| ACDAGT   | Number of ACD agents<br>Refer to Service Manual FlexRouting                                                                                                  |
| ACDCALEN | Number of calendar routing entries<br>Refer to Service Manual FlexRouting                                                                                    |
| ACDCQ    | Number of dynamically assignable ACD call-queuing pool elements<br>(Number of calls waiting for the next free agent.)<br>Refer to Service Manual FlexRouting |

|          |                                                                                                                                                                                                                                                                                                     |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACDGRP   | Number of ACD groups<br>Refer to Service Manual FlexRouting                                                                                                                                                                                                                                         |
| ACDLOGON | Number of ACD agents logged on at once (dynamically assignable entries)<br>Refer to Service Manual FlexRouting                                                                                                                                                                                      |
| ACDMONID | Number of monitored ID sets (e.g. ACD agents, route control groups (RCG), trunk groups, circuits, stations - only for ACD-G)<br>Refer to Service Manual FlexRouting                                                                                                                                 |
| ACDPRIM  | Number of primary ACD agent positions<br>(Number of devices which can be used to log on by an ACD-Agent.)<br>Refer to Service Manual FlexRouting                                                                                                                                                    |
| ACDRCG   | Number of ACD route-control groups<br>Refer to Service Manual FlexRouting                                                                                                                                                                                                                           |
| ACDRT    | Number of ACD routing step tables for FlexRouting<br>ACD routing step tables contain the commands for controlling an ACD call step-by-step. An ACDRT entry contains a maximum of 16 routing steps; an ART can comprise up to 64 routing steps.<br>Refer to Service Manual FlexRouting               |
| ACDRTX   | Number of auxiliary ACD routing step tables<br>Contains additional information for some route commands, like route to extension and route to offsite number.<br>Refer to Service Manual FlexRouting                                                                                                 |
| ACDSHIFT | Number of ACD shifts<br>Refer to Service Manual FlexRouting                                                                                                                                                                                                                                         |
| AP       | Number of Access Points                                                                                                                                                                                                                                                                             |
| APEGRP   | Number of Access Point emergency groups                                                                                                                                                                                                                                                             |
| APPL     | Number of DP applications<br>Used for ACL-C applications.                                                                                                                                                                                                                                           |
| ALTROUT  | Number of subscriber/SC individual alternate routing numbers for Out of Service or AP emergency state                                                                                                                                                                                               |
| ATND     | Number of attendant consoles                                                                                                                                                                                                                                                                        |
| ATNDCQ   | Number of dynamically assignable call-queuing pool elements for attendant groups (Number of calls waiting for the next free attendant console.)<br>This value can be set to 0 in systems without any attendant console. But then there are no calls possible to a central attendant in the network. |
| ATNDGR   | Number of attendant console groups                                                                                                                                                                                                                                                                  |
| AUXDIGI  | Number of auxiliary digits for HICOM Trading Classic and ViNet                                                                                                                                                                                                                                      |
| BLK100   | Number of 100-blocks with dialing numbers for all stations in the network<br>A block contains 100 dialing numbers without gaps.                                                                                                                                                                     |
| BUS      | Number of Optiset/optiPoint-busses, S0-busses and S0-trunks                                                                                                                                                                                                                                         |
| CALLOG   | Number of Optiset and optiPoint devices with call log<br>Refer to AMO Usage Example Call log for optiset E                                                                                                                                                                                          |
| CALLOGS  | Number of Optipoint devices in scrolling mode of Call Log                                                                                                                                                                                                                                           |
| CBK      | Number of dynamically assignable pool elements for callback and trunk queuing requests<br>Each callback and queued trunk, which is saved in the system, needs an element.<br>Refer to AMO Usage Example Features Available Throughout the Network                                                   |
| CCAP     | Number of access-point emergency processors                                                                                                                                                                                                                                                         |

## DIMSU - Feature Capacities

### Parameter Description

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CFWDEST  | Number of call forwarding destinations                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CFWHIST  | Number of elements for call forwarding history                                                                                                                                                                                                                                                                                                                                                                                                         |
| COMGR    | Number of COM groups (Communication Group Calling)<br>(refer to AMO COMGR)                                                                                                                                                                                                                                                                                                                                                                             |
| COS      | Number of classes of service                                                                                                                                                                                                                                                                                                                                                                                                                           |
| COSTI    | Number of dynamically assignable connection buffers for connections with charge data recording<br>Advice for dimensioning: $COSTI = CPB$ . This is adequate for call data recording of all outgoing trunk and tie-line connections. The number of buffers must be increased if, in addition, call data recording is required for incoming calls and/or internal connections<br>Refer to AMO Usage Example Central Configuration of Call Data Recording |
| CPB      | Number of dynamically assignable CP connection buffers<br>One CPB is required per connection.<br>If this value is changed, the values CPBLOWL and CPBUPPL of AMO ZAND must be checked.                                                                                                                                                                                                                                                                 |
| CPDBUF   | Number of dynamically assignable CP data buffers<br>(used for DSS1 services, networkwide PIN, Least Cost Routing, Callback, CHESE, Call Pickup Groups, Conference, Call Data Recording)                                                                                                                                                                                                                                                                |
| CRCP     | Number of call reference tables in CP<br>(Size = number of S0 + S2 trunks)                                                                                                                                                                                                                                                                                                                                                                             |
| CRICC    | Number of S0-busses (also with Optiset and optiPoint) plus number of S0/S2 point-to-point connections                                                                                                                                                                                                                                                                                                                                                  |
| CUGPROF  | Number of user profiles for Closed User Groups                                                                                                                                                                                                                                                                                                                                                                                                         |
| DCIPAR   | Number of parameter sets for the DCI                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DNI      | Number of Directory Number Information Table indices (refer to AMO DNIT)<br>Contains routing and display information concerning source and called party.<br>(DNI: Directory Number Information)<br>Refer to Service Manual FlexRouting                                                                                                                                                                                                                 |
| DPDNI    | Number of datapool elements reserved for DIMSU parameter DNI<br>(refer to AMO DNIT)<br>Contains strings to be displayed on the called device.<br>(DNIS: Dialed Number Identification Service)<br>Refer to Service Manual FlexRouting                                                                                                                                                                                                                   |
| DPDSPMOD | Number of datapool elements reserved for DIMSU parameter DSPMOD<br>(Refer to AMO KNMAT)<br>Contains the rules for display modification.                                                                                                                                                                                                                                                                                                                |
| DPINFO   | Number of datapool elements reserved for DIMSU parameter INFO<br>About 8 info fields can be stored in a datapool element.<br>Refer to AMO Usage Example Improved AMO Interface                                                                                                                                                                                                                                                                         |
| DPLNCD   | Number of dial plan blocks for access codes                                                                                                                                                                                                                                                                                                                                                                                                            |
| DPLNGR   | Number of dial plan blocks for dial plan group branches                                                                                                                                                                                                                                                                                                                                                                                                |
| DSPMOD   | Number of display modifications between network nodes (refer to AMO KNMAT)<br>Refer to AMO Usage Example INS Info Number Signalling (STNM)                                                                                                                                                                                                                                                                                                             |
| DSS      | Number of blocks of 5 DSS (direct station select) partners for storing DSS partner information<br>If a station is a DSS destination, one entry block will be allocated, it contains those station numbers for which the station is a DSS destination. If a station is more than 5 times destination, additional 5-blocks will be linked.                                                                                                               |

|          |                                                                                                                                                                                                                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DSSNA    | Number of blocks of 5 keys for DSS (direct station select) and name keys<br>The number of DSS/name keys per station is not limited. Blocks of 5 destination entries are allocated for the corresponding DIGITE.<br>Advice for dimensioning: The min. number must be the same as the number of digits in the system. |
| DSS1SCRD | Number of screening data records for incoming E-DSS1 connections for HICOM as carrier access node<br>This number corresponds to the number of used nodes where screening is performed.<br>Refer to AMO Usage Example EDSS1 System Interface / Trunk Interface and Screening on the EDSS1 Trunk Interface            |
| DSS1SCRP | Number of screening patterns for E-DSS1 connections<br>This number corresponds to the number of E.164 numbers checked during the number screening.<br>Refer to AMO Usage Example EDSS1 System Interface / Trunk Interface and Screening on the EDSS1 Trunk Interface                                                |
| DTILTG   | Number of device table entries (DTI) for trunks and terminal devices (one each)<br>(DH - device table)                                                                                                                                                                                                              |
| DTITMD   | Number of dynamically assignable device table entries reserved for B- and D-channel connections of all S0/S2 trunk interfaces<br>(Maximum number = $S0 * 2 + S2 * 60$ (or instead off 60, number of configured B-channel * 2))                                                                                      |
| ECCS     | Number of external computer controlled call setups<br>Used for ACL-C applications.<br>(e.g. Call Bridge, ACD Monitoring)                                                                                                                                                                                            |
| ES       | Number of integrated executive/secretary systems (refer to AMO CHESE)<br>Refer to AMO Usage Example CHESE Integrated Exec./Sec. System                                                                                                                                                                              |
| ESSTN    | Number of stations (executive, secretary, substitute) in integrated executive/secretary systems (refer to AMO CHESE)<br>Refer to AMO Usage Example CHESE Integrated Exec./Sec. System                                                                                                                               |
| EXTNAME  | Number of subscriber names for external call forwarding destinations                                                                                                                                                                                                                                                |
| FORMTAB  | Number of entries in the format table for subscriber numbers (refer to AMO KNFOR)<br>Refer to AMO Usage Example INS Info Number Signalling (STNM)                                                                                                                                                                   |
| GDTR     | Number of entries in the GDTR table for routing depending on the source and/or destination number (refer to AMO DNIT)<br>(GDTR: General Digit Translation Rule)<br>Refer to Service Manual FlexRouting                                                                                                              |
| GENBUF   | Number of additional dynamically assignable connection buffers for ACD-G<br>One element is needed per ACD call and per entry in the ACD call queue.<br>Refer to Service Manual FlexRouting                                                                                                                          |
| GWREG    | Number of internal and external gateways                                                                                                                                                                                                                                                                            |
| HGMEMB   | Number of stations, which are member of a hunt group (also network-wide hunt groups)                                                                                                                                                                                                                                |
| HOTDEST  | Number of HOTLINE destinations                                                                                                                                                                                                                                                                                      |
| HT       | Number of hunt groups (voice and non-voice)                                                                                                                                                                                                                                                                         |
| HTCQB    | Number of dynamically assignable buffers for hunt call queue<br>(Number of calls waiting for a free hunt group member.)                                                                                                                                                                                             |
| ID       | Number of personal identification numbers (PIN)                                                                                                                                                                                                                                                                     |
| INFO     | Number of info fields for AMO's (e.g. COT, COP, TAPRO)<br>Refer to AMO Usage Example Improved AMO Interface                                                                                                                                                                                                         |

## DIMSU - Feature Capacities

### Parameter Description

|          |                                                                                                                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEYSYS   | Number of Key System subscribers (also logged-off subscribers)<br>Refer to AMO Usage Example Integrated Key Functionality Multiline access                                                     |
| LCRCOS   | Number of LCR class of service                                                                                                                                                                 |
| LCRDSR   | Number of blocked digit strings for specific Least Cost Routing route elements<br>(refer to AMO LDSRT for Least Cost Routing digit string restriction)                                         |
| LDPLNx   | Number of dial plan entries for least cost routing in dial plan x<br>(refer to AMO LDPLN)<br>Refer to AMO Usage Example LCR (Least Cost Routing)                                               |
| LDPLNCx  | Number of entries in the LCR dial plan cache x<br>(refer to AMO LDPLN) (used for optimizing the dial plan x)<br>Refer to AMO Usage Example LCR (Least Cost Routing)                            |
| LIN      | Number of location identifications for emergency calls (location identification number)<br>(refer to AMO SDAT)                                                                                 |
| LODEN    | Number of permanently configured device table entries<br>(call-processing device memory CC)                                                                                                    |
| LODR     | Number of outdial rules for least cost routing (refer to AMO LODR)<br>Refer to AMO Usage Example LCR (Least Cost Routing)                                                                      |
| LODS0    | Number of dynamically assignable device table entries<br>(used for S0-busses, S0/S2 point-to-point connections)                                                                                |
| LODTMD   | Number of dynamically assignable device table entries for D-channel connections of all S0/<br>S2 trunk interfaces<br>(used for networkwide features, e.g. callback callforwarding, callpickup) |
| LROUT    | Number of route elements for least cost routing (refer to AMO LDAT)<br>Refer to AMO Usage Example LCR (Least Cost Routing)                                                                     |
| LRTPROF  | Number of profiles for source group dependent routing in LCR<br>(refer to AMO LPROF)                                                                                                           |
| MFCVAR   | Number of MFC variants for analog trunks and tie-lines                                                                                                                                         |
| MG       | Number of master groups for device search<br>Master groups are needed for routes, hunt groups per service and attendant groups.                                                                |
| NAME     | Number of subscriber names (refer to AMO PERSI)<br>Refer to AMO Usage Example Name and Organization to a Number (ORG Assigning)                                                                |
| NSTN     | Number of night stations for special night answer position (refer to AMO NAVAR)                                                                                                                |
| NWBCHL   | Number of B-channels for trunks + analog trunks and tie-lines<br>Value must be set to: S0, S2 and analog trunks<br>(Size = number of S0 * 2 + number of S2 * 30 + number of analog trunks)     |
| OPTCC    | Number of Optiset and optiPoint devices (also logged-off subscribers with Optiset or<br>optiPoint devices)                                                                                     |
| OPTEXP   | Number of Optiset/optiPoint key modules, Optiset/optiPoint signature modules and Optiset<br>E control adapters                                                                                 |
| ORG      | Number of organizational units (refer to AMO PERSI)<br>Refer to AMO Usage Example Name and Organization to a Number (ORG Assigning)                                                            |
| PARTNODE | Number of lines to partner nodes<br>Plus number of partner nodes, which are connected via a multiplexer and cannot be<br>reached via a separate B-Channel-Group.                               |
| PERMDL   | Number of peripheral hardware modules                                                                                                                                                          |

|          |                                                                                                                                                                                    |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PINBUF   | Number of dynamically assignable PIN buffers for networkwide identification<br>Refer to AMO Usage Example Personal Identification Number                                           |
| PRI      | Number of primary rate interfaces                                                                                                                                                  |
| PUGR     | Number of call pickup groups<br>Refer to AMO Usage Example Call Pickup                                                                                                             |
| REMIND   | Number of timed reminder entries                                                                                                                                                   |
| REMPUGR  | Number of links to pickup groups in remote nodes<br>Refer to AMO Usage Example Call Pickup                                                                                         |
| RSTCON   | Number of restricted connections from originating nodes (refer to AMO KNMAT)                                                                                                       |
| RTE      | Number of routes<br>(one route per trunk access code, attendant group access code and hunt group access code)                                                                      |
| SCTPATH  | Number of IP sectorpaths                                                                                                                                                           |
| SG       | Number of subgroups for device search<br>One subgroup is needed for each attendant group, night service variant, trunk group and hunt group.                                       |
| SILI     | Number of dynamically assignable entries in the list for saved connections (all connections which are recovered after a soft restart)<br>Advice for dimensioning: At least 2 * CPB |
| SPDCD    | Number of destinations for central speed dialing feature                                                                                                                           |
| SLKTEXT  | Number of self-labeling keys with individual text<br>(This parameter does not allocate memory - only limit for AMO LRNGZ)                                                          |
| SPDCL    | Number of lists for central speed dialing feature<br>(This parameter does not allocate memory - only limit for AMO LRNGZ)                                                          |
| SPDI     | Number of users with individual speed dialing                                                                                                                                      |
| STMA     | Number of spans on STMA boards<br>Refer to Service Manual ATM Connectivity                                                                                                         |
| STMACIR  | Number of logical circuits of all STMA boards<br>(S2 or Ports for Optiset or optiPoint)<br>Refer to Service Manual ATM Connectivity                                                |
| STMI     | Number of STMI boards for Access Point connection                                                                                                                                  |
| STMIHFA  | Number of STMI boards for IP device connection                                                                                                                                     |
| STMIHFA2 | Number of STMI2 boards for IP device connection                                                                                                                                    |
| STMI2IGW | Number of STMI2 boards for IP Trunking                                                                                                                                             |
| SLC24    | Number of SLC24 boards for CMI                                                                                                                                                     |
| STN      | Number of subscribers (also attendant consoles and logged-off subscribers)                                                                                                         |
| SU       | Number of devices with subunits (SU)<br>Advice for dimensioning: all Digite's + ATND + ATNDGR                                                                                      |
| SYNAN    | Number of dynamically assignable announcement buffers for synchronous announcement<br>Refer to AMO Usage Example Announcement Unit, Synchronized Announcements                     |
| S2PP     | Number of S2 point-to-point connections<br>(e.g. IVR-Unit, Fax-Server, Cordless-Server, LAN-Router)                                                                                |
| TEAMCONN | Number of connections to/from external team members for HICOM Trading<br>(extended connections in home node and from foreign nodes)                                                |

## DIMSU - Feature Capacities

### Parameter Description

|        |                                                                                                                                                                                                                                                                                          |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRK    | Number of analog trunks, number of digital trunks (S0/S2) and number of B-channel groups for S2                                                                                                                                                                                          |
| VOICO  | Number of compressed B-channels for voice connections<br>Refer to AMO Usage Example Voice Compression                                                                                                                                                                                    |
| WAML1  | Number of WAML boards for routing<br>Refer to AMO Usage Example Example of use for LAN Connectivity                                                                                                                                                                                      |
| WAML2  | Number of WAML boards for telecommuting<br>Refer to Service Manual Teleworking                                                                                                                                                                                                           |
| WSPROT | Integrated voice/data application using Workstation Protocol<br>Number of Optiset and optiPoint devices using Workstation Protocol. Plus number of Optiset and optiPoint devices without Workstation Protocol which are assigned to a line key of a Keysystem with Workstation Protocol. |

### Parameter Interrelationships

The following conditions are taken into account by AMO, and are reported in F03 and F04 if not observed.

