWCONT = SU for all alarms. This means : When at least one minor alarm is active, the LEDs 'P2' on IOP and 'NAL' on DP are in state 'on' and when at least one major alarm is active, the LEDs 'C3' on IOP and 'UAL' on DP are in state 'on' (summary signalisation). When HWCONT is set to S1 for one (or more) alarm(s), 'P2' and 'NAL' are on only when this (or these) alarm(s) are active. In the same way : When HWCONT is set to S2 for one (or more) alarm(s), the LEDs 'C3' and 'UAL' are on only when this (or these) alarm(s) are active.

## f) ALARM GROUP

### 1. Central SM alarms

Central SM alarms are used to indicate faults in common or shared HW components in the system.

Central alarms are preset by the system. There are central alarms for the SWU, the ISp (ADS) and the ISs (server). The AMO VADSM can only be used to change threshold values and validation times.

Out of 64 possible central alarms, the table below refers only to those central alarms which are used in the SM:

| +=====+=====+=====+=====+=====+=====+=====+=====+=====+=====+=====+=====+ |         |                                                                     |         |   |         |   |        |   |        |   |                             |
|---------------------------------------------------------------------------|---------|---------------------------------------------------------------------|---------|---|---------|---|--------|---|--------|---|-----------------------------|

## 2. Peripheral SM alarms

Peripheral SM alarms (up to 24) are used to indicate faults in the SM periphery. The SM periphery includes the TTY / VM / FAX hardware configured in the ISp and ISs as well as the storage periphery (HD / cartridge).

Peripheral SM alarms are preset by the system. The AMO VADSM can only be used to change threshold values and validation times.

Table 46 Peripheral SM alarms ( available for each server )

206.1 Restrictions

This description is valid from SP300 E V2.0

206.2 Interrelationships

- AMO VADSU : Administer NMC alarms in the SWU

206.3 Functions of the AMO

- CHANGE-VADSM : Change the validation data for central or peripheral NMC alarms in the SM
- ACTIVATE-VADSM : Activate a central or peripheral NMC alarm in the SM
- DEACTIVATE-VADSM : Deactivate a central or peripheral NMC alarm in the SM
- DISPLAY-VADSM : Display the validation data for central or peripheral NMC alarms in the SM
- REGENERATE-VADSM : Regenerate the validation data for central or peripheral NMC alarms in the SM

## 206.3.1 CHANGE-VADSM

CHANGE-VADSM can be used to change threshold values and validation times. An alarm is deactivated, when its threshold is set to 65535.

In case of a change of the threshold values of the central alarm 13 the error message

F09: CHANGE OF VALIDATION DATA FOR ALARM 13 NOT POSSIBLE

is displayed.

The threshold values of some central SM alarms cannot be changed (see Table 1).

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-VADSM | <pre>[UNIT=&lt;param&gt;],   ALARMGR=CENTRAL,ALARMNO=&lt;range&gt;   , {THRESHD1=&lt;number&gt;,THRESHD2=&lt;number&gt;   ,TIME1=&lt;number&gt;,TIME2=&lt;number&gt;,TIME=&lt;number&gt;,   ,PRIO=&lt;number&gt;,HWCONT=&lt;param&gt;} ;   ALARMGR=PERIPHER,ALARMNO=&lt;range&gt;   , {THRESHD1=&lt;number&gt;,THRESHD2=&lt;number&gt;   ,TIME1=&lt;number&gt;,TIME2=&lt;number&gt;,TIME=&lt;number&gt;,   ,PRIO=&lt;number&gt;,HWCONT=&lt;param&gt;} ;</pre> |

### Example

Change the threshold value for the major alarm of central alarm 21 in the ISp.

Input:

```
CHANGE-VADSM:UNIT=A1,ALARMGR=CENTRAL,ALARMNR=21,THRESHD1=20;
```

## 206.3.2 ACTIVATE-VADSM

ACTIVATE-VADSM can be used to activate a deactivated alarm.

This is possible also for alarms whose threshold values cannot be changed (see Table 1). When its threshold values can be changed, an alarm can also be activated using 'CHANGE-VADSM'.

## VADSM - Administration of NMC alarms in the SM

### Functions of the AMO

#### Procedure Overview

| Command Code   | Parameter                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------|
| ACTIVATE-VADSM | [UNIT=<param>],<br><br>ALARMGR=CENTRAL,ALARMNO=<range>;<br><br> ALARMGR=PERIPHER,ALARMNO=<range>; |

#### Example

Activate central alarm 13 in the ISp.

Input:

```
ACTIVATE-VADSM:UNIT=A1,ALARMGR=CENTRAL, ALARMNR=13;
```

### 206.3.3 DEACTIVATE-VADSM

DEACTIVATE-VADSM can be used to deactivate an active alarm. This is possible also for alarms whose threshold values cannot be changed (see Table 1). When its threshold values can be changed, an alarm can also be deactivated using 'CHANGE-VADSM'.

#### Procedure Overview

| Command Code     | Parameter                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------|
| DEACTIVATE-VADSM | [UNIT=<param>],<br><br>ALARMGR=CENTRAL,ALARMNO=<range>;<br><br> ALARMGR=PERIPHER,ALARMNO=<range>; |

#### Example

Deactivate central alarm 13 in the ISp.

Input:

```
DEACTIVATE-VADSM:UNIT=A1,ALARMGR=CENTRAL, ALARMNR=13;
```

## 206.3.4 DISPLAY-VADSM

### Procedure Overview

| Command Code  | Parameter                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------|
| DISPLAY-VADSM | [UNIT=<param>],<br>[ALARMGR=CENTRAL], [ALARMNO=<range>;<br><br>  [ALARMGR=PERIPHER], [ALARMNO=<range>; |

### Examples

1. Display peripheral SM alarms 0 to 2 in the ISp.

Input:

DISPLAY-VADSM: , PERIPHERAL, 0&&2;

Output:

```

=====
=+
| ALARM GROUP: PERIPHERAL SM ALARMS                                     |
+====+=====+=====+=====+=====+=====+=====+=====+=====+
=+
|AL.|THRSHD1|THRSHD2|ERR.|ERR.|TOTAL|TIME1|TIME2|TIME|PR|HW|NAME|      |
|NO.|IN %   |IN %   |ABSOL|IN %|      |[SEC]| [SEC]| [H]|  |CO|      |
+---+-----+-----+-----+-----+-----+-----+-----+-----+
-+
| 0 | DEACT | 1   | 0 | 0 | 0 | 0 | 600 | 0 | E0 | SU | SERVICE TELETYPE |
| 1 | DEACT | 1   | 0 | 0 | 0 | 0 | 600 | 0 | E0 | SU | SERVICE TELETYPE |
| 2 | DEACT | 1   | 0 | 0 | 0 | 0 | 600 | 0 | E0 | SU | SERVICE TELETYPE |
+====+=====+=====+=====+=====+=====+=====+=====+=====+
=+

```

The value "DEACT" in the column "THRSHD1" shows that the minor alarm has been deactivated. Similarly, "DEACT" in the column "THRSHD2" shows that the major alarm has been deactivated. The value '0' in the column 'TIME' shows that the single device alarm also is deactivated.

"ERR." corresponds to the number of errors found (actual). It is displayed as an absolute value and as a percent value.

"TOTAL" is the number of active units monitored by the dependability system under a specific alarm number

### 206.3.5 REGENERATE-VADSM

All alarms (already ADDED) are regenerated by means of CHANGE commands. Only those alarms are regenerated whose validation data (THRESHD1, THRESHD2, TIME1, TIME2, TIME) deviates from the basic initialization data, i.e. those which have been changed using the AMO VADSM. In the same way, only the validation values which deviate from the initialization data will be regenerated.

**Procedure Overview**

| Command Code     | Parameter                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| REGENERATE-VADSM | <div> [UNIT=&lt;param&gt;] ,<br/> [ALARMGR=CENTRAL] , [ALARMNO=&lt;range&gt;] ;<br/> <br/>   [ALARMGR=PERIPHER] , [ALARMNO=&lt;range&gt;] ; </div> |

**Example**

Regenerate central SM alarm 9 in the ISp.

Input:

REG-VADSM:A1,CENTRAL,9;

### 206.4 Parameter Description

|                 |                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| ALARMGR         | Alarm group                                                                                                                             |
| Type of Input   | <div> : Single value, mandatory (CHANGE )<br/> : Single value, optional ( DISPLAY; REGENERATE ) </div>                                  |
| Possible Values | <div> : CENTRAL   = central SM alarm group<br/> PERIPHER   = peripheral SM alarm group </div>                                           |
| Default Value   | : all SM alarm groups for DISPLAY, REGENERATE                                                                                           |
| ALARMNO         | Alarm number                                                                                                                            |
| Type of Input   | <div> : Single value, mandatory (CHANGE)<br/> Single value, optional (REGENERATE)<br/> Single value or range, optional (DISPLAY) </div> |
| Possible Values | <div> : 0- 63 ... central SM alarm<br/> 0- 23 ... peripheral SM alarm </div>                                                            |
| Default Value   | : range of possible input values for<br>DISPLAY, REGENERATE                                                                             |

|            |                                                               |                                        |                                                               |
|------------|---------------------------------------------------------------|----------------------------------------|---------------------------------------------------------------|
| HWCONT     | Hardware-Contact (Alarm Kontakt)                              |                                        |                                                               |
|            | Type of Input                                                 | : Single value, mandatory (CHANGE)     |                                                               |
|            | Possible Values                                               | : SU                                   | =Summary Signalization                                        |
|            |                                                               | S1                                     | = individual Signalization LED P2 (PAL) on IOP and NAL on DP  |

## 206.5 Error Messages and Advisories

### 206.5.1 Error Messages

F01: ALARM NUMBER <ALARMNO> IS NOT USED;  
FOR THIS REASON, CHANGE IS NOT POSSIBLE.

F02: THE THRESHOLD VALUES FOR THIS CENTRAL ALARM ARE PRESET;  
FOR THIS REASON, CHANGE IS NOT POSSIBLE.

F03: THRESHOLD VALUE 2 MUST BE GREATER THAN THRESHOLD VALUE 1.

F04: THE VALIDATION TABLE CANNOT BE LOADED FROM THE HARD DISK.

F05: THE VALIDATION TABLE CANNOT BE WRITTEN TO THE HARD DISK.

F06: DEVICE ALARM NOT POSSIBLE FOR THIS ALARM NUMBER

F07: DEVICE ALARM CAN NOT BE ACTIVATED, BECAUSE ONE UNIT  
IS ALREADY SUPERVISED BY MINOR OR MAJOR ALARM

F08: CHANGE NOT POSSIBLE, BECAUSE THE ENTERED THRESHOLD = 1 UNIT  
AND DEVICE ALARM ALWAYS SUPERVISES ONE UNIT

F09: CHANGE OF VALIDATION DATA FOR ALARM 13 NOT POSSIBLE

### 206.5.2 Advisories

H01: MINOR ALARM <ALARMNO> HAS BEEN DEACTIVATED.

H02: MAJOR ALARM <ALARMNO> HAS BEEN DEACTIVATED.

H03: NO ALARM PRESENT FOR THE SPECIFIED PARAMETERS.

H04: MINOR ALARM <ALARMNO> HAS BEEN ACTIVATED.

H05: MAJOR ALARM <ALARMNO> HAS BEEN ACTIVATED.

H06: EXPLANATION OF ALARM PRIORITY :

PRIORITY = 0 : ALARM MESSAGES FOR THIS ALARM GET THE MESSAGE PRIORITY DEFINED  
BY AMO-SIGNL (SEE A9000 TO A9007)

PRIORITY = 1 TO 8 : THIS PRIORITY IS USED AS MESSAGE PRIORITY FOR ALARM  
MESSAGES (SEE A9000 TO A9007) WHICH CONCERN THIS ALARM

PRIORITY = 9 TO 11 : SEE PRIORITY 0, BUT ADDITIONALLY :

(PRIORITY = 9 : ALARM MESSAGE OF THIS ALARM CLASS IS NOT SENT TO AFR1 (HTS)

(PRIORITY = 10 : ALARM MESSAGE OF THIS ALARM CLASS IS NOT SENT TO AFR2 (DMS))

(PRIORITY = 11 : ALARM MESSAGE OF THIS ALARM CLASS IS NOT SENT TO AFR1 (HTS)  
AND AFR2 (DMS))

H07: ONLY THE ALARMS WHOSE HWCONT IS S1 ARE SIGNALIZED TO LED P2 (PAL) ON IOP AND  
NAL ON DP. FOR THIS HW-CONTACT THE SUMMARY SIGNALISATION (ALL MINOR ALARMS) IS  
DEACTIVATED. IT WILL BECOME ACTIVE AGAIN, WHEN HW-CONTACT = S1 FOR NO ALARM.

H08: ONLY THE ALARMS WHOSE HWCONT IS S2 ARE SIGNALIZED TO LED C3 (ZAL) ON IOP AND  
UAL ON DP. FOR THIS HW-CONTACT THE SUMMARY SIGNALISATION (ALL MAJOR ALARMS) IS  
DEACTIVATED. IT WILL BECOME ACTIVE AGAIN, WHEN HW-CONTACT = S2 FOR NO ALARM.

## **VADSM - Administration of NMC alarms in the SM**

### Error Messages and Advisories

## 207 VADSU - Administration of NMC alarms in the SWU

|                 |                       |                               |
|-----------------|-----------------------|-------------------------------|
| Validation Data | Interrelationships    | Error Messages and Advisories |
| Alarm Groups    | Functions of the AMO  |                               |
| Restrictions    | Parameter Description |                               |

The AMO VADSU is used to administer the validation data of the NMC alarms (NMC = Network Management Center) for the dependability system in the SWU.

At a higher level, these alarms are used to indicate global system faults. At the AMO level, NMC alarms are handled in much the same way as error messages, i.e. they are output to the standard output devices such as printer, PC, RMA (Hicom teleservice or NMC).

Via AMO VADSU the SLA-Time can be entered. The SLA-Time defines the time interval, within which the alarm 'BAD IP CONNECTIVITY' is active.

The SNAPSHOT function can be activated and deactivated via AMO VADSU. If the SNAPSHOT is activated, non existent system elements will be excluded from alarm control. If the SNAPSHOT is deactivated, non existent system elements will be submitted to alarm control.

### 207.1 Validation Data

The characteristic data of an alarm are THRESHOLD1, THRESHOLD2, TIME1, TIME2, TIME, PRIORITY and HWCONT (alarm-contact).

There are the following alarm levels : Major (urgent), minor (not-urgent) alarm and device alarm (single device alarm). Each alarm level is defined by its validation data.

The validation data of minor alarm are THRESHOLD1 and TIME1 (validation time), the validation data of major alarm are THRESHOLD2 and TIME2. The respective alarm level is indicated, when the error counter assigned to the alarm has reached or exceeded the threshold value continuously during the specified validation time. This ensures that 'sporadic' faults are not indicated. Alternatively, the alarm will only be deactivated if the respective threshold value is not reached during the whole validation time. The threshold values of central alarms are defined as absolute values, the threshold values of peripheral or logical alarms are defined in percent of the count of relevant units. The difference between major and minor alarm is only that THRESHOLD2

must be greater than THRESHOLD1. The major or minor alarm can be deactivated, when its threshold is set to 65535. This can be done by call of either CHANGE-VADSU or DEACTIVATE-VADSU.

The most alarms have the device alarm (single device alarm) as a third alarm level. Its purpose is to indicate failed units below the threshold level of major / minor alarm. The two differences between the validation data of major / minor alarm and device alarm are the following : The threshold of device alarm is always equal to one unit and its validation time (TIME) can be much longer (255 hours instead of 65535 seconds). So the device alarm is indicated when at least one unit is defect during a long period. The device alarm can be deactivated, when its validation time is set to 0 (this is possible by CHANGE-VADSU only).

A global filter for alarm messages has been added to the system to prevent not-service-relevant messages. AMO-SIGNL defines the minimum priority of the alarms which are forwarded by SIT. The PRIORITY of each single SWU alarm can be changed by AMO-VADSU. Its default value is 0 (lowest priority).

Alarms can also be signaled by LEDs. The parameter 'HWCONT' defines, which LEDs are assigned to which alarm(s). Normally HWCONT = SU for all alarms. This means : When at least one minor alarm is active, the LEDs 'P2' on IOP and 'NAL' on DP are in state 'on' and when at least one major alarm is active, the LEDs 'C3' on IOP and 'UAL' on DP are in state 'on' (summary signalisation). But when HWCONT is set to S1 for one (or more) alarm(s), 'P2' and 'NAL' are in state 'on' only when this (or these) alarm(s) are active and when HWCONT is set to S2 for one (or more) alarm(s), the LEDs 'C3' and 'UAL' are in state 'on' only when this (or these) alarm(s) are active.

## 207.2 Alarm Groups

### 1. Central alarms

Central SWU ( max. 64; alarm nos. 0-63 ) alarms are used to indicate faults in common or shared HW components in the system (e.g. failure of redundant SWU hardware).

By default, central alarms are preset by the system. There are central alarms for the SWU (administered by the AMO VADSU), and central alarms for the ADS and the servers (administered by the AMO VADSM). The AMO VADSU can only be used to change threshold values and validation times.

The table below refers only to the central alarms used in the SWU (all other types of alarm are either not used or administered by the AMO VADSM).

| ALARMNO                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | THRSH<br>D1 | THRSH<br>D2 | TIME1<br>in sec | TIME2<br>in sec | TIME<br>in h | PR  | HW-<br>CO | NAME                      |

## 2. Peripheral SWU alarms

Peripheral SWU alarms (up to 32; alarm nos. 0 to 31) are used to indicate faults in the SWU periphery. So-called 'aggregate' alarms cover faults in all terminals/trunks of specific devices types, e.g. all CO trunks, all tie trunks, all special equipment (APSE), all voice functions, etc.

By default, peripheral SWU alarms are preset by the system. The AMO VADSU can only be used to change threshold values and validation times

## VADSU - Administration of NMC alarms in the SWU

### Alarm Groups

Table 47 Peripheral SWU alarms (basic initialization)

### 3. Locical SWU alarms

Logical SWU alarms (up to 583; alarm nos. 1 to 583) can be divided into the following three groups:

#### a) Special alarms

Special alarms (up to 7; alarm nos. 1 to 7) are 'aggregate' alarms which are used for example to indicate faults in route-specific CO trunks (outgoing/incoming).

By default, special alarms are preset by the system. The AMO VADSU can only be used to change threshold values and validation times.

| TIME    | Validation time for single device alarm (in hours) |                 |                 |                 |              |    |           |                       |
| PR      | Priority of the alarm                              |                 |                 |                 |              |    |           |                       |
| HW-CO   | HW contact (alarm contact)                         |                 |                 |                 |              |    |           |                       |
| DEACT   | Major/minor alarm has been deactivated             |                 |                 |                 |              |    |           |                       |

Table 48 Special alarms (basic initialization)

**Note**

Alarm numbers 1 and 2 must only be activated alternatively since it is not possible to monitor both incoming/bothway CO trunks (ALARMNO 2) and incoming CO trunks (ALARMNO 1) for trunk failure transfer at the same time.

## a) Directional alarms

Directional alarms (up to 512; alarm nos. 8 to 519) are used to indicate faults in trunk groups consisting of tie trunks, special equipment (APSE) or call charge lines. This means that all trunks of this type (which can be identified by the the fact that they have been set up with a "PEN") can be grouped together by setting up a directional alarm with the AMO VADSU. A single trunk, several trunks, a trunk group configured by the AMO BUEND or an individual group of trunks can be grouped together under one alarm type.

The AMO VADSU can be used to specify threshold values, validation times, priority, HW contact and alarm names.

The AMOs TACSU, TDCSU and TSCSU are used to assign the directional alarm numbers configured by means of the AMO VADSU to "PENs". Since V2.0 it is also possible to assign a directional alarm to a station number. This can be done only via a special DEP procedure.

Trunk groups and individual trunks (only 'incoming') can also be assigned to a directional alarm, provided they have not been assigned to alarm number 1 or 2 (special alarms) which are used for trunk failure transfer.

## VADSU - Administration of NMC alarms in the SWU

### Restrictions

#### b) Personal alarms

Personal alarms (up to 64; alarm nos. 520 to 583) are used to indicate faults in terminals which have been assigned a station number.

All terminals assigned to a station number (incl. multifunction terminals) are assigned to a particular alarm.

The AMO VADSU can be used to specify threshold values, validation times and alarm names.

The AMOs SBCSU and SCSU are used to assign the personal alarm numbers configured by means of the AMO VADSU to station numbers.

#### 4. Peripheral alarms

Peripheral SM (Service Module) alarms are used to indicate faults in the SM periphery. They are administered by the AMO VADSM.

## 207.3 Restrictions

This description is valid from SP300 E V2.0.

## 207.4 Interrelationships

- AMO SBCSU : Configure terminals and S0 bus in the SWU
- AMO SCSU : Configure stations in the SWU
- AMO TACSU : Configure analog trunk circuits in the SWU
- AMO TDCSU : Configure digital trunk circuits in the SWU
- AMO TSCSU : Configure special circuits in the SWU
- AMO VADSM : Administer NMC alarms in the SM

## 207.5 Functions of the AMO

- [ADD-VADSU](#) : Add the directional or personal alarms for logical NMC alarms in the SWU  
Add the SLA-Time
- [CHANGE-VADSU](#) : Change the validation data for central, peripheral or logical NMC alarms in the SWU
- [ACTIVATE-VADSU](#) : Activate a central, peripheral or logical alarm  
Activate the SNAPSHOT function

- **DEACTIVATE-VADSU** : Deactivate a central, peripheral or logical alarm  
Deactivate the SNAPSHOT function
- **DELETE-VADSU** : Delete the directional or personal alarms for the logical NMC alarms in the SWU (including their (assignments to "PENS" or station numbers)
- **DISPLAY-VADSU** : Display the validation data for central, peripheral or logical NMC alarms in the SWU, or display the assignments of logical NMC alarms in the SWU to "PENS" or station numbers  
Display the status of the SNAPSHOT function  
Display the SLA-Time
- **REGENERATE-VADSU** : Regenerate the validation data for central, peripheral, logical or all NMC alarms in the SWU

## 207.5.1 ADD-VADSU

Adding directional or personal alarms for logical alarms.

The alarm number can be specified directly using the parameter ALARMNO. If ALARMNO is not specified, the next free alarm number (directional or personal) will be assigned.

Add of SLA-Time: The SLA-Time ( the time interval, within which the alarm 'BAD IP

CONNECTIVITY' is active ) can be entered via the ramification parameter SLATIME.

The format of the further parameter 'begin time' and 'end time' is explained in the Procedure Overview.

### Procedure Overview

| Command Code | Parameter                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------|
| ADD-VADSU    | ANTYPE=<DIR>, [ALARMNO=<number>]<br>,THRESHD1=<number>,THRESHD2=<number><br>,TIME1=<number>,TIME2=<number>, [TIME=<number>] |

## VADSU - Administration of NMC alarms in the SWU

### Functions of the AMO

```
, [PRIO=<number>], [HWCONT=<param>], , NAME=<string>;

| ANTYPE=<PERS>, [ALARMNO=<number>]
, THRESHD1=<number>, THRESHD2=<number>
, TIME1=<number>, TIME2=<number>, [TIME=<number>]
, [PRIO=<number>], [HWCONT=<param>], , NAME=<string>;

| ANTYPE=<SPEC>, [ALARMNO=<number>]
, THRESHD1=<number>, THRESHD2=<number>
, TIME1=<number>, TIME2=<number>, [TIME=<number>]
, [PRIO=<number>], [HWCONT=<param>], , NAME=<string>;

| ANTYPE=SLATIME, BEGINH=<number>, BEGINM=<number>,
ENDH=<number>, ENDM=<number>;
```

### Examples

1. Add a directional alarm (search for a free alarm number).

#### Input:

```
ADD-VADSU: ANTYPE=DIR, THRESHD1=10, THRESHD2=20, TIME1=300, TIME2=600, TIME=1, PRIO=2,
HWCONT=S1, NAME=EXAMPLEALARM;
```

#### Output:

```
H01: ALARM NUMBER 11 WAS ADDED.
```

2. Add directional alarm 8.

#### Input:

```
ADD-VADSU: ANTYPE=DIR, ALARMNO=8, THRESHD1=1, THRESHD2=65535, TIME1=300, TIME2=0,
NAME=EXAMPLEALARM2;
```

#### Output:

```
H03: MAJOR ALARM 8 HAS BEEN DEACTIVATED.
```

3. Add SLA-Time:

#### Input:

```
ADD-VADSU: ANTYPE=SLATIME, BEGINH=13, BEGINM=45, ENDH=20, ENDM=30;
```

#### Output:

```
ADD COMPLETED;
```

## 207.5.2 CHANGE-VADSU

Changing the validation data of central, peripheral or logical alarms. CHANGE-VADSU can be used to change threshold values and validation times. With directional or personal alarms, it can also be used to change the alarm name.

The threshold values of some central SWU alarms cannot be changed (see Table 1).

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-VADSU | <pre> ALARMGR=CENTRAL,ALARMNO=&lt;number&gt; , {THRESHD1=&lt;number&gt;,THRESHD2=&lt;number&gt; ,TIME1=&lt;number&gt;,TIME2=&lt;number&gt;,TIME=&lt;number&gt; ,PRIO=&lt;number&gt;,HWCONT=&lt;param&gt;} ;   ALARMGR=PERIPHER,ALARMNO=&lt;number&gt; , {THRESHD1=&lt;number&gt;,THRESHD2=&lt;number&gt; ,TIME1=&lt;number&gt;,TIME2=&lt;number&gt;,TIME=&lt;number&gt; ,PRIO=&lt;number&gt;,HWCONT=&lt;param&gt;} ;   ALARMGR=LOGICAL,ALARMNO=&lt;number&gt; , {THRESHD1=&lt;number&gt;,THRESHD2=&lt;number&gt; ,TIME1=&lt;number&gt;,TIME2=&lt;number&gt;,TIME=&lt;number&gt; ,PRIO=&lt;number&gt;,HWCONT=&lt;param&gt;,NAME=&lt;string&gt;} ; </pre> |

### Example

Change the threshold value for the major alarm of central alarm 5.

Input:

```
CHANGE-VADSU:ALARMGR=CENTRAL,ALARMNO=5,THRESHD2=4;
```

## 207.5.3 ACTIVATE-VADSU

Activate a not active alarm. When threshold values can be changed, activation of an alarm is also possible using 'CHANGE-VADSU'.

**Procedure Overview**

| Command Code   | Parameter                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACTIVATE-VADSU | <div>[ALARMGR=CENTRAL,ALARMNO=&lt;range&gt;;<br/><br/> ALARMGR=PERIPHER,ALARMNO=&lt;range&gt;;<br/><br/> ALARMGR=LOGICAL,ALARMNO=&lt;range&gt;;<br/><br/> ALARMGR=SNAPSHOT;</div> |

**Examples**

1. Activate a central alarm:

Input:

ACT-VADSU:CENTRAL,5;

Output:

H500: AMO VADSU STARTED  
H09: MINOR ALARM 5 HAS BEEN ACTIVATED.  
H10: MAJOR ALARM 5 HAS BEEN ACTIVATED.  
AMO-VADSU-69 NMC ALARMS CONFIGURATION, SWITCHING UNIT  
ACTIVATE COMPLETED;

2. Activate the SNAPSHOT function

Input:

ACT-VADSU:SNAPSHOT;

Output:

H500: AMO VADSU STARTED  
AMO-VADSU-69 NMC ALARMS CONFIGURATION, SWITCHING UNIT  
ACTIVATE COMPLETED;

**207.5.4 DEACTIVATE-VADSU**

Deactivate a not active alarm. All alarms can be deactivated, even those, whose thresholds can not be changed.

When threshold values can be changed, an alarm can also be deactivated using 'CHANGE-VADSU'.

### Procedure Overview

| Command Code     | Parameter                                                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEACTIVATE-VADSU | <pre>[ALARMGR=CENTRAL,ALARMNO=&lt;range&gt;;   ALARMGR=PERIPHER,ALARMNO=&lt;range&gt;;   ALARMGR=LOGICAL,ALARMNO=&lt;range&gt;;;   ALARMGR=SNAPSHOT;</pre> |

### Examples

#### 1. Deactivate a central alarm:

Input:

```
DEACT-VADSU:CENTRAL,5;
```

Output:

```
H500: AMO VADSU STARTED
H02: MINOR ALARM 5 HAS BEEN DEACTIVATED.
H03: MAJOR ALARM 5 HAS BEEN DEACTIVATED.
AMO-VADSU-69          NMC ALARMS CONFIGURATION, SWITCHING UNIT
DEACTIVATE COMPLETED;
```

#### 2. Activate the SNAPSHOT function

Input:

```
DEACT-VADSU:SNAPSHOT;
```

Output:

```
H500: AMO VADSU STARTED
AMO-VADSU-69          NMC ALARMS CONFIGURATION, SWITCHING UNIT
DEACTIVATE COMPLETED;
```

## 207.5.5 DELETE-VADSU

Deleting directional or personal alarms for logical alarms (including their assignments to "PENs" or station numbers).

### Procedure Overview

| Command Code | Parameter         |
|--------------|-------------------|
| DELETE-VADSU | ALARMNO=<number>; |

Example

Delete the directional, logical alarm 60.

Input:

DELETE-VADSU: 60;

Output:

H04: ALARM NUMBER 60 HAS BEEN DELETED;  
ANY ASSIGNMENTS TO THE FOLLOWING PENS WERE CANCELED:  
1-01-007-00 1-01-007-01 1-01-007-02 1-01-007-03  
1-01-007-04  
1-01-007-05 1-01-007-06

207.5.6 DISPLAY-VADSU

Displaying the validation data of central, peripheral or logical alarms, or displaying the assignments of logical alarm numbers to "PENS" or station numbers.

Procedure Overview

| Command Code  | Parameter                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-VADSU | <div>[TYPE=CENTRAL], [ALARMNO=&lt;range&gt;];</div> <div>  [TYPE=PERIPHER], [ALARMNO=&lt;range&gt;];</div> <div>  [TYPE=LOGICAL], [ANTYPE=SPEC], [ALARMNO=&lt;range&gt;];</div> <div>  [ANTYPE=DIR], [ALARMNO=&lt;range&gt;];</div> <div>  [ANTYPE=PERS], [ALARMNO=&lt;range&gt;];</div> <div>  [TYPE=ASS], [ALARMNO=&lt;range&gt;];</div> <div>  [TYPE=SNAPSHOT];</div> <div>  [TYPE=SLATIME];</div> |

Examples :

1. Display peripheral alarms 0 to 2 :

Input:

DISPLAY-VADSU: PERIPHER,0&&2;

## Output:

```

=====+
| ALARM GROUP: PERIPHERAL SWU ALARMS
|
+====+=====+=====+=====+=====+=====+=====+=====+=====+=====+
|AL.|THRSHD1|THRSHD2|ERR.|ERR.|TOTAL|TIME1|TIME2|TIME|PR|HW| NAME
|
|NO.|IN % |IN % |ABSO|IN %| | [SEC]| [SEC]| [H]| |CO|
|
+---+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 0| 50 | 90 | 24 | 12 | 200 | 600 | 600 | 0 |E0|SU| C-O-TRUNK/EXCH-
LINE|
| 1| 50 | 90 | 0 | 0 | 5 | 600 | 600 | 0 |E0|SU| TIE-LINE
|
| 2| DEACT | 50 | 5 | 10 | 50 | 0 | 600 | 0 |E0|SU| MULTIPLE DEVICES
|
+====+=====+=====+=====+=====+=====+=====+=====+=====+=====+

```

The value "DEACT" in the column "THRSHD1" shows that the minor alarm has been deactivated. Similarly, "DEACT" in the column "THRSHD2" shows that the major alarm has been deactivated. The value '0' in the column 'TIME' shows that single device alarm also is deactivated.

"ERR." corresponds to the number of errors found (actual). The error count is displayed as an absolute value and, additionally, as a percent value. Note: Actual means an absolute from a system point of view e.g. for a Central Alarm LTU failure 2 would be set so a Major Alarm is generated. The value itself would never exceed 2 even with multiple LTU failures because 2 has already been reached and a Major Alarm set.

"TOTAL" is the number of active units (such as stations, CO/tie trunks etc.) monitored by the dependability system under a specific alarm number (e.g. trunks which have been deactivated by means of an AMO are not monitored).

## 2. Display the assignments for logical alarm numbers 61 to 66 :

## Input:

DISPLAY-VADSU: ASS,61&&66;

## Output:

```

=====+
| ASSIGNMENT: DIRECTIONAL ALARMS
|
+====+=====+=====+=====+=====+=====+=====+=====+=====+
| ALARM | ASSIGNED PENS / STATION NUMBERS
| NO. |
+-----+-----+-----+-----+-----+-----+-----+-----+
| 61 | 1-01-007-00 1-01-007-01 1-01-007-02 1-01-007-03
+-----+-----+-----+-----+-----+-----+-----+-----+
| 63 | 1-01-007-05
|

```

|                                  |      |      |      |      |      |      |      |      |  |
|----------------------------------|------|------|------|------|------|------|------|------|--|
|                                  |      |      |      |      |      |      |      |      |  |
| ASSIGNMENT: PERSONAL ALARMS      |      |      |      |      |      |      |      |      |  |
| ALARM   ASSIGNED STATION NUMBERS |      |      |      |      |      |      |      |      |  |
| NO.                              |      |      |      |      |      |      |      |      |  |
| 64                               | 2500 | 2501 | 2503 | 2507 | 2511 | 2533 | 2534 | 2535 |  |
|                                  | 2536 | 2541 |      |      |      |      |      |      |  |
| 65                               | 3405 | 3502 |      |      |      |      |      |      |  |
| 66                               | 3300 | 3301 |      |      |      |      |      |      |  |

3. Display the state of theSNAP function.

Input:

DISP-VADSU:TYPE=SNAPSHOT;

Output:

H500: AMO VADSU STARTED

|                         |  |  |  |  |  |  |  |  |  |
|-------------------------|--|--|--|--|--|--|--|--|--|
| DISPLAY SNAPSHOT: STATE |  |  |  |  |  |  |  |  |  |
|                         |  |  |  |  |  |  |  |  |  |
| SNAPSHOT - STATE : OFF  |  |  |  |  |  |  |  |  |  |
|                         |  |  |  |  |  |  |  |  |  |

AMO-VADSU-69 NMC ALARMS CONFIGURATION, SWITCHING UNIT  
DISPLAY COMPLETED;

Thereby "SNAPSHOT - STATE : ON": means that non existent system elements are exluded from alarm control. "SNAPSHOT - STATE : OFF": means that non existent system elements are submitted to alarm control.

4. Display of SLA - Time.

Input:

DISP-VADSU:TYPE=SNAPSHOT;

Output:

H500: AMO VADSU STARTED

|                         |  |  |  |  |  |  |  |  |  |
|-------------------------|--|--|--|--|--|--|--|--|--|
| SALATIME                |  |  |  |  |  |  |  |  |  |
| BEGIN: 02:35 END: 13:40 |  |  |  |  |  |  |  |  |  |

AMO-VADSU-69 NMC ALARMS CONFIGURATION, SWITCHING UNIT  
DISPLAY COMPLETED;

This means that the alarm "BAD IP CONNECTIVITY" is activated from 02H:35M to 13H:40M.

## 207.5.7 REGENERATE-VADSU

Regenerating the validation data of central, peripheral, logical or all alarms.

Any existing personal or directional alarms are completely regenerated by the ADD command.

All other alarms (always existing) are regenerated by means of CHANGE commands. Only those alarms are regenerated whose validation data (THRESHD1, THRESHD2, TIME1, TIME2, TIME, PRIO, HWCONT) deviates from the basic initialization data, i.e. those which have been changed using the AMO VADSU. In the same way, only the validation values which deviate from the initialization data will be regenerated.

The validation table with the basic initialization values, which is stored on the hard disk, serves as a reference.

The assignments of the personal and directional alarm numbers are regenerated using the AMOs SBSCU, SCSU, TACSU, TDCSU and TSCSU.

### Procedure Overview

| Command Code     | Parameter                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REGENERATE-VADSU | <p>[ALARMGR=CENTRAL], [ALARMNO=&lt;number&gt;;</p> <p>  [ALARMGR=PERIPHER], [ALARMNO=&lt;number&gt;;</p> <p>  [ALARMGR=LOGICAL], [ALARMNO=&lt;number&gt;;</p> |

### Example

Regenerate central alarm 1.

Input:

REG-VADSU:CENTRAL,1;

Output:

CHANGE-VADSU:MMA,CENTRAL,1,,3,300,300,,,;

## 207.6 Parameter Description

## 207.7 Error Messages and Advisories

### 207.7.1 Error Messages

F01: ALARM NUMBER <ALARMNO> ALREADY EXISTS.  
 F02: NO DIRECTIONAL ALARM NUMBER (8-519) FREE.  
 F03: NO PERSONAL ALARM NUMBER (520-583) FREE.  
 F04: THRESHOLD VALUE 2 MUST BE GREATER THAN THRESHOLD VALUE 1.  
 F05: ALARM NAME IS IMPLAUSIBLE.  
 F06: THE FIRST FOUR POSITIONS OF THE NAMES OF DIRECTIONAL ALARMS  
 MUST BE UNAMBIGUOUS.  
 F07: ALARM NUMBER <ALARMNO> IS NOT USED; FOR THIS REASON, CHANGE IS NOT POSSIBLE.  
 F08: THE THRESHOLD VALUES FOR THIS CENTRAL ALARM ARE PRESET;  
 FOR THIS REASON, CHANGE IS NOT POSSIBLE.  
 F09: ONLY THE NAME OF DIRECTIONAL AND PERSONAL ALARMS MAY BE CHANGED.  
 F10: ALARM NUMBER <ALARMNO> DOES NOT EXIST.  
 F11: ALARM NUMBERS 1 AND 2 (SPECIAL ALARMS) MUST NOT BE ACTIVATED SIMULTANEOUSLY.  
 ALARM NUMBER <1/2> CAN ONLY BE ACTIVATED WHEN ALARM NUMBER <2/1> WAS  
 DEACTIVATED  
 F12: THE VALIDATION TABLE CANNOT BE LOADED FROM THE HARD DISK.  
 F13: THE VALIDATION TABLE CANNOT BE WRITTEN TO THE HARD DISK.  
 F14: DEVICE ALARM NOT POSSIBLE FOR THIS ALARM NUMBER  
 F15: WHEN ONE UNIT IS SUPERVISED BY MAJOR OR MINOR ALARM,  
 DEVICE ALARM CAN NOT BE ACTIVE AT THE SAME TIME  
 F16: CHANGE NOT POSSIBLE, BECAUSE THE ENTERED THRESHOLD = 1 UNIT  
 AND DEVICE ALARM IS ACTIVE, WHEN ALWAYS SUPERVISES ONE UNIT  
 F17: NO RESPONSE FOR THE SNAPSHOT MESSAGE FROM DEVICE CONTROL  
 F18: BEGINTIME @@H,@@M DOES NOT LIE BEFORE ENDTIME @@H,@@M.  
 F19: NEGATIVE RESPONSE FOR THE SNAPSHOT MESSAGE FROM DEVICE CONTROL

### 207.7.2 Advisories

H01: ALARM NUMBER <ALARMNO> HAS BEEN ADDED.  
 H02: MINOR ALARM <ALARMNO> HAS BEEN DEACTIVATED.  
 H03: MAJOR ALARM <ALARMNO> HAS BEEN DEACTIVATED.  
 H04: ALARM NUMBER <ALARMNO> HAS BEEN DELETED;  
 ANY ASSIGNMENTS TO THE FOLLOWING PENS HAVE BEEN CANCELED:  
 <gg-u-bbb-ss> <gg-u-bbb-ss> ...  
 H05: ALARM NUMBER <ALARMNO> HAS BEEN DELETED;  
 ANY ASSIGNMENTS TO THE FOLLOWING STATION NUMBERS HAVE BEEN CANCELED:  
 <stno> <stno> ...  
 H06: ALARM NUMBER <ALARMNO> HAS BEEN DELETED; THERE WERE NO ASSIGNMENTS.  
 H07: NO ALARM PRESENT FOR THE SPECIFIED PARAMETERS.  
 H08: NO ALARM ASSIGNMENTS PRESENT.  
 H09: MINOR ALARM <ALARMNO> HAS BEEN ACTIVATED.

## VADSU - Administration of NMC alarms in the SWU

### Error Messages and Advisories

- H10: MAJOR ALARM <ALARMNO> HAS BEEN ACTIVATED.
- H11: AN ALARM INITIALIZED WITH 'DEACT' CAN ONLY BE ACTIVATED USING 'CHANGE-VADSU'
- H12: EXPLANATION OF ALARM PRIORITY :
- PRIORITY = 0 : ALARM MESSAGES FOR THIS ALARM GET THE MESSAGE PRIORITY DEFINED BY AMO-SIGNL (SEE A9000 TO A9007)
  - PRIORITY = 1 TO 8 : THIS PRIORITY IS USED AS MESSAGE PRIORITY FOR ALARM MESSAGES (SEE A9000 TO A9007) WHICH CONCERN THIS ALARM
  - PRIORITY = 9 TO 11 : SEE PRIORITY 0, BUT ADDITIONALLY :
    - (PRIORITY = 9 : ALARM MESSAGE OF THIS ALARM CLASS IS NOT SENT TO AFR1 (HTS)
    - (PRIORITY = 10 : ALARM MESSAGE OF THIS ALARM CLASS IS NOT SENT TO AFR2 (DMS))
    - (PRIORITY = 11 : ALARM MESSAGE OF THIS ALARM CLASS IS NOT SENT TO AFR1 (HTS) AND AFR2 (DMS))
- H13: ONLY THE ALARMS WHOSE HWCONT IS S1 ARE SIGNALIZED TO LED P2 (PAL) ON IOP AND NAL ON DP. FOR THIS HW-CONTACT THE SUMMARY SIGNALISATION (ALL MINOR ALARMS) IS DEACTIVATED. IT WILL ONLY BECOME ACTIVE AGAIN, WHEN HW-CONTACT = S1 FOR NO ALARM.
- H14: ONLY THE ALARMS WHOSE HWCONT IS S2 ARE SIGNALIZED TO LED C3 (ZAL) ON IOP AND UAL ON DP. FOR THIS HW-CONTACT THE SUMMARY SIGNALISATION (ALL MAJOR ALARMS) IS DEACTIVATED. IT WILL ONLY BECOME ACTIVE AGAIN, WHEN HW-CONTACT = S2 FOR NO ALARM.
- H15: THE SNAPSHOT FUNCTION IS ALREADY DEACTIVATED.

## **208 VBZ - internal traffic restrictions**

The description of this AMO is only available in html format!

## 209 VBZA - Internal traffic restrictions for stns. with card readers

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Funtions of the AMO   | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

A second static traffic relations matrix, traffic relations matrix 2, is introduced in addition to traffic relations matrix 1 (created by AMO VBZ). It regulates communications from subscribers with cards to stations with card readers.

The object is the limitation of the mobility of subscribers with ID cards, e.g. for tenant service, and limiting of follow-me call forwarding (AUL) of subscribers with ID cards. Without traffic relations matrix 2, subscribers with ID cards could move about freely within the system by bypassing the blocks set in traffic relations matrix 1.

The same traffic groups are used for traffic relations matrix 2 as for traffic relations matrix 1. Traffic relations matrix 2 is a fully-defined matrix (16 by 16).

The following traffic relations are possible between two traffic groups:

- A = allowed
- D = denied

Directional communications between 2 traffic groups can therefore be covered as well.

|       |           |     |             |
|-------|-----------|-----|-------------|
|       | Card      | --> | Card reader |
| E.g.: | ITR Gr 05 | --> | 03 allowed  |
|       | ITR Gr 03 | --> | 05 denied   |

When a subscriber inserts his ID card into a card reader, a check is made via traffic relations matrix 2 as to whether he can raise his class of service.

If the call to the card reader is not permitted, he can telephone only with the station owner's classes of service, as if he had not inserted his card.

Traffic relations matrix 2 is set up by the data base and initialized with A (allowed); the ADD branch is unnecessary in this AMO.

**VBZA - Internal traffic restrictions for stns. with card readers**  
Restrictions

**Example:**

Communications between ID card and card reader are shown and explained with the aid of an instantaneous representation of traffic relations matrix 2.

|                    | 13 | D                      | D  | D  | D  | D  | D  | D  | D  | D  | D  | D  | D  | A  | D  | D  | D  |
|                    | 14 | D                      | D  | D  | D  | D  | D  | D  | D  | D  | D  | D  | D  | D  | A  | D  | D  |
|                    | 15 | D                      | D  | D  | D  | D  | D  | D  | D  | D  | D  | D  | D  | D  | D  | A  | D  |

Meaning:

ITRGR 12 is permitted to communicate with traffic groups 1, 6, and 9. This means, for example, that a subscriber of traffic group 12 can insert his ID card in any card reader of traffic groups 1, 6, and 9 and use his own classes of service.

ITRGR 9 is not permitted to communicate with group 1, meaning that if a subscriber of traffic group 9 inserts his ID in a card reader of traffic group 1, he cannot use his own classes of service, but only those of the owner of the connection of group 1, as if he had not inserted his ID card.

**209.1 Restrictions**

This description is valid from SP300-V3.1

**209.2 Interrelationships**

None

## 209.3 Funtions of the AMO

- [CHANGE-VBZA](#) : Change traffic relations between ID card and card reader
- [DISPLAY VBZA](#) : Display traffic relations between ID card and card reader
- [REGENERATE VBZA](#) : Regenerate traffic relations between ID card card reader

### 209.3.1 CHANGE-VBZA

#### Procedure Overview

| Command Code | Parameter                                  |
|--------------|--------------------------------------------|
| CHANGE-VBZA  | ID=<number>, ITRGR=<param>, IDCR=<number>; |

#### Examples

1. The traffic groups of traffic relations matrix 2 are to contain all non-permitted traffic relations.

Input:

CHANGE-VBZA:0&&15,D,0&&15;

2. All traffic groups for the ID card may have permitted communications with the card reader traffic groups (3,4,5,6).

Input:

CHANGE-VBZA:0&&15, ITRGR=A, IDCR=3&&6;

### 209.3.2 DISPLAY VBZA

#### Procedure Overview

| Command Code | Parameter |
|--------------|-----------|
| DISPLAY-VBZA | ;         |

#### Example

Display of traffic relations from ID card to card reader.

Input:

DISPLAY-VBZA;

Output:

VBZA - Internal traffic restrictions for stns. with card readers

209.3.3 REGENERATE VBZA

Procedure Overview

| Command Code    | Parameter |
|-----------------|-----------|
| REGENERATE-VBZA | ;         |

Examples

Regeneration of traffic relations matrix given in example

Input:

REGENERATE-VBZA;

Output:

CHANGE-VBZA: 00&&15 , A , 00&&15 ;

CHANGE-VBZA: 0, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 1, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 2, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 3, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 4, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 5, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 6, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 7, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 8, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 9, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 10, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 11, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 12, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 13, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 14, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

CHANGE-VBZA: 15, D , 0& 1& 2& 7& 8& 9&10&11&12&13&14&15 ;

## 209.4 Parameter Description

|                 |                                                                  |                                                      |                                                                            |
|-----------------|------------------------------------------------------------------|------------------------------------------------------|----------------------------------------------------------------------------|
| ID              | Internal traffic restriction groups of a stn. with ID facility   |                                                      |                                                                            |
| Type of Input   | :                                                                | Single value, chained single values, range mandatory |                                                                            |
| Possible Values | :                                                                | 00 to 15                                             |                                                                            |
| IDCR            | Internal traffic restriction group of a station with card reader |                                                      |                                                                            |
| Type of Input   | :                                                                | Single value, chained single values, range mandatory |                                                                            |
| Possible Values | :                                                                | 00 to 15                                             |                                                                            |
| ITRGR           |                                                                  |                                                      |                                                                            |
| Type of Input   | :                                                                | Single value, mandatory                              |                                                                            |
| Possible Values | :                                                                | A                                                    | allowed from card user to card reader, card reader to card user unchanged. |
|                 |                                                                  | D                                                    | denied from card user to card reader, card reader to card user unchanged.  |

Error Messages and Advisories

## 210 VBZGR - Internal Traffic Restriction Groups

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Descriptions</a>        |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

AMO VBZGR (internal traffic restriction groups) allocates the corresponding destinations for hotline ( application) to the internal traffic restriction groups.

Hotline = Immediate call setup.

By means of this AMO, code calling system, customer names for call forwarding, listener, zone allocation for call detail recording for both internal and incoming connections and display suppression of the call forwarding destination can be entered.

### Code calling (CC) system code /Paging system (PS) code

This code is sent after the search access code is dialed (or after the CC/PS function key is pressed, if programmed) on a terminal.

### Customer Name

The customer name is displayed on the attendant console in cases of call forwarding. If dialing is complete, the ITR group of the destination is used; if dialing is not completed, the ITR group of the trunk seized incoming

### Application Number

Devices with ID card readers can be allocated a specific application, such as door opener or gas/petrol pump. The applications are identified with numbers that are allocated to the ITR groups.

In addition, the corresponding device must include the authorization "application hotline" in its COS (class of service). If a "neutral" ID card is inserted into a device thus identified, the application allocated to its ITR group is carried out. be initialized, that means that the first entry will be assigned to all groups. Every consecutive entry will be made in the groups specified in the AMO-call.

### Listener

For each ITR-group one dial number for a listener can be assigned. This number must lead to a DAR STN in the digit analysis. The listener can be an internal number, then the number must be assigned; in case the listener is an external number, this number must be relocated to a route number.

## VBZGR - Internal Traffic Restriction Groups

### Interrelationships

#### Zone-allocation for call detail recording

For each ITR-group one zone can be assigned. The zone must be parameterized in CDR.

#### Display-suppression of the call forwarding destination

For each ITR-group the displayed call forwarding destination can be suppressed.

## 210.1 Interrelationships

- AMO SCSU/SBCSU : Configure subscriber in SWU  
Allocate corresponding COS'  
DAR groups,etc.
- AMO ACSU : Configure attendant console
- AMO VFGR : Attendant console group  
Allocation the customer name for each area code
- AMO SA : Hunting group  
Create hunting groups for hotline  
Offhook recall, call forwarding
- AMO XAPPL : DPS applications  
Create the application for an application hotline
- AMO COSSU : Classes of services  
Create corresponding authorizations

## 210.2 Functions of the AMO

- [ADD-VBZGR](#) : Create/change destinations in ITR groups
- [DELETE-VBZGR](#) : Cancel destinations in ITR groups
- [DISPLAY-VBZGR](#) : Interrogate destinations in ITR groups
- [REGENERATE-VBZGR](#) : Regenerate destinations in ITR groups

### 210.2.1 ADD-VBZGR

Create and change destinations in ITR/FA groups:

4. Application hotline

5. Code calling system (paging system)
6. Customer name in cases of call forwarding
7. Listener
8. Zone allocation for call detail recording for internal connections
9. Zone allocation for call detail recording for incoming connections
10. Display suppression of the call forwarding destination

### Procedure Overview

| Command Code | Parameter                                       |
|--------------|-------------------------------------------------|
| ADD-VBZGR    | GROUP=<number>                                  |
|              | ,TYPE=APPL,APPLNO=<number>; (1)                 |
|              | ,TYPE=CC,CD=<key-num>; (2)                      |
|              | ,TYPE=CUSNAME,NAME=<string>; (3)                |
|              | ,TYPE=LSTNR,STNO=<number>; (4)                  |
|              | ,TYPE=CHRGINT,ITRGRB=<number>,ZONE=<param>; (5) |
|              | ,TYPE=CHRGINC,ITRGRB=<number>,ZONE=<param>; (6) |
|              | ,TYPE=CFW; (7)                                  |

#### Note:

Destinations for Hotlines and Code Blue are not checked for validity by the AMO. The user is responsible for correct entries.

#### Example

Create entries in internal traffic restriction groups 0 and 1, with code calling CD = 94.

Input:

```
ADD-VBZGR:0&1,CC,94;
```

## 210.2.2 DELETE-VBZGR

Cancel destinations in ITR/FA groups

1. Application hotline
2. Code calling system

**VBZGR - Internal Traffic Restriction Groups**

Functions of the AMO

- 3. Customer name in cases of call forwarding
- 4. Listeners
- 5. Zone allocation for call detail recording for internal connections
- 6. Zone allocation for call detail recording for incoming connections
- 7. Display suppression of the call forwarding destination
- 8. All types of the specified ITR/FA group

**Procedure Overview**

| Command Code | Parameter                            |
|--------------|--------------------------------------|
| DELETE-VBZGR | GROUP=<number>                       |
|              | ,TYPE=APPL; (1)                      |
|              | , TYPE=CC; (2)                       |
|              | , TYPE=CUSNAME; (3)                  |
|              | , TYPE=LSTNR; (4)                    |
|              | , TYPE=CHRGINT, ITRGRB=<number>; (5) |
|              | , TYPE=CHRGINC, ITRGRB=<number>; (6) |
|              | , TYPE=CFW; (7)                      |
|              | , TYPE=ALL; (8)                      |

**Example**

Delete the code calling of ITR group numbers 1 and 3.

Input:

DELETE-VBZGR:1&3,CC;

**210.2.3 DISPLAY-VBZGR**

Interrogate the destination of the ITR/FA groups with output in list format:

- 1. Application hotline
- 2. Code calling system
- 3. Customer name in cases of call forwarding

4. Listeners
5. Zone allocation for call detail recording for internal connections
6. Zone allocation for call detail recording for incoming connections
7. Display suppression of the call forwarding destination
8. All types of the specified ITR/FA group

These destinations specified in parameter TYPE are output.

When destinations in groups are interrogated, only those groups for which at least one destination is entered are output.

### Procedure Overview

| Command Code  | Parameter           |
|---------------|---------------------|
| DISPLAY-VBZGR | GROUP=<number>      |
|               | , TYPE=APPL; (1)    |
|               | , TYPE=CC; (2)      |
|               | , TYPE=CUSNAME; (3) |
|               | , TYPE=LSTNR; (4)   |
|               | , TYPE=CHRGINT; (5) |
|               | , TYPE=CHRGINC (6)  |
|               | , TYPE=CFW; (7)     |
|               | , TYPE=ALL; (8)     |

### Examples

1. Display the code calling numbers of ITR groups 0 to 10.

Input:

DISPLAY-VBZGR:0&&10,CC;

Output:

|   |          |   |
|---|----------|---|
| + | -----    | + |
|   | GROUP CC |   |
|   | 1 94     |   |
| + | -----    | + |

2. Display the customer names of ITR groups 3, 7, and 8.

## VBZGR - Internal Traffic Restriction Groups

### Functions of the AMO

Input:

```
DISPLAY-VBZGR:3&7&8,CUSNAME;
```

Output:

| ITRGR. CUSTOMER NAME |                |
|----------------------|----------------|
| 3                    | A COMPANY NAME |
| 7                    | TELEFUNKEN     |
| 8                    | OPEL AG        |

3. Display the zone for call detail recording for internal connections of ITR groups 0 to 4.

Input:

```
DISPLAY-VBZGR:0&&4,CHRGINT;
```

Output:

TARIFF                ZONES                FOR                INTERNAL                CONNECTIONS  
FROM ITRGROUP 2 TO:

| GROUP | ZONE    |
|-------|---------|
| 0     | NOENTRY |
| 1     | INT01   |
| 2     | NOENTRY |
| 3     | INT06   |

4. Display the display suppression for call forwarding of ITR groups 0 to 4.

Input:

```
DISPLAY-VBZGR:0&&4,CFW;
```

Output:

| NO CFW INDICATION ACTIVE IN TRAFFIC-GROUP |  |
|-------------------------------------------|--|
| 0,2,4                                     |  |

## 210.2.4 REGENERATE-VBZGR

Interrogate destinations of the ITR/FA groups with output in position-oriented commands for regeneration:

1. Application hotline
2. Code calling system
3. Customer name in cases of call forwarding

4. Listeners
5. Zone allocation for call detail recording for internal connections
6. Zone allocation for call detail recording for incoming connections
7. Display suppression of the call forwarding destination
8. All types of the specified ITR/FA groups

Those destinations that are specified in parameter TYPE are output.

### Procedure Overview

| Command Code     | Parameter           |
|------------------|---------------------|
| REGENERATE-VBZGR | GROUP=<number>      |
|                  | , TYPE=APPL; (1)    |
|                  | , TYPE=CC; (2)      |
|                  | , TYPE=CUSNAME; (3) |
|                  | , TYPE=LSTNR; (4)   |
|                  | , TYPE=CHRGINT; (5) |
|                  | , TYPE=CHRGINC; (6) |
|                  | , TYPE=CFW; (7)     |
|                  | , TYPE=ALL; (8)     |

### Example

Regenerate the code calling of ITR groups 1-10.

Input:

```
REGENERATE-VBZGR:1&&10,CC;
```

Output:

```
ADD-VBZGR:1,CC,94;
ADD-VBZGR:2,CC,94;
ADD-VBZGR:3,CC,94;
ADD-VBZGR:4,CC,94;
ADD-VBZGR:5,CC,94;
```

## VBZGR - Internal Traffic Restriction Groups

### Parameter Descriptions

## 210.3 Parameter Descriptions

|                 |                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------|
| APPLNO          | Application hotline number                                                                                                     |
| Type of Input   | : single value, required                                                                                                       |
| Possible Values | : valid application number<br>(from AMO XAPPL)<br>1 - 2 digits                                                                 |
| CD              | Access code                                                                                                                    |
| Type of Input   | : single value, required                                                                                                       |
| Possible Values | : valid access code<br>(from AMO WABE)<br>max. 6 digits                                                                        |
| GROUP           | internal traffic restriction group number or DPLN group number                                                                 |
| Type of Input   | : Single value, concatenated (single) values,<br>range(s), mandatory                                                           |
| Possible Values | : 0 - 15                                                                                                                       |
|                 | If TYPE=SM or CC, the parameter GROUP is treated as a DPLN group, otherwise, it denotes an internal traffic restriction group. |
| ITRGRB          | internal traffic restriction group number of B subscriber                                                                      |
| Type of Input   | : single value, concatenated (single) values,<br>range(s), mandatory                                                           |

## 211 VEGAS - Administrative Generation Runs on Support System

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

Several execution AMOs (GENDB, REGEN) are to run simultaneously on a support system, but only one for each HW module (SWU, ADS). The "VEGAS" central administration file generated by this AMO is used to coordinate these sequences for each support processor.

In the DISPLAY branch, the AMO VEGAS checks the system status by interrogating the following:

- APS (SP) numbers in the DIR files
- System number in the database.

In addition, all execution AMOs marked as 'RUNNING' are checked to determine whether or not they are really running. If necessary, entries in the VEGAS file are then updated. If no VEGAS file yet exists on the hard disk, then the file is created in the DISPLAY branch of the AMO and the current system data is entered.

The data contained in the VEGAS file is edited and output on screen at the service terminal or as hardcopy on the printer. The standard output format (LIST=SHORT) gives an overview of the system number, execution AMOs entered, the APS (SP) number of the AMO Text APS (if the DIR file record is complete, i.e. the 3 relevant APSs 'RES-CODE-APS', 'AMO-CODE-APS' and 'AMO-TEXT-APS' are entered). In addition, the format shows the start time of the AMO, the user code and the AMO status. In the more detailed format (LIST=LONG), the following additional information is output:

The callup parameters of entered generating runs, the end time of the AMO or time of termination if the AMO was aborted (status= ('FINISHED' / 'INTRUPTD'), all relevant APS (SP) numbers as well as the BREAK mark and the RESERVE code (if RESERVE=Y declared). The output may also be completely suppressed if desired by declaring LIST=NONE (e.g. if starting VEGAS in a branch of an execution AMO).

The DELETE branch allows the user to cancel current entries or reservations in the VEGAS file. This releases the HW modules concerned, i.e. the status is reset to 'FREE'. HW module entries can only be cancelled if they no longer have the status entry 'RUNNING', in other words, entries for active (operational) AMOs cannot be cancelled.

The CHANGE action allows the user to reserve modules for a future run.

## 211.1 Restrictions

This description is valid from SP300-V3.1

## 211.2 Interrelationships

- AMO GENDB : Generate Data Base with MML Command File
- AMO REGEN : Regenerate Customer Data from Data Base
- AMO ANUM : Enter System Number into Data Base
- AMO ANSU : Enter System Number into the SWU Data Base
- AMO ASPIK : Change System Program Number in MML Command File

## 211.3 Functions of the AMO

- [DELETE-VEGAS](#) : Cancel entries in the VEGAS file
- [DISPLAY-VEGAS](#) : Check system status, enter data in VEGAS file, output on screen/printer
- [CHANGE-VEGAS](#) : Reserve HW modules for future runs

### 211.3.1 DELETE-VEGAS

Cancel entries in the VEGAS file.

After cancellation, the status entry for the servers concerned is reset to "FREE". This is an important prerequisite for a successful start of the AMOs GENDB and REGEN. If Status = RESERVED, the user can simply cancel the reservation. The necessary parameters for the DELETE action are the entries for the reserved AMO, which the user can interrogate with the DISPLAY action (LIST=LONG).

If current entries are present (status neither FREE, RESERVED nor NOTPRSNT) and if a reservation has been made (RESERVE=Y for LIST=LONG), then a complete cancellation can only be undertaken in two steps: first the current entries must be cancelled, then the reservation entries. If Status = RES, then the AMO for which the reservation was made may be started directly without requiring the status to be reset to FREE.