- SPDI <= STN
- ECCS <= APPL

The following condition is taken into account by AMO, and is reported in H02 if not observed.

- COSTI >= CPB(If the ACTUAL value of parameter COSTI is set to 0, then only internal voice calls are possible.)

The following condition is valid but not checked in AMO DIMSU. When reducing the value of parameter CPB of AMO DIMSU the relation to parameter CPBUPPL of AMO ZAND must be watched.

- CPB (AMO DIMSU) > CPBUPPL (AMO ZAND)

Values for both of the following parameters have to be assigned. Otherwise the error message F02 will be displayed.

- SPDCL / SPDCLD
- ATNDGR / ATND
- ES / ESSTN

### Parameter Maximum Values and Default Values

The maximum values for the parameters are contained in the database, and can be interrogated with this AMO. When assigning memory entries, all DIMSU entries are checked against the database entries.

The value range of the parameters is 0 to maximum.

The default values are set so that no memory shortage can occur if the system is generated without declaring parameters. The default values are based on the premise that the configuration requirements of most customer systems will be satisfied.

## **76.4 Error Messages and Advisories**

### **76.4.1 Error Messages**

F01: PARAMETER <pppppppp> MUST BE GREATER THAN OR EQUAL TO THE MAX. USED VALUE (For parameters CCIDXS, CCIDXD and GPIDX, the max. used value must be greater by a factor of 3 than the value output for DISPLAY).

F02: ENTER PARAMETERS <pppppppp> and <pppppppp>.

F03: PARAMETER <pppppppp> MUST BE GREATER THAN OR EQUAL TO THE MAX. USED VALUE AND LESS THAN OR EQUAL TO THE ACTUAL VALUE OF <pppppppp>.

F04: PARAMETER <pppppppp> MUST BE GREATER THAN OR EQUAL TO THE MAX. USED VALUE AND GREATER THAN OR EQUAL TO THE ACTUAL VALUE OF <pppppppp>.

F05: <pppppppp> IS TOO LOW.

F06: PARAMETER <pppppppp> CAN ONLY BE INCREASED.

F07: VALUE FOR PARAMETER <pppppppp> IS GREATER THAN MAXIMUM PERMISSIBLE VALUE.

F08: THE RESULT OF VALUES FOR PARAMETER <pppppp + ppppppp> MUST BE < THAN <dddddd>.

F09: INSUFFICIENT MEMORY ALLOCATED FOR <pppppppp>.

F10: MEMORY REQUIRED FOR PARAMETER <pppppp>.

F20: THE VALUE FOR PARAMETER <pppppp> MUST BE >= 256.

F21: PARAMETER <HTCQB> MUST BE >= <dddddd> WHICH IS THE SUM OF ALL CURRENTLY CONFIGURED CQMAX PARAMETERS (AMO SA).

### **76.4.2 Advisories**

H00: +-----+  
| ppppppp.ACTUAL : nnnnn |  
| .PREVIOUS: vvvvv |  
+-----+

H01: <ttt>: <ddd>% OF THE TOTAL STATIC MEMORY AREAS AND <ddd>% OF THE TOTAL DYNAMIC MEMORY AREAS RESERVED FOR THE FLEXAMA WILL BE USED.  
(UP TO 20% OF THE MEMORY MAY NOT BE AVAILABLE IF IT IS HEAVILY FRAGMENTED).

H02: PARAMETER <pppppp> AND PARAMETER <pppppp> SHOULD HAVE THE SAME VALUE.

H03: THE MEMORY DIMENSIONS FOR THE LTG ARE NOT AVAILABLE.

### 76.4.3 Actions and Associated Error Messages

### 77.1 Restrictions

### 77.2 Interrelationships

AMO DISPA communicates with the Displayer task resident in the main memory. The resident Displayer task and the message tracer task are contained in the same subsystem.

### 77.3 General

The Memory Displayer is a tool which allows the system specialist to read and also to modify the contents of various predefined and/or specified memories at the service terminal.

The AMO DISPA controls the communication to the terminal. Without the AMO, the Displayer cannot execute its tasks, since the AMO is used for displaying the memory contents read by the Displayer at the service terminal, and the Displayer tasks themselves are started via the terminal.

The Displayer is an online test tool which can be used for component integration and system tests, by field technicians and customers.

The AMO DISPA contains the following features:

- Output of memory contents as a hexadecimal dump in a logical level operation (e.g. for all memories specified in the AMO with name, address and array dimensions).
- Creation of user-specific, logical memory definitions for any given memory address, even as a table.

- Optional storage of the addresses and array dimensions for further memories defined by the user either in the AMO work area (available only during AMO execution), in the save area of the resident Displayer task in each processor (restart-safe), or in a hard disk save area (reload-safe).
- Changing the memory contents in a logical level operation (contents of memories, whose names, addresses and array dimensions must be specified by the user in the AMO).
- Displaying and changing memory contents in a logical level operation (core image of a memory whose name, offset address and array dimensions have been defined in the AMO).

#### Limits of the Memory Displayer

The Displayer cannot and should not replace the functions of the debugger. It should rather be considered as an addition geared towards pin-point and problem-oriented diagnosis.

#### Note

For the SWU memories, the DISPS tool is available, which functions analogously to this AMO (see DISPS AMO-description).

## 77.4 Functional Overview

The following functions are realized by the AMO:

- |    |      |                                                                                                                                                                                                                          |
|----|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a. | CHAR | On/off switch for character display of hexadecimal dump format.<br>The hexadecimal dump format can be displayed with hexadecimal characters only or together with the corresponding ASCII characters. Default Value: ON. |
| b. | COPY | Copying memory addresses                                                                                                                                                                                                 |
| c. | DEF  | Creating memory addresses                                                                                                                                                                                                |
| d. | DEL  | Deleting memory definitions                                                                                                                                                                                              |
| e. | DIST | Determining the number of empty lines to be inserted<br>between the lines output in a hexadecimal dump format. Default Value: 0.                                                                                         |
| f. | DUMP | Listing file contents                                                                                                                                                                                                    |
| g. | E    | Assigning a file in order to edit file contents                                                                                                                                                                          |
| h. | END  | Terminating the AMO                                                                                                                                                                                                      |
| i. | EV   | Converting decimal to hexadecimal and vice versa<br>also binary output                                                                                                                                                   |
| j. | FILE | Assigning a file as hard disk save area                                                                                                                                                                                  |
| k. | LST  | Listing memory contents                                                                                                                                                                                                  |
| l. | P    | Switching to the Displayer task in another processor<br>The user sees which processor he is currently accessing with the aid of the input request message                                                                |

- m. PATCH Changing file contents
- n. SET Changing memory contents

## 77.5 Functions of the AMO

- EXEC-DISP : Start of AMO DISPA
- INPUT-DISPA : Data input request in dialog mode

### 77.5.1 EXEC-DISP

#### Procedure Overview

| Command Code                                                                                                                                                                                                                                                                                                                        | Parameter        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| EXEC-DISPA                                                                                                                                                                                                                                                                                                                          | [PROCID=<param>; |
| <b>Notes</b> <ul style="list-style-type: none"> <li>a) The AMO DISPA controls the Displayer installed in the processor specified. The AMO itself runs in the ADS.</li> <li>b) The AMO will remain in dialog mode for several minutes awaiting input. If no input is made, the AMO terminates automatically.</li> </ul>              |                  |
| <b>Example</b> <p>Input:</p> <pre>EXEC-DISP:ALL;</pre> <p>Output:</p> <pre>H500: AMO DISPA STARTED AMO DISPA VARIANT/VERSION F2/003 OF 1993-02-25 DISPLAYER VARIANT/VERSION G1/006 OF 1994-09-27 DISPLAYER-INPUT IN A1 PLEASE:</pre> <p>Input:</p> <pre>*END;</pre> <p style="text-align: right;">* = Request for command input</p> |                  |

### 77.5.2 INPUT-DISPA

The action INPUT-DISPA is only used for WRITE-READ access, and cannot be entered by the user at the administration and maintenance terminal (AMT). Only the text below is displayed at the AMT as an input request to the user (the asterisk which follows the text indicates the ready state):

## DISPA - Operation of the Displayer in the IS

### Functions of the AMO

DISPLAYER-INPUT IN <processor name> PLEASE:  
\*

This output text also indicates that the AMO has successfully executed the preceding command.

The following commands are possible:

|      |                                                          |

| CMD= | SET, CTYPE=LOGNAME, NAME=<string>, UNIT=<param>,           |
|      | , NO=<number>, VAL=<hex>, IDX=<number>, DISPLACE=<number>; |

**Notes**

1. The default setting of numbers by the AMO is 'H' (hexadeximal), in other cases, the numbers are explicitly assigned the suffix 'T' for decimal.
2. Until otherwise specified after the AMO has been started, hexadecimal dump format is always displayed with the correspondig ASCII charakters (branch CHAR) and not interspersed with empty lines (branch DIST).
3. The memory address has the same fomate for the commands LST, SET and DEF (ADR=<selektor>-<offset>).

**77.6 Working with Memory Definitions: DEF & COPY & DEL & LST, DEF & FILE**

By creating memory definitions it is possible to assign meaningful names to memory locations. This makes the Displaying and Modifying of these memory locations a lot easier.

Basically memory definitions can only be used if they are stored in the AMO Work Area, which is always empty after the AMO-DISPA is started. In order to save the definitions permanent they have to be copied to other storage areas. When creating and storing memory definitions, the higher-level storage includes the lower-level storage (i.e. if AREA=HD is specified, the memory definitions are also entered in the save area of the resident Displayer task and in the AMO work area).

Memory definitions are always created for the processor whose Displayer is currently being controlled by the AMO. Any memory definitions with the same name for other processors in the AMO work area or the hard disk save area are overwritten.

Blanks in memory definition names are always removed. Thus, no distinction is made between "DB\_D\_ CPB\_TBL" and "DB\_D\_CPB\_TBL". However, if the name consists entirely of blanks, one blank remains. An asterisk at the beginning or end of an entry of a memory definition name is regarded as a 'wildcard' character, whenever a complete, unambiguous name is not required (e.g. for the DEF command). Thus, "LST,DEF,DB\_D\_DH\*" would list the memory contents for both DB\_D\_DH\_DEV\_TBL and DB\_D\_DH\_LINE\_TBL.

The memory address has the same format for the commands LST, SET, and DEF (ADR=<selector>-<offset>).

## 77.6.1 Types of Memory Definitions

1. Physical memory definitions  
These are simply predefined symbolic names (symbolic addresses), for predefined physical memory addresses.
2. Logical memory definitions  
These define the array dimensions with the start address of the table, the length of the element mode and the index range.

## 77.6.2 Storage of the Memory Definitions

1. AMO Work Area  
The AMO work area contains the necessary data for processing memory contents as hexadecimal files. When the AMO is started, the work area buffer is empty. Up to 400 memory definitions can be buffered.  
For processing memory contents as hexadecimal dump files, only data in the AMO work area is accessed. If necessary, the user must copy the required data from other storage areas into the work area. The AMO work area buffer can be filled by:
  1. creating memory definitions
  2. copying memory definitions
    - a) from the save area of the resident Displayer task in the main memory of the processor accessed
    - b) from the hard disk save area
2. Resident Task Area  
A resident task area is installed in the main memory of each processor in which a resident Displayer task is installed. It allows

restart-safe storing of memory definitions. Up to 50 memory definitions can be saved.

The resident task area buffer can be filled by:

1. creating memory definitions
2. copying memory definitions
  - a) from the AMO work area
  - b) from the hard disk save area
3. Hard Disk Backup Area

The user can assign a file on the hard disk as a save area for reload-safe storage of memory definitions.

The hard disk save area can be filled by:

  1. creating memory definitions
  2. copying memory definitions
    - a) from the AMO work area
    - b) from the save area of the resident Displayer task in the main memory of the processor accessed

### **77.6.3 DEF: Creating Memory Definitions**

Users can create physical and logical memory definitions. The main difference is that for logical memory definitions an array structure must also be defined in addition to the storage address.

Physical memory definitions are used as descriptive symbols for storage addresses, and are intended for repeated use. They are assigned a Dummy Array structure (index range 0 to 0, element length 65535 Bytes), and are entered in the AMO administration area.

Logical memory definitions are used for addressing a storage location as an array, and accessing individual elements.

A created logical memory address can be stored in the AMO work area (available only during AMO execution), or in the save area of the resident task, or in a hard disk save area. Created physical memory addresses can only be stored in the AMO work area.

#### **Command Syntax**

- Defining the Address by specifying the Selector and Offset

`DEF,ADR,name,ADR,selector-offset;`

The selector and offset must be entered as hexadecimal.

- Defining the Address by specifying the Memory Location

## DISPA - Operation of the Displayer in the IS

Working with Memory Definitions: DEF & COPY & DEL & LST,DEF & FILE

```
DEF,ADR,name,TBL,table name,index,offset;
```

The "pointer offset" is the position of the read pointer relative to the beginning of the array element.

- Defining the Array Structure and the Storage Locations

```
DEF,LOGNAME,name,area,element  
length,minimalindex&&maximalindex;
```

The following entries are permitted for the storage locations: AMO, HD and RES

### Examples

The user wants to create an address symbol for the initial entry in the trace buffer of the message tracer. In accordance with the structure of the entries in the trace buffer, the address of the second entry can be found four bytes further on.