Since the update of entries in the VEGAS file only takes place when the DISPLAY action of the AMO is started, the user must always call the

DISPLAY action before starting the DELETE action. If the system number in the database has changed since the last VEGAS update (e.g. due to a generating run with the AMO GENDB), then this new number will not have been updated in the VEGAS file, without which the server status cannot be reset to FREE.

### Procedure Overview

#### Command Code

DELETE-VEGAS

#### Parameter

UNIT=<param>, SYSNO=<string>, AMO=<param>  
, USERCODE=<string>;

#### Example

Cancel the entries in the VEGAS file from the last generating run with the AMO GENDB.

Input:

DELETE-VEGAS:SWU&ADS,L31616S0001X00001,GENDB,SMITH;

## 211.3.2 DISPLAY-VEGAS

Update and output the VEGAS file.

### Procedure Overview

#### Command Code

DISPLAY-VEGAS

#### Parameter

[LIST=<param>], [UNIT=<param>;

#### Example

Output the VEGAS file in SHORT format.

Input:

DISPLAY-VEGAS;

Output:

LIST=SHORT:

| SYSTEM | NUMBER            | AMO   | AMO-TEXT-APS-NR   | START          |

Self-explanatory short messages are output in the VEGAS list whenever data is not available:

The field SYSTEM NUMBER may contain the following texts:

|                     |                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------|
| '-----'             | If STATUS=NOTPRSNT                                                                            |
| 'NO-ENTRY-IN-DBASE' | If no system number is entered or (in SWU DB) if the entered number does not start with "L31" |
| 'DB--ACCESS--ERROR' | If the DBAR is completed with errors                                                          |
| 'DB-NOT-CONSISTENT' | (Only in SWU): If different system numbers are present in different databases.                |
| 'PROCESSOR DOWN'    | If server is not connected or switched off (does not apply to SWU).                           |

In all other cases, the system number entered via the AMOs ANUM and ANSU (for SWU) is entered.

The field APS-NUMBER may contain the following texts:

- a) LIST=SHORT; If all 3 relevant APSs are present (RES-CODE-APS, AMO-CODE-APS, AMO-TEXT-APS), the APS (SP) number of the AMO-TEXT-APS is entered.  
Other entries:  
'DIR-FILES-UNCOMPL'

If a DB access error occurs while interrogating the language code (English, German), the following text is output:  
'LANGUAGE-READ-ERR'

- b) LIST=LONG; the APS (SP) number of each relevant and present APS is output. If an APS is not present, then a broken line is output:  
'-----'

The field STATUS may contain the following:

|          |                                                                                                                                                                                                                                                                                    |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NOTPRSNT | At least one of the three necessary APSs is not entered                                                                                                                                                                                                                            |
| UNKNOWN  | If an unknown AMO (GENDB, REGEN or some AMO which is internally called by one of these AMOs) is in running state when the VEGAS file is created. In order to recover from this state, ADP soft restart is required.                                                                |
| RUNNING  | The HW module is being (re)generated                                                                                                                                                                                                                                               |
| FREE     | Prerequisite for (re)generating run.<br>Status can be set with DELETE-VEGAS, if current status is not NOTPRSNT, UNKNOWN, RUNNING.                                                                                                                                                  |
| OCCUPIED | A generating AMO occupies all HW modules to be processed (defined in the callup parameters).                                                                                                                                                                                       |
| INTRUPTD | A GENDB run has been terminated abnormally. Continuation possible with parameter 'CONT'.                                                                                                                                                                                           |
| SYBRO    | A (re)generating run has been terminated by a system crash. continuation possible with parameter 'CONT'.                                                                                                                                                                           |
| ABORTED  | A (re)generating AMO has been aborted, no continuation possible.                                                                                                                                                                                                                   |
| FINISHED | The (re)generating run has been completed.                                                                                                                                                                                                                                         |
| RESERVED | HW module is reserved. If a reservation was entered at UNIT STATUS=FREE, or if a reservation code exists as a background entry after a DELETE action on a current entry, then STATUS=RES is entered. The AMO concerned can be directly started without having to reset the status. |

## 211.3.3 CHANGE-VEGAS

Change entries in the VEGAS file and reservation of HW modules for future runs.

Only one reservation can be entered per HW module. The reservations can be interrogated with the DISPLAY action (LIST=LONG).

### Procedure Overview

## **VEGAS - Administrative Generation Runs on Support System**

Error Messages and Advisories

## 212 VFGKZ - Administration of Attendant Group Dialing Codes

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

This AMO is used for assigning codes to *attendant groups* (ATNDGR) for exchange calls, internal calls and universal night answer.

At the same time, in certain cases, it is possible to discriminate between dial plan groups (DPLN) and/or call progress states (CPS) when allocating fixed call codes.

It is also possible to allocate several indial call codes (dial suffices) to one attendant group, e.g. in the case of several companies or corporate divisions ('customers') subscribing to the same system.

### 212.1 Interrelationships

- AMO ACDRT : Administration of ACD routing tables
- AMO SYNCA : Announcement synchronization
- AMO WABE : Dialing plans, feature access codes
- AMO VFGR : Attendant console groups
- AMO ZAND : Central system data

### 212.2 Functions of the AMO

- [ADD-VFGKZ](#) : Create call codes or customer names
- [CHANGE-VFGKZ](#) : Change the call codes or customer names
- [DELETE-VFGKZ](#) : Cancel the call codes or customer names
- [DISPLAY-VFGKZ](#) : Interrogate the call codes or customer names
- [REGENERATE-VFGKZ](#) : Regenerate the call codes or customer names

#### 212.2.1 ADD-VFGKZ

The action ADD-VFGKZ has two functions:

## VFGKZ - Administration of Attendant Group Dialing Codes

### Functions of the AMO

- a) Allocation of the Call Codes to ATNDGRs (TYPE=ATNDGR)  
Access codes with the digit analysis results ATND, ATNDDID and GENANS can be assigned an ATNDGR with this AMO. This then results in the following:

1. If DAR=ATND  
the ATNDGR can be reached via an internal call code.
2. If DAR=ATNDDID  
the ATNDGR can be reached via an indial call code (dial suffix).
3. If DAR=GENANS  
incoming trunk or internal calls for the ATNDGR can be answered at any station (with the appropriate authorization).

It is only possible to discriminate according to the CPS if the appropriate branch is declared in the DPLN lists of the AMO WABE.

- b) Allocation of incoming Call Codes to Customer Names  
(TYPE=NAME)

If a system is shared by several customers with one CAS attendant group, different attendant codes can be assigned per customer (DAR=ATND). These codes can be assigned a 'customer name'.

Two possibilities are existing for the assignment of the call code to the Customer Name. The possibility is selected by the AMO ZAND:

- 10 Customer Names for each attendant group (default)  
The last digit of the indial call code for the attendant group is the index to the table with the Customer Names.  
Consequently the codes can be assigned within the range 00 to 09.

1000 Customer Names for all attendant groups

"1000 Customer Names" will be activated by the element COMP1000 of the central system data by the AMO ZAND

(CHANGE-ZAND:TYPE=ATND,COMP1000=YES;). In this case, entries are created according to the access codes. For one access code, only one attendant group can be entered. But it is possible to create different DPLNs for one access code.

In this case, entries are created according to the access codes. For one access code, only one attendant group can be entered. But it is possible to create different DPLNs for one access code.

The Customer Names are assigned by the indial call code for an attendant group.

The table for the assignment of initial code, attendant group and company name is used by the AMO SYNCA too. Overall there are 1000 entries possible.

### Procedure Overview

| Command Code | Parameter                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------|
| ADD-VFGKZ    | TYPE=ATNDGR, CD=<number>, [DPLN=<number>]<br>, [CPS=<number>] , ATNDGR=<number>;<br><br>  TYPE=NAME, CD=<number>, NAME=<string>; |

### Examples

1. For attendant group 0, internal call code 6 is to be created.

Input:

```
ADD-VFGKZ:ATNDGR,6,,,0;
```

Output:

```
H500: AMO VFGKZ STARTED
```

2. When a call with the call code 09 is switched through to an ATND in the group, the name "A COMPANY NAME" is to be displayed at that ATND.

Input:

```
ADD-VFGKZ:NAME,09,"A COMPANY NAME";
```

## 212.2.2 CHANGE-VFGKZ

The parameter CD is the higher-order parameter, i.e. the attendant group assigned to a specific call code can be changed, but not vice-versa. In order to change the call code of an attendant group, the operator must cancel the existing call code and create a new one using the action ADD.

### Procedure Overview

| Command Code | Parameter                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-VFGKZ | TYPE=ATNDGR, CD=<number>, [DPLN=<number>]<br>, [CPS=<number>] , ATNDGR=<number>;<br><br>  TYPE=NAME, CD=<number>, NAME=<string>; |

### Example

Change the name displayed on the attendant console for call code 09.

Input:

CHANGE-VFGZ:NAME,09,FIELD SERVICE DEPT.;

### 212.2.3 DELETE-VFGKZ

If the optional parameters are declared, the operation is restricted to the range specified. The operation can be further restricted by entering specific values for ATNDGR (when TYPE=ATNDGR).

An internal call code may be deleted only if it is no longer referenced in an ACD routing table. It has to be previously removed by AMO ACDRT.

Either CD or ATNDGR must be specified when TYPE=ATNDGR.

## Procedure Overview

| Command Code | Parameter                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------|
| DELETE-VFGKZ | TYPE=ATNDGR, [CD=<number>], [DPLN=<number>]<br>, [CPS=<number>], [ATNDGR=<number>];<br><br>  TYPE=NAME, [CD=<number>]; |

### Example

Cancel all call code allocations of ATNDGR 2 between codes 1 and \*11.

Input:

DELETE-ATNDGR:TYPE=ATNDGR,CD=1&amp;\*11,ATNDGR=2;

Output:

```
H08: AMO ACTION EXECUTED FOR CODE 1
H08: AMO ACTION EXECUTED FOR CODE *11
```

#### 212.2.4 DISPLAY-VFGKZ

The action DISPLAY-VFGKZ gives the operator an overview of

1. the call codes and their allocated ATNDGRs  
(The type of call code is indicated by the digit analysis result.)  
If the optional parameter ATNDGR is declared, the operation is restricted to the ATND group range specified.
2. the customer names assigned to the initial call codes.  
By 1000 Customer Names all initial call codes - including the entries without an entry for the name - are displayed.

### Procedure Overview

| Command Code  | Parameter                       |
|---------------|---------------------------------|
| DISPLAY-VFGKZ | TYPE=ATNDGR, [ATNDGR=<number>]; |
|               | TYPE=NAME, [CD=<number>];       |

### Example

1. Interrogate the indial call codes with the associated customer names.

Input:

DISPLAY-VFGKZ:NAME;

Output:

| INDIAL CALL CODE | CUSTOMER NAME  |
|------------------|----------------|
| 00               | COMPANY NAME 1 |
| 01               | COMPANY NAME 2 |

2. Interrogate the call codes for all attendant groups

Input:

DISPLAY-VFGKZ:ATNDGR;

Output:

| ATNDGR | DAR     | CD  | DPLN | CPS |
|--------|---------|-----|------|-----|
| 0      | ATNDDID | 0   | --   | 6   |
| 0      | ATND    | 90  | --   | 5   |
| 0      | ATND    | 90  | --   | 8   |
| 0      | ATND    | 90  | --   | 9   |
| 0      | ATND    | 90  | --   | 10  |
| 0      | ATND    | 90  | --   | 11  |
| 0      | ATND    | 90  | --   | 12  |
| 0      | GENANS  | 811 | --   | 5   |
| 1      | ATNDDID | 1   | 0    | 6   |
| 1      | ATND    | 91  | 0    | 5   |
| 1      | ATND    | 91  | 0    | 8   |
| 1      | ATND    | 91  | 0    | 9   |
| 1      | ATND    | 91  | 0    | 10  |
| 1      | ATND    | 91  | 0    | 11  |
| 1      | ATND    | 91  | 0    | 12  |
| 1      | GENANS  | *11 | 0    | 5   |
| 2      | ATNDDID | 1   | 1    | 6   |
| 2      | ATND    | 91  | 1    | 5   |

|                                 |   |  |        |  |     |  |   |  |    |  |
|---------------------------------|---|--|--------|--|-----|--|---|--|----|--|
|                                 | 2 |  | ATND   |  | 91  |  | 1 |  | 8  |  |
|                                 | 2 |  | ATND   |  | 91  |  | 1 |  | 9  |  |
|                                 | 2 |  | ATND   |  | 91  |  | 1 |  | 10 |  |
|                                 | 2 |  | ATND   |  | 91  |  | 1 |  | 11 |  |
|                                 | 2 |  | ATND   |  | 91  |  | 1 |  | 12 |  |
|                                 | 2 |  | GENANS |  | *11 |  | 1 |  | 5  |  |
| +-----+-----+-----+-----+-----+ |   |  |        |  |     |  |   |  |    |  |

212.2.5 REGENERATE-VFGKZ

The action comprises two functions:

- 1. A create command can be generated that restores the allocation of ATNDGRs to call codes (code combinations).
- 2. A create command can be generated that restores the allocation of names to call codes.

If additional parameters are declared, the operation is limited to the range specified. The operation can be further restricted to specific entries by declaring a value for ATNDGR (when TYPE=ATNDGR).

Procedure Overview

| Command Code     | Parameter                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------|
| REGENERATE-VFGKZ | TYPE=ATNDGR, [CD=<number>], [DPLN=<number>]<br>, [CPS=<number>], [ATNDGR=<number>];<br><br>  TYPE=NAME, [CD=<number>]; |

Example

Regenerate the call codes for attendant group 2

Input:

REGENERATE-VFGKZ:TYPE=ATNDGR,ATNDGR=2;

Output:

ADD-VFGKZ:ATNDGR,1 ,1 ,6 ,2 ;  
ADD-VFGKZ:ATNDGR,91 ,1 ,5 ,2 ;  
ADD-VFGKZ:ATNDGR,91 ,1 ,8 ,2 ;  
ADD-VFGKZ:ATNDGR,91 ,1 ,9 ,2 ;  
ADD-VFGKZ:ATNDGR,91 ,1 ,10,2 ;  
ADD-VFGKZ:ATNDGR,91 ,1 ,11,2 ;  
ADD-VFGKZ:ATNDGR,91 ,1 ,12,2 ;  
ADD-VFGKZ:ATNDGR,\*11 ,1 ,5 ,2 ;

## 212.3 Parameter Description

|                 |                                                                                                                                                                                                                                                                                                                              |

## 212.4 Error Messages and Advisories

### 212.4.1 Error Messages

F01: CODE <nr> CANNOT BE PROCESSED.  
IT IS STILL REFERENCED IN THE ACD ROUTING TABLE <art-no>.  
DELETE THE CODE BY AMO ACDRT FROM ROUTING TABLES BEFORE REPEATING THIS COMMAND.

F02: ASSIGNMENT OF CODE <xxxxxx> FOR ATND GROUP <gg> EITHER NOT POSSIBLE OR NOT COMPLETELY POSSIBLE, BECAUSE THE MAXIMUM NUMBER OF CODES THAT CAN BE ASSIGNED HAS BEEN REACHED (THE DPLN LISTS PERMITTED THE ENTRY)

F03: ATND GROUP <gg> DOES NOT EXIST OR THERE IS NOT A SINGLE ATND GROUP IN THE AREA WITH THE SPECIFIED ATND GROUP AS THE UPPER LIMIT

F04: ONE OF THE PARAMETERS "ATNDGR" OR "CD" MUST BE SPECIFIED

F05: CODE <xxxxxx> IS GROUPED ACCORDING TO DPLN GROUPS IN THE DPLN LISTS

F06: NO SUITABLE DAR HAS BEEN FOUND IN THE DPLN LISTS FOR CODE <xxxxxx> OR THE CODE COULD NOT BE INTERPRETED CORRECTLY BY THE DPLN

F07: IT WAS NOT POSSIBLE TO FIND A SUITABLE LOCATION IN THE DPLN LISTS FOR CODE <xxxxxx>, I.E.  
DURING ASSIGNMENT: CODE ALREADY ASSIGNED,  
OTHERWISE : NO CODE ASSIGNED YET

F08: NO CODE FOR ATND GROUP <gg> ASSIGNED

F09: IN CONTRAST TO PREVIOUS TESTS, NO ACTIONS COULD TAKE PLACE FOR CODE <xxxxxx>;  
REASON: INDICATED IN PRECEDING MESSAGE OR DATABASE (DPLN LIST) MODIFICATION DURING AMO RUN (NOTE FURTHER MESSAGES)

F10: THERE CAN BE NO ENTRY, READOUT OR REMOVAL OF THE CUSTOMER NAME FOR CODE <xxxxxx>, I.E.,  
DURING ASSIGNMENT: CUSTOMER NAME ALREADY ASSIGNED,  
OTHERWISE : NO CUSTOMER NAME ASSIGNED YET

F12: CODE <xxxxxx> NOT ASSIGNED AS ATND GROUP CODE

F13: CODE <xxxxxx>: ASSIGNMENT OF NAME NOT POSSIBLE, BECAUSE THE MAXIMUM NUMBER OF NAMES THAT CAN BE ASSIGNED HAS BEEN ALREADY REACHED

F14: CODE <xxxxxx> NOT ALLOWED

F15: CODE @@@@@@@@@@ IS ALREADY ASSIGNED FOR AC GROUP.

F16: CPS PARAMETER MUST BE ENTERED IF VNR IS ACTIVE.

## 212.4.2 Advisories

H01: CODE <xxxxxx> NOT ASSIGNED FOR ATND GROUP <gg>

H02: CPS <cc> NOT REQUIRED FOR CODE <xxxxxx>

H03: DPLN <dd> NOT REQUIRED FOR CODE <xxxxxx>

H04: THERE IS NO NIGHT OPTION FOR "GENERAL ANSWERING" FOR ATND GROUP <gg>, ALTHOUGH THE RELEVANT CODE <xxxxxx> IS ENTERED IN THE DPLN LISTS

H05: CPS <cc> NOT REQUIRED

H06: DPLN <dd> NOT REQUIRED

H07: ATND GROUP <gg> REMAINS ASSIGNED FOR CODE <xxxxxx> AND DAR <d-----d> IN THE CASE OF CERTAIN DPLN GROUPS AND/OR CALL PROGRESS STATES (CPS)

H08: AMO ACTION <tttttt> EXECUTED FOR CODE <xxxxxx>

H09: ATND GROUP <gg> DOES NOT EXIST OR THERE IS NOT A SINGLE ATND GROUP IN THE AREA WITH THE SPECIFIED ATND GROUP AS THE UPPER LIMIT

H10: THERE EXIST A CONFIGURATION WHICH CAN NOT BE DISPLAYED / DELETED BECAUSE OF CURRENT SETTINGS OF AMO-ZAND. TO DISPLAY / DELETE THIS CONFIGURATION, THE PARAMETER COMP1000, BRANCH ATND HAS TO BE CHANGED BY MEANS OF AMO-ZAND. IT CONCERNS THE FUNCTION > 1000 COMPANY NAMES

H11: DPLN PARAMETER IS IGNORED IF VNR IS ACTIVE

### Output Texts

<cc>: call progress state

<dd>: feature access group / dial plan

<gg>: attendant group number

<xxxxxx>: attendant console group access code

<tttttt>: text ({ PARTLY, NOT, nil})

<d-----d>: digit analysis result

<rn timer>: internal call code

<art-no>: number of ACD routing table

## 213 VFGR - Attendant Console Groups

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Descriptions</a>        |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

This AMO unites the day attendant consoles created with the AMO ACSU (attendant console configuration) in attendant console groups (ATNDGR). Each day attendant console must be assigned to an ATNDGR. All attendant consoles (max. 64) can be assigned to an ATNDGR.

Before an ATNDGR can operate, at least one exchange access code or internal access code must be defined for that ATNDGR, using the AMO VFGKZ (administration of attendant group access codes).

Each attendant group can be assigned up to 8 night options (parameter NOPT1..8). These must have been previously assigned with AMO NAVAR with the night option numbers 1 to 128. One night option for each ATNDGR must be defined (at an attendant console of the ATNDGR concerned) as the one to represent the ATNDGR when the night service is activated.

The feature "Centralized Attendant Services" offers the option of temporarily transferring all attendant functions of one ATNDGR to another ATNDGR. This ATNDGR then becomes a centralized ATND services group (CASGR). The CASGR may belong to the same PABX as the ATNDGR which it represents (CASINT option), or may belong to another PABX within an integrated network (CASEXT option). The CASGR is defined as a night option with the AMO NAVAR, and automatically takes on its additional functions each time that night option is activated.

For the user, there is no difference between a CASGR night option and the other night options. However, care must be taken to ensure that at least one other night option is assigned to each ATNDGR, and that an ATNDGR may not be its own night option.

Only an existing internal CASGR can be assigned to an ATNDGR with the aid of a night option.

The ATNDs are automatically activated when added to an ATNDGR, and automatically deactivated when deleted from that group.

If a call to the attendant is forwarded using CASMCF and if the external AC group is also in CASMCF mode, a signal from the system where the call originated controls whether the call will be forwarded to the destination specified in the external AC group or to the destination in the local NOPT list.

Each ATNDGR has one call queuer, which, according to the mode of operation (daytime operation or night operation), distributes each internal call and each exchange call to one of the day ATNDs of the ATNDGR, or to one of the devices of the corresponding night option, as well as queuing the calls at the appropriate device. In addition, any calls which cannot terminate normally to a station are intercepted by one of the ATNDGRs following a predefined allocation procedure, i.e. on busy, on unassigned etc. (parameter ITDEST).

The assignment of the calls to the answer keys and the priority of the calls can be freely configured using the AMO VFGR.

The priority with which the calls are answered is set in two stages: each call type and each incoming trunk group is assigned a priority number (1 - 48). The incoming trunk priority can be overwritten, if needed, for multiple DID AC codes usage, by means of reroute internal to dummy trunk groups (still populated with trunk channels but not necessary in READY state- boards and cables not needed). The priority numbers are combined into priority levels and assigned to an answer key. The calls can be configured into eight priority levels in each case for each answer key. The priority numbers of the calls that are to be given the highest priority must be assigned to the relevant answer key with priority level 1.

The call queuer can be operated in two modes. These are set with parameter QUEMODE when the ATNDGR is set up:

- Double queue (QUEMODE=DQ):  
The calls can be assigned to two answering keys - Line 1 and Line 2. The overall size of the call queuer (CQMAX), the number of first attendant calls per attendant console (CQMAXF), and the maximum number of calls waiting in the call queuer (WC) can be set for each ATNDGR.
- Multiple queue (QUEMODE=MQ):  
The calls can be assigned to twelve answering keys - queues SQ01 to SQ12.  
The overall size of the call queuer (CQMAX) can be set for each ATNDGR. Setting of the number of first attendant calls per attendant console (CQMAXF) and maximum number of calls waiting in the call queuer (WC) does not apply. Entries for these parameters are ignored. The operator is notified of this with an advisory message.  
An ATNDGR with a multiple queue can only be assigned type ACWIN (AMO-ACSU:ACTYPE=ACWIN) attendant consoles.  
When an ATNDGR is set up, the call queuer's priority control is configured with default values. Modifications must be performed subsequently using the CHANGE action.
- Priority control default values in the double queue mode:

| CALL TYPE                   | PRIORITY NUMBER |
|-----------------------------|-----------------|
| EMERGENCY_CALL              | 3               |
| HOTLINE_CALL                | 3               |
| LOCAL_FIRST_CALL            | 2               |
| LOCAL_RECALL                | 2               |
| LOCAL_PRIO_CALL             | 4               |

\*) for calls for CAS from systems with a software status older than Hicom 300E-V3.0

## 213.1 Interrelationships

- AMO ACSU : Attendant console configuration  
Configuration of day ATNDs for the ATNDGRs
- AMO BUEND : Assign priority number to trunk group
- AMO DIMSU : Allocate database memory
- AMO NAVAR : Administration of the static night switch option data  
Administration of night options for the ATNDGRs
- AMO VFGKZ : Administration of attendant group access codes  
Administration of access codes for the ATNDGRs
- AMO ZAND : Administration of central system data

## 213.2 Functions of the AMO

- [ADD-VFGR](#) : Assign attendant console group (ATNDGR)
- [CHANGE-VFGR](#) : Change ATNDGR data
- [DELETE-VFGR](#) : Delete ATNDGR
- [DISPLAY-VFGR](#) : Interrogate ATNDGR static data
- [REGENERATE-VFGR](#) : Regenerate current ATNDGR data

### 213.2.1 ADD-VFGR

It should be noted that

- a given night ATND option may only be assigned to one ATNDGR.

## VFGR - Attendant Console Groups

### Functions of the AMO

- it is possible to create an ATNDGR without assigning it a day ATND. In this case, one night option (not the "none" night option) must be allocated, which constantly represents the ATNDGR (permanent night service).
- at all times every internal traffic restriction group (ITRGR) must have an ATNDGR as intercept destination. When the first ATNDGR is created, this ATNDGR is implicitly defined as intercept destination for all internal traffic restriction groups.
- each ATND may only be assigned to one ATNDGR. If more than 16 attendant consoles are to be assigned to an attendant console group, these must be assigned subsequently using the action CHANGE.
- parameters CQMAXF, SDIST, and WC are only taken into account or required in the operating mode QUEMODE=DQ.
- the priority control is configured with defaults. Changes must be carried out subsequently using the action CHANGE.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                               |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-VFGR     | ATNDGR=<number>, [QUEMODE=<param>], [ATNDNO=<number>]<br>, {NOPT1=<number>, . . . . . , NOPT8=<number>}<br>, OPT=<number>, [NOPTNAME=<number>-<string>]<br>, [CQMAXF=<number>], [CQMAX=<number>], [ITDEST=<number>]<br>, [AUTNS=<param>], [SDIST=<param>], [CASMCF=<param>]<br>, [ANSYN=<param>], [OFLGR=<number>], [WC=<param>]<br>, [COD=<param>], [INIGHTPR=<param>; |

### Example

Create the ATNDGR 0 with the default value double queue for the mode of the queue and the day attendant 4300, assign NOPT1 to night option 3, NOPT2 to night option 2 and NOPT8 to night option 12. The initialized night option is 1. Each night option must be assigned a name. The call queue must be assigned for three CQ calls, first answer calls per attendant. The automatic night switch will be deactivated. The destination for call overflow is the attendant group 2.

Input:

```
ADD-  
VFGR:ATNDGR=0,QUEMODE=DQ,ATNDNO=4300,NOPT1=3,NOPT2=2,NOPT8=12,OP  
T=1,NOPTNAME="1-NIGHT 3"&"2-NIGHT 2"&"8-NIGHT  
12",CQMAXF=3,AUTNS=OFF,OFLGR=2;
```

## **213.2.2 CHANGE-VFGR**

In order to facilitate the allocation of a day ATND to an ATNDGR, the parameter FUNCT offers three additional options.

**FUNCT=ADD:**

Add one or more ATNDs to the set of ATNDs allocated to the ATNDGR specified.

**FUNCT=DEL:**

Remove one or more ATNDs from the group. If more than one group is specified as a value of the parameter ATNDGR, then the ATND specified here is sought in all these ATNDGRs. However, for reasons of clarity, the system administrator may only specify either more than one ATND or more than one ATNDGR.

**FUNCT=ND:**

ND stands for New Definition and allows the system administrator to redefine the set of ATNDs of an ATNDGR without needing to know its previous configuration. The specification of ATNDs for the new definition is optional. However, if no ATND number is entered, then this is regarded in the same way as the non-declaration of the corresponding value for ADD-VFGR, i.e. then the ATNDGR will be redefined as an ATNDGR with permanent night service, in which case the necessary conditions for a permanent night service must be fulfilled (at least one night option which is not the "none" night option).

It is not possible to remove an allocated traffic restriction group (ITRGR) from an ATNDGR without allocating it to a new ATNDGR.

It is possible to remove a night option allocated to an ATNDGR by allocating the night option number "0" to that night option. However, this function may not be applied to an activated night option.

However, a night option set can be changed via the parameter OPT, or by setting a different night option at the attendant console.

When changing the parameters for a call queue (CQMAXF, CQMAX), the call queue must be idle, i.e. empty of calls. Otherwise the job will be ignored. The call queue can be emptied by deleting the appropriate dialing codes with the aid of the AMO VFGKZ.

An exception to this is when the length of the call queue is increased with the aid of the parameter CQMAX. This is also possible when some calls are still queued.

Any alteration via AMO of the night option assignments (NOPT1,...NOPT8) or the night option name (NOPTNAME) is automatically refreshed at the attendant console.

## VFGR - Attendant Console Groups

### Functions of the AMO

The priority control settings can be changed in two branches:

- In the TYPE=PRIOCALL branch, each call type can be assigned a priority number. The previous assignment is overwritten.
- In the TYPE=PRIOLEV branch, each priority number can be allotted to an answer key with the required priority level.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| CHANGE-VFGR  | <pre>ATNDGR=&lt;number&gt;,   TYPE=GENERAL   , {ATNDNO=&lt;number&gt;, FUNCT=&lt;param&gt;   , NOPT1=&lt;number&gt;, ... , NOPT8=&lt;number&gt;, OPT=&lt;number&gt;   , NOPTNAME=&lt;number&gt;-&lt;string&gt;, CQMAXF=&lt;number&gt;   , CQMAX=&lt;number&gt;, ITDEST=&lt;number&gt;, AUTNS=&lt;param&gt;   , SDIST=&lt;param&gt;, CASMCF=&lt;param&gt;, ANSYN=&lt;param&gt;,   , OFLGR=&lt;number&gt;, WC=&lt;number&gt;, CO=&lt;param&gt;   , INIGHTPR=&lt;param&gt;} ;    TYPE=PRIOCALL   , {EMERG=&lt;number&gt;, HOT=&lt;number&gt;   , LOFC=&lt;number&gt;, LOREC=&lt;number&gt;, LOPRIC=&lt;number&gt;   , COREC=&lt;number&gt;, COSER=&lt;number&gt;, COINCO=&lt;number&gt;,   , COONHOOK=&lt;number&gt;, TIREC=&lt;number&gt;, TISERTT=&lt;number&gt;   , TIINCO=&lt;number&gt;, TIONHOOK=&lt;number&gt;, OVLOFC=&lt;number&gt;   , OVLOPRIC=&lt;number&gt;, OVCOFC=&lt;number&gt;, OVTIFC=&lt;number&gt;   , PERSONAL=&lt;number&gt;, ACLOOP=&lt;number&gt;} ;    TYPE=PRIOLEV   , PRIONO=&lt;number&gt;, ANSKEY=&lt;param&gt;, PRIOLEV=&lt;number&gt;;</pre> |

### Examples

1. Allocation of the night option number 2 as NOPT1 for ATNDGR 0.

Input:

```
CHANGE-VFGR:ATNDGR=0, TYPE=GENERAL, NOPT1=2;
```

2. Delete allocation of night option number 2 as NOPT1 for ATNDGR 0.

Input:

```
CHANGE-VFGR:ATNDGR=0, TYPE=GENERAL, NOPT1=0, OPT=2;
```

3. Redefine day option for attendant group 1.

The day attendant 490 is to replace the existing day attendants.