Input:

```
*def,adr,entry1,adr,3cf0-099c;
```

Output:

```
DISPLAYER-INPUT IN A1 PLEASE:
```

Input:

```
*def,adr,entry2,tbl,entry1,0,4;
```

Output:

```
DISPLAYER-INPUT IN A1 PLEASE:
```

The following command creates a logical memory definitions from an address symbol. In the example an array structure has been assigned to the trace buffer of the message tracer from the second entry on, with the range of elements numbered from 1 to 25. One element is 30 Bytes long (=length of a standard entry for OS messages).

Input:

```
*def,logname,entry2,amo,30,1&&25;
```

Output:

```
DISPLAYER-INPUT IN A1 PLEASE:
```

## 77.6.4 LST,DEF: Listing Memory Definitions

### Command Syntax

```
LST,DEF,[name],area;
```

The name may also be partially qualified by entering an asterisk at the beginning and/or the end of the text string. This is interpreted as a wildcard symbol. If no name or partial name is entered all memory definitions are listed.

The following storage areas can be specified: AMO, HD and RES.

### Example

In connection with the example given above the user wants to display all memory definitions in the AMO Work Area.

Input:

```
*lst,def,,amo;
```

Output:

```
DEFINITIONS IN AMO DISPA

NAME                SEL      OFF      ELEM_L  MIN_I  MAX_I
PID
ENTRY1              3CF0H  099CH   FFFFH   0H     0H   A1
ENTRY2              3CF0H  09BAH   1EH     1H     19H  A1
DISPLAY-INPUT IN A1 PLEASE:
```

Description of the Headers:

|        |                                                |
|--------|------------------------------------------------|
| NAME   | Name of the defined memory                     |
| SEL    | Selector of the defined memory                 |
| OFF    | Offset of the defined memory                   |
| ELEM_L | Element length of the defined memory           |
| MIN_I  | Minimum index of the defined memory            |
| MAX_I  | Maximum index of the defined memory            |
| PID    | Processor identification of the defined memory |

## 77.6.5 COPY: Copying Memory Definitions

The memory addresses can be copied from their respective storage locations into the AMO work area during AMO execution, into the save area of the resident Displayer task, or into the hard disk save area.

### Command Syntax

- General Procedure for Copying between Storage Areas

```
COPY,DEF,[name],[source area-target area];
```

The default setting is for copying from the resident task backup area to the AMO work area (RES-AMO).

## DISPA - Operation of the Displayer in the IS

Working with Memory Definitions: DEF & COPY & DEL & LST, DEF & FILE

- Copying the Layout Data Module into the AMO Work Area

```
COPY, DBL, [name];
```

Since there are no layout data modules in the IHS, this command is rejected with the advisory „H3: REQUESTED FUNCTION NOT AVAILABLE“.

### Example

The user wants to copy all memory definitions, which start with the string "ENT", from resident Task Area to the AMO Work Area.

Input:

```
*copy, def, ent*, res-amo;
```

Output:

```
DISPLAYER-INPUT IN A1 PLEASE:
```

Input:

```
*lst, def, , amo;
```

Output:

```
DEFINITIONS IN AMO DISPA
```

| NAME   | SEL   | OFF   | ELEM_L | MIN_I | MAX_I | PID |
|--------|-------|-------|--------|-------|-------|-----|
| ENTRY1 | 3CF0H | 099CH | FFFFH  | 0H    | 0H    | A1  |
| ENTRY2 | 3CF0H | 09BAH | 1EH    | 1H    | 19H   | A1  |

```
DISPLAY-INPUT IN A1 PLEASE:
```

## 77.6.6 DEL: Deleting Memory Definitions

Memory definitions are deleted in order to create free storage space in the corresponding storage location.

The AMO work area is automatically cleared when the AMO DISPA is terminated.

### Command Syntax

```
DEL, DEF, [name], area;
```

## 77.6.7 FILE: Assigning a File as a Hard Disk Backup Area

This file is used to store the memory definitions transferred to the hard disk backup area with COPY command or the DEF command.

Using the hard disk backup area not only ensures that the memory definitions are reload-safe, but also has the advantage of enabling memory definitions to be copied onto a portable data medium (e.g. cartridge) for use in other systems, by simply copying the file.

**Command Syntax**

```
FILE,filename,[number];
```

The specified filename must be valid within the system.

If the number of memory definitions to be stored is specified in this command, the AMO assumes that the file does not yet exist, and attempts to create it with the specified size. The number of memory definitions to be stored does not need to be exact, since the file is dynamically expanded if necessary.

If no number is entered, the AMO assumes that the file already exists. In this case the AMO opens the file and the number of memory definitions it contains is listed.

If a file with the same name is already assigned for processing (with the DUMP or PATCH command), it cannot be opened a second time. In this case the AMO will respond with the error message F16. However users are permitted to use the FILE-command to repeatedly open different files for subsequent processing during the same displayer dialog.

**Example**

Input:

```
*file,:dbd:els/defsavl;
```

Output:

```
DISPLAYER-INPUT IN A1 PLEASE:
```

The specified file already exists. Otherwise an error message would have been displayed.

## **77.7 Displaying and Modifying of Memory Contents: LST & SET**

### **77.7.1 LST,ADR/DA/LOGNAME: Listing Memory Contents without High-Level Access**

When using logical memory definitions, the output is always in bytes. In all other cases, the user can choose between output in bytes (BYTE), word output (WORD) or double-length (double-precision) word output (DWORD).

## DISPA - Operation of the Displayer in the IS

### Displaying and Modifying of Memory Contents: LST & SET

#### Command Syntax

- Output using an Address Symbol

`LST,ADR,name,outputstyle,number;`

The number of memory units to be displayed must be entered in decimal form.

- Output using a Direct Address

`LST,DA,selector-offset,outputstyle,number;`

Selector and Offset must be entered as hexadecimal numbers, separated by a hyphen.

The number of memory units to be displayed must be entered in decimal form.

- Output using a logical Memory Definition

`LST,LOGNAME,name,indices;`

The indices must be entered in decimal form; either linked single values or index ranges are permitted.

#### Examples

The address of the Static Task Table is entered as 0F38:0265 in the linkage listing of the ADS database. In the Prolib Listing, the element length is defined as 7.

Input:

```
*lst,da,f38-265,byte,140;
```

Output:

```
                                ADDRESS: 0F38H:0265H
CONTENTS  HEX                                (ASCII)
  0(   0)  0D55542000000814  4654200000021B46  .UT ....FT ....F
 10(  16)  54200000020B4143  541400020C414652  T ....ACT....AFR
 20(  32)  0001021846415300  0102194655500001  ....FAS....FUP..
 30(  48)  0201545420010105  1520202000000215  ..TT ....
 40(  64)  2020200000021520  2020000002152020  ....
 50(  80)  2000000215202020  0000021520202000  ....
 60(  96)  0002152020200000  0215202020000002  ...
 70( 112)  1520202000000215  2020200000021520  .
 80( 128)  2020000002152020  20000002          ....
DISPLAYER-INPUT IN A1 PLEASE:
```

The user wants to create a logical memory definition for the Static Task Table. This memory definition is also stored in the backup area of the resident displayer task for later use.

Input:

```
*def,adr,static_task_tbl,adr,0f38-0265;
```

Output:

## DISPA - Operation of the Displayer in the IS

### Displaying and Modifying of Memory Contents: LST & SET

```
DISPLAYER-INPUT IN A1 PLEASE:
```

Input:

```
*def,logname,static_task_tbl,res,7,1&&20;
```

Output:

```
DISPLAYER-INPUT IN A1 PLEASE:
```

Now the elements 1, 2, 3 and 8 of the Static Task Table should be displayed.

Input:

```
*lst,logname,static_task-tbl,1&&3&8;
```

Output:

```
TABLE: STATIC_TASK_TBL
INDEX: 0001H ADDRESS: 0F38H:0265H
CONTENTS HEX (ASCII)
0( 0) 0D555420000008 .UT ...
TABLE: STATIC_TASK_TBL
INDEX: 0002H ADDRESS: 0F38H:026CH
CONTENTS HEX (ASCII)
0( 0) 14465420000002 .FT ...
TABLE: STATIC_TASK_TBL
INDEX: 0003H ADDRESS: 0F38H:0273H
CONTENTS HEX (ASCII)
0( 0) 1B465420000002 .FT ...
TABLE: STATIC_TASK_TBL
INDEX: 0008H ADDRESS: 0F38H:0296H
CONTENTS HEX (ASCII)
0( 0) 01545420010105 .TT ...
DISPLAYER-INPUT IN A1 PLEASE:
```

## 77.7.2 LST,INT: Displaying of Memory Contents with High-Level Access

In the high-level access mode, the user defines various output types (pre-defined in the MML interface) for memory definitions, or specifies groups of related memory contents.

When displaying the save area of the boot communication area (BCASA) on the operator console (SEL=SCREEN) is requested, the AMO interrupts the output after every 2000 bytes, giving the operator the opportunity to abort the function. The reason is the large size of the BCA, with approximate 48 kbyte. The output order to a hard disk file takes the full size of the BCASA. Each command needs a new file name. This prevents inadvertant overwriting of data, in a file that already exists (see message F29).

### Command Syntax

```
LST,INT,output_type;
```

## DISPA - Operation of the Displayer in the IS

### Displaying and Modifying of Memory Contents: LST & SET

The permitted values for output\_type can be seen in Section 77.10 (parameter TYPE).

#### Example

Input:

```
*lst,int,dchs;
```

Output:

```
TABLE: DASS_HW_CHAN_D_STATE_TBL
CONTENTS HEX                                     (ASCII)
 0(   0) 4242424242424242 0102424242424242 BBBBBBBB..BBBBBB
10(  16) 4242424242424242 4242424242424242 BBBBBBBBBBBBBBBB
20(  32) 4242424242424242 4242424242424242 BBBBBBBBBBBBBBBB
30(  48) 4242424242424242 4242424242424242 BBBBBBBBBBBBBBBB
40(  64) 42                                     B
DISPLAYER-INPUT IN A1 PLEASE:
```

The user wants to copy BCA save area into a hard disk file.

Input:

```
*lst,int,bcasa,hd,:pds:cer/bcafile;
```

Output:

```
H6: 49152T BYTES COPIED INTO FILE :PDS:CER/BCAFILE
DISPLAYER-INPUT IN A1 PLEASE:
```

## 77.7.3 SET: Modifying Memory Contents

In order to help avoid typing errors, the number of new values entered must correspond to the number of memory units to be changed. In addition the length of the new values must exactly correspond to the memory output option selected (e.g. a 2-digit hexadecimal number if BYTE was selected).

#### Command Syntax

The number of memory units to be changed must be entered in decimal form.

The new values must be entered as hexadecimal numbers and separated by hyphens.

The input can be made in BYTE-, WORD- oder DWORD-format.

- Modification using an Address Symbol

```
SET,ADR,name,input_style,number,values;
```

- Modification using a Direct Address

```
SET,DA,selector-offset,input_style,number,values;
```

## DISPA - Operation of the Displayer in the IS

### Displaying and Modifying of Memory Contents: LST & SET

The selector and offset must be entered as hexadecimal numbers and separated by hyphens.

- Modification using a logical Memory Definition

```
SET,LOGNAME,name,input_style,number,values,indices,offset;
```

The indices of the array elements concerned must be entered in decimal form; either linked single values or index ranges are permitted.

The offset of the memory area to be changed must be entered in decimal form; it is the displacement of the pointer relative to the beginning of the array element.

### Example

For the purpose of this example we will assume that the device type for the terminal task is to be changed from 02 to 05.

The address of the Static Task Table is entered as 0F38:0265 in the linkage listing of the ADS database. In the Prolib listing, the element length is defined as 7 and the offset of the device type relative to the beginning of the element is 6.

In most cases the element 3 is the element for the terminal task.

Input:

```
*def,adr,tt_elem,adr,0f38-0273;
```

Output:

```
DISPLAYER-INPUT IN A1 PLEASE:
```

Input:

```
*lst,adr,tt_elem,byte,7;
```

Output:

```
TABLE: TT_ELEM                ADDRESS: 0F38H:0273H
CONTENTS HEX                  (ASCII)
0( 0) 01545420010102          .TT ...
DISPLAYER-INPUT IN A1 PLEASE:
```

Input:

```
*set,adr,tt_elem,byte,7,01-54-54-20-01-01-05;
```

Output:

```
DISPLAYER-INPUT IN A1 PLEASE:
```

Input:

```
*lst,adr,tt_elem,byte,7;
```

Output:

## DISPA - Operation of the Displayer in the IS

Displaying and Modifying of File Contents: E & DUMP & PATCH

```
TABLE: TT_ELEM
ADDRESS: 3E20H:00FBH
CONTENTS HEX (ASCII)
0 ( 0) 01545420010105 .TT ...
DISPLAYER-INPUT IN A1 PLEASE:
```

## 77.8 Displaying and Modifying of File Contents: E & DUMP & PATCH

### 77.8.1 E: Assigning a File for processing the File Contents

Files which are to be processed with the DUMP command or PATCH command have to be assigned first by using this command.

If a file with the same name has already been assigned as a hard disk backup area, it cannot be opened a second time. In this case the displayer AMO will respond with the error message F16. However users are permitted to use the E-command to repeatedly open different files for subsequent processing during the same displayer dialog session.

#### Command Syntax

```
E, filename;
```

The specified file must already exist.

### 77.8.2 DUMP: Listing File Contents

The file whose contents are to be listed must first be assigned with the E command.

The addresses, which are implemented in the memory definitions are interpreted as 4-Byte Integers, which define the displacement of the data to be output relative to the beginning of the file. The same applies to the addresses output with the LST command.

When using logical memory definitions, the output is always in bytes. In all other cases the user can choose between output in bytes (BYTE), word output (WORD) or double-length (double-precision) word output.

#### Command Syntax

- Output using an Address Symbol

```
DUMP, ADR, name, output, number;
```

The number of memory units to be output must be entered in decimal form.

## DISPA - Operation of the Displayer in the IS

### Displaying and Modifying of File Contents: E & DUMP & PATCH

- Output using a Direct Address (Pointer Offset/Displacement)

DUMP,DA,offset,output,number;

The pointer offset must be entered in hexadecimal form, whereas the number of memory units to be output must be entered in decimal form.

- Output using a logical Memory Definition

DUMP,LOGNAME,name,indices;

The indices must be entered in decimal form; either linked single values or index ranges are permitted.

### Example

It is assumed that the HD saved memory definitions are stored in the file defsav1. The user wants to list the first two memory definitions.

Input:

```
*e,:dbdb:els/defsav1;
```

Output:

```
DISPLAYER-INPUT IN A1 PLEASE:
```

Input:

```
*def,adr,entry_tbl,adr,0-0;
```

Output:

```
DISPLAYER-INPUT IN A1 PLEASE:
```

Input:

```
*def,logname,entry_tbl,amo,37,1&&2;
```

Output:

```
DISPLAYER-INPUT IN A1 PLEASE:
```

Input:

```
*dump,logname,entry_tbl,1&&2;
```

Output:

```
TABLE: ENTRY_TBL
INDEX: 0000H          ADDRESS: 0000H:0000H

DISPLAYER INPUT IN A1 PLEASE:
```

### 77.8.3 PATCH: Changing File Contents

This feature is not intended to replace the functions of the AMO PATCH. The displayer does not use memory address in order to change the appropriate memory area on the hard disk; in fact for the purpose of this displayer function it is irrelevant whether the file to be processed corresponds to any memory locations on the hard disk at all.

The file whose contents are to be modified must first be assigned with the E command.

In order to help avoid typing errors, the number of new values entered must correspond to the number of memory units to be changed. In addition the length of the new values must exactly correspond to the memory output option selected (e.g. a 2-digit hexadecimal number if BYTE was selected).

#### Command Syntax

The number of memory units to be changed must be entered in decimal form. The new values must be entered as hexadecimal numbers and separated by hyphens.