Input:

CHANGE-VFGR:ATNDGR=0,TYPE=GENERAL,ATNDNO=490,FUNCT=ND;

#### 4. New definition of priorities for attendant console group 0.

- a) The call type "CO recall" is to be assigned priority number 2.  
(If the values initialized for priority control during setup have not been changed, then after this change a "CO recall" - and all other call types and trunk groups with priority number 2 - will be taken to answer key L1 for answering with priority level 3).

Input:

CHANGE-VFGR:ATNDGR=0,TYPE=PRIOCALL,COREC=2;

- b) Priority number 2 is to be assigned to answer key L2 with priority level 5.  
(After changes 4.1 and 4.2, a "CO recall" - and all other call types and trunk groups with priority number 2 - will be taken to answer key L2 for answering with priority level 5).

Input:

CHANGE-VFGR:ATNDGR=0,TYPE=PRIOLEV,PRIONO=2,ANSKEY=L2,PRIOLEV=5;

### 213.2.3 DELETE-VFGR

The following points must first be observed:

- the attendant group dialing code allocated to the ATNDGR with the aid of AMO VFGKZ must be deleted.
- existing allocations of ITRGRs to ATNDGRs must be deleted (see example).
- the call queuer of the ATNDGR is also deleted with this function. If the call queuer is not empty, then DELETE-VFGR is rejected.
- the ATNDGR may not be assigned as internal centralized ATND service in another ATDGR.

#### Procedure Overview

| Command Code | Parameter        |
|--------------|------------------|
| DELETE-VFGR  | ATNDGR=<number>; |

#### Example

Delete ATNDGR 1 with the ITR groups 3 and 5 for attendant intercept.

1. Re-allocate assignments to ATNDGR 0.

Input:

VFGR - Attendant Console Groups

Functions of the AMO

CHANGE-VFGR:ATNDGR=0,TYPE=GENERAL,ITDEST=3&5;

2. Delete ATNDGR1.

Input:

DELETE-VFGR:1;

213.2.4 DISPLAY-VFGR

Procedure Overview

| Command Code | Parameter                           |
|--------------|-------------------------------------|
| DISPLAY-VFGR | [ATNDGR=<number>],[FORMAT=<param>]; |

Description of display

Explanation of the code letters displayed after the night option

- S = Station
- G = General answering
- N = "None" night option
- I = Internal centralized ATND service group
- E = External centralized ATND service group

- NOPT = correspond to NOPT1..8
- NOPTNO = correspond to NOPTNO in AMO NAVAR

The active night option is marked with an asterisk '\*'.

Example

Display data of ATNDGR 0.

Input:

DISPLAY-VFGR:ATNDGR=0;

Output:

|                                                               |             |                                                           |    |               |  |  |  |  |  |
|---------------------------------------------------------------|-------------|-----------------------------------------------------------|----|---------------|--|--|--|--|--|
| +-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+ |             |                                                           |    |               |  |  |  |  |  |
|                                                               | ATNDGR: 0   |                                                           |    |               |  |  |  |  |  |
|                                                               | NOPT/NOPTNO | THE ATNDGR COMPRISES THE FOLLOWING DAY AND NIGHT OPTIONS: |    |               |  |  |  |  |  |
|                                                               |             | DAY ATND                                                  | :  | 490, 491, 492 |  |  |  |  |  |
|                                                               | 1 1         | * NIGHT OPTION 1                                          | :S | 302, 303, 315 |  |  |  |  |  |

|        | <p>It has to be considered that calls ringing at an attendant console are counted. Internal, central office calls and charge calls to this attendant group are counted. Two buffers from the allocated CQMAX buffers are reserved and cannot be used for regular queuing. Even if the attendant group is in permanent night mode to an external attendant group buffers need to be allocated in order to process recalls, intercept calls, serial calls and on hook transfer calls to the external attendant group. Each of these calls allocate one buffer in the originating attendant group till this call is answered. See also description of OFLGR.</p> |                                                                                                                            |

## VFGR - Attendant Console Groups

### Error Messages and Advisories

not available in the case of QUEMODE=MQ  
(an entry will be ignored; the operator will be  
notified with an advisory message)

Possible Values : 0 - 255

Default Value : 0 limitation not activated

This parameter limits the number of waiting calls in the call queue. The max. number is limited by the number of elements of the call queue (parameter CQMAX). If OFLGR is set then calls to this attendant group who exceeds the max. number of waiting calls will be diverted to the assigned overflow attendant group.

## 213.4 Error Messages and Advisories

### 213.4.1 Error Messages

F01: ATNDGR <gg>: THE NUMBER OF ATND GROUPS THAT CAN BE ASSIGNED IS LIMITED TO <gg>  
(AMO DIMSU: PARAMETER ATNDGR)

F02: ATNDGR <gg> ALREADY ASSIGNED

F03: ATNDNO <xxxxxx> ALREADY ASSIGNED TO ATNDGR <gg>

F04: ATNDGR <gg>: UNDER PERMANENT NIGHT SERVICE CONDITIONS AT LEAST ONE NIGHT  
OPTION MUST BE ASSIGNED

F05: ATNDGR <gg>: NOPT<x> NOT DEFINED

F06: ATNDGR <gg>: AT LEAST ONE NIGHT OPTION MUST BE DEFINED

F07: NOPTNO <nnn> NOT ASSIGNED (AMO NAVAR)

F08: NOPTNO <nnn> IS A NIGHT ATND AND ALREADY ASSIGNED TO AN ATND GROUP

F09: NO PORT MEMORY TO ASSIGN AN ATND GROUP

F10: NO DEVICE MEMORY TO ASSIGN AN ATND GROUP (AMO DIMSU: PARAMETER LODEN)

F11: ATNDGR <gg>: NO ROUTES AVAILABLE FOR ASSIGNMENT  
(AMO DIMSU: PARAMETER RTE)

F12: ATNDGR <gg>: NO MAIN GROUP INDEX AVAILABLE  
(AMO DIMSU: PARAMETER MG)

F13: ATNDGR <gg>: NO MEMORY AVAILABLE FOR MAIN GROUP

F14: ATNDGR <gg>: NO SUBGROUP INDEX AVAILABLE  
(AMO DIMSU: PARAMETER SG)

F15: ATNDGR <gg>: NO MEMORY AVAILABLE FOR SUBGROUP

F16: ATNDGR <gg>: NO MEMORY AVAILABLE FOR CALL QUEUER  
(AMO DIMSU: PARAMETER ATNDCQ)

F17: ATNDGR <gg> NOT YET ASSIGNED

F18: ATNDGR <gg>: DELETE NOT POSSIBLE AS ATNDGR IS INTERCEPT DESTINATION FOR ITR  
GROUPS

F19: ATNDGR <gg>: DELETE NOT POSSIBLE AS ATNDGR IS STILL ASSIGNED AT LEAST  
ONE ACCESS CODE (DELETE ASSIGNMENT WITH AMO VFGKZ)

F20: ATNDGR <gg>: DELETE NOT POSSIBLE BECAUSE CALL QUEUER IS NOT YET EMPTY

F21: VALUES FOR PARAMETER PRI MUST START WITH 1

F22: VALUES FOR PARAMETER <param> ENTERED SEVERAL TIMES

F23: ATNDNO <xxxxxx> IS NOT AN ASSIGNED DAY ATND

F24: ATNDNO <xxxxxx> ENTERED SEVERAL TIMES  
F25: RANGE <xxxxxx> TO <xxxxxx> DOES NOT CONTAIN ANY ASSIGNED ATNDNO  
F26: INPUT OF SEVERAL VALUES FOR ATNDGR AND ATNDNO ONLY ALTERNATELY ADMISSIBLE  
F27: FUNCTION ONLY PLAUSIBLE IF A SINGLE VALUE FOR ATNDGR IS ENTERED  
F28: ATNDNO <xxxxxx> NOT ASSIGNED TO SPECIFIED ATNDGR <gg>  
F29: ATNDNO <xxxxxx> NOT ASSIGNED TO ANY OF THE SPECIFIED ATND GROUPS  
F30: ATNDGR <gg>: ACTIVATED NIGHT OPTION MAY NOT BE DELETED  
F31: ATNDGR <gg>: AUTOMATIC NIGHT SERVICE REQUIRES NOPT8  
F32: FORMAT ERROR IN NOPTNAME PARAMETER  
F33: SPECIFICATION OF PARAMETER FUNCT ONLY ADMISSIBLE IF A VALID ATNDNO IS ENTERED  
F35: NO ATNDGR ASSIGNED  
F36: ATNDGR <gg>: VALUE OF PARAMETER CQMAXF TOO LARGE COMPARED WITH CQMAX  
F37: IF AUTNS = ON IS INDICATED, "NONE" NIGHT OPTION MAY NOT BE SPECIFIED FOR NOPT8  
F38: ATNDGR <gg>: A NIGHT OPTION NUMBER MAY ONLY BE ASSIGNED TO ONE NIGHT OPTION  
F40: ATNDGR <gg> IS DEFINED AS INTERNAL CENTRALIZED ATND SERVICE IN NOPTNO <nnn>  
F41: ONLY CENTRALIZED ATND SERVICE NIGHT OPTIONS ASSIGNED FOR ATNDGR <gg>  
F42: INTERNAL CENTRALIZED ATND SERVICE <gg> OF NOPTNO <nnn> NOT ASSIGNED  
F43: ATNDGR <gg>: DELETE NOT POSSIBLE, BECAUSE THE SPECIFIED ATNDGR IS ASSIGNED AS  
INTERNAL CENTRALIZED ATND SERVICE IN ATNDGR <gg> IN NOPT<x>  
F44: NO USER INDEX TO ASSIGN AN ATND GROUP  
(AMO DIMSU: PARAMETER STN)  
F45: ATNDGR <gg>: OVERFLOW TO OWN ATND GROUP NOT ALLOWED  
F46: VALUE OF PARAMETER INADMISSIBLE  
F47: ATNDNO <xxxxxx>: AC TYPE INADMISSIBLE  
IN MULTIPLE QUEUES MODE ONLY AC OF TYPE=ACWIN CAN BE ASSIGNED  
F48: ATNDGR <gg>: NIGHT OPTION <nnn> INADMISSIBLE  
A NIGHT AC MAY NOT BE ASSIGNED IN MULTIPLE QUEUES MODE.  
F49: ATNDGR <gg>: CALLTYPE <aaa> INADMISSIBLE IN <param> MODE  
F50: ATNDGR <gg>: ANSWER KEY <param> INADMISSIBLE IN <param> MODE  
F51: ATNDGR <gg>: PARAMETER <aaa> MUST BE SPECIFIED IN <param> MODE

## **213.4.2 Advisories**

H01: DAY ATNDNO <xxxxxx> NOT ASSIGNED TO ANY ATNDGR  
H02: ATNDGR <gg> IS IN PERMANENT NIGHT SERVICE  
H03: ATNDGR <gg> NOT YET ASSIGNED  
H04: RANGE <gg> TO <gg> DOES NOT CONTAIN ANY ASSIGNED ATNDGR  
H05: VALUES FOR ATNDGR ARE IGNORED  
H06: NIGHT SERVICE FOR ATNDGR <gg> NEEDS TO BE ACTIVATED  
(AMO ACTDA:TYPE=ATNDGR,ATNDGR= ,NOPT= ,ACT=ACT)  
H07: ATNDGR <gg>: PARAMETER <aaa> IS IGNORED IN <param> MODE  
H08: ACCESSCODE FOR ATNDGR <gg> STILL NEEDS TO BE ASSIGNED  
(ADD\_VFGRKZ:TYPE=ATNDGR)  
H09: PLEASE NOTE THAT PRIOLEV ENTRIES WITH DEFAULT VALUES ARE NOT REGENERATED. USE  
DISPLAY VFGR TO QUERY SETTINGS.

**213.4.2.1 Output Texts**

<aaa>        parameter name  
<x>         1 - 8 (for NOPT1 - NOPT8)  
<gg>        ATND group number  
<nnn>       Night option number (assigned by AMO NAVAR)  
<xxxxxx>   Code of devices  
<param>    One of the parameters of the AMO

## 214 VOICO - Administration of Voice Compression

|                                    |                                      |                                               |
|------------------------------------|--------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Configure-sequence</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Interrelationships</a> | <a href="#">Functions of the AMO</a> | <a href="#">Error messages and advisories</a> |

The AMO VOICO can be used to set up Voice Compression (VC) connections. Further it can be used to DELETE, DISPLAY and REGENERATE the VC connections, and ACTIVATE and DEACTIVATE it.

### 214.1 Restrictions

This description is valid from SP300-V3.5

### 214.2 Interrelationships

- AMO BCSU : Configuration of boards
- AMO BUEND : Configuration of trunks
- AMO DIMSU : Configuration of memory
- AMO DSSU : Activation and deactivation of circuits
- AMO TDCSU : Configuration of circuits

### 214.3 Configure-sequence

AMO-DIMSU -> AMO-BCSU -> AMO-BUEND -> AMO-TDCSU -> AMO-DSSU.

### 214.4 Functions of the AMO

- [ADD-VOICO](#) : Create a VC connection
- [DELETE-VOICO](#) : Delete a VC connection
- [ACTIVATE-VOICO](#) : Activate the VC connection(s)

## VOICO - Administration of Voice Compression

### Functions of the AMO

- **DEACTIVATE-VOICO** : Deactivate the VC connection(s)
- **DISPLAY-VOICO** : Display the status of VCM/Partner connections
- **REGENERATE-VOICO** : Regenerate VCM connections

## 214.4.1 ADD-VOICO

This function configures the VC connections between a VCM board (VCSU) and a partner board (S0 or S2) (B-channel) in data base. Further the new STMA board working with mode PBB (port backboning) or NW20 (networking 2.0) can be used as partner board as well. In this case the STMA board is handled as S2 board.

Mind following steps:

- Both boards (VCM and S0/S2) have to be configured.
- At least on B-channel has to be configured for VCSU to be added, the circuit of a partner board has to be configured too.
- The VC connection of VCSU 1 has to be added first.
- All VCM subunits (VCSUs) have to be configured always to the same partner board.

Possible combinations:

| VCM board | VCSU | Partner board | Circ./B-Channel | Possible Connection |
|-----------|------|---------------|-----------------|---------------------|
| VCM - B15 | 1-4  | STMD (S0)     | 8 / 2           | 2                   |
| VCM - B15 | 1-4  | DIUS2         | 2 / 30          | 4                   |
| VCM - B7  | 1-2  | STMD (S0)     | 8 / 2           | 2                   |
| VCM - B7  | 1-2  | DIUS2         | 2 / 30          | 2                   |

A VC connection can be added in two ways:

- After adding no activation of VC connection ( INS=N ).
- After adding activation of VC connection ( INS=Y ).

### Procedure Overview

| Command Code | Parameter                                                                    |
|--------------|------------------------------------------------------------------------------|
| ADD-VOICO    | PEN1=<pen>, VCSU=<number>, PEN2=<pen>, BCHANNEL=<number><br>, [INS=<param>]; |

**Examples**

3. Add a VC connection with VCSU1 ( VCM pen: 1-1-49-0 ) and B-channel 5 of partner board (pen: 1-2-55-0). The VC connection should not be activated after adding.

Input:

```
ADD-VOICO:1-1-49-0,1,1-2-55-0,5;
```

4. Add a VC connection with VCSU2 ( VCM pen: 1-1-49-0 ) and B-channel 4 of partner board (pen: 1-2-55-0) . The VC connection should not be activated after adding.

Input:

```
ADD-VOICO:1-1-49-0,2,1-2-55-0,4;
```

5. Add a VC connection with VCSU1 ( VCM pen: 1-1-43-0 ) and B-channel 3 of partner board ( pen: 1-2-55-1 ). The VC connection should be activated after adding.

Input:

```
ADD-VOICO:1-1-43-0,1,1-2-55-1,3,Y;
```

**214.4.2 DELETE-VOICO**

This command is used to delete VC connections. Before deleting the VC connection has to be deactivated. The VC connection VCSU1 has to be deleted last.

**Procedure Overview**

| Command Code | Parameter                   |
|--------------|-----------------------------|
| DELETE-VOICO | LAGE1=<pen>, VCSU=<number>; |

**Examples**

1. Delete the VC connection to VCSU1 on the VCM pen: 1-1-43-0.

Input:

```
DEL-VOICO:1-1-43-0,1;
```

**214.4.3 ACTIVATE-VOICO**

This command is used to activate the configured VC connections.

Mind following steps:

- Both circuits (VCM and partner board) have to be deactivated.

## VOICO - Administration of Voice Compression

### Functions of the AMO

- The VC connection of the specified VCSU has to be configured.
- The VC connection VCSU1 has to be activated first.

#### Procedure Overview

| Command Code   | Parameter                    |
|----------------|------------------------------|
| ACTIVATE-VOICO | PEN1=<pen>, [VCSU=<number>]; |

#### Examples

1. Activate a VC connection with VCSU1 for VCM pen: 1-1-49-0.

Input:

```
ACT-VOICO:1-1-49-0,1;
```

2. Activate all configured VC connections for VCM pen 1-1-49-0 .

Input:

```
ACT-VOICO:1-1-49-0;
```

## 214.4.4 DEACTIVATE-VOICO

This command is used to deactivate the activated VC connections.

Mind following steps:

- Both circuits (VCM and partner board) have to be deactivated.
- The VC connection of the specified VCSU has to be configured and activated.
- The VC connection VCSU1 has to be deactivated last.

#### Procedure Overview

| Command Code     | Parameter                    |
|------------------|------------------------------|
| DEACTIVATE-VOICO | PEN1=<pen>, [VCSU=<number>]; |

#### Examples

1. Deactivate a VC connection with VCSU2 for VCM pen: 1-1-49-0.

Input:

```
DEACT-VOICO:1-1-49-0,2;
```

2. Deactivate all activated VC connections for VCM pen: 1-1-49-0.

Input:

```
DEACT-VOICO:1-1-49-0;
```

## 214.4.5 DISPLAY-VOICO

This command can be used to display the contents of the Voice Compression Table. There are following display options to choose from :

- Type specific

In this case, the board type is used as the search criterium. The AMO scans the specified VCM or PARTNER type and displays the entries that meet the search criterium.

- Pen specific

The connections can be output as in part ( for entered pen).

### Procedure Overview

| Command Code  | Parameter                                                    |
|---------------|--------------------------------------------------------------|
| DISPLAY-VOICO | [TYPE=VCM], [PEN1=<pen>];<br>  [TYPE=PARTNER], [PEN2=<pen>]; |

### Examples

1. List VCM board connections.

Input:

DISPLAY-VOICO:VCM;

Output:

| VCM - BOARD |      |  | PARTNER - BOARD |           |           | IN      |  |
|-------------|------|--|-----------------|-----------|-----------|---------|--|
| PEN         | VCSU |  | PEN             | B-CHANNEL | HW-MODULE | SERVICE |  |
| 01-01-043-0 | 1    |  | 01-02-055-1     | 03        | DIU-S2    | YES     |  |
| 01-01-049-0 | 1    |  | 01-02-055-0     | 05        | DIU-S2    | NO      |  |
| 01-01-049-0 | 2    |  | 01-02-055-0     | 04        | DIU-S2    | NO      |  |

2. List PARTNER board connections.

Input:

DISPLAY-VOICO:PARTNER;

Output:

| PARTNER - BOARD |           |           | VCM - BOARD |      |  | IN      |  |
|-----------------|-----------|-----------|-------------|------|--|---------|--|
| PEN             | B-CHANNEL | HW-MODULE | PEN         | VCSU |  | SERVICE |  |
| 01-02-055-1     | 03        | DIU-S2    | 01-01-043-0 | 1    |  | YES     |  |
| 01-02-055-0     | 04        | DIU-S2    | 01-01-049-0 | 2    |  | NO      |  |

## VOICO - Administration of Voice Compression

### Functions of the AMO

|             |    |        |             |   |    |
|-------------|----|--------|-------------|---|----|
| 01-02-055-0 | 05 | DIU-S2 | 01-01-049-0 | 1 | NO |
|-------------|----|--------|-------------|---|----|

#### 3. List VC connections for PEN: 1-1-43-0.

Input:

DISPLAY-VOICO:VCM,1-1-43-0;

Output:

| VCM - BOARD |      | PARTNER - BOARD |           |           | IN      |
|-------------|------|-----------------|-----------|-----------|---------|
| PEN         | VCSU | PEN             | B-CHANNEL | HW MODULE | SERVICE |
| 01-01-043-0 | 1    | 01-02-055-1     | 03        | DIU-S2    | YES     |

## 214.4.6 REGENERATE-VOICO

The verb REGENERATE is used to output the data of the Voice Compression table in the form of one or more position-oriented 'ADD' commands. The command can be regenerated for a specific PEN1.

It is possible that one of both or both circuits of one VC-connection that is marked as active, is/are deactivated by AMO-DSSU. In this case a DEACT-DSSU has to be regenerated before the ADD-VOICO-command, respectively an ACT-DSSU-command has to be regenerated after the ADD-VOICO-command for each deactivated circuit.

### Procedure Overview

| Command Code     | Parameter     |
|------------------|---------------|
| REGENERATE-VOICO | [PEN1=<pen>]; |

### Examples

#### 1. Regenerate VC connections for VCM PEN: 1-1-49-0.

Input:

REGEN-VOICO:1-1-49-0;

Output:

ADD-VOICO:1-1-49-0,1,1-2-55-0,5,N;

ADD-VOICO:1-1-49-0,2,1-2-55-0,4,N;

#### 2. Regenerate the table for all configured VCM boards.

Input:

REGEN-VOICO;;

**Output:**

```
ADD-VOICO:1-1-49-0,1,1-2-55-0,5,N;
ADD-VOICO:1-1-49-0,2,1-2-55-0,4,N;
DEACT-DSSU:DC,PEN,1-2-55-0;
DEACT-DSSU:DC,PEN,1-1-43-0;
ADD-VOICO:1-1-43-0,1,1-2-55-0,3,Y;
ACT-DSSU:ACL,PEN,1-1-43-0;
ACT-DSSU:ACL,PEN,1-2-55-0;
```

## 214.5 Parameter Description

|                 |                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------|
| BCHANNEL        | B-channel number on partner board                                                                   |
| Type of Input   | : single value, optional (ADD)                                                                      |
| Possible Values | : 1 to 30                                                                                           |
| INS             | Switch VCSU in service after add                                                                    |
| Type of Input   | : single value, optional (ADD)                                                                      |
| Possible Values | : Y                      Switch in service after add                                                |
|                 | N                      Don't switch in service after add                                            |
| Default Value   | : N                                                                                                 |
| PEN1            | Physical address of VCM board                                                                       |
| Type of Input   | : 4 compound values, required (ADD, DELETE, ACTIVATE, DEACTIVATE)<br>optional (DISPLAY, REGENERATE) |
| Possible Values | : LTG-LTU-SLOT-CIRCUIT                                                                              |
|                 | LTG-Number        1                                                                                 |
|                 | LTU-Number       1 to 99                                                                            |
|                 | Slot              1 to 121                                                                          |
|                 | Circuit           0                                                                                 |
| Default Value   | : All VCM boards in system (DISPLAY and REGENERATE)                                                 |
| PEN2            | Physical address of partner board                                                                   |
| Type of Input   | : 4 compound values, required (ADD)<br>optional (DISPLAY)                                           |
| Possible Values | : LTG-LTU-SLOT-CIRCUIT                                                                              |
|                 | LTG-Number       1                                                                                  |
|                 | LTU-Number       1 to 99                                                                            |
|                 | Slot              1 to 121                                                                          |

## 214.6 Error messages and advisories

### 214.6.1 Error messages

F01: THE ADMISSIBLE RANGE FOR <param> IS: <number> TO <number>  
Input range has been exceeded.

F02: NOT POSSIBLE LOADING THE 'UBGDAT00' SUBSYSTEM  
The board data can not be loaded.

F03: ON PEN <ltg-ltu-slot> IS NO <bctype> BORD CONFIGURED  
On the entered pen is no board configured or the configured board is not a VCM/S0/S2 board. Configuration by AMO BCSU.

F04: INSUFFICIENT MEMORY (AMO DIMSU: PARAMETER VOICO, TYP=CC)  
The system table in DB is too small, erlarge by AMO-DIMSU.

F05: FOR VCSU <number> NO B-CHANNAL ON VCM BOARD HAS BEEN CONFIGURED  
ADD WITH AMO-TDCSU  
For the entered VC connection at least one B-channel has to be configured on the VCM board (VCSU).

F06: CIRCUIT <number> ON S0/S2 BOARD HAS NOT BEEN CONFIGURED  
ADD WITH AMO-TDCSU  
The entered circuit of the partner board is not configured and has to be configured with AMO-TDCSU.

F07: FOR VCM BOARD VCSU 1 HAS TO BE CONFIGURED FIRST  
The VCconnection VCSU 1 has to be configured always first.

- F08: VCSU <number> HAS TO BE CONFIGURED ON SAME PARTNER BOARD: <ltg-ltu-slot>  
AS VCSU 1  
All VC connections has to use the same partner pen as VCSU 1 .
- F09: VCSU <number> HAS ALREADY BEEN CONFIGURED  
The entered VCSU number has already been configured.
- F10: B-CHANNAL <number> OF PARTNERBOARD HAS ALREADY BEEN CONFIGURED  
The entered B-channel number has already been configured.
- F11: VCSU <number> IS NOT CONFIGURED  
The entered VC connection (VCSU) is not configured or already deleted.
- F12: VCSU 1 HAS TO BE DELETED AT LAST ONE  
The VC connection to VCSU1 has to be deleted always last.
- F13: THE VCSU <number> HAS TO BE DEACTIVATED BEFORE ACTION DELETE  
An active VC connection can not be deleted.
- F14: FOR <action> A VCSU THE CIRCUIT OF <type>PEN (<ltg-ltu-slot-circuit>)  
HAS TO BE DEACTIVATED (DEACTIVATE WITH AMO DSSU)  
<action>                   ACTIVATE or DEACTIVATE  
<type>                    VCM or PARTNER
- F15: FOR VCM BOARD VCSU 1 HAS TO BE ACTIVATED FIRST  
The VC connection VCSU1 has to be activated always first.
- F16: <action> OF VCSU <number> HAS BEEN REJECTED FROM DC  
<action>                   ACTIVATE or DEACTIVATE  
Unknown error at Device Control. A softrestart could solve the problem.
- F17: FOR VCM BOARD VCSU 1 HAS TO BE DEACTIVATED AT LAST  
The VC connection VCSU1 has to be deactivated always last.
- F18: THERE ARE NO MORE FREE TIMESLOTS AVAILABLE  
For the VC connection if was not possible to reserve free timeslots. Probably  
too many connections are active.

## 214.6.2 Advisories

- H01: VCSU <number> IS ALREADY ACTIVATED  
The entered VC connection (VCSU) is already activated and can only be  
deactivated.
- H02: VCSU <number> IS ALREADY DEACTIVATED  
The entered VC connection (VCSU) is already deactivated and can be deleted or  
activated.
- H03: VCSU <number> HAS BEEN ACTIVATED  
The entered VC connection(s) is/are active.
- H04: VCSU <number> HAS BEEN DEACTIVATED  
The entered VC connection(s) is/are deactive.
- H05: NO VCSU CONFIGURED  
By interrogating all VC connections no configured VC connection was found.
- H06: FOR SPECIFIED PEN NO VCSU CONFIGURED  
For entered pen no configured VC connection was found (Display VCM, PEN or  
Display PARTNER, PEN).
- H07: ATTENTION - THE CONFIGURATION OF VOICO HAS TO BE SYMMETRICAL!  
BEFORE REACTIVATING THE S0/S2 CONNECTION BE CAREFUL TO SWITCH  
THE SAME VCSU'S AT YOUR PARTNER PBX!

## **VOICO - Administration of Voice Compression**

Error messages and advisories

## 215 WABE - Digit Analysis

"Digit analysis" refers to the assignment of a digit analysis result (DAR) to a dialed digit sequence or code. This assignment is dependent on the call progress state (CPS) and digit analysis group or dial plan (DPLN).

In general it is recommended to allocate for each DAR only closed station number ranges (e.g. CD=3000&&3699 for DAR=STN), in this case the internal used dialling plan tree is very short, uses less memory space and works performant. The dialling plan tree will be then built-on until the 2. digit of the station number, because the following 3. and 4. digit are all available in the DAR, this means only a few number of dialplan blocks is needed. When now one station number (e.g. "DEL-WABE:CD,3111;") is deleted from this station number range, then the AMO WABE must extend the dialling plan tree in general by the 3. digit and for the station number range 3110 - 3119 also by the 4. digit. Note, additional memory space in the form of dialplan blocks is therefore necessary to remove the station number 3111 from dialling plan! Please pay attention during creation of a dialling number plan, as more as a station number range for a DAR is subdivided also more increases the need of dialplan blocks to perform a correct digit analysis.

There are two types of digit analysis result: DARs with a specific dialing outcome (e.g. 'STN'; dialing result is station number), and DARs whose dialing outcome must be defined in other AMOs (e.g. 'CO'; the trunk routes which can be accessed via this DAR are defined with the AMO RICHT).

The DARs NETW, NETWFAX and NETWDTE have a special status; for these DARs

the AMO WABE enters supplementary information (parameter DESTNO) as well as the digit analysis result. In addition, information entered with the AMO RICHT for the NETRTE DAR is relevant for call processing purposes.

The DAR STN in HICOM networks has a special status very similar to the DAR NETW. If an STN is in another node, it is added in the local node with the parameter DESTNO. Then it is used just like NETW. Every DAR STN is only permissible independently of DPLN, i.e. without specifying the parameter DPLN.

DAR NETRTE also has a special position: Just as with STN, it must be assigned independently of DPLN groups and only for CPS=0, so that it cannot be directly dialed.

Associated digit analysis results are combined into a digit analysis result pair.

Some digit analysis result pairs are viable only if both parts are assigned (e.g. activate call hunt group - deactivate call hunt group). An expanded input is provided so that such pairs can be handled together if changes are made in the DPLN table. Parameters exist for the partner DAR in the ADD and DELETE commands (CD2, CPS2 & 2). The parameter DPLN applies to both DARs of a pair. In the DELETE command with TYPE=CD, the partner DAR must always be explicitly included. This is done automatically in the ADD command (default value CHECK=ALL), even if CHECK=PART is specified. By specifying CHECK=N, the user is able to specifically exclude the partner DAR. This can save time in some cases; however, the user must remember to create a new partner DAR with the appropriate command. The REGENERATE command generates an ADD command batch with CHECK=N in each case (i.e. with less parameters). This speeds up a generate command sequence because of less parameter checks.