- Modification using an Address Symbol

```
PATCH,ADR,name,input,number,values;
```

- Modification using a Direct Address

```
PATCH,DA,offset,input,number,values;
```

The offset must be entered as hexadecimal numbers.

- Modification using a logical Memory Definition

```
PATCH,LOGNAME,name,input,number,values,indices,offset;
```

The indices of the array elements concerned must be entered in decimal form; either linked single values or index ranges are permitted.

The offset of the memory area to be changed must be entered in decimal form; it is the displacement of the pointer relative to the beginning of the array element.

#### Example

In connection with the DUMP-example given above the user wants to correct the address of the second memory from 34C0:5170 to 34A0:CEDA.

Input:

```
*patch,logname,entry_tbl,dword,1,34a0ceda,1,1a;
```

Output:

## DISPA - Operation of the Displayer in the IS

### Displaying and Modifying of File Contents: E & DUMP & PATCH

DISPLAYER-INPUT IN A1 PLEASE:

Input:

```
*dump,logname,entry_tbl,1&&2;
```

Output:

```
TABLE: ENTRY_TBL

|                 | For PATCH, SET:                                                                                                                                                                    |                                                                            |
|                 | Hexadecimals 00 - FF,<br>Hexadecimals 0000 - FFFF,<br>Hexadecimals 00000000 - FFFFFFFF                                                                                             |                                                                            |

## 77.11 Error Messages and Advisories

### 77.11.1 Error Messages

F01: COMMUNICATION WITH DISPLAYER IN <xxxxx> IMPOSSIBLE

F02: WRITING ACCESS FAILED (START ADDRESS = <xxxx>H:<xxxx>H)

F03: NO TABLE DEFINITION EXISTS WITH THIS NAME

F04: OVERFLOW OF DEFINITION TABLE IN AMO

F05: OVERFLOW OF RESIDENT DEFINITION TABLE

F06: INDEX ILLEGAL

F07: DATABASE ACCESS FAILED

F08: DEFINITION REJECTED

F09: ADDRESS TABLE NOT FOUND

F10: DISPLACEMENT ILLEGAL

F11: INPUT FOR "UNIT", "NO", "VAL" INCONSISTENT

The number of values specified for "VAL" must be entered in the parameter "NO"; this helps detect input errors.  
The values specified for "VAL" may not exceed the maximum length defined by the parameter "UNIT".

F12: DATABASE TABLE DOES NOT EXIST

F13: LTG NUMBER EXCEEDS <xx>H

F14: LTU NUMBER EXCEEDS <xx>H

F15: INPUT FOR "TYPE" AND "SEL" INCONSISTENT

For example, the input TYPE=CPB is inconsistent with SEL=DTI

F16: FILE "<xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx>" ALREADY ASSIGNED

In order to assign a file, the AMO must be terminated and restarted.

F17: CREATION OF FILE FAILED WITH STATUS <xxxx>H

Status output is the same as FAM call.

F18: OPENING OF FILE FAILED WITH STATUS <xxxx>H

Status output is the same as FAM call.

F19: SEEKING IN FILE FAILED WITH STATUS <xxxx>H

Status output is the same as FAM call.

F20: READING FROM FILE FAILED WITH STATUS <xxxx>H

Status output is the same as FAM call.

F21: WRITING TO FILE FAILED WITH STATUS <xxxx>H

Status output is the same as FAM call.

F22: CLOSING OF FILE FAILED WITH STATUS <xxxx>H

## **DISPA - Operation of the Displayer in the IS**

### **Error Messages and Advisories**

Status output is the same as FAM call.

F23: NO FILE ASSIGNED

...therefore no hard disk backup area can be used.

F24: NECESSARY PARAMETER VALUE MISSING

F29: FILE "<xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx>" ALREADY EXISTS

A file with the same name already exists on the hard disk and will NOT be overwritten. Enter a new name.

F30: ALLOCATION OF TEMPORARY SEGMENT FAILED; NOT ENOUGH MEMORY AVAILABLE

The temporary segment for intermediate storage of the BCASA-data could not be created in the system. There is not enough free main storage available.

## **77.11.2 Advisories**

H01: ONLY <xxxx>H BYTES CAN BE ACCESSED

This messages explains the reason for a failed attempt at read or write access.

H02: NO DATA FOUND

This message explains the reason for a failed attempt at data output.

H03: REQUESTED FUNCTION NOT AVAILABLE

This messages means that the input function or command is not available on the processor accessed, or is not applicable.

## 78 DISPS - Operation of the Displayer in the SWU

|                      |                                                                     |                               |

| Restrictions         | Working with Memory Definitions: DEF & LST, DEF & COPY & DEL & FILE | Parameter Description         |
| Interrelationships   | Displaying and Modifying of Memory Contents: LST & SET              | Error Messages and Advisories |
| General              | Displaying and Modifying of File Contents: E & DUMP & PATCH         |                               |
| Functions of the AMO | Parameter Tree                                                      |                               |

### 78.1 Restrictions

### 78.2 Interrelationships

AMO DISPS communicates with the Displayer task resident in the main memory of the SWU processor to be accessed. The resident Displayer task and the message tracer task are contained in the same subsystem.

### 78.3 General

The Memory Displayer is a tool which allows the system specialist to read and also to modify the contents of various predefined and/or specified memories at the service terminal.

The AMO DISPS controls the communication to the terminal. Without the AMO, the Displayer cannot execute its tasks, since the AMO is used for displaying the memory contents read by the Displayer at the service terminal, and the Displayer tasks themselves are started via the terminal.

The Displayer is an online test tool which can be used for component integration and system tests, by field technicians and customers. The Displayer can operate in all processors (base processors and group processors) in which the administration and maintenance system is loaded.

The AMO DISPS contains the following features:

- Output of memory contents as a hexadecimal dump, both in a high-level operation (e.g. for all call processing memories maintaining an established connection) and in a logical level operation (e.g. for all memories specified in the AMO with name, address and array dimensions).
- Creation of user-specific, logical memory definitions for any given memory address, even as a table.
- Determining the addresses and array dimensions for the most important SWU database memories.
- Optional storage of the addresses and array dimensions for further memories defined by the user either in the AMO work area (available only during AMO execution), in the save area of the resident Displayer task in each processor (restart-safe), or in a hard disk save area (reload-safe).
- Changing the memory contents in a logical level operation (contents of memories, whose names, addresses and array dimensions must be specified by the user in the AMO).
- Displaying and changing memory contents in a logical level operation (core image of a memory whose name, address offset and array dimensions must be specified by the user in the AMO).
- Switching between processor units with memories to be displayed in a logical level operation.

#### Limits of the Memory Displayer

The Displayer cannot and should not replace the functions of the debugger. It should rather be considered as an addition geared towards pin-point and problem-oriented diagnosis.

#### Note

For the IS memories, the DISPA tool is available, which functions analogously to this AMO (see DISPA AMO-description).

### 78.3.1 Functional Overview

The following functions are realized by the AMO:

- |    |      |                                                                                                                                                                                                                          |
|----|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a. | CHAR | On/off switch for character display of hexadecimal dump format.<br>The hexadecimal dump format can be displayed with hexadecimal characters only or together with the corresponding ASCII characters. Default Value: ON. |
| b. | COPY | Copying memory addresses                                                                                                                                                                                                 |
| c. | DEF  | Creating memory addresses                                                                                                                                                                                                |

- d. DEL Deleting memory definitions
- e. DIST Determining the number of empty lines to be inserted between the lines output in a hexadecimal dump format. Default Value: 0.
- f. DUMP Listing file contents
- g. E Assigning a file in order to edit file contents
- h. END Terminating the AMO
- i. EV Converting decimal to hexadecimal and vice versa, also binary output
- j. FILE Assigning a file as hard disk save area
- k. LST Listing the memory contents
- l. P Switching to the Displayer task in another processor  
The user sees which processor his currently accessing with the aid of the input request message
- m. PATCH Changing file contents
- n. SET Changing memory contents

## 78.4 Functions of the AMO

- [EXEC-DISPS](#) : Start of AMO DISPS
- [DISPLAY-DISPS](#) Displays logical device number of a station
- [INPUT-DISPS](#) : Data input request in dialog mode

### 78.4.1 EXEC-DISPS

#### Procedure Overview

| Commandcode | Parameter       |
|-------------|-----------------|
| EXEC-DISPS  | PROCID=<param>; |

#### Notes

- a) The AMO DISPS controls the Displayer installed in the processor specified. The AMO itself runs in the ADS.
- b) The AMO will remain in dialog mode for several minutes awaiting input. If no input is made, the AMO terminates automatically.

#### Example

Input:

## DISPS - Operation of the Displayer in the SWU

### Functions of the AMO

<EXEC-DISPS:BPA;

#### Output:

```
H500: AMO DISPS STARTED
AMO DISPS VARIANT/VERSION G1/002 OF 1994-09-29
DISPLAYER VARIANT/VERSION G1/007 OF 1994-09-29
DISPLAYER-INPUT IN BPA      PLEASE:
```

#### Input:

\*END; \* = Request for command input

## 78.0.1 78.4.3 DISPLAY-DISPS

### Procedure Overview

To ease up service actions, the new DISPLAY action was introduced for a quick call of DISPS data, with three options:

#### 1.Station number

##### Input:

DISPLAY-DISPS:STN,<stno>;

is the equivalent of:

EXEC-DISPS:BP;

LST, SW, LODEN, STNO, <stno>, VCE;

#### 2.Line (physical / logical) in hexadecimal

##### Input:

DISPLAY-DISPS:LINE,<LINE>;

is the equivalent of (LINE in decimal):

EXEC-DISPS:BP;

LST, SW, LODEN, LN, <LTG>, <LINE>;

#### 3.Circuit

##### Input:

DISPLAY-DISPS:CIRC,<LTG>,<LTU>,<SLOT>,<CCT>;

is the equivalent of:

EXEC-DISPS:BP;

LST, SW, LODEN, CIR, <LTG>,<LTU>,<SLOT>,<CCT>;

## Output:

```

H500:  AMO DISPS STARTED
        AMO DISPS VARIANT/VERSION 4A/001 OF 2014-03-07
        DISPLAYER VARIANT/VERSION 5E/001 OF 2016-05-26
        STATION NUMBER: 12100

## 78.5 Working with Memory Definitions: DEF & LST,DEF & COPY & DEL & FILE

By creating memory definitions it is possible to assign meaningful names to memory locations. This makes the Displaying and Modifying of these memory locations a lot easier.

Basically memory definitions can only be used if they are stored in the AMO Work Area, which is always empty after the AMO-DISPS is started. In order to save the definitions permanent they have to be copied to other storage areas. When creating and storing memory definitions, the higher-level storage includes the lower-level storage (i.e. if AREA=HD is specified, the memory definitions are also entered in the save area of the resident Displayer task and in the AMO work area).

The Resident Task Area always contains the constant CC and GP layout element table. Those definitions are available after the command DEF,DBL.

Memory definitions are always created for the processor whose Displayer is currently being controlled by the AMO. Any memory definitions with the same name for other processors in the AMO work area or the hard disk save area are overwritten.

Blanks in memory definition names are always removed. Thus, no distinction is made between "DB\_D\_ CPB\_TBL" and "DB\_D\_CPB\_TBL". However, if the name consists entirely of blanks, one blank remains. An asterisk at the beginning or end of an entry of a memory definition name is regarded as a 'wildcard' character, whenever a complete, unambiguous name is not required (e.g. for the DEF command). Thus, "LST,DEF,DB\_D\_DH\*" would list the memory contents for both DB\_D\_DH\_DEV\_TBL and DB\_D\_DH\_LINE\_TBL.

The memory address has the same format for the commands LST, SET, and DEF (ADR= <selector> -<offset>).

### **78.5.1 Types of Memory Definitions**

- a) Physical memory definitions  
These are simply predefined symbolic names (symbolic addresses), for predefined physical memory addresses.
- b) Logical memory definitions  
These define the array dimensions with the start address of the table, the length of the element mode and the index range.
- c) High-level memory definitions  
These are handled by the Displayer code and used with DBARs (database access routines), in some cases with the aid of the layout data modules.

### **78.5.2 Storage of the Memory Definitions**

- 1. Layout Data Module  
Each CC and LTG has a corresponding layout data module. It is used for accessing predefined memories (storage areas) in the SWU database. For each of these memories, it contains the following information:
  - 1. the memory name
  - 2. the logical data for determining the memory address

## **DISPS - Operation of the Displayer in the SWU**

Working with Memory Definitions: DEF & LST, DEF & COPY & DEL & FILE

3. the memory address itself
  4. the index range
  5. the length of the elementary mode
2. AMO Work Area
- The work area in the AMO task contains the necessary data for processing memory contents as hexadecimal files. When the AMO is started, the work area buffer is empty. Up to 400 memory definitions can be buffered.
- For processing memory contents as hexadecimal dump files, only data in the AMO work area is accessed. If necessary, the user must copy the required data from other storage areas into the work area. The AMO work area buffer can be filled by:
1. creating memory definitions
  2. copying memory definitions
    - a) from the layout data module in the processor accessed
    - b) from the save area of the resident Displayer task in the main memory of the processor accessed
    - c) from the hard disk save area
3. Resident Task Area
- A resident task area is installed in the main memory of each processor, in which a resident Displayer task is installed. It allows restart-safe storing of memory definitions. Up to 50 memory definitions can be saved.
- The resident task area buffer can be filled by:
1. creating memory definitions
  2. copying memory definitions
    - a) from the AMO work area
    - b) from the hard disk save area
4. Hard Disk Backup Area
- The user can assign a file on the hard disk as a save area for reload-safe storage of memory definitions.
- The hard disk save area can be filled by:
1. creating memory definitions
  2. copying memory definitions
    - a) from the AMO work area
    - b) from the save area of the resident Displayer task in the main memory of the processor accessed

### 78.5.2.1 DEF: Creating Memory Definitions

Users can create physical and logical memory definitions. The main difference is that for logical memory definitions an array structure must also be defined in addition to the storage address.

Physical memory definitions are used as descriptive symbols for storage addresses, and are intended for repeated use. They are assigned a Dummy Array structure (index range 0 to 0, element length 65535 Bytes), and are entered in the AMO administration area.

Logical memory definitions are used for addressing a storage location as an array, and accessing individual elements.

A created logical memory address can be stored in the AMO work area (available only during AMO execution), or in the save area of the resident task, or in a hard disk save area. Created physical memory addresses can only be stored in the AMO work area.

#### Command Syntax

- Defining the Address by specifying the Selector and Offset

```
DEF,ADR,name,ADR,selector-offset;
```

The selector and offset must be entered as hexadecimals.

- Defining the Address by specifying the Memory Location

```
DEF,ADR,name,TBL,table name,index,offset;
```

The "pointer offset" is the position of the read pointer relative to the beginning of the array element.

- Defining the Array Structure and the Storage Locations

```
DEF,LOGNAME,name,area,element  
length,minimalindex&&maximalindex;
```

The following entries are permitted for the storage locations: AMO, HD and RES

#### Examples

The user wants to create an address symbol for the initial entry in the trace buffer of the message tracer. In accordance with the structure of the entries in the trace buffer, the address of the second entry can be found four bytes further on.

Input:

```
*def,adr,entry1,adr,3cf0-099c;
```

Output:

```
DISPLAYER-INPUT IN BPA PLEASE:
```

Input:

## DISPS - Operation of the Displayer in the SWU

Working with Memory Definitions: DEF & LST, DEF & COPY & DEL & FILE

```
*def,adr,entry2,tbl,entry1,0,4;
```

Output:

```
DISPLAYER-INPUT IN BPA PLEASE:
```

The following command creates a logical memory definitions from an address symbol. In the example an array structure has been assigned to the trace buffer of the message tracer from the second entry on, with the range of elements numbered from 1 to 25. One element is 30 Bytes long (=length of a standard entry for OS messages).