When the feature VNR is activated (VNR switch in ZANDE is set), DPLN dependent configuration must be allowed for DAR=STN and forbidden for DAR=OWNNODE. Both station and node access code can not be deleted as long as at least one subscriber is configured for it, a delete command is rejected with the existing F11 error message. The destination number associated with an access code leading to DAR=STN can be configured individually for different virtual nodes in CHANGE-WABE. Therefore the CD parameter allows up to 12 digits representing a the station number with node access code. The CD parameter in ADD, DELETE, DISPLAY or REGENERATE remains up to 6 digit long. When the feature is activated, the subscriber output has to be changed too. Together with the VNR feature that grouping makes no longer sense, because the same number can be configured in different destination nodes for the individual virtual nodes. In many cases it will also be configured for some of the virtual nodes and reserved for the other. Therefore the output for DAR=STN will show no extra lines with reservation flag or destination number. This information is displayed in individual blocks for each virtual node together with the associated DAR=OWNNODE entries.

The DARs APIN1 to APIN15 (activate personal identification number for copin1 to copin15) and the DAR DPIN (deactivate personal identification number) have a special status within the digit analysis result pairs. These DARs are practicable only in pairs, but have to be added with single AMO calls. This is because there is only 1 deactivation DAR for the 15 activation DARs. Independent of DPLN or for a specific DPLN, if one of the DARs APIN1 to APIN15 exists, the user is responsible for ensuring that the DAR DPIN exists and vice versa.

In addition, some DARs belong to specific DAR sequences, in other words, within the specific DPLN group and CD category a predecessor DAR must be entered before the successor DAR in the sequence can be added. The sequence must also be adhered to when deleting. The sequence may be ignored if CHECK=N is specified.

Associated pairs for simultaneous processing are listed in [Table 49](#) and pairs for sequential processing in Table 50. Digit analysis results AFWDVCE, ADND and ACOSX can also be used as 'feature toggling' digit analysis results. Thus, in the case of these digit analysis results, it is no longer necessary to handle them in pairs with the corresponding deactivation digit analysis results.

Simultaneous updating of the TWABE tables is not carried out automatically. In order to speed up call processing, it is recommended that the desired data be imported with the AMO TWABE (e.g. all CDs to DAR=STN).

| Add simultaneously |          |
|--------------------|----------|
| DAR 1              | DAR 2    |
| ACBK               | DCBK     |
| AFFWDDTE           | DFFWDDTE |

Table 49 Digit analysis result pairs

| Must be entered in sequence |              |
|-----------------------------|--------------|
| Enter first                 | Enter second |
| SPDC1                       | SPDC2        |
| CCS                         | CCSURG       |
| CCMS                        | CCMSURG      |

Table 50 DAR pairs for sequential processing

There are more features connected to special DARs, e.g. there are only decimal digits allowed with DAR STN or FLASHCD, also only 1 digit is allowed for DAR FLASHCD.

### **Call forwarding for DSS1 terminals**

The range of validity for the DARs AFWDREM, DFWDREM and FWDREM is defined by AMO WABE as a supplementary information to the DARs according to the parameters CFREMVVAR and CFREMSE. Meaningful combinations of these parameters are listed in the following table (not checked by the AMO):

| <b>CF Remote Service<br/>CFREMSE</b> | <b>CF Remote Variant (forwarding variant)<br/>CFREMVVAR</b> |
|--------------------------------------|-------------------------------------------------------------|
| ALL                                  | CFU, CFNR, CFB                                              |
| SPEECH                               | CFU, CFNR, CFB                                              |
| UDI                                  | CFU, CFNR                                                   |
| AUDIO3K1                             | CFU, CFNR, CFB                                              |
| UDITA                                | CFU, CFNR                                                   |
| TEL3K1                               | CFU, CFNR, CFB                                              |
| FAX4                                 | CFU, CFNR                                                   |
| VIDEO                                | CFU, CFNR                                                   |
| FAX3                                 | CFU, CFNR                                                   |
| TEL7K                                | CFU, CFNR, CFB                                              |
| VOICE                                | CFU, CFNR, CFB                                              |
| DTEH                                 | CFU, CFNR                                                   |
| FAXH                                 | CFU, CFNR                                                   |

*Table 51                      Combination of CFREMVVAR and CFREMSE parameters*

### **DAR for devices with dial pulse only option**

If CD assigned to the DAR in question should also be available to terminals which only support the dial pulse option (previously known as pulse dialing), but contains special characters (SC),

- the parameter 1 must be specified (except when CHECK=PART/N).
- the parameter 2 must be specified in the case of DAR pairs (except when CHECK=PART/N).
- neither the parameter 1 nor 2 may be specified in the case of a CPS expansion.

**Networks:**

All STN codes in a network are stored with the DAR STN in the tables of each node. To the external STNs (these are the STNs in other nodes) the DESTNO is assigned with a separate CHANGE action.

With DAR NETW now only those codes are stored, that must be reached from all nodes of the network.

If an external STN becomes an internal one, first the DESTNO must be changed to 0.

The station number (CD) of DAR OWNNODE is used for feature networking route optimization of the AMO ZAND TYPE=ALLDATA, parameter NODECD. Before changing or deleting this digit code, the relating information has to be changed or deleted with the AMO ZAND.

The ISDN dial plan has been implemented via QSIG since Hicom 300 E V1.0 and V3.5. With this dial plan it is possible to image the public dial plan on a private network.

If a Hicom system is connected to or in a network that operates using the ISDN dial plan, the network access code to the ISDN network **must** be created with DAR=TIE (tie-trunk) instead of DAR=CO (attention must also be paid here to the CPS-dependent creation of the DAR TIE). There is no longer a CO DAR there as only the LCR decides whether the call is routed to a real public exchange or to a carrier.

Use of the ISDN dial plan for access to systems smaller than EV1.0 / V3.5 is not allowed in the private network.

**Range inputs:**

If a job with range inputs cannot be carried out completely, only the permissible entries are made in the DPLN table. The dominant parameter is the station number or digit code (CD). Error messages are generated for the entries that cannot be executed.

**CPS range**

Call progress states (CPS) cannot be specified as ranges. However, it is possible not to specify the parameter CPS, in which case all CPSs permitted for the associated digit analysis results are intended. The permitted values are defined in a table that cannot be changed by administration and maintenance.

The `DISP-WABE:TYPE=CPS` command allows the user to output either the complete table or a specific row (`DAR=<param>`).

### Note for Optiset terminals:

The function of some digit analysis results can be called via the Optiset menu. This function is only displayed in the Optiset menu if at least one CD was set up for an Optiset-relevant DAR. Optiset-relevant digit analysis results are required to be added with full CPS range, i.e. with all CPSs permitted for the associated digit analysis result. This is achieved by entering no value for the CPS value. The CPS range permitted for the associated digit analysis result is stored in a read only table in the database of the system. This table, i.e. the CPS amount of digit analysis results, can be displayed using DISPLAY-WABE:TYPE=CPS,[DAR=<param>];.

| Always create without CPS specification |          |          |          |          |          |

| VMFOR                                   | VMOWN    |          |          |          |          |

Table 52 Optiset-relevant DARs to be created without CPS specification

### NOTE!

If the CPS range permitted for a digit analysis result has been enlarged, e.g. caused by a change request, all configured access codes for that digit analysis result must be expanded to fit the new CPS range. This can be done using the command ADD-WABE with CHECK=N. This action must be called for each access code assigned to the respective digit analysis result (see example below). If the additional new call progress states are specified in the ADD command, the advisory message H07 is

displayed and the action is performed using the full new CPS range to ensure that the CPS expansion really fits the full CPS range.

Example:

Optiset-relevant digit analysis result APIN1 has been enlarged from CPS 5 to 58&9&17:

```
DIS-WABE:TYPE=GEN,DPLN=0&63,DAR=APIN1;
```

| DIGIT INTERPRETATION |                              | VALID FOR ALL DIAL PLANS |                   |
|----------------------|------------------------------|--------------------------|-------------------|
| CODE                 | CALL PROGRESS STATE          | DIGIT                    | RESERVED/DIALCONV |
|                      | 1 11111 11112 22             | ANALYSIS                 | DNI/ADD-INFO      |
|                      | 0 12345 67890 12345 67890 12 | RESULT                   | *=OWN NODE        |
| 881                  | . ....* ..... ..             | APIN1                    |                   |
| *81                  | . ....* ..... ..             | APIN1                    |                   |

```
DIS-WABE:TYPE=CPS,DAR=APIN1;
```

| STANDARD CPS SUBSETS |                              |
|----------------------|------------------------------|
|                      | 1 11111 11112 22             |
| DAR                  | 0 12345 67890 12345 67890 12 |
| APIN1                | . ....* ..** . .... .*... .. |

Expand the access codes \*81 and 881 assigned to the respective digit analysis result APIN1 to the full CPS range using the command ADD-WABE with CHECK=N (one command, giving the new, additional CPS values - therefore H07 - and one command without parameter CPS):

```
ADD-WABE:CD=881,CPS=8&9&17,DAR=APIN1,CHECK=N;
```

```
H07: OPTISET-RELEVANT DAR MUST ALWAYS HAVE FULL CPS SET.
```

```
- PARAMETER CPS WILL BE IGNORED.
```

```
- ACTION CONTINUES WITH FULL CPS SET.
```

```
ADDITION COMPLETE;
```

```
ADD-WABE:CD=*81,DAR=APIN1,CHECK=N;
```

```
ADDITION COMPLETE;

DISP-WABE:TYPE=GENERAL,DAR=APIN1;

-----
| DIGIT INTERPRETATION                                VALID FOR ALL DIAL PLANS |
-----
|          | CALL PROGRESS STATE | DIGIT | RESERVED/CONVERT |
| CODE     | 1 1111 11112 22| ANALYSIS | DNI/ADD-INFO     |
|          | 0 12345 67890 12345 67890 12| RESULT  | *=OWN NODE       |
-----
| 881      | . . . . * . . ** . . . . . * . . . . | APIN1 |                  |
| *81      | . . . . * . . ** . . . . . * . . . . | APIN1 |                  |
-----
```

**Note for output interruption:**

The output of long lists can be canceled using I/O interrupt. In the case of the actions DISPLAY and REGENERATE, the output can be canceled immediately. In the case of ADD, DELETE and CHANGE, the output of the error messages can be canceled. Cancellation is not carried out until the dominant parameter (CD) has been tested completely, i.e. error messages can still be output before the AMO is canceled.

**Note for 7/8-digit codes:**

This feature can not be activated together with the VNR feature. The code is converted to a 6-digit code within the dial plan.

In the case of a 7/8-digit code, the last 4 digits define the code base and the 3-4 digits ahead define the office code. The office code is assigned to DAR OWNNODE. A 2-digit alternative reference number (ARN) is assigned to the office code. The ARN is stored in the additional data of the DAR OWNNODE.

The 4-digit code base is prefixed with the 2-digit alternative reference number and results in a 6-digit alternative code. The 6-digit alternative code is assigned to the target DAR.

More than one office code can be assigned to the same ARN. This enables the access of a destination using several codes. However, only one office code can be defined for display. Using a CHANGE command, the office code used for the display can be specifically defined.

The feature was not developed to display the own 7/8 digits number on the IDLE devices.

If the real number configured by SBCSU is not desired on IDLE display, there is the option to hide it by:

ZAND:ALLDATA2 parameter DSPOWNNO for optiset, optipoint, Openstage 15/20/30, and by ZANDE:OPTFEA,708 for Openstage 40/60/80, DP/IP, CP (device restart required).

Figure 85 Example for a 7- and a 8-digit subscriber number:

In special cases, the code base can be defined with less than 3 digits, the office code even with less than 3 digits. However, the ARN always consists of 2 digits.

## 215.1 Interrelationships

- AMO ACSU : Configure attendant console
- AMO DIMSU : Feature capacities
- AMO LDPLN : LCR dial plan
- AMO PERSI : Personal identification data
- AMO RICHT : Routes
- AMO SA : Hunting group
- AMO SCSU/SBCSU : Configure station in SWU
- AMO VFGKZ : Attendant console group access codes
- AMO GKREG : Gatekeeper Registry
- AMO ZAND : System data

## 215.2 Functions of the AMO

- **ADD-WABE** : Assign digit analysis results
- **CHANGE-WABE** : Change digit analysis results
- **DELETE-WABE** : Delete digit analysis results
- **DISPLAY-WABE** : Display digit analysis results
- **REGENERATE-WABE** : Regenerate digit analysis results

### 215.2.1 ADD-WABE

With this command it is possible to create 1 DAR for one or more CDs or several DARs for one CD.

In the case of digit analysis result pairs, it is possible to assign both partners for the same station number if the desired call progress states are completely mutually exclusive.

If parameter DPLN is omitted, the DAR is created without DPLN branching for all DPLN groups.

When DARs for central offices and tie trunks are created, the AMO prevents the assignment of another CO/tie trunk DAR to the same station number using different CPS's only. The assignment is also prevented in the case of various long station numbers for CO and tie trunk DARs that correspond up to the number of digits of the shorter station number.

When a DAR for station is created, the AMO prevents the assignment of an individual attendant console DAR to the same station number using different CPS's only and vice versa. This is because stations are stored in station line memory only depending of the station number, but data cannot be stored depending on CPS.

The DAR NETRTE can be preset for a suitable route with the AMO WABE. The connection between all DARs NETW, NETWFAX and NETWDTE with the same DESTNO and a suitable NETRTE must be set up with the AMO RICHT.

If CHECK is not specified, CHECK=ALL is taken as default value.

The DAR STN can be marked as external with DESTNO as supplementary information. For operating reasons, the DESTNO should only be specified for individual STNs in the ADD command but for ranges in the CHA command. In the case of regeneration, normal ADD commands (without DESTNO) are also created for the external STN, followed by a list of CHA commands sorted in ascending order added to the end.

Station numbers for DAR=STN should, where possible, be set up in closed ranges. This applies both to external and internal STNs, as no external/internal distinction is made in WABE. This saves a significant amount of memory and runtime.

The specification of a value greater than 00 for the parameter ARN is only permitted in the case of a CD containing up to 4 digits and the DAR OWNNOE. The CD is then assigned to the ARN as office code for call number display. This action overwrites any previous office code assignment.

The assignment of CFREMVAR and/or CFREMSE is only permitted in the case of the DARs AFWDREM, DFWDREM and FWDREM.

### **Station number categories**

A number of special characters cannot be dialed from all terminals. The digits are therefore split into categories:

- a) A,B,C,D only for devices with a 16-key keypad
- b) \*, # also for devices with a 12-key keypad
- c) 0...9 for all devices

The highest value that occurs must correspond in both specified access codes.

Examples:

CD=A35                      CD2=C\*                      permitted

## WABE - Digit Analysis

### Functions of the AMO

|         |         |               |
|---------|---------|---------------|
| CD=#5   | CD2=*48 | permitted     |
| CD=#A37 | CD2=B   | permitted     |
| CD=A    | CD2=#   | not permitted |
| CD=*12  | CD2=123 | not permitted |

The following table provides a summary of the possible combinations of input parameters.

| Add                                                                                                                                                                                                                          | CHECK        | CD       |          | CD2      | 2        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|----------|----------|----------|----------|
| 1. Indep. DAR w/o SC                                                                                                                                                                                                         | in any case  | DARw/oSC |          |          |          |
| 2. " " with SC                                                                                                                                                                                                               | PART,N       | DAR w SC |          |          |          |
| 3. " " " SC                                                                                                                                                                                                                  | (ALL)        | DAR w SC | DARw/oSC |          |          |
| 4. DAR pair w/o SC                                                                                                                                                                                                           | (ALL) , PART | DARw/oSC |          | DARw/oSC |          |

Table 53 Combinations of possible input parameters

### Procedure Overview

| Command Code | Parameter                                        |
|--------------|--------------------------------------------------|
| ADD-WABE     | CD=<key-num>, [DPLN=<number>], [CPS=<number>]    |
|              | , DAR=<param>, [CHECK=<param>], [=<number>]      |
|              | , [CD2=<key-num>], [CPS2=<number>], [2=<number>] |
|              | , [DESTNO=<number>], [ARN=<number>]              |
|              | , [CFREMVAR=<param>], [CFREMSE=<param>];         |

### Examples

1. Assign the DAR=STN (station) to station numbers 3200-3299 for all call progress states allowed for STN.

Input:

ADD-WABE:CD=3200&&3299,DAR=STN;

2. Assign the DAR 'saved number redial' in DPLN group 2, for the CPSs 'station prefix dialing', 'in-house consultation', 'CO consultation'; code = \*11 for dial pulsing = 5111.

Input:

```
ADD-WABE:CD=*11,DPLN=2,CPS=5&8&9,DAR=SNR,=5111;
```

3. Assign the DAR 'add station to hunt group, voice' in DPLN group 2 for all CPSs allowed for AHTVCE, with code = \*56, dial pulsing = 5156. Since the DAR is part of a DAR pair, reporting of the partner code = #56 or 5256 in the CPS = 'station prefix dialing'.

Input:

```
ADD-  
WABE:CD=*56,DPLN=2,DAR=AHTVCE,=5156,CD2=#56,CPS2=5,2=5256;
```

4. Assign the DAR 'network point', without taking individual DPLN groups into account, in all CPSs provided for CDs 4800 to 4999, with DESTNO 213.

Input:

```
ADD-WABE:CD=4800&&4999,DAR=NETW,DESTNO=213;
```

5. Assign the DAR 'add station to hunt group, voice' in DPLN group 3, for all CPSs permitted for this DAR and CD = \*86. Assign the partner DAR 'DHTVCE' with CD2 = #86, without associated DP station numbers.

Input:

```
ADD-WABE:CD=*86,DPLN=3,DAR=AHTVCE,CHECK=PART,CD2=#86;
```

### **CPS expansion**

Each DAR is assigned a fixed range of possible CPSs (display with DIS-WABE:TYPE=CPS). By specifying the parameter CPS, a CD for a DAR can also be added for a subset of the possible CPSs of a DAR. The CD can be extended to the other CPSs by repeating the ADD action. Please note that the parameters , CD2 and 2 must not be specified. The ADD action must be activated separately for CPS expansion for the , CD2 and 2 station number. A CPS expansion is only possible for the applicable CPS range for the relevant DAR, provided a DAR has not yet been assigned for this CD/CPS combination (neither this nor another).

Example:

1. Add a DAR pair with CPS subset (specify parameter CD2)

Input:

```
ADD-WABE:CD=*75,CPS=1,DAR=CAFAFWD,CD2=#75,CPS2=1;
```

2. CPS expansion for the new station numbers of the DAR pair (parameter CD2 must not be specified - separate ADD command necessary for partner DAR)

Input:

```
ADD-WABE:CD=*75,CPS=5,DAR=CAFAFWD;
```

```
ADD-WABE:CD=#75,CPS=5,DAR=CAFDFWD;
```

3. Add a DAR for devices with dial pulse only option with DAR subset (specify parameter )

Input:

```
ADD-WABE:CD=*76,CPS=2,DAR=HUNT,=876;
```

4. CPS expansion for the new station numbers of the DAR for devices with dial pulse only option (parameter must not be specified - separate ADD command necessary for station number)

Input:

```
ADD-WABE:CD=*76,CPS=3,DAR=HUNT;
```

```
ADD-WABE:CD=876,CPS=3,DAR=HUNT;
```

## 215.2.2 CHANGE-WABE

With this command, different actions which change existing entries in the DPLN tree can be performed by entering the parameters CDNEW, DESTNO, ARN, CFREMVVAR or CFREMSE. The parameters can be entered alternative only, except CFREMVVAR and CFREMSE, that can be entered together.

1. Entering the parameter CDNEW allows to change the CD of existing entries. All data like DPLN or CPS is kept, the entry only is moved in the DPLN tree. It is also possible to move only such entries, that have certain characteristics in their DARs. After moving data to destination the entry at the source is deleted. In case of a CD range the action is performed for every single CD.

If a valid ARN (01 to 99) is stored for a CD with DAR OWNNODE, CDNEW must have maximum 4 digits. The CDNEW (office code) is assigned to the current ARN. A previously assigned office code is overwritten.

2. Entering the parameter DESTNO allows to change the DESTNO still assigned to the CD. If VNR feature is active , CD must be entered as long number for STN : Access code + STN. This function only affects the DAR STN, NETW, NETWFAX and NETWDTE. In case of DAR STN also DESTNO=0 is allowed (external->internal), just as the old value can be 0 (internal->external). If STN is still assigned internal, the command will be rejected with F11. For the network DARs, only an external DESTNO (1..254) can be specified (as

DESTNO=0 is the actual system -> internal DESTNO). In addition the parameter CPS must be specified (see also DAR parameter default values).

3. The alternative reference number of the CD can be changed by entering the parameter ARN (for information on ARN, see 7/8-digit DPLN). This action is valid only for CD with DAR OWNNO. Valid values for ARN are 00 for "no ARN" and 01 to 99 for "valid ARN".

The ARN to office code assignment table for digit code display is updated as follows:

- If the ARN is changed from no ARN to a valid ARN, the CD (office code) is assigned to the new ARN. A previously assigned office code is overwritten.
  - If the ARN is changed from a valid ARN to "no ARN", the CD (office code) is removed from the old ARN if this code is still assigned. Another office code is assigned to the old ARN if the old ARN is stored in the dial plan at another CD.
  - If the ARN is changed from a valid ARN to another valid ARN, the CD (office code) is removed from the old ARN if this code is still assigned and the CD is assigned to the new ARN. A previously assigned office code is overwritten. Another office code is assigned to the old ARN if the old ARN is stored in the dial plan at another CD.
  - If the ARN actually stored in the dial plan is entered, the CD is assigned to this ARN. A previously assigned office code is overwritten. This function is used to enter a CD (office code) selectively into the table or to rebuild the ARN to office code assignment table for digit code display during data output of action REGENERATE.
4. Entering the parameter CFREMVVAR and/or CFREMSE allows to change the supplementary information of a DAR assigned to the CD. This action is valid only for a CD of DAR AFWDREM, DFWDREM or FWDREM.
  5. DARs that receive additional information from other AMOs (LDPLN, SA, VFGKZ and RICHT and GKREG), e.g. GATEWAY(Gateway), CO (= central office), ATND (= attendant position) cannot be changed.

#### **Note on CD relocations (parameter CDNEW)**

It is not possible to change DAR=STN!

Procedure for changing DAR=STN:

- Create new station number range with AMO WABE
- Transfer STN-CD to the new range with AMO SCSU.

- Delete old station number range with AMO WABE.

If a CD range is changed, only the lower range of destination is to be input. All data regarding DPLN, CPS and gaps are transferred identically, with numbering in ascending order, from the old range to the new range.

**Note for all types of change commands**

Changes which cannot be implemented with this function must be carried out using the delete command followed by the add command.

If the DPLN parameter is missing, only the CPSs that were added independently of the DPLN are modified. On the other hand, if the DPLN parameter is specified, the DPLN-independent CPSs are not modified.

If no appropriate point can be found among the specified station numbers for the requested change, an error message is output (F40).

**DAR parameter default values**

If the parameter DAR is not declared, different default values apply, depending on what is changed.

- If CDNEW is entered, the default value is ALL
- If DESTNO is entered, the default value is STN.
- If ARN is entered, the default value is OWNNODE.
- If CFREMPVAR and/or CFREMPSE is entered, the default value is AFDWREM, DFDWREM or FWDREM.

**Procedure Overview**

| Command Code | Parameter                                       |
|--------------|-------------------------------------------------|
| CHANGE-WABE  | CD=<key-num>                                    |
|              | , {DESTNO=<number>,CDNEW=<key-num>,ARN=<number> |
|              | ,CFREMPVAR=<param>,CFREMPSE=<param>}            |
|              | , [DPLN=<number>], [DAR=<param>];               |

**Examples**

1. All DAR=SNR (and no other DARs) in the range 800-999 are relocated to the range 3800-3999.

Input:

CHANGE-WABE:CD=800&&999,DAR=SNR,CDNEW=3800;

2. DAR=NETW for the station number 7125 (DPLN=7) receives the new DESTNO 125 to replace the previous DESTNO.

Input:

`CHANGE-WABE:7125,125,,7,NETW;`

3. The default value DAR=STN (previously DESTNO=0) is assigned as an external DAR with DESTNO 164, for the station number range 2127 to 2133 **while VNR is not active.**

Input:

`CHA-WABE:2127&&2133,164;`

4. The default value DAR=STN (previously DESTNO=0) is assigned as an external DAR with DESTNO 164, for the station number range 2127 to 2133 in Virtual node with Access Code of 19 while VNR is active.

Input:

`CHA-WABE:192127&&192133,164;`

### 215.2.3 DELETE-WABE

This command deletes either the entries found for given CD's or all entries that can be deleted in the given DPLN groups.

Before DELETE-WABE can be used, all entries that are linked to the CDs to be deleted must be eliminated. This must be done in the reverse order in which they were assigned. This applies to the AMOs LDPLN, SBCSU, ACSU, SCSU, SA, VFGKZ, RICHT and GKREG for example.

---

**NOTE:** The DAR ATNDIND may be erased only if the correspondent attendant console has also been erased (AMO-ACSU).

---

Two types of deletion are available:

- **TYPE=CD is the exact opposite of the ADD command. All data specified for the delete command in this branch must match the actual entries for the CD in the database exactly. The CD is only deleted if no input errors exist, otherwise an error message is output. An executed CD delete command can be undone by performing an input command with the same data.**

To keep data consistency in the WABE tables, DAR pairs must be always deleted together. There are no exceptions here in contrast to CHECK=N in the case of ADD. As in the case of ADD, CD pairs which contain special characters must belong to the same category. If several equal DAR pairs of the same category are present, a delete pair has not to be identical with an assign pair. This association is not defined anywhere. It is essential that an even number of CD's of paired DAR's is assigned in each case.

As for the ADD command, if the parameter DPLN is not declared for DELETE, a DAR valid without DPLN branching is expected. Similarly, if CPS is not specified, the given DAR is expected for all possible CPSs, as entered in the table. The DAR is only deleted in these cases.

- In the TYPE=DPLN branch, all entries for a specified DPLN can be deleted, as long as additional information assigned with other AMOs is deleted first.

Independent from the type of deletion (TYPE=), for every CD of DAR OWNNOE with a valid ARN (01 to 99), the CD (office code) must be removed from the ARN to office code assignment table for digit code display at this ARN if this code is still assigned. Another office code is assigned to the old ARN if the old ARN is stored in the dial plan at another CD.

### Procedure Overview

| Command Code | Parameter                              |
|--------------|----------------------------------------|
| DELETE-WABE  | TYPE=CD, CD=<key-num>, [DPLN=<number>] |
|              | , [CPS=<number>], DAR=<param>          |
|              | , [CD2=<key-num>], [CPS2=<param>];     |
|              |                                        |
|              | TYPE=DPLN, DPLN=<number>;              |

### Examples

1. Delete station numbers 3200-3249, in CPS = station user preliminary dialing, DAR = station.

Input:

```
DELETE-WABE:TYPE=CD,CD=3200&&3249,CPS=5,DAR=STN;
```

2. Delete all DARs of the DPLN = 2

Input:

```
DELETE-WABE:TYPE=DPLN,DPLN=2;
```

3. Delete the digit analysis result pair = \*75, #76 in all CPSs of DPLN = 15, DAR = 'Mailbox access by the owner'.

Input:

```
DELETE-WABE:TYPE=CD,CD=*75,DPLN=15,DAR=VMOWN,CD2=#76;
```

### **CPS reduction**

A CD added for a DAR is assigned for a specific CPS range, i.e. that the CD in the assigned CPSs leads to this DAR. The CPS range assigned to a CD can be reduced by specifying the parameter CPS during the DELETE action. Please note, that the parameter CD2 is not permitted in the case of CPS reduction, even for DAR pairs (Exception: if a CD is completely deleted, i.e. for all CPSs configured, CD2 must be entered for DAR pairs). A CPS reduction for the CD of a partner DAR (CD2) must be performed by repeating the DELETE action.

Example:

1. Delete a DAR pair with full CPS range (specify the parameter CD2)

Input:

```
DELETE-WABE:TYPE=CD,CD=*75,CDDAR=CAFAFWD,CD2=#75;
```

2. CPS reduction for the new station numbers of the DAR pair (parameter CD2 must not be specified - separate DELETE command necessary for partner DAR)

Input:

```
DELETE-WABE:TYPE=CD,CD=*75,CPS=5,DAR=CAFAFWD;
```

```
DELETE-WABE:TYPE=CD,CD=#75,CPS=5,DAR=CAFDFWD;
```

## **215.2.4 DISPLAY-WABE**

This function allows the user to

1. display the contents of the DPLN tables according to various criteria (TYPE=GEN).
2. display STN seizures throughout the network based on the destination numbers (TYPE=STN) or the destination node numbers (TYPE=DNNO).
3. output all CPS values valid for specific DARs (TYPE=CPS).
4. view the office codes currently assigned to the ARNs (TYPE=ARN). This display reflects the current data stored in the ARN to office code assignment table for digit code display.

In the TYPE=GEN branch, all dial plan data is listed in a table, that is valid independent of DPLN groups. This is followed by the specific tables for the individual DPLN groups. These tables show the CDs and CPSs for which a DAR is set up. To obtain a complete output (independent of DPLN groups and all DPLN group specific), enter the parameter DPLN=0&&15. If no value is entered for the parameter DPLN, then the table with the DPLN-independent entries is only output.

---

**NOTE:** When VNR is activated and a range in AMO WABE is displayed (DISP-WABE:GEN,29981&&29991;) the VNNO and DESTNO are missing in the output. If the display is made for each code, then the correct info is displayed.

---

The column for additional information (RESERVED and so on) shows which route DARs are predefined in the dial plan and are not otherwise used in the system. This is shown by the value 'R'. The same information is output for DAR=STN. If dialed number conversion is assigned to a station, then this will be shown by the value 'C' in this column (It is assigned by the AMO RUFUM). If a station is assigned as destination for DNI by ACD, then this will be shown by the value 'D' in this column (It is assigned by the AMO DNIT). The output of an ARN assigned to a CD of DAR OWNNO in the dial plan is done also in this column as well as the output of a DESTNO and DNNO assigned to a CD of DAR STN, NETW, NETRTE.

Apart from the parameter TYPE, all parameters are optional. If parameters are not explicitly declared, the inputs are initialized with the maximum permitted range in most cases. The default range for the parameter DESTNO is the entire possible range (0...254); the default value for DAR is ALL. The exception is parameter DPLN, which must be specified if any DPLN group specific data should be output.

In the DISPLAY command with TYPE=GEN, a range for the parameter CD may be specified both, with special characters and different length.

#### Notes for displayed tables

If value 0 is displayed for DESTNO, the DAR is located in the local node (e.g. for DAR=STN it is an internal subscriber). In this case, the DNNO of the own node is displayed.

If value > 0 is displayed for DESTNO, the DAR is located in a remote node (e.g. for DAR=STN it is an external subscriber). The DESTNO corresponding to the AMO RICHT configuration is output for this.

If value 0-0-0 is displayed for DNNO, the destination node number is undefined, i.e. there is (still) no route assigned (CD is reserved) in the case of DESTNO>0 or there is (still) no value defined for own node (AMO ZAND) in the case of DESTNO=0.

For TYPE=STN and TYPE=DNNO there are advisory messages displayed only if there were no STNs assigned for the DESTNO/ DNNO range.

For DAR=GATEWAY , GWNO is displayed if any additional information is entered bei Amo-GKREG for this access code.

For TYPE=GEN , NODES that include this number should also be DISPLAYED If TLN number is not asked for a RANGE .( see examples 9 and 10)

Parameter FORM has the following values :

- L - large :Shows all entries with all data
- M - medium: Only one line with short info per node showing destination number (0 or other) and Reserved/Convert/DNIT flag :
- S - small : Same as M, reserved elements are not displayed
- XS - extra small : No info per node, only one line for DAR=STN (without extra info, as it is node dependant)

Default value is S, if only one ore more single values (concatenated with & ) are entered for the CD parameter,

otherwise (no input or at least one range) the default is XS.

## Procedure Overview

| Command Code | Parameter                                 |
|--------------|-------------------------------------------|
| DISPLAY-WABE | TYPE=GEN, [CD=<key-num>], [DPLN=<number>] |
|              | , [CPS=<number>], [DAR=<param>];          |
|              |                                           |
|              | TYPE=STN, [DESTNO=<number>];              |
|              |                                           |
|              | TYPE=CPS, [DAR=<param>];                  |
|              |                                           |
|              | TYPE=DNNO, [DNNO=<number>];               |
|              |                                           |
|              | TYP=ARN, [ARN=<number>];                  |

Examples

1. Display the DPLN data with the DAR=ADND

Input:

DISPLAY-WABE:TYPE=GEN,DAR=ADND;

Output:

| DIGIT INTERPRETATION |   |                     |       | VALID FOR ALL DIAL PLANS |          |                  |                    |
|----------------------|---|---------------------|-------|--------------------------|----------|------------------|--------------------|
|                      |   | CALL PROGRESS STATE |       | DIGIT                    |          | RESERVED/CONVERT |                    |
| STATION NUMBER       | 1 | 11111               | 11112 | 22                       | ANALYSIS | DNI/ADD-INFO     |                    |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         | PDNNO  | 0- | 0- | 0 |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |        |    |    |   |
|       | ```

## 215.2.5 REGENERATE-WABE

REGENERATE is similar to DISPLAY. First the commands are output which are valid for all DPLN (DLN group independent), followed by those that are valid for individual DPLN groups. All commands are output with CHECK=N.

The DARs STN always are treated as internal reserved stations. After the last ADD command is output, external stations are searched and the CHANGE commands are output for increasing order of station numbers. **New TYPE param is added to see only CHANGE commands by TYPE=STN.**

## WABE - Digit Analysis

### Parameter Description

The DARs OWNNOE are always displayed with the actual ARNs, stored in the dial plan. To rebuild the ARN to office code assignment table for digit code display, the CHANGE commands of TYPE=ARN are created after the last ADD command is output.

For the parameters of the REGENERATE command please refer the notes for the parameters of action DISPLAY / TYPE=GEN.

### Procedure Overview

| Command Code    | Parameter                                       |
|-----------------|-------------------------------------------------|
| REGENERATE-WABE | [CD=<key-num>], [DPLN=<number>], [CPS=<number>] |
|                 | , [DAR=<param>], [TYPE=<param>];                |

### Example:

Regenerate the DPLN group 2 when VNR feature is not active.

Input:

```
REG-WABE:DPLN=2;
```

Output:

```
ADD-WABE: 0          ,  , 9, ANSINT  , N,,,,, , ;
ADD-WABE: 00         ,  , 2, SPDC1   , N,,,,, , ;
ADD-WABE: 00         ,  , 3, SPDC1   , N,,,,, , ;
ADD-WABE: 20         ,  , 2, SPDC2   , N,,,,, , ;

```

## 215.3 Parameter Description

In this part, you can find the following parameter descriptions:

- [Basic parameters CD, DPLN, CPS and DAR](#)

- CHECK parameter for controlling the test scope during ADD
- Parameter for CD with special characters (\*, #, A, B, C, D)
- Parameter CD2, CPS2 and 2 for partner or sequence DAR
- Parameter DESTNO, ARN, CFREMVVAR and CFREMSE for additional information on DAR
- Other parameters CDNEW, TYPE and DNNO

**Basic parameters CD, DPLN, CPS and DAR**

|      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CD   | <p>Access code / station number</p> <p>Note: The station numbers are arranged according to Station number categories.</p> <p>Input type : Single value</p> <p>chained individual values (without SC and only for independent DAR)</p> <p>Area (without SC and only for independent DAR)</p> <p>Mandatory (for ADD-WABE, DELETE-WABE TYPE=CD, CHANGE-WABE; only 1 value or 1 range)</p> <p>Optional (for DISPLAY-WABE, REGENERATE-WABE)</p> <p>Possible values : 0 - 9, '*', '#', 'A', 'B', 'C', 'D'; up to 6 characters</p> <p>MMI interprets X.21 characters '-', ':', '/', ',' as control characters. This must therefore be displayed as follows for digit analysis:</p> <p>'-' corresponds to 'A'</p> <p>':' corresponds to 'B'</p> <p>',' corresponds to 'C'</p> <p>',' corresponds to 'D'</p> |
| DPLN | <p>Digital analysis result group</p> <p>Note : Must not be specified for DAR=STN and NETRTE!</p> <p>Input type : Single value</p> <p>chained individual values, range</p> <p>Optional</p> <p>Mandatory (in DELETE-WABE TYPE=DPLN)</p> <p>Possible values : 0 to 63</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CPS  | <p>Call progress state</p> <p>Note : In CPS, a subset of the CPS range permanently defined for each DAR can be specified</p> <p>Specification is not permitted for CPS expansion and CPS reduction.</p> <p>Note for Optiset terminals: may only be created with full CPS range.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|          |                                                                    |
|----------|--------------------------------------------------------------------|
| APIN3    | Activate PIN for COPIN 3<br>(see AMO PERSI)                        |
| APIN4    | Activate PIN for COPIN 4<br>(see AMO PERSI)                        |
| APIN5    | Activate PIN for COPIN 5<br>(see AMO PERSI)                        |
| DPIN     | Deactivate PIN                                                     |
| AREM     | Activate reminder                                                  |
| DREM     | Deactivate reminder                                                |
| ATND     | Attendant/internal operator code                                   |
| ATNDDID  | Indial to attendant console                                        |
| ATNDIND  | Individual attendant console                                       |
| BABYLSNG | Baby listening                                                     |
| BUZZ     | Alert (buzz) a target station                                      |
| CDRACC   | CDR account code                                                   |
| CO       | Central office<br>(Please see note for <a href="#">Networks</a> :) |
| CTDL     | Seize lines for<br>cut-through or suffix dialling in tie traffic   |
| DICT     | Dictation equipment                                                |
| DIGIDAT  | DIGITE data input (DP systems)                                     |
| DISUOFF  | Display suppression off                                            |
| DISUON   | Display suppression on                                             |
| DOORCL   | Query of the entrance telephone system                             |
| DOOROPEN | Open via the entrance telephone system                             |
| DTE      | Code for DTE service for analog traffic via DIUC                   |
| DTED     | Code for DTE service for digital traffic via DIUC                  |
| DTMFCONV | DTMF-conversion when dialling to public network                    |
| EOVR     | Emergency override (feature emergency override/release)            |
| EXTANS   | Interception by console in partner system                          |
| FAX      | Code for fax service                                               |
| GATEWAY  | gateway                                                            |
| GENANS   | General answering/universal night answering                        |
| HOLD     | Call hold by an analog phone                                       |
| KNOVR    | Camp-on (knocking)/override                                        |
| LNR      | Last number redial                                                 |
| MANDOWNL | Manual downloading                                                 |
| MHFALGOF | Logoff by a mobile HFA subscriber                                  |
| MHFALGON | Logon by a mobile HFA subscriber                                   |
| NETRTE   | Auxiliary DAR for networking                                       |

|          |                                                                                                                                             |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------|
| NETW     | DAR for a voice feature in another node; route is automatically seized via DESTNO and the dialed digit sequence is repeated.                |
| NETWDTE  | DAR for a DTE feature in another node; route is automatically seized via DESTNO and the dialed digit sequence is repeated.                  |
| NETWFAX  | DAR for a fax feature in another node; route is automatically seized via DESTNO and the dialed digit sequence is repeated.                  |
| NOPT     | Change of night switch option                                                                                                               |
| OUTPULSE | Outpulse specific digits on the line during call status for cut-through or suffix dialing in tie traffic<br>e.g. for flashing to EB5 system |
| OWNNODE  | Code number for own node                                                                                                                    |
| PUEXT    | Acceptance (or pickup) of ext. consult call from remote system in simple tie trunk traffic                                                  |
| RA       | Recorded announcement for a specific area (loudspeaker device)                                                                              |
| RELEASE  | Release (feature emergency override/release)                                                                                                |
| REMKY    | Reminder key                                                                                                                                |
| RESDOWNL | Reset of modified parameters by downloading the basic parameter sets (DCI)                                                                  |
| SIGNOFF  | Sign off a line via terminal device (autoset relocate)                                                                                      |
| SIGNON   | Sign on a line via terminal device (autoset relocate)                                                                                       |
| SNR      | Stored number redial                                                                                                                        |
| SPD      | Change the speed (DCI)                                                                                                                      |
| SPDC1    | Speed calling central 1                                                                                                                     |
| SPDC2    | Speed calling central 2                                                                                                                     |
| SPDI     | Speed calling individual                                                                                                                    |
| SPDIPROG | Speed call individual programming code                                                                                                      |
| SPLIT    | Split/alternating calls                                                                                                                     |
| STN      | Station                                                                                                                                     |
| STNREL   | STN DAR for destination-dependent release                                                                                                   |
| TRACE    | Malicious call tracing                                                                                                                      |
| VOICECAL | Voice call                                                                                                                                  |
| WHISANN  | Whisper Announcement                                                                                                                        |

**DARs for call forwarding feature**

**For voice service**

|          |                                              |
|----------|----------------------------------------------|
| AFWDVCE  | Activate fixed call forwarding voice         |
| DFWDVCE  | Deactivate fixed call forwarding voice       |
| AFFWDVCE | Program and activate fixed forwarding voice  |
| DFFWDVCE | Deactivate and delete fixed forwarding voice |

**For fax service**

|         |                              |
|---------|------------------------------|
| AFWDFAX | Activate call forwarding fax |
|---------|------------------------------|

## WABE - Digit Analysis

### Parameter Description

|          |                                 |
|----------|---------------------------------|
| DFWDFAX  | Deactivate call forwarding fax  |
| AFFWDFAX | Activate fixed forwarding fax   |
| DFFWDFAX | Deactivate fixed forwarding fax |

#### **For DTE service**

|          |                                 |
|----------|---------------------------------|
| AFWDDTE  | Activate call forwarding dte    |
| DFWDDTE  | Deactivate call forwarding dte  |
| AFFWDDTE | Activate fixed forwarding dte   |
| DFFWDDTE | Deactivate fixed forwarding dte |

#### **Activate via the attendant console**

|         |                                        |
|---------|----------------------------------------|
| AFWDREM | Act call forwarding remote/follow me   |
| DFWDREM | Deact call forwarding remote/follow me |
| FWDREM  | Show call forwarding remote/follow me  |

#### **Miscellaneous**

|          |                                                                                                                             |
|----------|-----------------------------------------------------------------------------------------------------------------------------|
| AFWDDWD  | Activate call forwarding for DIGITE without display<br>(activate FWD without the Check key)                                 |
| FWDTERM  | Call forwarding for all stns assoc. to terminal                                                                             |
| FWDIGNOR | Ignore call forwarding<br>(in the case of FWD from STN-B to STN-C, STN-A can call STN-B<br>directly with FWDIGNOR+CD-STN-B) |
| DFWDEXT  | Deactivate call forwarding external                                                                                         |
| AFWDEXT  | Activate call forwarding external                                                                                           |
| DFWDINT  | Deactivate call forwarding internal                                                                                         |
| AFWDINT  | Activate call forwarding internal                                                                                           |
| AFWDEXIN | Activate call forwarding ext and int                                                                                        |
| AFWDB    | Activate call forwarding busy                                                                                               |
| AFWDNA   | Activate call forwarding no answer                                                                                          |
| AFWDBNA  | Activate call forwarding busy or no answer                                                                                  |
| DSYSFWD  | Deactivate system call forwarding voice                                                                                     |
| ASYSFWD  | Activate system call forwarding voice                                                                                       |
| FFWDREMK | Store call forwarding<br>via remote by key                                                                                  |

#### **DARs for call pickup feature**

|        |                                             |
|--------|---------------------------------------------|
| PU     | Call pickup                                 |
| PUGDIS | Display group pickup information on request |
| PUDIR  | Directed call pickup                        |

#### **DARs for call park feature**

|          |                                          |
|----------|------------------------------------------|
| PARK     | Call park and retrieve to<br>system slot |
| CALLPARK | Call park for anate                      |

|          |                                                                |
|----------|----------------------------------------------------------------|
| DCPA     | Park a user at a specific user<br>(DARs for national features) |
| SELFPA   | Park a user on one's own line<br>(DARs for national features)  |
| RECONNPA | Reconnect on held call<br>(DARs for national features)         |

**DARs for combi-code feature**

|        |                                                           |
|--------|-----------------------------------------------------------|
| DTEDNO | Combi-code for DTE terminal with digital traffic via DIUC |
| DTENO  | Combi-code for DTE terminal with analog traffic via DIUC  |
| FAXNO  | Combi-code for fax terminal                               |

**DARs for hunting group feature**

|        |                                                 |
|--------|-------------------------------------------------|
| HUNT   | Hunting group (HT)                              |
| HTKY   | Hunt group key (on/off)                         |
| AHTVCE | Add station to hunt group voice                 |
| DHTVCE | Disassociate stn. from hunt group, voice eqpt.  |
| AHTFAX | Add station to hunt group fax                   |
| DHTFAX | Disassociate station from hunt group, fax eqpt. |
| DHTDTE | Disassociate station from hunt group, DTE eqpt. |
| AHTDTE | Add station to hunt group DTE                   |

**DARs for code calling feature**

(Single code calling / multiple code calling)

|          |                                                |
|----------|------------------------------------------------|
| CCKY     | Code calling key                               |
| CCDIS    | Code calling display with code                 |
| CCMEETME | Code calling meet-me with code                 |
| CCSTN    | Code calling station A with code               |
| CCVCE    | Code calling for voice with code               |
| CCSURG   | Code calling urgent search with code           |
| CCS      | Code calling normal search with code           |
| CCANS    | Code calling answer                            |
| CCSCD    | Code calling search with code                  |
| CCSN     | Code calling search normal                     |
| CCMANS   | Code calling answer to mult. task page attempt |
| CCMSURG  | Code calling multiple task paging urgent       |
| CCMS     | Code calling multiple task paging normal       |

**DARs for tie trunk traffic feature**

(network-wide features)

|         |                                                                     |
|---------|---------------------------------------------------------------------|
| TIE     | Tie line access<br>(please see note for <a href="#">Networks:</a> ) |
| TIEATND | Analogue tie trunk, special seizure type                            |
| SCONSCO | Sat. connection in consultation hold from CO                        |

## WABE - Digit Analysis

### Parameter Description

|        |                                                 |
|--------|-------------------------------------------------|
| SCONSI | Sat. connection in consult hold from internal   |
| SAT    | Extend indial or trunk call to satellite system |

#### **DARs for IP Distributed Architecture (IPDA) feature**

|          |                                                   |
|----------|---------------------------------------------------|
| FRCALTRT | Force alternate route                             |
| INCALTRT | Incoming alternate route                          |
| NOEC     | CLC without echo cancellation for encrypted calls |

#### **DARs for key function assignment**

|          |                                                                 |
|----------|-----------------------------------------------------------------|
| KYPROG   | Key programming on digite                                       |
| KNOVRKY  | Knocking/camp-on, override key                                  |
| DNDKY    | Do not disturb                                                  |
| IUSEKY   | Show-line-key-I-use key<br>(DARs for key functionality feature) |
| FWDKY    | Call forwarding key                                             |
| MSGRKY   | Messenger key (CHESE)                                           |
| MBKY     | Mailbox key                                                     |
| DAKY     | Non-voice key                                                   |
| VCRKY    | Voice call reject key                                           |
| VCKY     | Voice call key                                                  |
| DSSKY    | Direct station select key                                       |
| EXHOLDKY | Exclusive hold key<br>(DARs for key functionality feature)      |
| HOLDKY   | Hold key<br>(DARs for key functionality feature)                |
| CONFKY   | Conference key                                                  |
| TOGGLEKY | Toggle key                                                      |
| NAMEKY   | Name key                                                        |
| PARKKY   | Park key                                                        |
| PRIVKY   | Privacy key<br>(DARs for key functionality feature)             |
| CONSKY   | Consultation key                                                |
| CBKKY    | Callback key                                                    |
| RCTOFFKY | Ringer cutoff key<br>(DARs for key functionality feature)       |
| HTKY     | Hunt group key (on/off)                                         |
| FLASHCD  | Equivalent flash signal code                                    |
| STKY     | Start key/output                                                |
| RLSKY    | Release/Cancel key                                              |
| TRNSKY   | Call transfer key                                               |
| TIMEKY   | Date/time                                                       |

LNRKY Last number redial key

SNRKY Saved number redial key

**DARs for answering machine functions**

MBON Mailbox LED on

MBOFF Mailbox LED off

VMOWN Access to own voice mailbox  
(routes to Voice Mail Service)

VMFOR Access to other ('foreign') user's voice mailbox  
(routes to Voice Mail Service)

MWACT Message waiting activation

MWANS Message waiting answer

MWCAN Message waiting cancel by terminating party

MWCANORI Message waiting cancel by originating party

**DARs for broadcast functions**

BROADCAST Speaker call - one-way broadcast

COMGRP COM group call

COMSPK COM group speaker call - two way

SPKRCALL Speaker call - one way

**DARs for conference feature**

CONFKY Conference key

CONF Establish conference/add party to conference

RMCONFLP Remove last party from conference

RMCONFP1 Remove party at position 1 from conference

RMCONFP2 Remove party at position 2 from conference

RMCONFP3 Remove party at position 3 from conference

RMCONFP4 Remove party at position 4 from conference

RMCONFP5 Remove party at position 5 from conference

RMCONFP6 Remove party at position 6 from conference

RMCONFP7 Remove party at position 7 from conference

RMCONFP8 Remove party at position 8 from conference

## WABE - Digit Analysis

### Parameter Description

#### DARs for MLPP feature

|         |                                       |
|---------|---------------------------------------|
| FLASH   | MLPP flash call                       |
| FLASHOV | MLPP flash override call - high level |
| IMMED   | MLPP immediate call                   |
| PRTY    | MLPP priority call - low level        |
| DSNR    | MLPP dsn-routine                      |

#### DARs for call center features

|          |                                                                                                                                                                 |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACC      | Account code                                                                                                                                                    |
| ACDWORK  | Agent works                                                                                                                                                     |
| ACDSHMSG | Short message                                                                                                                                                   |
| ACDLOGON | Agent logon                                                                                                                                                     |
| ACDLOGOF | Agent logoff                                                                                                                                                    |
| ACDEMMSG | Emergency message                                                                                                                                               |
| ACDNAV   | Agent not available                                                                                                                                             |
| ACDPGS   | Primary group status                                                                                                                                            |
| ACDPQS   | Primary queue status                                                                                                                                            |
| ACDSGS   | Secondary group status                                                                                                                                          |
| ACDSQS   | Secondary queue status                                                                                                                                          |
| ACDAV    | Agent available                                                                                                                                                 |
| CAFDFWD  | CAF deactivate forwarding of RCG                                                                                                                                |
| CAFAFWD  | CAF activate forwarding of RCG                                                                                                                                  |
| CAFGROFF | CAF group logoff                                                                                                                                                |
| CAFGRNAV | CAF group not available                                                                                                                                         |
| CAFGRAV  | CAF group available                                                                                                                                             |
| CAFLOGOF | CAF Agent logoff                                                                                                                                                |
| CAFNAV   | CAF agent not available                                                                                                                                         |
| CAFAV    | CAF agent available                                                                                                                                             |
|          | CAF = Control of Agent Feature<br>(only at telephones with CAF authorization)<br>RCG = Route Control Group<br>(the RCG is a table<br>of AMO ACDSD, TYPE=CAFRCG) |
| MONSLNT  | Silent monitoring                                                                                                                                               |
| MONTONE  | Tone monitoring                                                                                                                                                 |
| RCG      | Route control group number                                                                                                                                      |

#### DARs for key functionality feature

|          |                         |
|----------|-------------------------|
| IUSEKY   | Show-line-key-I-use key |
| EXHOLDKY | Exclusive hold key      |
| HOLDKY   | Hold key                |
| KEYPADIE | Keypad ie               |

|          |                         |
|----------|-------------------------|
| TOGGLEKY | Toggle key              |
| APRIV    | Activate privacy        |
| DPRIV    | Deactivate privacy      |
| PRIVKY   | Privacy key             |
| CONSKY   | Consultation key        |
| CBKKY    | Callback key            |
| RCTOFFKY | Ringer cutoff key       |
| RLSKY    | Release/Cancel key      |
| TRNSKY   | Call transfer key       |
| LNRKY    | Last number redial key  |
| SNRKY    | Saved number redial key |

**DARs for national features**

|          |                                                                                                                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROT     | Override protection (Belgium)<br><i>Protected or prioritized connection;<br/>protected against override<br/>(CR: BEMILCOM Protected/Priority Call)</i>                                                              |
| ASTN     | Check a-station number in the case of transit                                                                                                                                                                       |
| CALLPARK | Call park for anate                                                                                                                                                                                                 |
| OPROVR   | Demand to override by CO operator (post) in call status<br>(feature: earth CO trunk/flash to CO)                                                                                                                    |
| DCPA     | Park a user at a specific user<br><i>Directed parking of a user at another station (Direct Call Park)<br/>(Feature: Directed Call Park)</i>                                                                         |
| SELFPA   | Park a user on one's own line<br><i>Parking a user but not in the PU group (SELF PARK)<br/>(feature: Directed Call Park)</i>                                                                                        |
| RECONNPA | Reconnect on held call<br><i>Reconnecting with a user parked specifically on this line (RECONNect Park)<br/>(either self-parked with SELFPA or<br/>by another user with DCPA)<br/>(feature: Directed Call Park)</i> |
| RERING   | Ring partner again                                                                                                                                                                                                  |
| CTDL     | Line seizure for cut-through or suffix dialing in tie traffic                                                                                                                                                       |
| OUTPULSE | Suffix-transmission of digits on the line during call status for cut-through or suffix dialing in tie traffic<br>e.g. for flashing the EB5 system                                                                   |

**DARs for the Optiset API feature**

|     |                                                            |
|-----|------------------------------------------------------------|
| WSS | Start workstation session<br><b>(feature not released)</b> |
|-----|------------------------------------------------------------|

**DARs for service functions**

|         |                     |
|---------|---------------------|
| FLTRACE | Activate flag trace |
|---------|---------------------|

## WABE - Digit Analysis

### Parameter Description

|          |                                                                                                                                                                                                         |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FREQTEST | DTMF/MFC transmitter test<br>(check DTMF/MFC character at SIU,<br>check DTMF/MFC character at SIUX,<br>check DTMF/MFC character at SIUCX.<br>check DTMF/MFC character of SIUCO,<br>check MFC-R2 signal) |
| CTLS     | Controlled trunk and line selection                                                                                                                                                                     |
| HWTEST   | Activate hw test on terminal device (optiset)                                                                                                                                                           |
| TESTLN   | Test line                                                                                                                                                                                               |
| TESTTONE | Connect test tone transmitter for 800_hz-test                                                                                                                                                           |
| COMBO    | Combination test (transmission test termination)                                                                                                                                                        |
| LOOPBACK | Loopback test (transmission test termination)                                                                                                                                                           |
| MILLWAT  | Milliwatt test (transmission test termination)                                                                                                                                                          |
| SILENCE  | Silence test (transmission test termination)                                                                                                                                                            |
| PRITEST  | Primary rate test line loopback                                                                                                                                                                         |

### CHECK parameter for controlling the test scope during ADD

Table 53 lists the possible input parameter combinations depending on the value of the CHECK parameter.

|                 |                                                                                                                                              |                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHECK           | Tells which combination of CD parameters is expected, i.e. extent to which the consistency and integrity of CD combinations will be checked. |                                                                                                                                                                                                                                                                                |
| Note            | :                                                                                                                                            | If the parameter CHECK=N is specified, the user is responsible for checking the consistency of the data specified.                                                                                                                                                             |
| Input type      | :                                                                                                                                            | Single value, optional                                                                                                                                                                                                                                                         |
| Possible values | :                                                                                                                                            | ALL      All possible checks will be performed and, dependant on other data, parameters , CD2 and 2 will be expected                                                                                                                                                           |
|                 | N                                                                                                                                            | No consistency checks will not be performed and neither CD2 nor 2 will be expected<br>(see also<br>CHECK=N for DAR pairs,<br>CHECK=N for sequence DAR,<br>CHECK=N for Optiset-relevant DAR)                                                                                    |
|                 | PART                                                                                                                                         | Most of the checks will be performed depending on the CD and DAR (e.g. DAR pair, DAR sequence, etc.), but neither parameter nor CD2 will be accepted. It is thus possible to create a CD with special characters without specifying /2 for a DAR, the actual /2 was requested. |

### Parameter for CD with special characters (\*, #, A, B, C, D)

If DAR should also be created for devices with dial pulse only option (dial pulse only option = pulse dialing):

Pulse dialing station number (analog terminal)

Note : Entry mandatory in DAR for devices with dial pulse only option if CD contains special characters and CHECK=ALL.  
specification not permitted if CHECK/=ALL or if DAR already exists for this CD and DPLN (CPS expansion).

Input type : Single value, optional

Possible values : Digits 0 to 9, up to 6 digits

**Parameter **CD2**, **CPS2** and **2** for partner or sequence DAR**

**CD2** Feature access code for 2nd digit analysis result of a pair

Note : Mandatory if the DAR part is a pair and CHECK/=N; CD2 must be from the same Station number categories as CD.  
Specification is not permitted in CPS expansion and CPS reduction.

Input type : Single value, optional

Possible values : 0 - 9, '\*', '#', 'A', 'B', 'C', 'D'; up to 6 characters  
MMI interprets X.21 characters '-', ':', '/', ',' as control characters. This must therefore be displayed as follows for digit analysis:  
'-' corresponds to 'A'  
'.' corresponds to 'B'  
'/' corresponds to 'C'  
'/' corresponds to 'D'

**CPS2** Call progress state for the partner DAR

Input type :

Possible values :

**2** Feature access code for dial pulse station

Note : Entry mandatory if CD2 and were specified.  
Specification not permitted in CPS expansion and if is not specified (e.g. because not necessary/permited)

Input type : Single value, optional

Possible values : numeric, up to 6 digits

**Parameter **DESTNO**, **ARN**, **CFREMVAR** and **CFREMSE** for additional information on DAR**

**DESTNO** Destination number

Note : DESTNO is only permitted for DAR=STNREL, NETW, NETWFAX, NETWDTE or STN.  
The value 0 is only permitted for DAR=STN and STNREL.  
DESTNO must not be specified if the parameter CDNEW, ARN, CFREMSE or CFREMVAR is specified in CHANGE-WABE.

## WABE - Digit Analysis

### Parameter Description

|          |                                                                            |                                                                                                                                                                |
|----------|----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | Input type                                                                 | : Single value                                                                                                                                                 |
|          | Range                                                                      | (for DISPLAY-WABE)                                                                                                                                             |
|          | Optional                                                                   | (in ADD-WABE,<br>DISPLAY-WABE TYPE=STN)                                                                                                                        |
|          | Possible values                                                            | : 0 - 254                                                                                                                                                      |
|          | Default value:                                                             | 0 (for ADD-WABE)                                                                                                                                               |
|          |                                                                            | 0&&254 (see DISPLAY-WABE)                                                                                                                                      |
| ARN      | Alternative reference number (for Note for 7/8-digit codes: feature China) |                                                                                                                                                                |
|          | Note                                                                       | : ARN is only permitted for DAR=OWNNODE.<br>ARN may not be entered if the parameter DESTNO, CFREMSE or CFREMVAR is specified in CHANGE-WABE.                   |
|          | Input type                                                                 | : 1 to 2 single values, concatenated with &&, optional<br>single value, (CHANGE)<br>3. parameter of a min-1-group<br>single value, (ADD)<br>optional           |
|          | Possible values                                                            | : numeric, 2 characters                                                                                                                                        |
| CFREMVAR | Call forward remote variant (Call forwarding for DSS1 terminals variant)   |                                                                                                                                                                |
|          | Note                                                                       | : CFREMVAR may not be entered if the parameter DESTNO, CDNEW or ARN is specified in CHANGE-WABE.                                                               |
|          | Input type                                                                 | : Individual values<br>Optional                                                                                                                                |
|          | Possible values                                                            | : CFU Call Forwarding - unconditional<br><br>CFNR Call forwarding - no reply<br><br>CFB Call Forwarding - busy<br>(Call forwarding on busy, no answer advance) |
|          | Default value                                                              | : CFU                                                                                                                                                          |

|                 |                                                                                                 |                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| CFREMSE         | Call forward remote service (Call forwarding for DSS1 terminals services)                       |                                                                         |
| Note            | : CFREMSE may not be entered if the parameter DESTNO, CDNEW or ARN is specified in CHANGE-WABE. |                                                                         |

### **215.4.1 Error messages**

F01: SPECIFY CODE FOR DIAL PULSE DEVICES

F02: SPECIFY CODE FOR PARTNER DIGIT ANALYSIS RESULT

F03: ENTRY FOR CODE @@@@@@@@@@@@@@ IS NOT POSSIBLE DUE TO SHORTAGE OF MEMORY SPACE  
(@@@ TABLES)

(The following steps help minimize memory space requirements:

- create digit analysis results for only a few CPSs and so that they are DPLN-independent
- create DAR STN as far as possible for complete (!) blocks of 10, 100 or 1000 units.)

F04: DELETION OF NUMBER @@@@@@@@@@@@@@ NOT POSSIBLE DUE TO SHORTAGE OF MEMORY SPACE  
(CD TABLES)

(When (individual) stations are being deleted, excessive memory may be required if a number of stations belonging to different blocks of ten is specified.)