Input:

```
*def,logname,entry2,amo,30,1&&25;
```

Output:

```
DISPLAYER-INPUT IN BPA PLEASE:
```

### 78.5.2.2 LST,DEF: Listing Memory Definitions

#### Command Syntax

```
LST,DEF,[name],area;
```

The name may also be partially qualified by entering an asterisk at the beginning and/or the end of the text string. This is interpreted as a wildcard symbol. If no name or partial name is entered all memory definitions are listed.

The following storage areas can be specified: AMO, HD and RES.

#### Example

In connection with the example given above the user wants to display all memory definitions in the AMO Work Area.

Input:

```
*lst,def,,amo;
```

Output:

```
DEFINITIONS IN AMO DISPS
```

| NAME   | SEL   | OFF   | ELEM_L | MIN_I | MAX_I | PID |
|--------|-------|-------|--------|-------|-------|-----|
| ENTRY1 | 3CF0H | 099CH | FFFFH  | 0H    | 0H    | BPA |
| ENTRY2 | 3CF0H | 09BAH | 1EH    | 1H    | 19H   | BPA |

```
DISPLAYER-INPUT IN BPA PLEASE:
```

Description of the Headers:

|      |                                |
|------|--------------------------------|
| NAME | Name of the defined memory     |
| SEL  | Selector of the defined memory |
| OFF  | Offset of the defined memory   |

|        |                                                |
|--------|------------------------------------------------|
| ELEM_L | Element length of the defined memory           |
| MIN_I  | Minimum index of the defined memory            |
| MAX_I  | Maximum index of the defined memory            |
| PID    | Processor identification of the defined memory |

### 78.5.3 COPY: Copying Memory Definitions

**The memory addresses can be copied from their respective storage locations into the AMO work area during AMO execution, into the save area of the resident Displayer task, or into the hard disk save area.**

#### Note

When copying logical memory definitions from a layout data module for memories with more than one data blocks, the additional memory blocks are marked with a "#" followed by a 2-digit block number appended to the memory name.

The functions "copy" and "lst,def" are intended only for those memory blocks that actually have a physical memory area. Flexama memories without a valid memory address may exist in the layout data modules, but they are not displayed to the user.

#### Command Syntax

- Copying the Layout Data Module into the AMO Work Area

```
COPY,DBL,[name];
```

If the name is missing all memory definitions are going to be copied.

- General Procedure for Copying between Storage Areas

```
COPY,DEF,[name],[source area-target area];
```

The default setting is for copying from the resident task backup area to the AMO work area (RES-AMO).

#### Examples

The user wants to copy all memory definitions, which contain the string "CP\_DEV" as part of their table name, from the Layout Data Module in Base Processor A to the AMO Work Area.

Input:

```
*copy,dbl,*cp_dev*;
```

Output:

```
DISPLAYER-INPUT IN BPA PLEASE:
```

Input:

## DISPS - Operation of the Displayer in the SWU

Working with Memory Definitions: DEF & LST, DEF & COPY & DEL & FILE

```
*lst,def,,amo;
```

Output:

```
DEFINITIONS IN AMO DISPS

### 78.5.4 DEL: Deleting Memory Definitions

**Memory definitions are deleted in order to create free storage space in the corresponding storage location.**

The AMO work area is automatically cleared when the AMO DISPS is terminated.

#### Command Syntax

```
DEL,DEF,[name],area;
```

## **78.5.5 FILE: Assigning a File as a Hard Disk Backup Area**

This file is used to store the memory definitions transferred to the hard disk backup area with COPY command or the DEF command.

Using the hard disk backup area not only ensures that the memory definitions are reload-safe, but also has the advantage of enabling memory definitions to be copied onto a portable data medium (e.g. cartridge) for use in other systems, by simply copying the file.

### **Command Syntax**

```
FILE,filename,[number];
```

The specified filename must be valid within the system.

If the number of memory definitions to be stored is specified in this command, the AMO assumes that the file does not yet exist, and attempts to create it with the specified size. The number of memory definitions to be stored does not need to be exact, since the file is dynamically expanded if necessary.

If no number is entered, the AMO assumes that the file already exists. In this case the AMO opens the file and the number of memory definitions it contains is listed.

If a file with the same name is already assigned for processing (with the DUMP or PATCH command), it cannot be opened a second time. In this case the AMO will respond with the error message F16. However users are permitted to use the FILE-command to repeatedly open different files for subsequent processing during the same displayer dialog.

### **Example**

Input:

```
*file,:dbd:els/defsavl;
```

Output:

```
DISPLAYER-INPUT IN BPA PLEASE:
```

The specified file already exists. Otherwise an error message would have been displayed.

**78.6 Displaying and Modifying of Memory Contents: LST & SET**

**78.6.1 LST,ADR/DA/LOGNAME: Listing Memory Contents without High-Level Access**

When using logical memory definitions, the output is always in bytes. In all other cases, the user can choose between output in bytes (BYTE), word output (WORD) or double-length (double-precision) word output (DWORD).

**Command Syntax**

- Output using an Address Symbol  
`LST,ADR,name,outputstyle,number;`  
The number of memory units to be displayed must be entered in decimal form.
- Output using a Direct Address  
`LST,DA,selector-offset,outputstyle,number;`  
Selector and Offset must be entered as hexadecimal numbers, separated by a hyphen.  
The number of memory units to be displayed must be entered in decimal form.
- Output using a logical Memory Definition  
`LST,LOGNAME,name,indices;`  
The indices must be entered in decimal form; either linked single values or index ranges are permitted.

**Examples**

Input:

```
*copy,dbl,db_d_cp_logical_dev_tbl;
```

Output:

```
DISPLAYER-INPUT IN BPA PLEASE:
```

The user wants to display the device-memory for Loden 2 and 5.

Input:

```
*lst,logname,db_d_cp_logical_dev_tbl,2&5;
```

Output:

```
TABLE: DB_D_CP_LOGICAL_DEV_TBL
INDEX: 0002H ADDRESS: 3E20H:006EH
CONTENTS HEX (ASCII)
0( 0) 0000000000000000 00000082600F0002 .....
```

## DISPS - Operation of the Displayer in the SWU

### Displaying and Modifying of Memory Contents: LST & SET

```

```

Output:

```
ADDRESS: 3E20H:010AH
CONTENTS HEX (ASCII)
0( 0) 0002 0002 0003 0002 0003 .....
DISPLAYER-INPUT IN BPA PLEASE:
```

Therefor the reference indices are plausible.

## 78.6.2 LST,INT/SW: Displaying of Memory Contents with High-Level Access

In the high-level access mode, the user defines various output types (pre-defined in the MML interface) for memory definitions, or specifies groups of related memory contents.

If a selection of certain memory-elements is expected, this takes place by user-orientated terms (station number, loden, ..).

## DISPS - Operation of the Displayer in the SWU

Displaying and Modifying of Memory Contents: LST & SET

### technical Notes

When using high-level memory definitions for displaying call processing memories, the DISPLAYER on principle always shows the memory content of the corresponding 'active' processor. That means, it is not possible during a DISPS-connection with a processor in 'standby'-state, to output its memories using the high-level memory access. Since the addresses of memories are identically in a 'standby'- and an 'active'-Processor, it is possible to use the existing logical memory definition to output the data. This function remains in the current connected processor!

Status data (LST,SW,STA,..?) is output in words.

The output of device memories (DH and CP) for S0-bus stations is done with an other concept as for normal ports. The reason is, that a S0-bus port may have up to 8 terminal devices arranged. As normally the position (=DI) of a terminal device on S0-bus is unknown to the user, therefore this value is handled like a SERVICE INDICATOR (values see Abschnitt 78.9 parameter 'DI'). In this case the DISPS puts out the position (TSI) and the device memories of ALL terminal devices which correspond to the given service. The TSI (terminal selection identifier) defines the physical position of a terminal device at the S0-bus. This method is only necessary if the user take circuit (CIR) or line address (LN), because in this cases a device is not addressed definitely. LODEN, STNO, CRF and DTI input select exactly one device and produce only an output of the device memories belonging to it! The LODEN of the terminal devices can be determined with the command LST,SW,LODEN,CIR/LN,... and thereby the position (see column DI/TSI) is also shown.

Functional terminal devices on S0-bus need additional to the fix available device memories some special, with a dynamic LODEN addressable, dynamic device memories. It is necessary for running parallel transactions, and only usable during the connection exist. In the output it is identified with CRI (call reference internal). By existing connection at first the fix available device memories (TSI) are put out and subsequently if need be, the dynamic allocated device memories (CRI) follow.

### Command Syntax

- Output for the Integration Test Team
  - Output of the Boot Communication Area

```
LST,INT,BCA;
```
  - Output of the Backup Area of the Boot Communication Area

```
LST,INT,BCASA,HD,filename;
LST,INT,BCASA,SCREEN,[offset],[length],[continue];
```

## DISPS - Operation of the Displayer in the SWU

### Displaying and Modifying of Memory Contents: LST & SET

A filename, which is not already existing, has to entered. Otherwise the command will be rejected with error message F29. This way an unintentional deleting of files is prevented.

Offset is the number, from which on the BCA-backup area should be displayed.

Length is the number of Bytes to be displayed. The AMO always interrupts after 2000 Bytes the output and gives the user the opportunity to terminate the function.

- Output of module data for PIT

```
LST,INT,BDITYT,[module_id];
```

The module-ID is a value of type DB\_M\_BG\_KENNUNG\_RNG and is to be entered as a hexadecimal number. If this is left out, the AMO displays the data of all existing modules.

- Output of the CPB-Pool-Header

```
LST,INT,CPBH;
```

- Output of the status-data for DC and PTI

```
LST,INT,STA,LTG,ltg_number;
```

```
LST,INT,STA,LTU,ltg_number,ltu_nummer;
```

```
LST,INT,STA,BOARD,ltg_number,ltu_nummer;mounting_slot;
```

- Output for Switching Process

```
LST,SW,outputtype,addressingtype,...
```

Just certain combinations of outputtype and addressingtype are valid. If an invalid combination is entered the input is rejected and the error message F15:"INPUT FOR "TYPE" AND "SEL" INCONSISTENT" occurs. Which combinations actually are valid can be seen in Abschnitt 78.9 (parameter SEL).

### Examples

The user wants to display the module data for the module TMBC (modul\_identity: 30H).

Input:

```
*lst,int,bdityt,30;
```

Output:

```

### 78.6.3 SET: Modifying Memory Contents

In order to help avoid typing errors, the number of new values entered must correspond to the number of memory units to be changed. In addition the length of the new values must exactly correspond to the memory output option selected (e.g. a 2-digit hexadecimal number if BYTE was selected).

#### Command Syntax

The number of memory units to be changed must be entered in decimal form.

The new values must be entered as hexadecimal numbers and separated by hyphens.

The input can be made in BYTE-, WORD- oder DWORD-format.

- Modification using an Address Symbol

```
SET,ADR,name,input,number,values;
```

- Modification using a Direct Address

```
SET,DA,selector-offset,input,number,values;
```

The selector and offset must be entered as hexadecimal numbers and separated by hyphens.

- Modification using a logical Memory Definition

```
SET,LOGNAME,name,input,number,values,indices,offset;
```

The indices of the array elements concerned must be entered in decimal form; either linked single values or index ranges are permitted.

## DISPS - Operation of the Displayer in the SWU

### Displaying and Modifying of Memory Contents: LST & SET

The offset of the memory area to be changed must be entered in decimal form; it is the displacement of the pointer relative to the beginning of the array element.

#### Example

The user wants to change a memory entry from 12345678 to BADEAFFE. The address of the memory is e36f:0f00, the length of one element is 8 and the offset of the device type relative to the beginning of the third element is 2.

Input:

```
*def,adr,korr_elem,adr,e36f-0f10;
```

Output:

```
DISPLAYER-INPUT IN BPA PLEASE:
```

Input:

```
*lst,adr,korr_elem,byte,8;
```

Output:

DISPLAYER-INPUT IN BPA PLEASE:
```

## **78.7 Displaying and Modifying of File Contents: E & DUMP & PATCH**

### **78.7.1 E: Assigning a File for processing the File Contents**

Files which are to be processed with the DUMP command or PATCH command have to be assigned first by using this command.

If a file with the same name has already been assigned as a hard disk backup area, it cannot be opened a second time. In this case the displayer AMO will respond with the error message F16. However users are permitted to use the E-command to repeatedly open different files for subsequent processing during the same displayer dialog session.

#### **Command Syntax**

`E, filename;`

The specified file must already exist.

### **78.7.2 DUMP: Listing File Contents**

The file whose contents are to be listed must first be assigned with the E command.

The addresses, which are implemented in the memory definitions are interpreted as 4-Byte Integers, which define the displacement of the data to be output relative to the beginning of the file. The same applies to the addresses output with the LST command.

When using logical memory definitions, the output is always in bytes. In all other cases the user can choose between output in bytes (BYTE), word output (WORD) or double-length (double-precision) word output.

#### **Command Syntax**

- Output using an Address Symbol

`DUMP, ADR, name, output, number;`

The number of memory units to be output must be entered in decimal form.

- Output using a Direct Address (Pointer Offset/Displacement)

`DUMP, DA, offset, output, number;`

The pointer offset must be entered in hexadecimal form, whereas the number of memory units to be output must be entered in decimal form.

## DISPS - Operation of the Displayer in the SWU

### Displaying and Modifying of File Contents: E & DUMP & PATCH

- Output using a logical Memory Definition

```
DUMP, LOGNAME, name, indices;
```

The indices must be entered in decimal form; either linked single values or index ranges are permitted.

#### Example

It is assumed that the HD saved memory definitions are stored in the file defsav1. The user wants to list the first two memory definitions.

Input:

```
*e,:dbdb:els/defsav1;
```

Output:

```
DISPLAYER-INPUT IN BPA PLEASE:
```

Input:

```
*def,adr,entry_tbl,adr,0-0;
```

Output:

```

### 78.7.3 PATCH: Changing File Contents

This feature is not intended to replace the functions of the AMO PATCH. The displayer does not use memory address in order to change the appropriate memory area on the hard disk; in fact for the purpose of this displayer function it is irrelevant whether the file to be processed corresponds to any memory locations on the hard disk at all.

The file whose contents are to be modified must first be assigned with the E command.

In order to help avoid typing errors, the number of new values entered must correspond to the number of memory units to be changed. In addition the length of the new values must exactly correspond to the memory output option selected (e.g. a 2-digit hexadecimal number if BYTE was selected).

#### Command Syntax

The number of memory units to be changed must be entered in decimal form. The new values must be entered as hexadecimal numbers and separated by hyphens.

- Modification using an Address Symbol

```
PATCH,ADR,name,input,number,values;
```

- Modification using a Direct Address

```
PATCH,DA,offset,input,number,values;
```

The offset must be entered as hexadecimal numbers.

- Modification using a logical Memory Definition

```
PATCH,LOGNAME,name,input,number,values,indices,offset;
```

The indices of the array elements concerned must be entered in decimal form; either linked single values or index ranges are permitted.

The offset of the memory area to be changed must be entered in decimal form; it is the displacement of the pointer relative to the beginning of the array element.

#### Example

In connection with the DUMP-example given above the user wants to correct the address of the second memory from 34C0:5170 to 34A0:CEDA.

Input:

```
*patch,logname,entry_tbl,dword,1,34a0ceda,1,1a;
```

Output:

## DISPS - Operation of the Displayer in the SWU

### Displaying and Modifying of File Contents: E & DUMP & PATCH

DISPLAYER-INPUT IN BPA PLEASE:

Input:

```
*dump,logname,entry_tbl,1&&2;
```

Output:

```
TABLE: ENTRY_TBL
INDEX: 0000H          ADDRESS: 0000H:0000H
CONTENTS HEX
  0 (  0)  44425F445F43505F  4445565F53544154  DB_D_CP_DEV_STAT (ASCII)
 10 ( 16)  4520202020202020  2020DADEA0340100  E      ...4..
 20 ( 32)  0000FF0700                .....
INDEX: 0001H          ADDRESS: 0000H:0025H
CONTENTS HEX

 20 ( 32)  0000FF0700                .....
DISPLAYER INPUT IN BPA  PLEASE:
```

The correction was successfully completed.

#### Notes

- If the user switches over to access the displayer of another processor, and specifies this processor according to its status (e.g. active base processor), the connection, once established, is maintained even if the Hicom system switches processors. In other words, if a connection is established to base processor B (being the active processor at the time of the AMO switchover), then the user remains with this processor even when it is switched to standby operation. The user sees which processor he is currently accessing with the aid of the input request message.
- The default setting for output of numbers by the AMO is "H" (hexadecimal); in other cases, the numbers are explicitly assigned the suffix "T" for decimal.
- Until otherwise specified after the AMO has been started, hexadecimal dump format is always displayed with the corresponding ASCII characters (branch CHAR) and not interspersed with empty lines (branch DIST).
- Memory definitions are always created for the processor whose displayer is currently being controlled by the AMO. Any memory definitions with the same name for other processors in the AMO work area or the hard disk save area are overwritten.
- The addresses and index ranges of the CC and GP layout element table are re-initialized each time the AMO is started and for each processor switchover, and remain constant for the duration of the linkup to the processor.

## DISPS - Operation of the Displayer in the SWU

### Displaying and Modifying of File Contents: E & DUMP & PATCH

- f) Unless otherwise specified, the layout element tables of the layout data modules (CC layout data module or LTG layout data module) are stored as logical memory definitions in the resident task area of the processor being accessed. This allows the user to enter new Flexama memories in the layout element tables which can then be copied from their appropriate layout data module as memory definitions for the next AMO run or processor switchover. These two memory definitions always occupy the first two places in the resident save area and cannot be changed.
- g) When copying logical memory definitions from a layout data module for memories with more than one data blocks, the additional memory blocks are marked with a "#" followed by a 2-digit block number appended to the memory name. The functions "copy" and "lst,def" are intended only for those memory blocks that actually have a physical memory area. Flexama memories without a valid memory address may exist in the layout data modules, but they are not displayed to the user.
- h) The allocation of an address to a memory definition (DEF,ADR,..?) is only executed in the AMO work area. By following up with a DEF command (DEF,LOGNAME,..?) or a COPY comand (COPY,DEF,...?), the allocation can be transferred to other areas.
- i) When creating and storing memory definitions, the higher-level storage includes the lower-level storage (i.e. if AREA=HD is specified, the memory definitions are also entered in the save area of the resident displayer task and in the AMO work area).
- j) After assigning a filename for storing memory definitions on the hard disk, the file is not created until the estimated number of memory descriptions to be stored is specified (otherwise the file will be regarded as created and will be opened). The file is expanded as necessary (dynamically).
- k) Blanks in memory definition names are always removed. Thus, no distinction is made between "DB\_D\_ CPB\_TBL" and "DB\_D\_CPB\_TBL". However, if the name consists entirely of blanks, one blank remains.
- l) An asterisk at the beginning or end of an entry of a memory definition name is regarded as a 'wildcard' character, whenever a complete, unambiguous name is not required (e.g. for the DEF command). Thus, "LST,DEF,DB\_D\_DH\*" would list the memory contents for both DB\_D\_DH\_DEV\_TBL and DB\_D\_DH\_LINE\_TBL.

- m) When using high-level memory definitions for displaying call processing memories (e.g. LST,SW,<DCLD/SCLD/....>,...), the DISPLAYER on principle always shows the memory content of the corresponding 'active' processor. That means, it is not possible during a DISPS-connection with a processor in 'standby'-state, to output its memories using the high-level memory access. Since the addresses of memories are identically in a 'standby'- and an 'active'-Prozessor, it is possible to use the existing logical memory definition to output the data. This function remains in the current connected processor!
- n) When processing file contents, the "address" shows the position in the file with respect to the start of the file (offset).
- o) Status data (LST,SW,STA,..?) is output in words.
- p) When displaying the save area of the boot communication area (BCASA) on the operator console (SEL=SCREEN) is requested, the AMO interrupts the output after every 2000 bytes, giving the operator the opportunity to abort the function. The reason is the large size of the BCA, with approximate 48 kbyte. The output order to a hard disk file takes the full size of the BCASA. Each command needs a new file name. This prevents inadvertent overwriting of data, in a file that already exists (see message F29).
- q) The memory address has the same format for the commands LST, SET, and DEF (ADR=<selector>-<offset>).
- r) The module identification is required in order to output the module data of a particular peripheral module. If the module-ID is missing, the AMO outputs the data of all peripheral modules in the system configuration.
- s) The output of device memories (DH and CP) for S0-bus stations is done with an other concept as for normal ports. The reason is, that a S0-bus port may have up to 8 terminal devices arranged. As normally the position (=DI) of a terminal device on S0-bus is unknown to the user, therefore this value is handled like a SERVICE INDICATOR (values see chapter 0.1.4 parameter 'DI'). In this case the DISPS puts out the position (TSI) and the device memories of ALL terminal devices which correspond to the given service. The TSI (terminal selection identifier) defines the physical position of a terminal device at the S0-bus. This method is only necessary if the user take circuit (CIR) or line address (LN), because in this cases a device is not addressed definitely. LODEN, STNO, CRF and DTI input select exactly one device and produce only an output of the device memories

## **DISPS - Operation of the Displayer in the SWU**

Displaying and Modifying of File Contents: E & DUMP & PATCH

belonging to it! The LODEN of the terminal devices can be determined with the command LST,SW,LODEN,CIR/LN,.... and thereby the position (see column DI/TSI) is also shown.

- t) Functional terminal devices on S0-bus need additional to the fix available device memories some special, with a dynamic LODEN addressable, dynamic device memories. It is necessary for running parallel transactions, and only useable during the connection exist. In the output it is identified with CRI (call reference internal). By existing connection at first the fix available device memories (TSI) are put out and subsequently if need be, the dynamic allocated device memories (CRI) follow.

78.8 Parameter Tree

**DISPS - Operation of the Displayer in the SWU**  
Parameter Tree

## 78.9 Parameter Description

**ADR** Used in commands: DEF, DUMP, LST, PATCH SET;  
address (selector and offset) or distance with regard to beginning of file

Type of Input : For DEF, LST, SET:  
2 linked single values, mandatory  
For DUMP, PATCH:  
Single value, mandatory

Possible Values : For DEF, LST, SET:  
Hexadecimals, 0000 - FFFF (e.g. 3BF0-387)  
For DUMP, PATCH:  
Hexadecimals 00000000 - FFFFFFFF

**AREA** Used in commands: COPY, DEF, DEL, LST;  
areas for which the command is valid

## DISPS - Operation of the Displayer in the SWU

| HWY  | <p>Used in command: LST;<br/>defines the number of the speech highway</p> <p>Type of Input : Single value, mandatory</p> <p>Possible : 0 - 127</p> <p>Values</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| IDX  | <p>Used in commands: DEF, DUMP, LST, PATCH, SET;<br/>defines either the index at which data is to be changed or output, or the index range of the specified array.</p> <p>Type of Input : For DEF with CTYPE=ADR:<br/>Single value, mandatory<br/>For DEF with CTYPE=LOGNAME:<br/>Range, mandatory<br/>For DUMP, PATCH, SET:<br/>Single value, linked single values<br/>and/or range(s), mandatory<br/>For LST with CTYPE=SW:<br/>Single value, mandatory<br/>For LST with CTYPE=LOGNAME:<br/>Single value, linked single values<br/>and/or range(s), mandatory</p> <p>Possible : 0 - 255 for LST,SW,..</p> <p>Values 0 - 65535 else</p> |
| LEN  | <p>Used in commands: DEF, LST;<br/>defines the length of an array element in a logical memory definition or the length of the data of a BCA save area to be output.</p> <p>Type of Input : Single value, mandatory for DEF and<br/>optional for LST</p> <p>Possible : For DEF: 1 - 6000</p> <p>Values For LST: 0 - 65535</p>                                                                                                                                                                                                                                                                                                             |
| LN   | <p>Used in command: LST;<br/>line number</p> <p>Type of Input : Single value, mandatory</p> <p>Possible : 0 - 65535</p> <p>Values</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## DISPS - Operation of the Displayer in the SWU

### Parameter Description

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LODEN | Used in command: LST;<br>defines the LOGical DEvice Name (LODEN)<br>Type of Input : Single value, mandatory<br>Possible Values : 0 - FFFF                                                                                                                                                                                                                                                                                                                                                                                                  |
| LTG   | Used in command: LST;<br>LTG number<br>Type of Input : Single value, mandatory<br>Possible Values : 1 - 32                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LTU   | Used in command: LST;<br>LTU number<br>Type of Input : Single value, mandatory<br>Possible Values : 1 - 15 and 17 - 99                                                                                                                                                                                                                                                                                                                                                                                                                     |
| NAME  | Used in commands: COPY, DEF, DEL, DUMP, LST, PATCH, SET;<br>name of various elements used.<br>Type of Input : Single value, optional for COPY and LST,DEF<br>mandatory else<br>Possible Values : text string<br>(e.g. "DB_S_AM_TERM_TBL")                                                                                                                                                                                                                                                                                                  |
| NO    | Used in commands: DIST, DUMP, EV, FILE, LST, PATCH, SET;<br>number of empty lines to be inserted in hexadecimal dump output, or number of decimal numbers to be converted to binary or hexadecimal for output, or number of memory definitions to be saved, or number of memory units to be changed or listed<br>Type of Input : Single value, optional for FILE, mandatory else<br>Possible Values : For DIST:<br>0 - 4<br>For EV:<br>0 - 2147483647<br>For FILE:<br>0 - 65535<br>For DUMP, LST:<br>1 - 1500<br>For PATCH, SET:<br>1 - 10 |
| PAR1  | Used in command: LST;<br>defines the first parameter of the call reference input<br>(line number if TYPE=DCLD, DTI if TYPE=DDHD).<br>Type of Input : Single value, mandatory                                                                                                                                                                                                                                                                                                                                                               |

Possible : 0 - 65535  
Values

PAR2      Used in command: LST;  
defines the second parameter of the call reference input  
(call reference number).

Type of Input : Single value, mandatory

Possible : 0 - 255  
Values

PROCID    Used in command P  
Processor which contains the Displayer task to be accessed

Type of Input : Single value, mandatory

Possible : BP                      Base Processor active  
Values

BPA                      Base Processor A

BPB                      Base Processor B

BPS                      Base Processor standby

GP1                      Group Processor 1 active

GP1A                    Group Processor 1 A

GP1B                    Group Processor 1 B

GP1S                    Group Processor 1 standby

.

.

GP8                      Group Processor 8 active

GP8A                    Group Processor 8 A

GP8B                    Group Processor 8 B

GP8S                    Group Processor 8 standby

SEL      Used in command: LST;  
selection criterion to be used (=SElection)

Type of Input : Single value, mandatory

Possible : if TYPE = BCHLN, DHCRF:  
Values

CIR                      circuit

DTI                      device table index

LN                        line

if TYPE = CPB, DCLDC, SCLD, STA:

**SLOT**      Used in command: LST;  
                  slot number

Type of Input    : Single value, mandatory

Possible            : 1 - 121

Values

A suitable module must be configured for the slot addressed by PEN (AMO BCSU).

**STNO**      Used in command: LST;  
                  call number for which output has to be done (= Station Number)

Type of Input    : Single value, mandatory

Possible            : Letters A - D, digits, "#" and "\*"

Values

**SU**         Used in command: LST;  
                  sub-unit

Type of Input    : Single value, optional  
                          (requested by the AMO if necessary)

Possible            : 0 - 16

Values

**SVC**        Used in command: LST;  
                  service indicator (= SerViCe)

Type of Input    : Single value, mandatory

Possible            : VTX                        videotext

Values

|     |          |
|-----|----------|
| DTE | data     |

UNIT      Used in commands: DUMP, LST, PATCH, SET;  
unit of memory to be used

Type of Input    : Single value, mandatory

|          |        |             |
|----------|--------|-------------|
| Possible | : BYTE | Byte        |
| Values   | DWORD  | Double Word |
|          | WORD   | Word        |

VAL      Used in commands: EV, PATCH, SET;  
hexadecimal value to be displayed in decimals, binary and hexadecimal (=VALue), or value  
to be stored at specified storage location (=VALue).

Type of Input    : For EV:  
Single value, mandatory  
For PATCH, SET:  
linked single values, mandatory

|          |                                  |
|----------|----------------------------------|
| Possible | : For EV:                        |
| Values   | Hexadecimals 0 - 7FFFFFFF        |
|          | For PATCH, SET:                  |
|          | Hexadecimals 00 - FF,            |
|          | Hexadecimals 0000 - FFFF,        |
|          | Hexadecimals 00000000 - FFFFFFFF |

## 78.10 Error Messages and Advisories

### 78.10.1 Error Messages

F01: COMMUNICATION WITH DISPLAYER IN <xxxxx> IMPOSSIBLE

F02: WRITING ACCESS FAILED (START ADDRESS = <xxxx>H:<xxxx>H)

F03: NO TABLE DEFINITION EXISTS WITH THIS NAME

F04: OVERFLOW OF DEFINITION TABLE IN AMO

F05: OVERFLOW OF RESIDENT DEFINITION TABLE

F06: INDEX ILLEGAL

F07: DATABASE ACCESS FAILED

F08: DEFINITION REJECTED

F09: ADDRESS TABLE NOT FOUND

F10: DISPLACEMENT ILLEGAL

F11: INPUT FOR "UNIT", "NO", "VAL" INCONSISTENT

The number of values specified for "VAL" must be entered in the parameter "NO"; this helps detect input errors. The values specified for "VAL" may not exceed the maximum length defined by the parameter "UNIT".

F12: DATABASE TABLE DOES NOT EXIST

F13: LTG NUMBER EXCEEDS <xx>H

F14: LTU NUMBER EXCEEDS <xx>H

F15: INPUT FOR "TYPE" AND "SEL" INCONSISTENT

For example, the input TYPE=CPB is inconsistent with SEL=DTI

F16: FILE "<xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx>" ALREADY ASSIGNED

In order to assign a different file, the AMO must be terminated and restarted.

F17: CREATION OF FILE FAILED WITH STATUS <xxxx>H

Status output is the same as FAM call.

F18: OPENING OF FILE FAILED WITH STATUS <xxxx>H

Status output is the same as FAM call.

F19: SEEKING IN FILE FAILED WITH STATUS <xxxx>H

Status output is the same as FAM call.

F20: READING FROM FILE FAILED WITH STATUS <xxxx>H

Status output is the same as FAM call.

F21: WRITING TO FILE FAILED WITH STATUS <xxxx>H

Status output is the same as FAM call.

F22: CLOSING OF FILE FAILED WITH STATUS <xxxx>H

Status output is the same as FAM call.

- F23: NO FILE ASSIGNED  
...therefore no hard disk backup area can be used.
- F24: NECESSARY PARAMETER VALUE MISSING
- F25: LINE NUMBER EXCEEDS <xxxx>H
- F26: CIRCUIT ADDRESS UNPLAUSIBLE OR LINE DOES NOT EXIST  
The address used for addressing the memory was implausible / invalid.
- F27: FLEX-ADDR HIERARCHY NOT SUFFICIENT FOR ADDRESSING  
Conversion error due to flexible addressing.
- F28: <xxxxx> INDEX EXCEEDS <xx>H  
Access index too high for LINK or LINE paths
- F29: FILE "<xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx>" ALREADY EXISTS  
A file with the same name already exists on the hard disk and will NOT be overwritten.  
Enter a new name.
- F30: ALLOCATION OF TEMPORARY SEGMENT FAILED; NOT ENOUGH MEMORY AVAILABLE  
The temporary segment for intermediate storage of the BCASA- data could not be created in the system. There is not enough free main storage available.