F05: FOR CODE @@@@@@@@@@@@@@ THIS DIGIT ANALYSIS RESULT WAS ALREADY ADDED

F06: FOR CODE @@@@@@@@@@@@@@ ANOTHER DIGIT ANALYSIS RESULT WAS ALREADY ADDED

F07: CALL PROGRESS STATE @@ NOT PERMITTED FOR THIS DIGIT ANALYSIS RESULT

F08: NO SPECIAL CHARACTERS ARE POSSIBLE FOR THIS DIGIT ANALYSIS RESULT

F09: DPLN GROUP MAY NOT BE SPECIFIED FOR THIS DIGIT ANALYSIS RESULT

F10: SECOND CODES (CD2/2) ARE NOT PERMITTED  
- FOR A DIGIT ANALYSIS RESULT THAT DOES NOT BELONG TO A PAIR  
- IF CHECK=N

F11: ACTION NOT POSSIBLE - CODE @@@@@@ IS STILL ASSIGNED TO A STATION OR KNDEF ENTRY  
(Any additional information must first be deleted with the appropriate AMOs.)

F12: DELETION OF CODE @@@@@@ FOR DPLN @@@@ AND CPS @@ NOT POSSIBLE AS ATTENDANT  
GROUP STILL ASSIGNED

F13: DELETION OF CODE @@@@@@ FOR DPLN @@@@ AND CPS @@ NOT POSSIBLE AS ROUTE STILL  
ASSIGNED

F14: FOR CODE RANGES, BOTH LIMITS MUST HAVE THE SAME NUMBER OF DIGITS

F15: TARGET RANGE EXCEEDS THE DECIMAL CODE RANGE

(In the destination range, the number of digits in the calculated upper limit is not the same as for the specified lower limit. However, only ranges with an equal number of digits are permitted.)

F16: CHANGING OF CODE @@@@@@ NOT POSSIBLE AS USED BY ANOTHER DAR

F17: CHANGING OF CODE @@@@@@ NOT POSSIBLE AS SAME DAR ALREADY ASSIGNED

F18: FOR DPLN @@ THE DIGIT ANALYSIS RESULT @@@@@@@@ HAS NOT YET BEEN ADDED

(The correct DAR sequence has not been observed. The digit analysis result shown must be created first.)

## WABE - Digit Analysis

### Messages and Advisories

- F19: FOR DPLN @@ THE DIGIT ANALYSIS RESULT @@@@@@@@ HAS NOT YET BEEN DELETED  
(The correct DAR sequence has not been observed. The digit analysis result shown must be deleted first.)
- F20: DAR @@@@@@@@ HAS NOT YET BEEN ADDED INDEPENDENTLY OF DPLN, I.E. WITHOUT SPECIFICATION OF SPECIFIC DPLN  
(See explanation for F18:.)
- F21: DAR @@@@@@@@ HAS NOT YET BEEN DELETED INDEPENDENTLY OF DPLN, I.E. WITHOUT SPECIFICATION OF SPECIFIC DPLN  
(See explanation for F19:.)
- F22: SPECIAL CHARACTERS ARE PERMITTED ONLY IN SINGLE ENTRIES FOR CODE
- F23: ONLY SINGLE CODE ENTRIES ARE PERMITTED FOR A PAIRED DAR
- F24: SPECIAL CHARACTERS IN THE SPECIFIED CODES ARE NOT COMPATIBLE  
(The numbers concerned must belong to the same special character category:  
Cat DEC : digits 0...9 only  
Cat 12-key: as for DEC, also \*, #  
Cat 16-key: as for DEC and 12-key, also A,B,C,D
- F25: IF DIAL PULSE STATION CODE IS SPECIFIED, ONLY ONE CODE IS PERMITTED
- F26: WITH ENTRY OF A CODE RANGE, LOWER LIMIT MUST BE <= UPPER LIMIT
- F27: THIS DIGIT ANALYSIS RESULT IS NOT PERMITTED FOR DIAL PULSE DEVICES  
(Therefore, it makes no sense to specify .)
- F28: THE SPECIFICATION OF A DIAL PULSE STATION CODE IS NOT PERMITTED
- F29: ENTRY OF 2 WITHOUT ENTRY OF IS NOT PERMITTED
- F30: PARAMETERS @@@@@@ AND @@@@@@ HAVE THE SAME VALUES  
(Some combinations of numbers make it necessary to enter two values for certain parameters. In particular, this occurs if one number is contained in a higher number in the combination.)
- F31: ENTRY OF CPS2 WITHOUT ENTRY OF CD2 IS NOT PERMITTED
- F32: IF CD IS EXPANDED, NEITHER NOR CD2 MAY BE SPECIFIED  
(A digit analysis result is already assigned to this code. At this stage, the DAR can only be entered when expanding the CPS allocation. Therefore, a (new) or 2 is not permitted.)
- F33: EXPANSION OF PARAMETER @@@@@@@@ IS NOT PERMITTED  
(The digit analysis result is already assigned to this number with a different CPS allocation. In this case, the DAR must be assigned to a different number.)
- F34: AN ENTRY FOR CODE @@@@@@ IS NOT POSSIBLE BECAUSE A @@@@ DIGIT ANALYSIS RESULT ALREADY EXISTS HERE.  
PLEASE DISPLAY USING: DIS-WABE:GEN,@@@@@@&@@@@@@;  
(The assignment of central office and tie trunk digit analysis results or station and individual attendant console digit analysis results to the same number is not permitted.)
- F35: ENTRY FOR CODE @@@@@@ IS NOT POSSIBLE BECAUSE A CENTRAL OFFICE OR TIE TRUNK DIGIT ANALYSIS RESULT ALREADY EXISTS  
(The assignment of central office and tie trunk digit analysis results to numbers which are contained in higher numbers (e.g. 12 and 125) is not permitted.)

- F36: DELETION OF CODES @@@@@@@@@@@@@@ IS NOT POSSIBLE BECAUSE THERE IS EITHER NO SUCH ENTRY OR THE ENTRY DOES NOT CORRESPOND EXACTLY WITH THE DATA INPUT
- (The entries in the DPLN table do not match the data in the DELETE command. The parameter values entered in the DELETE command must match the entries in the table exactly, i.e. not only the CD, but also the CPS and DPLN allocations are checked. Use the DISPLAY function to view the table entries for the number (CD) concerned.)
- F37: SPECIFY CODE FOR DIAL PULSE DEVICES FOR PARTNER DIGIT ANALYSIS RESULT
- F38: CODES @@@@@@ - @@@@@@ NOT DELETED
- (This error message occurs only in conjunction with F11. If individual stations of a specified block of 10, 100 or 1000 cannot be deleted, the stations concerned are shown in F11. In order to prevent such stations from unnecessarily occupying memory space, the entire range is not deleted. If individual stations within a range are to be kept, they must be explicitly left out of the range to be deleted, i.e. several smaller ranges must be entered instead of one large one.)
- F39: SOURCE AND TARGET RANGES OVERLAP
- (If two ranges overlap, the second range must initially be specified outside the first range (in the ADD command), and then changed to the actual range desired by means of a CHANGE command.)
- F40: NO DIGIT ANALYSIS RESULTS COULD BE CHANGED
- F41: SPECIFY DESTNO > 0
- F42: STATIONS AND DIGIT ANALYSIS RESULT WITH ROUTING OR ATTENDANT GROUP ASSOCIATIONS CANNOT BE CHANGED
- (If no digit analysis result is explicitly specified in the change command, then this error message means that no station, route or attendant DARs were changed.)
- F43: NO CHAINED VALUES ARE PERMITTED FOR CODE
- F44: CODE VALUES 0 TO 9 ONLY FOR DAR FLASHCD
- F45: SPECIFIED DAR NOT PERMITTED FOR THIS COMMAND
- F46: ACTION IMPOSSIBLE DUE TO SHORTAGE OF CD TABLES
- F47: ACTION IN RULO NOT POSSIBLE FOR STNO @@@@@@ BECAUSE VALUE FOR DIMSU-PARAMETER @@@@@@ IS TOO SMALL
- F48: PARAMETERS DESTNO, CDNEW, ARN, CFREMVVAR AND CFREMSE ARE VALID ONLY ALTERNATIVELY  
EXCEPTION: CFREMVVAR AND CFREMSE CAN BE ENTERED TOGETHER
- F50 IF 01 TO 99 IS ENTERED FOR ARN CD IS VALID ONLY UP TO 4 DIGITS
- F51: ARN IS ALLOWED ONLY FOR DAR OWNNO
- F52: FOR CD @@@@@@ WITH DAR OWNNO AND ARN > 00  
CDNEW IS VALID ONLY UP TO 4 DIGITS
- F53: DNNO IS INVALID  
VALUE RANGE: <0-29> - <0-253> - <0-999>
- F54: ACTION NOT POSSIBLE FOR CODE @@@@@@ - RCG IS STILL ASSIGNED (AMO ACDSD)
- F55: FOR CODE STARTING WITH @@@@@@ A DIGIT ANALYSIS RESULT WAS ALREADY ADDED  
PLEASE DISPLAY USING: DIS-WABE:GEN,@@@@@@&@@@@@,0&15;
- F56: LOWER BOUND OF @@@@@@@@ FOR DAR=PARK MUST END IN 0
- F57: NOT ENOUGH CONSECUTIVE ACCESS CODES AVAILABLE  
FOR DAR=PARK @@@@@@ - @@@@@@

## WABE - Digit Analysis

### Messages and Advisories

F58: ACCESS CODE FOR DAR PARK CANNOT BE CHANGED  
-> DELETE AND ADD WITH NEW ACCESS CODE

F59: CODE <xxxxxx> IS STILL ASSIGNED AS A COMBI CODE (AMO RUFUM)

F60: DELETION OF CODE <xxxxxx> FOR DPLN <xxxx> AND CPS <xx> NOT POSSIBLE AS GATEWAY NUMBER STILL ASSIGNED

F61: CHINA\_7\_DIG\_NUMBERING IS NOT ACTIVE AND NUNP IS ACTIVE , ARN CAN NOT BE USED

F62: CODE <RNR> IS NOT A STN OR A COMBINATION OF OWNNOE AND STN FOR VNR

F63: PARAMETER DESTNO CAN NOT BE SET, AS NO DEFAULT NODE IS ASSIGNED (AMO KNDDEF).

F64: DELETION OF CODES <xxxxxx>-<xxxxxx> IS NOT POSSIBLE AS ROUTE STILL ASSIGNED.  
IF YOU ARE SURE TO DELETE WABE ENTRIES , FIRSTLY YOU SHOULD DELETE THESE ROUTES BY USING FOLLOWING COMMANDS :  
CHA-WABE:<xxxxxxxxxxxx>&<xxxxxxxxxxxx>,0;

F65: DELETION OF CODE <xxxxxx> IS NOT POSSIBLE AS ROUTE STILL ASSIGNED.  
IF YOU ARE SURE TO DELETE WABE ENTRY , FIRSTLY YOU SHOULD DELETE THESE ROUTES BY USING FOLLOWING COMMANDS :  
CHA-WABE:<xxxxxxxxxxxx>,0;

F66: IT IS NOT POSSIBLE TO ADD <xxxxxx> AS DPLN INDEPENDANT. PLEASE ADD THIS NUMBER AS DPLN DEPENDANT (E.G. DPLN = 0&15).

F67: OWNNOE CAN BE ADDED/DELETED ONLY DPLN INDEPENDENT, SINCE IT IS A VNR SYSTEM.

F68: OWNNOE IS POSSIBLE FOR ALL DPLN (0&15) TOGETHER. IT CAN NOT BE DELETED FOR SUBSETS OF DPLN (0&15).

F69: DELETION OF CODE <xxxxxx> IS NOT POSSIBLE WHEN IT IS ASSIGNED TO UFIP DEVICES.  
ONLY CHANGE IS ALLOWED.

F70: DELETION OF CODE <xxxxxx> IS NOT POSSIBLE AS ROUTE STILL ASSIGNED. PLEASE CHECK AMO KNDDEF CONFIGURATION.

F71: CD LENGTH IS LIMITED TO 5 DIGITS FOR DAR=BABYLSNG.

## 215.4.2 Advisory Messages

H01: THERE ARE NO DPLN INDEPENDENT ENTRIES IN THIS RANGE  
or  
H01: THERE ARE NO ENTRIES FOR DPLN @@ IN THIS RANGE

H02: DESTNO MAY NOT BE SPECIFIED FOR THIS DAR

H03: NO STN ENTERED FOR RANGE OF DESTNO

H04: STATION WITH STNO @@@@ WILL BE EXPANDED, DESTNO WILL BE IGNORED

H05: CHECK WHETHER THE CD FOR SPDC\_X MUST BE UPDATED USING AMO LWPAR TYPE=NWWTK /  
PARAM DGTPRC OR DGTPR

H06: NO STN ENTERED FOR RANGE OF DNNO

H07: OPTISET RELEVANT DAR MUST ALWAYS HAVE FULL CPS SET.  
- PARAMETER CPS WILL BE IGNORED.  
- ACTION CONTINUES WITH FULL CPS SET.

H08: FOR ARN @@ THE OFFICE CODE @@@@ HAS BEEN ASSIGNED

H09: FOR ARN @@ THE OFFICE CODE @@@@ HAS BEEN REPLACED BY @@@@

H10: FOR ARN @@ THE OFFICE CODE @@@@ HAS BEEN REMOVED

H11: PARAMETER CFREMPVAR AND CFREMPSE ARE ALLOWED ONLY FOR  
DAR=FWDREM/AFWDREM/DFWDREM

H12: @@@@@@-@@@@@ HAVE BEEN ADDED FOR DAR PARK

H13: @@@@@@-@@@@@ HAVE BEEN DELETED FOR DAR PARK

H14:

H15: H15: PARAMETER DESTNO IS IGNORED, IF DAR=STN IS ADDED TO A VNR SYSTEM.  
NODECD + STNO HAVE TO BE LINKED TO A DESTNO WITH CHANGE-WABE.

H16: PARAMETER DPLN IS IGNORED SINCE IT IS A NON-VNR SYSTEM.

H17: PARAMETER ARN IS IGNORED AS ARN IS ONLY MEANINGFUL IF SEVEN DIGIT  
NUMBERING IS ACTIVE. (SEE PARAMETER SEVDIG IN DISP-ZAND:ALLDATA;)

H18: THE CODE ASSIGNED TO UFIP DEVICES CHANGED. NEW CODE @@@@@@ IS NOW  
ASSIGNED TO UFIP DEVICES. PLEASE RESTART ALL UFIP GATEWAYS AND CONFIGURE THE  
UFIP DEVICES WITH THE NEW CODE.

H19: CODE @@@@@@ IS NOW ASSIGNED TO UFIP DEVICES. PLEASE RESTART ALL UFIP  
GATEWAYS AND CONFIGURE THE UFIP DEVICES WITH THE NEW CODE.

H20: CODES WITH DAR=STN WERE NOT DELETED.  
DAR=STN CAN BE DELETED ONLY WITH FOLLOWING COMMAND:  
DEL-WABE:TYPE=CD,CD=..., DPLN=...,DAR=STN;

## **ZANDE - System data - extended**

Activation of optional features

## 219 ZAUSL - User Activity Metering

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

Amongst other things, a PABX system offers a number of supplementary station features. User activity metering registers the active usage of each of these features.

This AMO evaluates the supplementary feature counters; no distinction is made between the communication services (voice, Fax, TTX, etc.) or traffic type. In addition, general traffic carried data is recorded and collated according to types of seizure.

After the counter states have been output, the text 'COUNTERS HAVE (NOT) BEEN CLEARED' is displayed.

The AMO permits the counter states for supplementary station features and general traffic carried data to be output simultaneously, as well as offering the option of resetting the counters after output.

If any counter state equals or exceeds 16777215, the counter state is replaced by the text 'OVERFLOW'.

A metering run is automatically initialized and started when the system is started or restarted.

In the case of duplex systems, the counter lists for each of the two processors (standby or active processor or processor A or B) must be evaluated separately if the metering is still in progress after a routine changeover. This is because the counter values are not saved on hard disk.

**The following is a complete list of the supplementary station features and the respective actions metered:**

- N0009: Individual speed dialing – used
- N0010: Destination keys – used
- N0011: Repertory keys – used
- N0012: DSS (Direct Station Selection) keys – used
- N0013: Call forwarding – activated
- N0014: Call waiting/override – executed
- N0015: Class of service changeover – executed
- N0016: Do-not-disturb – activated
- N0017: Add-on conference – established
- N0018: Saved number redial – used

- N0019: Callback/trunk queuing – activated
- N0020: Mixed-mode communication – executed

### **The following general traffic carried data is recorded:**

- N0001: Num. of internal seizures

This counter logs the number of times internal system users lift the handset of their telephones either to make internal/external calls or to activate features. Feature activation or interrogation via the Memory key is also included. All user telephones including attendant consoles are scanned regardless of whether the seizure was made offhook, handsfree, or via a feature key.

- N0002: Num. of call processing events

This counter registers every software event in the central processor related to the processing (setup, release, transfer etc.) of calls in the system. An internal call between 2 analog telephones requires typically 9 events to be processed, a call between digital telephones typically 12 events; an external call from a digital telephone 18 events. The very large number of events processed for example in a large system in the course of a day can lead to overflow of this counter, (currently = 24 bit register) which will result in seemingly implausible values (eg. Dunton values attached).

- N0003: Num. of call processing buffers allocated

Call processing buffers are pooled memory elements which are dynamically allocated each time call setup is attempted. This count gives an approximate BHCA value assuming ZAUSL has been run for an hour only.

- N0004: Num. of external seizures incoming

This counter records the total number of calls signalled to the system node from an external source i.e. exchange calls, tie calls, transit seizures. A combination of this and "number of internal seizures" gives an accurate BHCA value for the system concerned.

- N0005: Num. of external seizures outgoing

This counter records the total number of calls leaving the system to an external destination (exchange, other node etc.).

- N0006: Num. of calls answ. at ATND queue A / S1 til S12 (ANSDEV=COIC)

This counter registers all calls appearing on the trunk answer key i.e. "T" category on the attendant screen.

- N0007: Num. of calls answered at ATND queue M (ANSDEV=O)

This counter registers all calls appearing on the operator key i.e. "O" category on the attendant screen.

- N0008: Num. of seizures with trunk group key (ANSDEV=OUTG)  
These are outgoing seizures dialled via the trunk group keys marked.
- N0021: NCT invocation: Attempts that are successful  
This counter logs the number of successful NCT (network call transfer) invocation attempts.
- N0022: NCT invocation: Attempts that fail  
This counter logs the number of failed NCT invocation attempts.
- N0023: Num. of Rerouting Events  
This counter logs the number of attempts to search for a possible route in case of network congestion.
- N0024: Num. of Transit Calls  
This counter logs the number of (successful and unsuccessful) transit call attempts.
- N0025: Num. of Completed Calls  
This counter logs the number of attempts to save two party connections.
- N0026: Num. of ACL Output (Monitoring) Messages  
This counter logs the number of messages that CP sends to ACL.
- N0027: Num. of ACL Input (Commands) Messages  
This counter logs the number of messages that ACL sends to CP.
- N0028: Num. of (1.5) Seconds in Dynamic Overload  
This counter logs the total number of (1.5) Second intervals that the system is in Dynamic Overload condition.
- N0029: Num. of Transitions to Dynamic Overload  
This counter logs the number of times the system goes from non Dynamic Overload into a Dynamic Overload condition.
- N0030: Num. of calls rejected due to Dynamic Overload  
This counter registers every call attempt which is rejected because the system is in Dynamic Overload.
- N0031: Num. of all AM adapt Events  
This counter logs the number of all events, which are released at AM adapt.

- N0032: Neg. ack. events of AM adapt due to timeout.  
This counter logs the number of negativ acknowledge events of AM adapt, which are re-leased by timeout.
- N0033: Neg. ack. evts. of AM adapt due to num. of evt.  
This counter logs the number of negativ acknowledge events of AM adapt, which are re-leased by max. number of events.
- N0034: Segments transferred by AM update  
This counter logs the number of transferred segments by AM update.
- N0035: 1.5 sec spot check count. for incons. partner DB  
This counter logs every 1.5 sec spot checks for an inconsistent partner database.
- N0036: 1.5 sec spot check count. for cons. partner DB  
This counter logs every 1.5 sec spot checks for a consistent partner database.
- N0037: Update cycles started by AM update  
This counter logs every updates, started by AM update cycles.
- N0038: Num. of messages from HSR to HHS  
This counter logs the number of messages, sending from HSR to HHS.
- N0039: Num. of messages from a AP to HSR  
This counter logs the number of messages, sending from any LS shelf (activation point AP) to HSR.
- N0040: Num. of blockades while sending from HSR to HHS  
This counter logs the number of blockades, while sending from HSR to HHS.
- N0041: Num. of messages from HHS to HSR  
This counter logs the number of messages, sending from HHS to HSR.
- N0042: Num. of messages from HSR to AP  
This counter logs the number of messages, sending from HSR to any LS shelf (activation point AP).
- N0043: Num. of blockades while sending from HSR to AP  
This counter logs the number of blockades, while sending from HSR to a LS shelf (activation point AP).

- N0044: Num. of network conn. attempts in HHS  
This counter logs the number of B channel connection attempts (incoming or outgoing) between HHS and IP network.
- N0045: Num. of network conn. blocked in HHS (no B chl)  
This counter logs the number of B channel connection blocked (incoming or outgoing) between HHS and IP network, because no more B channel or no DSP license is available.
- N0046: Num. of network conn. attempts in any AP  
This counter logs the number of B channel connection attempts (incoming or outgoing) between any LS shelf (activation point AP) and IP network via NCUI.
- N0047: Num. of netw. conn. blocked in any AP (no B chl)  
This counter logs the number of B channel connection blocked (incoming or outgoing) between any LS shelf (activation point AP) and IP network via NCUI, because no more B channel or no DSP license is available.
- N0048: Num. of seiz. attempts of code sender in HHS  
This counter logs the number of seizure attempts of a code sender in HHS.
- N0049: Num. of seiz. rejected of code sender in HHS  
This counter logs the number of blocking with the seizure of a code sender in HHS, since no more code sender was available.
- N0050: Num. of seiz. attempts of code sender in any AP  
This counter logs the number of seizure attempts of a code sender in any LS shelf (activation point AP).
- N0051: Num. of seiz. rejected of code sender in any AP  
This counter logs the number of blockings with the seizure of a code sender in any LS shelf (activation point AP), since no more code sender was available.
- N0052: Num. of seiz. attempts of code receiver in HHS  
This counter logs the number of seizure attempts of a code receiver in the HHS.
- N0053: Num. of seiz. rejected of code receiver in HHS  
This counter logs the number of blockings with the seizure of a code receiver in the HHS, since no more code receiver was available.
- N0054: Num. of seiz. attempts of code receiv. in any AP

This counter logs the number of seizure attempts of a code receiver in any LS shelf (activation point AP).

- N0055: Num. of seiz. rejected of code receiv. in any AP

This counter logs the number of blockings with the seizure of a code receiver in any LS shelf (activation point AP), since no more code receiver was available.

**Shelf Blockage Counters**

The following fields are output for every LTU/SLOT, where at least one timeslot seizure attempt fails:

- **LTU: Line trunk unit**  
The LTU number at which timeslot seizure attempts failed.
- **SLOT: Specification of the mounting pitch in the LTU**  
The SLOT number at which timeslot seizure attempts failed.
- **# Timeslot Seizures:**  
The total number of attempts to make a connection to this LTU/SLOT.
- **# Failed Attempts:**  
The number of attempts to make a connection to this LTU/SLOT which failed due to shelf timeslot blockage.

**Message Blockage Counters between AP and HSR**

The following fields are output for every LTU, where at least one message blockage between any IPDA shelf (LS) (activation point AP) and the HiPath signalling router (HSR) occurred:

- **LTU: Line trunk unit**  
The LTU number during a message blockage occurred.
- **# Mess. to HSR:**  
The total number of messages of this LTU from any LS shelf (activation point AP) to HSR.
- **# Mess. from HSR:**  
The total number of messages of this LTU from HSR to any LS shelf (activation point AP).
- **# Blockades:**  
The number of message blockages of this LTU between any LS shelf (activation point AP) and the HSR.

**B Channel Blockage Counters between AP and IP Network via NCUI**

The following fields are output for every LTU, where at least one B channel connection blockage (incoming or outgoing) between any IPDA shelf (LS) (activation point AP) and IP network via NCUI occurred:

- **LTU: Line trunk unit**  
The LTU number during a B channel connection blockage occurred.

- # Seizure Attempts:

The total number of B channel connection attempts of this LTU between any LS shelf (activation point AP) and IP network via NCUI.

- # Blocked B Channel:

The number of B channel connection blockages of this LTU between any LS shelf (activation point AP) and IP network via NCUI, because no more B channel or no DSP license is available.

#### **Seizure Rejected Counters of a Code Sender**

The following fields are output for every LTU, where at least one blockage with the seizure of a code sender in the IPDA shelf (LS) (activation point AP) occurred:

- LTU: Line trunk unit

The LTU number during a seizure blockage of a code sender occurred.

- # Seizure Attempts:

The total number of seizure attempts of a code sender of this LTU.

- # Seizure Rejected:

The number of rejected seizure attempts (seizure blockage) of a code sender of this LTU, since no more code sender was available.

#### **Seizure Rejected Counters of a Code Receiver**

The following fields are output for every LTU, where at least one blockage with the seizure of a code receiver in the IPDA shelf (LS) (activation point AP) occurred:

- LTU: Line trunk unit

The LTU number during a seizure blockage of a code receiver occurred.

- # Seizure Attempts:

The total number of seizure attempts of a code receiver of this LTU.

- # Seizure Rejected:

The number of rejected seizure attempts (seizure blockage) of a code receiver of this LTU, since no more code receiver was available.

## 219.1 Restrictions

Valid from HiPath 4000 V1.0 .

219.2 Interrelationships

None

219.3 Functions of the AMO

- [DISPLAY-ZAUSL](#) : Interrogate the counters for supplementary station features (and reset counters)

219.3.1 DISPLAY-ZAUSL

The function DISPLAY-ZAUSL accesses the counters in the database and outputs the counter states in tabular form for print-out. Depending on how 'DEL' is declared, the text 'COUNTERS HAVE (NOT) BEEN CLEARED is also output.

The operator can interrogate the counters of the active processor (PROCID='BP', default value), the standby processor ('BPS'), processor A ('BPA') or processor 'B' ('BPB').

All counter states of the specified processor are output and can be optionally reset.

If DEL=Y is specified, the counters in the database of the processor are interrogated and subsequently reset. At the same time, the reset date and time are stored.

Procedure Overview

| Command Code  | Parameter                        |
|---------------|----------------------------------|
| DISPLAY-ZAUSL | [PROCID=<param>], [DEL=<param>]; |

Example

Interrogation of the Counters

Input:

DISPLAY-ZAUSL:DEL=Y;

Output:

DIS-ZAUSL:BP;  
H500: AMO ZAUSL STARTED

## 220 ZIEL - Destination Addresses for Stations

|                                                           |                                       |                                               |
|-----------------------------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Key layout of the digital voice terminals</a> | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a>                        | <a href="#">Parameter Description</a> |                                               |

This AMO is used to enter, interrogate or regenerate destinations in the database (DB) for the following features:

- [Call forwarding - fixed](#) (FWD)
- [Messenger Call](#) (MSGR)
- [Direct station select keys](#) (DSS)
- [Name/repertory key](#) (NAME)
- [Individual speed dialing](#) (SPDI)
- [Saved Number Redial](#) (SNR)
- [Attendant Console Direct Destination Select keys](#) (DDS)
- [Destinations for the BUZZ Feature](#)

ZIEL is extended to allow administration of which type of Electronic Key Label shall be used and which individual text shall be used for the Electronic Key.

AMO-ZIEL is also used to add, delete, interrogate or regenerate for:

- dialing external servers to deposit messages
- identifying external servers when retrieving messages with the START key

### Call forwarding - fixed

Two forwarding variants are possible:

- STATION forwarding  
can be added or deleted by AMO ZIEL or by the subscriber, and activated or deactivated by the subscriber or by AMO ACTDA.
- SYSTEM forwarding is a new forwarding type  
Adding and deleting destinations is only possible by AMO ZIEL, whereby different destinations can be entered for different forwarding types (eg.busy, no response), immaterial, if the incoming call is internal or external. The forwarding can be activated or deactivated by AMO ACTDA, or by the subscriber using the relevant codes .

## ZIEL - Destination Addresses for Stations

- Call forwarding on no response  
The fixed call forwarding destinations do not act as destinations for call forwarding on no response any more. These can be added as fixed destinations for forwarding type CFNR (no response) or CFB (busy) in the SYSTEM forwarding (AMO ZIEL), and activated by AMOACTDA, or can be added and activated as variable forwarding (CFNR or CFB) (AMO ACTDA).

Fixed destinations can be created for each service. This AMO however does not activate or deactivate forwarding. Destinations can be entered in the services VCE (voice), FAX and DTE. Destinations for devices working to the DSS1 protocol can only be activated as variable forwarding destinations by AMO ACTDA.

Destinations can be entered for all created STNOs (station numbers) with the exception of attendant terminals, irrespective of whether or not the station concerned has any terminal devices.

The following diversion types can be used:

for SYSTEM forwarding

- CFU (Call Forward Unconditional)
- CFB (Call Forward Busy)
- CFNR (Call Forward No Reply)
- CFDND (Call Forward Do Not Disturb)

for STATION forwarding

- CFU (Call Forward Unconditional)

At the system forwarding it is distinguished, whether it is operative for internal or external calls.

Destinations can be entered for all added phone numbers except attendant consoles, immaterial, if a device is installed or not.

The following destinations are allowed:

- Existing station numbers and hunting group masters for each service
- Personal attendant call numbers
- General attendant call numbers
- Specific hunting groups
- PSs (paging systems, also 'code calling' systems)
- Voice mailboxes
- Announcements via TMOM (adapter set for special equipment)

- External destinations
- ACD (automatic call distribution) DNIS (dialed number identification service) routing number
- special codes for CP
  - C13: NON VOICE KEY
  - C14: DUE KEY
  - C15: START KEY
  - C18: HOLD KEY
  - C24: CONSULTATION KEY

Destinations are not checked any more, except for few cases. To external destinations a name can be assigned.

More informations about call forwarding can be found in the service handbook .

### **Messenger Call**

The members of an integrated executive/secretary system can have a messenger call key on their voice terminal for which a fixed destination can be entered. This destination can also be programmed at the administration and maintenance terminal. Only analog stations are permitted.

### **Direct station select keys**

Direct station select (DSS) keys can be assigned to all terminals. The key functions for OPTISET and Optipoint 500 are defined with the help of the AMO TAPRO.

Only internal destinations are possible (analog telephone, digital voice terminal, and personal attendant call number).