## 78.10.2 Advisories

- H01: ONLY <xxxx>H BYTES CAN BE ACCESSED  
This message explains the reason for a failed attempt at read or write access.
- H02: NO DATA FOUND  
This message explains the reason for a failed attempt at data output.
- H03: REQUESTED FUNCTION NOT AVAILABLE  
This message means that the input function or command is not available on the processor accessed, or is not applicable.
- H04: S0-BUS, CIR- AND LN- ADDRESS CAN'T RETURN A SINGLE DEVICE-ADDR;  
USE STNO OR LODEN  
It is not possible to address a single device on the S0 bus by means of a circuit or line address. Please use station number or loden.
- H05: THERE IS NO DEVICE TABLE ELEMENT FOR SELECTED SERVICE: DI=<x> (<xxx>)  
S0 bus only with functional terminals; no DH device memory currently available for stipulated service (DI). The output has been performed only with the global DH device memory of the S0 bus.
- H06: <xxxxx>T BYTES COPIED INTO FILE "<xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx>"  
Notice relating the number of bytes written into the stipulated file.
- H07: S0-BUS LINE; PARAMETER 'DI' INPUT USED AS SERVICE INDICATOR 'SI'  
MEMORY DISPLAY FOR SVC = "<xxx>"

## **DISPS - Operation of the Displayer in the SWU**

### **Error Messages and Advisories**

This advisory message means, that the given circuit- or line-address belongs to a S0-bus and the value of parameters 'DI' is handled as a SERVICE INDICATOR 'SI'. The device memories of ALL terminals of the given service will be detected and put out on the user terminal.

## 79 DLSM - Hard Disk Area Allocation - Logical

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">AMO Functions</a>         | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO DLSM is used for allocating up to 8 logical area names to a data storage area.

The logical area name must be unique in the system. If more than one logical area exists with the same logical area name in this system, this can lead to a soft restart when the system attempts to activate the areas. The AMO only checks the logical area name assignments to the specified UNIT.

EXCEPTION: The logical area name :PDS: can be added twice for the area 'E' on different controller, in the same unit, but only once per controller. By deleting, in case logical name :PDS: is added twice in the same unit, it will be deleted only that logical name :PDS: which corresponds to a not active area.

Exception: UW7-UNIX (used in Unity) stores its data in own partitions (AMO DDSM).

'PHY'-areas used by UNIX in previous variants will only be activated physically and will contain no NAMED FILES, either.

A logical area name beginning with "PHY" may not be added to an area with pair allocation.

If the area is subsequently activated by means of the AMO DSSM, the user can access the files of the area by using the logical area name allocated with this AMO.

### 79.1 Restrictions

This description is valid from HiPath 4000 V6.0.

### 79.2 Interrelationships

- AMO DASM : Hard disk area allocation - physical
- AMO DSSM : Disk switchover
- AMO DDSM : Disk status
- AMO DPSM : Device Pair Allocation

## 79.3 AMO Functions

- [ADD-DLSM](#) : Creating logical area names
- [DELETE-DLSM](#) : Deleting logical area names

### 79.3.1 ADD-DLSM

#### Procedure Overview

| Command Code | Parameter                                                     |
|--------------|---------------------------------------------------------------|
| ADD-DLSM     | [UNIT=<param>],CNO=<number>,ANO=<string><br>,LANAME=<string>; |

#### Example

1. Allocating the logical area names PDS, ABC35, and EFG3333 to area E on controller 1 .

Input:

```
ADD-DLSM: ,1,E," :PDS:"&" :ABC35:"&" :EFG3333:";
```

2. Configure a logical name for Flash Memory.

Input:

```
ADD-DLSM: ,8,A," :CDBR:";
```

### 79.3.2 DELETE-DLSM

This action cancels the allocation of a logical area name to an area.

#### Procedure Overview

| Command Code | Parameter                       |
|--------------|---------------------------------|
| DELETE-DLSM  | [UNIT=<param>],LANAME=<string>; |

#### Example

Deleting the logical area names PDS and ABC35 .

Input:

```
DELETE-DLSM: , " :PDS:"&" :ABC35:";
```

## 79.4 Parameter Description

|        |                                         |                                                                                                                                            |
|--------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| ANO    | Area number                             |                                                                                                                                            |
|        | Type of Input                           | : Single value<br>mandatory                                                                                                                |
|        | Possible Values                         | : A, E - K                                                                                                                                 |
| CNO    | Controller number                       |                                                                                                                                            |
|        | Type of Input                           | : Single value<br>mandatory                                                                                                                |
|        | Possible Values                         | : 1 - 8                                                                                                                                    |
| LANAME | Logical area name                       |                                                                                                                                            |
|        | Type of Input                           | : max. 8 with '&' chained single values<br>mandatory                                                                                       |
|        | Possible Values                         | : All ASCII characters except '/' ':' ';' ''<br>1 to 7 characters between two colons, e.g.<br>":PDS:". 1st character must be alphabetical. |
| UNIT   | Functional system unit i.e. server code |                                                                                                                                            |
|        | Type of Input                           | : Single value<br>optional                                                                                                                 |
|        | Possible Values                         | : A1 = Administration and Data Server                                                                                                      |
|        | Default Value                           | : A1                                                                                                                                       |

### List of most used logical device names:

|        |                                     |
|--------|-------------------------------------|
| :PDS:  | Program area                        |
| :DBD:  | Debug area                          |
| :AMD:  | Administration and maintenance area |
| :CGD:  | Call charge area                    |
| :TMD:  | Traffic metering area               |
| :PAS:  | Miscellaneous usage                 |
| :DBDA: | Debug disk for ADINIT               |
| :DMP:  | HiPath dump area                    |
| :DMS:  | Domain Management System Area       |
| :DSY:  | Database synchronization            |
| :GLA:  | Golden Load Area                    |

## 80 DNIT - Directory Number Information and Translation

|                                    |                                        |                                               |
|------------------------------------|----------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>   | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Descriptions</a> |                                               |

The administration and maintenance order DNIT makes it possible to add, change, display, delete and regenerate information for ACD Directory Number Information and General Digit Translation.

With this AMO we can add an ACD number.

### Three tables are required for DNIT:

- **DNI: Directory Number Information table**  
Stores routing and display information concerning source (SID/ANI) and called party (DNIS) digit strings for ACD.
- **GDTR: General Digit Translation table**  
Stores the translation information used to evaluate the Calling Number.  
This table contains rules that will evaluate the source number (Calling Number).
- **GDTRSR: General Digit Translation Service Rule table**  
Stores the information concerning the DNIS GDTRRULE for Primary Rate Interface trunks.

### Definition of Terms:

- **DNIS: Dialed Number Identification Service**  
This feature allows special call routing and special call displays based on the *Original Called (Dialed) Number*.
- **SID/ANI: Station Identification / Automatic Number Identification**  
This Feature allows special call routing and special call displays based on the *Calling Number*.
- **ANI: The Automatic Number Identification** is a public network customer billing number stored at the public network central office serving the originator of the call. The ANI may be delivered when the SID number is not available.
- **SID: The Station Identification** is the calling party number of the station originating the call.

A unique internal routing number is assigned to each entry in the DNI table. Then, an entry in the GDTR table can be created with a rule and a digit string that will translate to the ACD internal routing number. The

internal routing number is used to access the routing and display information stored in the DNI table. Multiple digit strings may translate to the same internal routing number.

### **The DNI table stores the following fields for Automatic Call Distribution (ACD):**

- **INTRTDN**  
The Internal Routing Number (INTRTDN) field is the internal routing directory number and specifies the number that will access the DNI entry. This number must have been previously set to have a digit analysis result of 'STN' by AMO WABE.
- **GDTRRULE**  
The Source Rule (GDTRRULE) field is the general digit translation rule that is applied to the entry. For a SID/ANI entry (ROUTING=SA), the rule must be 0, which is a null rule.
- **TARGET**  
When entering a networking number for the TARGET parameter, up to 22 digits (barrier code, location code, and network extension) can be entered. The location code, if applicable, should only be entered for networking TARGETs. All other types of TARGETs, including local extension numbers, should be entered without barrier codes or location codes.
- **SARULE**  
The Source Rule (SARULE) field is the general digit translation rule that is applied to the entry. For SID/ANI, the rule must be 0, which is a null rule.
- **DISPLAY**  
The DISPLAY field stores the information to be displayed on the called device, depending on the type of routing being used. It is possible that the memory for the display pool may be exhausted. In this case, the amount of memory can be increased through AMO DIMSU.
- **ROUTING**  
The ROUTING field determines what type of routing takes place. For DNIS entry routing on DNIS (DRTD), an GDTRRULE is optional. For DNIS entry routing on SID/ANI (DRTSA), a GDTRRULE must be present; and for SID/ANI (SA) entry, the GDTRRULE must be set to null.
- **RCG**  
The Route Control Group (RCG) field stores the route control group number, which is used to access the ARTs established in the ACD Route Selection tables by AMO ACDRS. The RCG must have been previously created by AMO ACDSD, and have its routing defined by AMO ACDRS.

- **PRI and OVRPRI**  
The priority field (PRI) and overflow priority (OVRPRI) fields are used to determine the priority of the call. PRI is the initial primary priority of a call, while OVRPRI is the priority of the call when it is queued to an overflow ACD group. The lower the number is for these parameters, the higher the priority of the call. If the value for OVRPRI is 0, or no value is input for the priority in the ADD command, the override priority will default to whatever the PRI value is.
- **AUDSRCID**  
The Audible Source Identification Recorded Announcement Number (AUDSRCID) field stores the identification number of a recorder. The recorder is required to be configured as a random start ACD recorded announcement operating under continuous mode by AMO RCSU. A value of 0 means that no recorder is required.
- **THRSHLD**  
The Threshold (THRSHLD) parameter determines the maximum number of incoming trunk ACD calls in progress allowed for a given internal routing number before busy is returned. Initially the threshold is set to H'FFFF', which is no threshold. If the threshold is ever desired to be set back to the null value, the value (\*) should be entered through the CHANGE function.
- **REVCHA**  
The Reversed-Charged (REVCHA) parameter determines if the Internal Routing Number (INTRTDN) is allowed to receive reversed charging calls (used in Brazil).

**The GDTR table stores the following fields for DNIS and SID/ANI entries:**

- **GDTRRULE**  
The General Digit Translation Rule stores the GDTR DNIS rule (129-255) for non-sequential DNIS numbers, or the GDTR SID/ANI rule (1-128) for SID/ANI numbers.
- **DGTSTR**  
The Digit String (DGTSTR) field stores the SID/ANI digit string and can be up to 22 digits in length. Wildcards (\*) are allowed at the trailing positions and will match any digit. ANI only routing can be accomplished by using the Joker (#) which will match all digits of any length. When the Joker is used, it can be the only character for the DGTSTR. A digit string may be assigned to more than one rule.
- **INTRTDN**  
The Internal Routing Number (INTRTDN) field stores the internal routing number and translates into an entry in the DNI table.

## DNIT - Directory Number Information and Translation

### Restrictions

- SVCDATA

The Service data (SVCDATA) field stores the service preference, and is not allowed for a SID/ANI entry.

#### **The GDTRSR table stores the following fields:**

- The GDTRSR table is indexed by trunk group (TGRP) and stores the called party (DNISRULE) for the different Network Services (NETSVC). The GDTRSR table will be initialized to 0, which indicates that no translation is possible for any network service. The CHANGE function must be used to establish a DNIS GDTR rule for at least one network service before the associated trunk group may access the GDTR table.

#### **Possibilities:**

- Destination Based Routing

1 DNI Table with Routing = DRTD.

- Source Based Routing

1 DNI Table with Routing = SIAN (source).

1 GDTR Table rule.

1 DNI Table with Routing = DRTSA (destination).

## 80.1 Restrictions

This description is valid from HiPath 4000 V1.0.

## 80.2 Interrelationships

- AMO-ACDRS : Automatic Call Distribution Route Selection  
A route control group must be assigned ACD routing tables before AMO DNIT can access it.
- AMO-ACDRT : Automatic Call Distribution Routing Tables  
ACDRT can route to an internal routing number

- AMO-ACDSD : Automatic Call Distribution System Data  
ACDSD can define a Route Control Group (RCG).
- AMO-DIDCR : Direct Inward Dial Digit Conversion Rule  
DIDCR can translate a number to a internal routing number that references an entry in the DNI table.
- AMO-DIMSU : Dimensioning of features  
The size of the DNI, GDTR, Display Pool, and RULO tables can be changed.
- AMO RCSU : Recorder Configuration for Switching Unit  
The recorder must be configured as a random start ACD recorded announcement operating under continuous mode before being referenced by AUDSRCID.
- AMO-WABE : Dial Plan  
The DAR for the INTRTDN must be of type 'STN'.
- AMO-ZAND : Sets the ACD feature on or off. ACD groups can not be added or changed if the ACD feature is off.

## 80.3 Functions of the AMO

- [ADD-DNIT](#) : Add directory number information and translation information
- [CHANGE-DNIT](#) : Change directory number information and translation information
- [DELETE-DNIT](#) : Delete directory number information and translation information
- [DISPLAY-DNIT](#) : Display directory number information and translation information
- [REGENERATE-DNIT](#) : Regenerate directory number information and translation information

### 80.3.1 ADD-DNIT

Directory number information and translation can be created with the function ADD. The ADD-DNIT command can be used to add routing and display information concerning general digits to the DNI table, and translation information for SID/ANI and non-sequential DNIS numbers to the GDTR table. The CHANGE function must be used to set up at least one valid DNIS rule for a given trunk group in the GDTRSR table before the GDTR table may be accessed.

If the ACD feature has not been turned on, no ACD features may be used.

## DNIT - Directory Number Information and Translation

### Functions of the AMO

#### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-DNIT     | <pre> TBL=DNI,INTRTDN=&lt;number&gt;,[ROUTING=&lt;param&gt;], [SARULE=&lt;number&gt;],[DISPLAY=&lt;string&gt;]  ACD=NO,TARGET=&lt;key-num&gt;,[REVCHA=&lt;yes/no&gt;];  ACD=YES,RCG=&lt;number&gt;,[PRI=&lt;number&gt;],[OVRPRI=&lt;number&gt;] ,[AUDSRCID=&lt;number&gt;],[THRSHLD=&lt;number&gt;] ,[REVCHA=&lt;yes/no&gt;];   TBL=GDTR,GDTRRULE=&lt;number&gt;,DGTSTR=&lt;key-num&gt; ,INTRTDN=&lt;number&gt;,[SVCDATA=&lt;param&gt;];</pre> |

#### Examples:

1. Set up the Directory Number Information and Translation tables:

Set up the Directory Number Information and Translation tables for a call that will have an ACD SID/ANI routing path with a called party display of 'TYME MAGAZINE' and a calling party display of 'BARF SIMPSON'.

#### Input:

```
ADD-DNIT:TBL=DNI,INTRTDN=88111,ROUTING=SA,DISPLAY="BARF
SIMPSON",ACD=YES,
RCG=5,PRI=10,OVRPRI=1,AUDSRCID=3,THRSHLD=20;
```

#### Output:

```
H01: INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=88111 HAS BEEN
ADDED.
```

#### Input:

```
ADD-DNIT:TBL=GDTR,GDTRRULE=111,DGTSTR=4075551212,INTRTDN=88111;
```

#### Output:

```
H05: DIGIT STRING DGTSTR=4075551212 HAS BEEN ADDED TO RULE
GDTRRULE=111.
```

#### Input:

```
ADD-DNIT:TBL=DNI,INTRTDN=44444,ROUTING=DRTSA,SARULE=111,ACD=YES,
DISPLAY="TYME MAGAZINE",RCG=6;
```

#### Output:

H01: INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=44444 HAS BEEN ADDED.