In addition to entering the destination in the database, the AMO ZIEL also enters partner information for the destination station (controls the lamps in the DSS key).

The DSS functionality is kept if the number of source or DSS destination is changed with SBCSU or SDAT (parameter NEWNO).

Example: Station X is configured as DSS destination for station A

- If station A's number is changed, then the ZIEL/DSS entry is updated with new number of A and X stays as DSS destination.
- Is station X's number is changed, then the ZIEL/DSS entry is updated for station A with new number of X as DSS destination.

### **Name/repertory key**

The key functions for the OPTISET and Optipoint 500 are defined with the help of the AMO TAPRO. Destinations can only be entered after the key functions have been defined. The destination entry may be any combination of digits comprising a maximum of 22 characters. Destination entries may be protected against changing and deleting by the destination terminal user, using parameter PROTECT=YES. Changing or deleting by AMO will be possible furthermore. Name/repertory keys of OPTISET / Optipoint 500 add on terminals have two (Spirit IP add on terminals: four) levels to store destination entries. A level can be selected by entering a value for parameter LEVEL.

### **Individual speed dialing**

Stations that are permitted to use the SPDI are provided an SPDI list when created by means of AMO SBCSU. Stations with an analog telephone, a voice terminal, mobile users (without a device, but with a separate terminal connection), and DTE stations may use the SPDI. Voice terminals can also use name/repertory keys and DSS keys.

### **Saved Number Redial**

Each analog telephone and voice terminal can store a dialed number with up to 22 digits for redial. The destination can be any combination of digits (0-9,\*,#,A,B,C,D).

### **Attendant Console Direct Destination Select keys**

Each attendant console has 42 destination (DDS) keys

- 40 destinations via the destination keys
- 2 destinations via R1, R2 keys (trunk group keys for reserving lines).

The destinations are entered into a storage area that can hold up to 42. The configuration is carried out when the attendant console is created by means of AMO ACSU.

The destination keys write memory locations 1-40, while the trunk group keys R1 and R2 are always defined at locations 41 and 42.

### **Destinations for the BUZZ Feature**

The buzz feature allows a user to alert (buzz) a predefined keyset or DFT (Optiset and Optipoint 500) by pressing the BUZZ key or by keying an access code. Voice communication is not possible. Buzz causes the target keyset or DFT to be alerted and the originator's station number to be displayed for two seconds. The buzz target (destination) and the originator must be located in the same node.

### Entries for dialing external servers

Any INFO 2000 server can be connected via a Common Voice Mail Interface (EVM). To this end, the type of seizure of the server, a master hunting group number for dialing the server, and if necessary, a call code for identifying the call code for PREDIA=Y (AMO SCSU) must be assigned to one another.

The following types of seizure are implemented:

|         |                                                                                                             |
|---------|-------------------------------------------------------------------------------------------------------------|
| FWD     | Call Forwarding                                                                                             |
| FWDNANS | Seizure after no answer forward                                                                             |
| DSZINT  | Direct Seizure internal                                                                                     |
| DSZCO   | Direct Seizure CO Call                                                                                      |
| EXPR    | Expressbox Seizure - achieved through suffix dialing                                                        |
| ATND    | Seizure for EVM Attendant - allows simplified recording of messages without specifying ID or mailbox number |

The following types of seizure can be grouped together:

- FWD/FWDNANS
- DSZINT/DSZCO/EXPR/ATND

If the type of seizure is entered in concatenated form, the AMO does not check for the validity of the entry.

The station number assigned to the type of seizure must be the station number of a master hunting group. The AMO simply checks as to whether the station number leads to the digit analysis result STN.

If the interfaces with the server have been parameterized as PREDIA=Y using AMO SCSU, each type of seizure must be assigned a call code; for PREDIA=N, the call code should not be specified. The AMO does not check this interrelationship. The call code must match the server.

### Entries for message retrieval using the START key

When the START key is pressed to retrieve voice or FAX messages from an external server, the server must first be identified. For the VOICE service, the code VMWON is entered in the database ; for the FAX service, the codes FAX and VMOWN are entered.

If the server is located in a remote node, the code NETW or TIE is entered for the VOICE service and the codes FAX and NETW or FAX and TIE are entered for the FAX service in the database of the local node.

## **ZIEL - Destination Addresses for Stations**

Key layout of the digital voice terminals

### **220.1 Key layout of the digital voice terminals**

For standard key layout numbers for programmable function keys, see AMO TAPRO.

### **220.2 Interrelationships**

- AMO SBCSU : Configure station for S0-Bus
- AMO SCSU : Configure station
- AMO SSCSU : Configure special subscribers
- AMO ACSU : Configure attendant console
- AMO SSC : Configure special station (messenger station etc.)
- AMO TAPRO : Key mapping (arrangement), DIGITE (standard)
- AMO DIMSU : Feature set (no. stations with indiv. speed dial)
- AMO DNIT : Set up ACD DNIS routing numbers

### **220.3 Functions of the AMO**

- [ADD-ZIEL](#) : Create destinations
- [DELETE-ZIEL](#) : Cancel destinations
- [DISPLAY-ZIEL](#) : Interrogate destinations
- [REGENERATE-ZIEL](#) : Regenerate destinations

#### **220.3.1 ADD-ZIEL**

Creation of destinations for

1. call forwarding - fixed
2. messenger call
3. DSS keys
4. name/repertory keys
5. individual speed dialer
6. saved no. redial
7. DDS keys for attendant console

## 8. BUZZ feature

Enter data for

1. dialing external servers to deposit messages
2. identifying external servers when retrieving messages with the START key

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                               |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|              | TYPE=SPDI, SRCNO=<number>, SPDNO=<number> (5)<br>, DESTNOR=<key-num>;                                                                                                                                                   |
|              | TYPE=SNR, SRCNO=<number>, DESTNOR=<keynum>; (6)                                                                                                                                                                         |
|              | TYPE=DDS, SRCNO=<number>, ATNDKYNO=<number> (7)<br>, DESTNOR=<key-num>;                                                                                                                                                 |
|              | TYPE=BUZZ, SRCNO=<number>, DESTNOBZ=<number>; (8)                                                                                                                                                                       |
|              | TYPE=EVMTAB, SZTYPE=<param>, EVMCD=<number>; (9)<br>, [SZCD=<number>;                                                                                                                                                   |
|              | TYPE=EVMACC, SI1=<param>, MRCD=<keynum>; (10)                                                                                                                                                                           |

## Functions of the AMO

A fixed call forwarding destination for diversion type CFNR to STNO 3101 for the VOICE service can be created for voice station 2100.

```
ADD-
ZIEL:TYPE=FWD, SRCNO=2100, SI=VCE, DESTNOF=3101, DTYPE=CFNR, ITYPE=GE
N.CFVAR=SYSTEM;
```

A CFW destination number, which was added with a LCR Digit Pattern with "Z" (AMO LDPLN), must be completed by a "#".

Cancel destinations for:

1. call forwarding - fixed
2. messenger call
3. DSS keys
4. name/repertory keys
5. individual speed dialer
6. saved no. redial
7. DDS keys
8. BUZZ feature

Delete data for

1. dialing external servers to deposit messages
2. identifying external servers when retrieving messages with the START key

## Procedure Overview

| Command Code | Parameter                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------|
| DELETE-ZIEL  | TYPE=FWD, SRCNO=<number>, [SI=<param>]<br>, [DTYPE=<param>], [ITYPE=<param>], [CFVAR=<param>]; (1) |
|              | TYPE=MSGR, SRCNO=<number>; (2)                                                                     |
|              | TYPE=DSS, SRCNO=<number>, [KYNO=<number>], (3)                                                     |

| Command Code | Parameter                                                                           |
|--------------|-------------------------------------------------------------------------------------|
|              | , [DEV=<param>];                                                                    |
|              | TYPE=NAME, SRCNO=<number>, [KYNO=<number>],<br>[DEV=<param>], [LEVEL=<number>]; (4) |
|              | TYPE=SPDI, SRCNO=<number>, [SPDNO=<number>]; (5)                                    |
|              | TYPE=SNR, SRCNO=<number>; (6)                                                       |
|              | TYPE=DDS, SRCNO=<number>, [ATNDKYNO=<number>]; (7)                                  |
|              | TYPE=BUZZ, SRCNO=<number>;<br>(8)                                                   |
|              | TYPE=EVMTAB, [SZTYPE=<param>]; (9)                                                  |
|              | TYP=EVMACC, [SI1=<param>]; (10)                                                     |

**Note**

If one or more of the parameters CFVAR, DTYPE, ITYPE or SI is entered, the AMO deletes forwarding destinations to the entered values, otherwise destinations to all possible values of the not entered parameters are deleted.

### 220.3.3 DISPLAY-ZIEL

Interrogate destinations for

1. call forwarding - fixed
2. messenger call
3. DSS keys
4. name/repertory keys
5. individual speed dialing
6. saved no. redial
7. DDS keys
8. BUZZ feature
9. all specified features

Interrogate data for

ZIEL - Destination Addresses for Stations

Functions of the AMO

- 1. dialing external servers to deposit messages
- 2. identifying external servers when retrieving messages with the START key

Procedure Overview

| Command Code | Parameter                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------|
| DISPLAY-ZIEL | TYPE=FWD, [SRCNO=<number>], [DESTNOF=<number>] (1)<br>, [DTYPE=<param>], [ITYPE=<param>], [CFVAR=<param>]; |
|              | TYPE=MSGR, [SRCNO=<number>], [DESTNOM=<number>]; (2)                                                       |
|              | TYPE=DSS, [SRCNO=<number>], [DESTNOD=<number>]; (3)                                                        |
|              | TYPE=NAME, [SRCNO=<number>], [DESTNON=<string>]; (4)                                                       |
|              | TYPE=SPDI, [SRCNO=<number>], [DESTNOR=<keynum>]; (5)                                                       |
|              | TYPE=SNR, [SRCNO=<number>], [DESTNOR=<keynum>]; (6)                                                        |
|              | TYPE=DDS, [SRCNO=<number>], [DESTNOR=<keynum>]; (7)                                                        |
|              | TYPE=BUZZ, [SRCNO=<number>], [DESTNOBZ=<keynum>]; (8)                                                      |
|              | TYPE=ALL; (9)                                                                                              |
|              | TYPE=EVMTAB; (10)                                                                                          |
|              | TYP=EVMACC; (11)                                                                                           |

Example

Interrogate the call forwarding destination for station 2100.

Input:

DISPLAY-ZIEL:TYPE=FWD,SRCNO=2100;

Output:

|                                     |         |       |       |        |             |
|-------------------------------------|---------|-------|-------|--------|-------------|
| FWD                                 |         |       |       |        |             |
| SOURCE                              | SERVICE | DTYPE | ITYPE | CFVAR  | DESTINATION |
| -----+-----+-----+-----+-----+----- |         |       |       |        |             |
| 2100                                | VCE     | CFU   | INT   | SYSTEM | 3140        |

Display EVM-Server

Input:

DISPLAY-ZIEL:TYPE=EVMTAB;

Output:

| EVMTAB  |       |       |
|---------|-------|-------|
| SZTYPE  | EVMCD | SZCD  |
| ----    | +     | ----- |
| FWD     |       |       |
| FWDNANS |       |       |
| DSZINT  |       |       |
| DSZCO   |       |       |
| EXPR    |       |       |
| ATND    |       |       |

Display EVMACC

Input:

DISPLAY=ZIEL:TYPE=EVMACC;

Output:

| SERVER |       |
|--------|-------|
| EVMACC | MRCD  |
| -----  | ----- |
| VCE    |       |
| FAX    |       |

## 220.3.4 REGENERATE-ZIEL

Regenerate destinations for:

1. call forwarding - fixed
2. messenger call
3. DSS keys
4. name/repertory keys
5. individual speed dialing
6. saved no. redial
7. DDS keys
8. all specified features
9. BUZZ feature

Regenerate data for

## ZIEL - Destination Addresses for Stations

### Functions of the AMO

1. dialing external servers to deposit messages
2. identifying external servers when retrieving messages with the START key

### Procedure Overview

| Command Code    | Parameter                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------|
| REGENERATE-ZIEL | TYPE=FWD, [SRCNO=<number>], [DESTNOF=<number>]; (1)<br>[, [DTYPE=<param>], [ITYPE=<param>], [CFVAR=<param>]; |
|                 | TYPE=MSGR, [SRCNO=<number>], [DESTNOM=<number>]; (2)                                                         |
|                 | TYPE=DSS, [SRCNO=<number>], [DESTNOD=<number>]; (3)                                                          |

|                 | TYPE=SNR, [SRCNO=<number>], [DESTNOR=<keynum>]; (6)                                                          |
|                 | TYPE=DDS, [SRCNO=<number>], [DESTNOR=<keynum>]; (7)                                                          |
|                 | TYPE=BUZZ, [SRCNO=<number>], [DESTNOBZ=<number>]; (8)                                                        |
|                 | TYPE=ALL; (9)                                                                                                |
|                 | TYPE=EVMTAB;<br>(10)                                                                                         |
|                 | TYP=EVMACC; (11)                                                                                             |

### Example

Regenerate the call forwarding destination for station 2100.

Input:

```
REGENERATE-ZIEL:TYPE=FWD,SRCNO=2100;
```

Output:

```
ADD-ZIEL :FWD,2100,VCE,2100,VCE,3101,,CFNR,GEN,SYSTEM;
```

## 220.5 Error Messages and Advisories

### 220.5.1 Error Messages

F00: FUNCTION NOT IMPLEMENTED  
 F01: SOURCE STATION <srcno> IS UNASSIGNED OR AS AN ACD NUMBER (AMO DNIT) CONFIGURED.  
 F02: SOURCE STATION <srcno> IS AN ATND  
 F03: SOURCE STATION <srcno> IS NOT AN ATND  
 F04: SOURCE STATION <srcno> IS NOT A DIGITE WITH PROGRAMMABLE KEYS  
 F05: SOURCE STATION <srcno> IS NOT AN ANATE / DIGITE  
 F06: SOURCE STATION <srcno> IS NOT A MEMBER OF AN EXEC./SECRETARY SYSTEM  
 F07: SOURCE STATION <srcno> HAS NO SPEED CALLING DIRECTORY  
 F08: DESTINATION NO. IS UNASSIGNED  
 F09: DESTINATION NO. IS NOT A MESSENGER  
 F10: FOR SOURCE STATION <srcno>, THE MAX. VALUE FOR SPDNO IS <num>.  
 F11: DESTINATION NO. MAY ONLY CONTAIN THE CHARACTERS 0-9,\*,#, AND THE CODES C13, C14, C15, C18, OR C24  
 F12: DESTINATION NO. IS NOT ALLOWED AS FORWARDING DESTINATION.  
 F13: DSS LIMIT EXCEEDED, INCREASE PARAMETER DSS IN AMO DIMSU  
 F14: KEY <kyno> IS AT <dev> NOT PREASSIGNED FOR DIRECT STATION SELECTION  
 F15: KEY <kyno> IS AT <dev> NOT PREASSIGNED AS A REPERTORY KEY  
 F16: SOURCE STATION <srcno> IS NOT AN OPTISET/OPTIP500  
 F19: ADD-ON TERMINAL @@@ HAS NOT BEEN ADDED. LEVEL 3 AND 4 CAN NOT BE ENTERED.  
 F20: KEY <kyno> IS INVALID  
 F21: ADD-ON TERMINAL <terminal> HAS NOT BEEN ADDED.  
 F22: NO FREE MEMORY FOR DESTINATION ENTRY  
 INCREASE PARAMETER CFWDEST IN AMO DIMSU  
 F23: NO FREE MEMORY FOR ENTRY IN LEVEL 3 OR 4.  
 INCREASE PARAMETER DSSNA IN AMO DIMSU.  
 F24: NO FREE MEMORY FOR SLK-TEXT ENTRY.  
 INCREASE PARAMETER SLKTEXT IN AMO DIMSU.  
 F25: DESTINATION NO. IS NOT A ROUTE CODE  
 F26: DESTINATION NO. LEADS TO DAR 'VMOWN';  
 ONLY POSSIBLE FOR SERVICES VOICE/FAX  
 F27: DESTINATION NO. DOES NOT LEAD TO DAR 'STN'

## ZIEL - Destination Addresses for Stations

### Error Messages and Advisories

- F28: FUNCTIONAL TERMINALS AND ATTACHED ANALOG TERMINALS ARE NOT PREASSIGNED FOR DSS.
- F29: DESTINATION HAS ALREADY BEEN ENTERED AS DSS DESTINATION BY MAX. NO. OF DSS USERS. SEE PARAMETER DSSRT IN AMO ZAND.
- F30: IN THE CASE OF SI1=VCE, A CODE MUST BE SPECIFIED FOR DAR VMOWN (FOR SERVERS LOCATED IN THE LOCAL NODE) OR DAR NETW (FOR SERVERS LOCATED IN REMOTE NODES) FOR PARAMETER MRCD
- F31: IN THE CASE OF SI1=FAX, A CODE MUST BE SPECIFIED FOR DAR FAX FOLLOWED BY A CODE EITHER FOR DAR VMOWN (FOR SERVERS LOCATED IN THE LOCAL NODE) OR DAR NETW (FOR SERVERS LOCATED IN REMOTE NODES) FOR PARAMETER MRCD
- F32: DEV=<dev> IS INVALID FOR SOURCE STATION <srcno>
- F33: LEVEL IS NOT VALID FOR THE ENTERED DEVICE.  
LEVEL=2 IS VALID ONLY FOR NAME KEYS ON OPTISET/OPTIPOINT ADD ON TERMINALS OR OPENSTAGE/DPIP MAIN DEVICES. OR OPENSTAGE/DPIP/DPCP MAIN DEVICES.  
LEVEL=3 AND 4 ARE VALID ONLY FOR NAME KEYS ON OPTISET ADD ON TERMINALS AD1 AND AD2.
- F34: WITH CFVAR = SYSTEM, PARAMETER ITYPE MUST BE ENTERED (INT/EXT).
- F35: SOURCE STATION <srcno> IS A SPECIAL SUBSCRIBER WHICH MUST NOT BE ASSIGNED AS DESTINATION.
- F36: SOURCE @@@@ does NOT HAVE A DEVICE CONFIGURED WITH THE VALUE ENTERED UNDER PARAMETER SERVICE INDICATOR(SI)
- F37: Forwarding is not allowed for value entered in parameter SI and API configuration
- F40: THE STATION NUMBER IS NOT ALLOWED TO BE SET UP AS A FWD-DESTINATION, BECAUSE IT IS USED AS ACD HELP STATION NUMBER.
- F42: SOURCE STATION <srcno> IS UNASSIGNED FOR SERVICE <si>.
- F43: THE FEATURE FWD FOR SERVICE <si> IS NOT RELEASED.
- F44: RANGE LIMIT VALUES FOR PARAMETER <par> HAVE DIFFERENT LENGTHS
- F45: HE GIVEN DSS-KEY IS WRITE-PROTECTED AND CAN ONLY BE PROCESSED BY AMO ZIELN.
- F46: PARAMETER COMBINATION NOT ALLOWED.  
PERMISSIBLE COMBINATIONS:

|            |         |       |         |
|------------|---------|-------|---------|
| PARAMETER: | CFVAR   | DTYPE | ITYPE   |
| VALUES:    | STATION | CFU   | GEN     |
|            | SYSTEM  | CFU   | INT,EXT |
|            |         | CFB   | INT,EXT |
|            |         | CFNR  | INT,EXT |
|            |         | CFDND | INT,EXT |

- F47: SRCNO IS A DSS1 DEVICE: FOR ADMINISTRATION USE AMO ACTDA.
- F48: NO DESTINATION ADDED TO THE ENTERED <type>-KEYS ON <dev>.
- F49: DESTINATION NUMBER LEADS TO AN EMERGENCY ROUTE.
- F50: INTERNAL LOGIC FAULT
- F51: KEY <tasnr> IS AT <ger> NOT PREASSIGNED AS A REPERTORY KEY OR TERMINAL TYPE <ger> IS NOT CONFIGURED. (DISPLAY-SBCSU:<qrnr>;AND CHECK PARAMETER REP).
- F52: CALL FORWARDING IS NOT ALLOWED BETWEEN MEMBERS OF THE SAME ONS GROUP.
- F53: NO FREE MEMORY FOR EXTNAME ENTRY. INCREASE PARAMETER EXTNAME IN AMO DIMSU.
- F54: DEV=@@@ AND LEVEL=@ ARE INVALID FOR SOURCE STATION @@@@
- F55: ONLY LEVEL=1 & 2 ARE SUPPORTED FOR NAME KEYS ON OPENSTAGE/DPIP/DPCP MAIN MODULES AND ADD ON TERMINALS.
- F56: ONLY LEVEL=1 IS SUPPORTED FOR NAME KEYS ON OS15 ADD ON TERMINAL.
- F57: BG5 IS SUPPORTED ONLY FOR BLF.

F58: ONLY LEVEL=1 IS SUPPORTED FOR KEYS ON BLF.  
 F59: NO NAME KEYS WITH CONFIGURED DESTINATIONS COULD BE FOUND  
 F60: NO NAME KEY CONFIGURED ON @@@  
 F61: NO DESTINATION ADDED TO THE ENTERED @@@@-KEYS.  
 F62: SRCNO is not a DESK number. (AMO SBSCSU)

## 220.5.2 Advisories

H01: SOURCE STATION <srcno> HAS NO DSS KEYS  
 H02: SOURCE STATION <srcno> HAS NO NAME KEYS FOR DEV=<dev> AND LEVEL=<level>  
 H03: NAME MUST NOT BE SPECIFIED FOR INTERNAL FORWARD DESTINATIONS; ENTRY IGNORED  
 H04: NO ADD-ON TERMINAL POSSIBLE AT SOURCE STATION <srcno>. PARAMETER DEV=AD IGNORED.  
 H05: The station is signed off / not active, therefore the destination number was checked with the source group index of HHS. When the station is signed on / activated in an other source group, the LCR configuration has to be checked by means of AMO-LPROF and AMO-LDPLN.  
 H08: THE GIVEN NAME-KEY IS MARKED FOR DIRECT ACCESS (AMO ZIELN).  
 WRITE PROTECTION STAYS ON.  
 H09: MORE DSS-DESTINATIONS CAN BE DISPLAYED BY AMO ZIELN.  
 H10: FOR THE ENTERED <type>-KEYS ON <dev> THE DESTINATIONS WERE DELETED.  
 H11: ALTHOUGH SLKTYPE=SLKNAME IS SET, THE STATION NUMBER WILL BE DISPLAYED ON THE LABEL INSTEAD AS LONG AS THE RESPECTIVE PERSI NAME ENTRY IS NOT WELL DEFINED (E.G. NAME ENTRY DOES NOT EXIST YET/ANYMORE, NON-LATIN CHARACTER CONVERSION USED, ETC.).  
 H12: NO TERMINAL PLUGGED (YET) WITH SELF-LABELLING KEYS SUPPORT.  
 H13: THE SPECIFIED DESTINATION NUMBER IS TOO LONG. ONLY THE FIRST SIX DIGITS ARE CONSIDERED, THE OTHERS WILL BE IGNORED. PROBABLY THE PROBLEM IS CAUSED BY A TYPING ERROR.  
 H14: THE PARAMETERS SLKTYPE AND SLKTEXT ARE IGNORED FOR THE KEYS 13, 14 OR 15 OF AN ADD-ON TERMINAL  
 H15: THE FEATURE SELF LABELING KEY IS NOT SUPPORTED ON ADD-ON UNITS 3 AND 4.  
 H16: CHANGE OF KEY 17 AND 18 ONLY TAKES PLACE IF PLUGGED ADD-ON IS LOW-COST ADD-ON.  
 H17: TO CONFIGURE A CALL FORWARDING FOR AN ONS GROUP, DESTINATION OF MASTER SHOULD BE SET ALSO FOR SLAVE DEVICES OF THE ONS GROUP.  
 H18: STATION @@@@ HAS NOT BEEN ASSIGNED.  
 H19: FOR THE ENTERED @@@@-KEYS THE DESTINATIONS WERE DELETED.

| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The *central automatic dialer* is a memory area of abbreviated numbers which is distributed among several lists. All system subscribers can access a maximum of 2 lists each. The speed dialing lists are created by AMO LRNGZ.

An abbreviated number is used to simplify dialing. Each abbreviated number can be assigned an unabbreviated number. The number of suffix dialing digits describes the number of digits in the unabbreviated number which are to be transmitted with a time lag during automatic suffix dialing.

### 222.1 Restrictions

This description is valid from SP300-V3.4

### 222.2 Interrelationships

- AMO LRNGZ : Speed call dialing central, lists
- AMO DIMSU : Dimensioning of features (switching unit)
- AMO FEASU : Customer feature list (switching unit)

### 222.3 Functions of the AMO

- [ADD-ZRUNGZ](#) : Creating abbreviated number destinations
- [DELETE-ZRUNGZ](#) : Cancelling abbreviated number destinations
- [DISPLAY-ZRUNGZ](#) : Displaying abbreviated number destinations
- [REGENERATE-ZRUNGZ](#) : Regenerating abbreviated number destinations

### 222.3.1 ADD-ZRNGZ

Creating destinations for abbreviated numbers of the central automatic dialer.

If a destination has already been created for the abbreviated number, the previous entry is deleted automatically.

#### Procedure Overview

| Command Code | Parameter                                                                                |
|--------------|------------------------------------------------------------------------------------------|
| ADD-ZRNGZ    | LST=<number>, SPDNO=<number>, DESTNO=<key-num><br>, [SUPDIAL=<number>], [NAME=<string>]; |

#### Example

The external subscriber with directory number 0897220 is to be accessed with abbreviated number 00; the final digit of the destination directory number is to be transmitted with a time lag. The name of the external subscriber is MUNICH. The list has the number 12.

Input:

```
ADD-ZRNGZ:LST=12, SPDNO=00, DESTNO=00897220, SUPDIAL=1, NAME=MUNICH;
```

### 222.3.2 DELETE-ZRNGZ

Delete the entries for the abbreviated numbers in the central automatic dialer list.

#### Procedure Overview

| Command Code | Parameter                     |
|--------------|-------------------------------|
| DELETE-ZRNGZ | LST=<number>, SPDNO=<number>; |

### 222.3.3 DISPLAY-ZRNGZ

Interrogating the entries for the abbreviated numbers in the central automatic dialer lists (with output in list form).

1. All lists in the system
2. One list in the system
3. Specific abbreviated numbers in a list

### Procedure Overview

| Command Code  | Parameter                                     |
|---------------|-----------------------------------------------|
| DISPLAY-ZRNGZ | TYPE=SYS; (1)                                 |
|               | TYPE=LST, LST=<number>; (2)                   |
|               | TYPE=SPDNO, LST=<number>, SPDNO=<number>; (3) |

#### Example

Displaying abbreviated numbers 00 to 49 in list number 12.

Input:

DISPLAY-ZRNGZ:TYPE=SPDNO, LST=12, SPDNO=00&&49;

Output:

```

LST: 12      SPDNO RANGE: 00 TO 49
SPDNO DESTNO      SUPDIAL NAME
00 00897221      1 MUNICH
02 003432564738  0 SPAIN
03 0613111515    0 MAINZ MOVIE THEATER SERVICE

```

## 222.3.4 REGENERATE-ZRNGZ

1. All lists in the system
2. One list in the system
3. Specific abbreviated numbers in a list

### Procedure Overview

| Command Code     | Parameter                                     |
|------------------|-----------------------------------------------|
| REGENERATE-ZRNGZ | TYPE=SYS; (1)                                 |
|                  | TYPE=LST, LST=<number>; (2)                   |
|                  | TYPE=SPDNO, LST=<number>, SPDNO=<number>; (3) |

#### Example

Regenerating all abbreviated numbers in list number 12.

Input:

REGENERATE-ZRNGZ:TYPE=LST, LST=12;

Output:

**ZRNGZ - Central Speed Calling Digit Series**

Parameter Description

```
ADD-ZRNGZ:12, 00, 0897221, 1,
"MUNICH
ADD-ZRNGZ:12, 02, 003432564738, 0,
"SPAIN
ADD-ZRNGZ:12, 03, 0613111515, 0,
"MAINZ MOVIE THEATER SERVICE
```

**222.4 Parameter Description**

|                 |                                                                            |
|-----------------|----------------------------------------------------------------------------|
| DESTNO          | Complete destination station number                                        |
| Type of Input   | : Single value, mandatory                                                  |
| Possible Values | : 1-22 positions; digits (0-9), #,*,A,B,C,D                                |
| LST             | Central speed calling list number                                          |
| Type of Input   | : Single value, mandatory                                                  |
| Possible Values | : 0-15                                                                     |
| NAME            | Name of destination station (in words)                                     |
| Type of Input   | : Single value, optional                                                   |
| Possible Values | : 1-50 positions                                                           |
| SPDNO           | Speed call destination number                                              |
| Type of Input   | : Single value, chained single values, area, single value, (ADD) mandatory |
| Possible Values | : 00-99; 000-999                                                           |
| SUPDIAL         | Number of digits to be held back for automatic suffix dialing              |
| Note            | : SUPDIAL is not supported in the U.S.                                     |
| Type of Input   | : Single value, optional                                                   |
| Possible Values | : 0 to number of digits of DESTNO - 1                                      |
| TYPE            | Branching parameter (desired option)                                       |
| Type of Input   | : Single value, mandatory                                                  |
| Possible Values | : SYS = SYSTEM                                                             |
|                 | LST = LIST                                                                 |
|                 | SPDNO = SPEED CALLING NUMBER                                               |

## **222.5 Error Messages and Advisories**

### **222.5.1 Error Messages**

F01: NUMBER OF SUFFIX-DIALING DIGITS IS GREATER THAN THE NUMBER OF DIGITS IN THE UNABBREVIATED CALL NUMBER. ADMISSIBLE VALUES FOR SUPDIAL: 0 TO xx

F02: ABBREVIATED CALL NUMBER NOT FOUND LIST CONTAINS ABBREVIATED CALL NUMBERS: xxx TO xxx

F03: ABBREVIATED CALL NUMBER(S) NOT FOUND LIST CONTAINS ABBREVIATED CALL NUMBERS: xxx TO xxx

F04: LIST NOT CREATED.

F06: ADMISSIBLE LIST NUMBERS: 0 TO xx

F07: NO LISTS CREATED IN SYSTEM.

### **222.5.2 Advisories**

H01: NO LISTS CREATED IN SYSTEM.

H02: LIST HAS NOT BEEN CREATED.

### **222.5.3 Use of the Output Messages for Each Action**

|            |   |      |      |      |      |      |
|------------|---|------|------|------|------|------|
| ADD        | : | F01, | F02, | F04, | F06, | F07, |
| DELETE     | : | F03, | F04, | F06, | F07  |      |
| DISPLAY    | : | F03, | H01, | H02  |      |      |
| REGENERATE | : | F03, | H01, | H02  |      |      |