## 2. "Destination Based Routing":

Add a "Destination Based Routing" via RCG 5, with priority 10 and with overflow priority assuming the same value of the set priority. In addition the display information shown shall be: 'ACD CALL'.

### Input:

```
ADD-DNIT:TBL=DNI,INTRTDN=22222,ROUTING=DRTD,DISPLAY="ACD  
CALL",SARULE=0,ACD=YES,  
RCG=5,PRI=10,OVRPRI=0;
```

### Output:

H01: INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=22222 HAS BEEN ADDED.

## 3. "Source Based Routing":

Add a "Source Based Routing" via RCG 5 for ACD calls without source number identification, and for calls with source number identification that do not come from Brazil. In addition this calls shall have priority 10 and overflow priority 20. The ACD calls that come from Brazil (with source number identification) shall be routed to RCG 6, with a display information "CALLING FROM BRAZIL", with priority 10 and overflow priority 20. The other calls (not from Brazil) shall display "GENERAL ACD CALL".

In addition the ACD number shall not treat more than 20 calls.

### Input:

```
ADD-DNIT:TBL=DNI,INTRTDN=33333,ROUTING=SA,DISPLAY="GENERAL ACD  
CALL",ACD=YES,  
RCG=5,PRI=10,OVRPRI=20,THRSHLD=20;
```

### Output:

H01: INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=33333 HAS BEEN ADDED.

### Input:

```
ADD-DNIT:TBL=DNI,INTRTDN=44445,ROUTING=SA,DISPLAY="CALLING FROM  
BRAZIL",  
RCG=6,PRI=10,OVRPRI=20,THRSHLD=20;
```

### Output:

## DNIT - Directory Number Information and Translation

### Functions of the AMO

H01: INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=44445 HAS BEEN ADDED.

Input:

```
ADD-DNIT:TBL=GDTR,GDTRRULE=1,DGTSTR=0055***,INTRTDN=44445;
ADD-DNIT:TBL=GDTR,GDTRRULE=1,DGTSTR=0055****,INTRTDN=44445;
ADD-DNIT:TBL=GDTR,GDTRRULE=1,DGTSTR=0055*****,INTRTDN=44445;
ADD-DNIT:TBL=GDTR,GDTRRULE=1,DGTSTR=0055*****,INTRTDN=44445;
ADD-DNIT:TBL=GDTR,GDTRRULE=1,DGTSTR=0055*****,INTRTDN=44445;
ADD-DNIT:TBL=GDTR,GDTRRULE=1,DGTSTR=0055*****,INTRTDN=44445;
ADD-DNIT:TBL=GDTR,GDTRRULE=1,DGTSTR=0055*****,INTRTDN=44445;
ADD-
DNIT:TBL=GDTR,GDTRRULE=1,DGTSTR=0055*****,INTRTDN=44445;
ADD-
DNIT:TBL=GDTR,GDTRRULE=1,DGTSTR=0055*****,INTRTDN=44445;
ADD-
DNIT:TBL=GDTR,GDTRRULE=1,DGTSTR=0055*****,INTRTDN=44445;
ADD-DNIT:TBL=GDTR,GDTRRULE=1,DGTSTR=#,INTRTDN=33333;
```

Output (for each command, where nnn...n = <rule string>):

H05: DIGIT STRING DGTSTR=nnn...n HAS BEEN ADDED TO RULE GDTRRULE=1.

Input:

ADD-

```
ADD-  
DNIT:TBL=DNI, INTRTDN=88888,ROUTING=SA,ACD=YES,RCG=1,PRI=10,OVPR  
I=20;
```

#### Output:

```
H01: INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=88888 HAS BEEN  
ADDED.
```

#### Input:

```
ADD-  
DNIT:TBL=DNI, INTRTDN=77777,ROUTING=SA,ACD=YES,RCG=2,PRI=10,OVPR  
I=20;
```

#### Output:

```
H01: INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=77777 HAS BEEN  
ADDED.
```

#### Input:

```
ADD-DNIT:TBL=GDTR,GDTRRULE=2,DGTSTR=0089498980001,INTRTDN=77777;  
ADD-DNIT:TBL=GDTR,GDTRRULE=2,DGTSTR=0089498980009,INTRTDN=77777;  
ADD-DNIT:TBL=GDTR,GDTRRULE=2,DGTSTR=008949898000*,INTRTDN=88888;
```

#### Output (for each command, where nnn...n = <rule string>):

```
H05: DIGIT STRING DGTSTR=nnn...n  
HAS BEEN ADDED TO RULE GDTRRULE=2.
```

#### Input:

```
ADD-DNIT:TBL=DNI, INTRTDN=66666, SARULE=2, ROUTING=DRTSA, ACD=YES,  
RCG=3, PRI=10, OVPRPRI=20, THRSGLD=20;
```

#### Output:

```
H01: INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=66666 HAS BEEN  
ADDED.
```

## 80.3.2 CHANGE-DNIT

The change function can be used to modify information in the DNI, GDTR or GDTRSR tables.

A DNIS GDTR rule for at least one network service for a given trunk group must be established in the GDTRSR table before the associated trunk group may access the GDTR table. If the NETSVC parameter is not entered, all network services for the trunk group will be set to the

## DNIT - Directory Number Information and Translation

### Functions of the AMO

DNISRULE. When changing an ACD to a non-ACD entry, the TARGET parameter is required and when changing a non-ACD to an ACD entry, the RCG parameter is required.

If the ACD feature is disabled, changing ACD related information is allowed but it may not take effect.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-DNIT  | <pre>  TBL=DNI, INTRTDN=&lt;number&gt;, [ROUTING=&lt;param&gt;],<br/>  [SARULE=&lt;number&gt;], [DISPLAY=&lt;string&gt;]<br/>  ACD=NO, TARGET=&lt;key-num&gt;, [REVCHA=&lt;yes/no&gt;];<br/>  ACD=YES, [RCG=&lt;number&gt;], [PRI=&lt;number&gt;], [OVRPRI=&lt;number&gt;]<br/>  , [AUDSRCID=&lt;number&gt;], [THRSHLD=&lt;number&gt;]<br/>  , [REVCHA=&lt;yes/no&gt;];<br/><br/>  TBL=GDTR, GDTRRULE=&lt;number&gt;, DGTSTR=&lt;key-num&gt;<br/>  , [NEWRULE=&lt;number&gt;], [NEWDGTS=&lt;number&gt;]<br/>  , [INTRTDN=&lt;number&gt;], [SVCDATA=&lt;param&gt;];<br/><br/>  TBL=GDTRSR, TGRP=&lt;number&gt;, DNISRULE=&lt;number&gt;<br/>  , [NETSVC=&lt;param&gt;];</pre> |

### Example:

1. Change the overflow priority for an ACD entry in the DNI table that is routed through internal number 76767.

#### Input:

```
CHANGE-DNIT:TBL=DNI,INTRTDN=76767,ACD=YES,OVRPRI=10;
```

#### Output:

```
H02: THE ATTRIBUTES OF INTERNAL ROUTING DIRECTORY  
     NUMBER INTRTDN=76767 HAVE BEEN CHANGED.
```

2. Change the GDTRRULE from 200 to 210 for a particular entry.

#### Input:

```
CHANGE-DNIT:TBL=GDTR,GDTRRULE=200,DGTSTR=8005551212,NEWRULE=210;
```

#### Output:

```
H07: DIGIT STRING DGTSTR=8005551212  
     HAS BEEN REMOVED FROM RULE GDTRRULE=200.  
H05: DIGIT STRING DGTSTR=8005551212  
     HAS BEEN ADDED TO RULE GDTRRULE=210.
```

### 80.3.3 DELETE-DNIT

The deletion of an entry in the DNI or GDTR table can be accomplished by the function DELETE. To delete an entry in the GDTRSR table use the function CHANGE by setting DNISRULE to zero (e.g. `CHANGE-DNIT:GDTRSR,<TGRP>,0;`).

To delete an entry in the DNI table, the INTRTDN parameter must be specified. Deletion of the entry cannot occur if the internal routing number is still being referenced by the GDTR table. If AMO DIDCR was referencing this internal routing number, it will be intercepted. To delete an entry in the GDTR table, the GDTRRULE and DGTSTR parameters must be specified.

#### Procedure Overview

| Command Code | Parameter                                                                      |
|--------------|--------------------------------------------------------------------------------|
| DELETE-DNIT  | TBL=DNI,INTRTDN=<number>;<br><br> TBL=GDTR,GDTRRULE=<number>,DGTSTR=<key-num>; |

#### Examples:

1. Delete an entry in the GDTR table.

Input:

```
DELETE-DNIT:TBL=GDTR,GDTRRULE=222,DGTSTR=8005552000;
```

Output:

```
H07: DIGIT STRING DGTSTR=8005552000
      HAS BEEN REMOVED FROM RULE GDTRRULE=222.
```

2. Delete the entry in the DNI table whose internal directory number is 444333.

Input:

```
DELETE-DNIT:TBL=DNI,INTRTDN=444333;
```

Output:

```
H03: INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=444333 HAS BEEN
      DELETED.
```

80.3.4 DISPLAY-DNIT

Display information about directory number information and translation. The displays can be for entries in the DNI, GDTR or GDTRSR tables. To display an entry in the DNI or GDTR table, only one of the optional parameters can be entered. Only a range of 100 numbers inclusive will be allowed when displaying the DNI table when specifying the INTRTDN parameter. If any table is specified but no parameters are entered for that table, the entire table will be displayed.

Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                         |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-DNIT | TBL=DNI,{ (max 1) [INTRTDN=<number>],[SARULE=<number>]<br>,[TARGET=<key-num>],[RCG=<number>],[AUDSRCID=<number>]};<br><br> TBL=GDTR,{ (max 1) [GDTRRULE=<number>],[DGTSTR=<key-num>]<br>,[INTRTDN=<number>]};<br><br> TBL=GDTRSR,[TGRP=<number>]; |

Examples:

1. Display non-sequential SID/ANI numbers with a GDTRRULE of 222.

Input:

DISPLAY-DNIT:TBL=GDTR,GDTRRULE=222;

Output:

| GDTRRULE | DGTSTR          | INTRTDN | SVCDATA |
|----------|-----------------|---------|---------|
| 222      | 8005552000      | 88111   | ANIPREF |
| 222      | 8005552001      | 88111   | ANIPREF |
| 222      | 8005553000      | 88222   | SIDPREF |
| 222      | 8005553001      | 88822   | SIDPREF |
| 222      | 800555****      | 88000   | SID     |
| 222      | 011425176731001 | 100000  | SID     |

2. Display entry with an internal routing directory number of 55555.

Input:

DISPLAY-DNIT:TBL=DNI,INTRTDN=55555;

Output:

## DNIT - Directory Number Information and Translation

### Functions of the AMO

```
+-----+
| INTRTDN - 55555                                     |
| SARULE - 111   DISPLAY - TYME MAGAZINE             ROUTING - DRTSA |
| RCG - 3       PRI - 10       OVRPRI - 1           AUDSRCID - 5   |
| THRSHLD - 20   REVCHA - NO                               |
+-----+
```

#### 3. Display Digit strings from 8005552000 to 8005554\*\*\*.

##### Input:

```
DISPLAY-DNIT:TBL=GDTR,DGTSTR=8005552000&&8005554***;
```

##### Output:

```
+-----+-----+-----+-----+
| GDTRRULE | DGTSTR | INTRTDN | SVCDATA |
+-----+-----+-----+-----+
| 180      | 8005553000 | 88222   | NOREQU  |
| 180      | 8005553001 | 88222   | NOREQU  |
+-----+-----+-----+-----+
| 184      | 800555**** | 88000   | SID     |
+-----+-----+-----+-----+
| 199      | 8005553000 | 88223   | SID     |
+-----+-----+-----+-----+
| 222      | 8005552000 | 88111   | ANIPREF |
| 222      | 8005552001 | 88111   | ANIPREF |
+-----+-----+-----+-----+
```

#### 4. Display non-sequential SID/ANI numbers with an internal routing directory number of 1212.

##### Input:

```
DISPLAY-DNIT:TBL=GDTR,INTRTDN=1212;
```

##### Output:

```
+-----+-----+-----+-----+
| GDTRRULE | DGTSTR | INTRTDN | SVCDATA |
+-----+-----+-----+-----+
| 100      | 4077752891 | 1212    | NOREQU  |
| 100      | 4077752892 | 1212    | NOREQU  |
+-----+-----+-----+-----+
| 102      | 3052811919 | 1212    | NOREQU  |
+-----+-----+-----+-----+
| 103      | 5197885434 | 1212    | NOREQU  |
+-----+-----+-----+-----+
| 106      | 6091226548 | 1212    | NOREQU  |
+-----+-----+-----+-----+
| 109      | 2025554543 | 1212    | NOREQU  |
+-----+-----+-----+-----+
| 110      | 4146652931 | 1212    | NOREQU  |
+-----+-----+-----+-----+
```

## DNIT - Directory Number Information and Translation

### Functions of the AMO

5. Display internal routing directory number entries with a range from 44444 to 44447.

Input:

```
DISPLAY-DNIT:TBL=DNI,INTRTDN=44444&&44447;
```

Output:

```
+-----+
| INTRTDN - 44444                                     |
| SARULE - 111   DISPLAY - TYME MAGAZINE                ROUTING - DRTSA |
| RCG - 3        PRI - 10          OVRPRI - 1          AUDSRCID - 5 |
| THRSILD - 20   REVCHA - NO                                     |
+-----+
| INTRTDN - 44445                                     |
| SARULE - 120   DISPLAY - LYFE MAGAZINE                ROUTING - DRTSA |
| RCG - 4        PRI - 10          OVRPRI - 0          AUDSRCID - 12 |
| THRSILD - 20   REVCHA - NO                                     |
+-----+
| INTRTDN - 44447                                     |
| SARULE - 0     DISPLAY - DAVES TOWING                 ROUTING - SA   |
| TARGET - 3333                                     |
+-----+
```

6. Display the DNISRULEs associated with each network service for trunk groups 1,3,5,100, and 200.

Input:

```
DISPLAY-DNIT:TBL=GDTRSR,TGRP=1&3&5&100&200;
```

Output:

```
+-----+-----+
| TGRP | NETWORK SERVICE |
|-----+-----+
|      | FX | INTLWATS | INWATS | LDS | NONE | PPC900 | SDS | TTA | VPN |
+-----+-----+
| 1    | 130 | 131      | 140    | 150 | 0    | 255    | 130 | 0   | 0   |
| 3    | 0   | 200      | 0       | 0   | 190  | 255    | 0   | 199 | 0   |
| 5    | 0   | 0         | 0       | 0   | 0    | 0       | 0   | 0   | 0   |
| 100  | 129 | 131      | 139    | 0   | 0    | 0       | 243 | 191 | 0   |
| 200  | 143 | 0         | 165    | 0   | 178  | 222    | 0   | 0   | 0   |
+-----+-----+
```

## 80.3.5 REGENERATE-DNIT

The output format is set up so that it can be used directly as an input command for the ADD or CHANGE function. Due to the interdependency of the tables on each other, all the tables must be regenerated at once. However it's possible to regenerate only a certain

kind of data (parameter TBL) but in the latter case not all interdependencies of the tables are considered and it may result in malfunction if the craftperson tries to make the partly regenerated commands run.

There are no error/advisory messages associated with the function REGENERATE-DNIT.

### Procedure Overview

| Command Code    | Parameter                                                                  |
|-----------------|----------------------------------------------------------------------------|
| REGENERATE-DNIT | [TBL=DNI], [INTRTDN=<number>];<br><br>  [TBL=GDTR];<br><br>  [TBL=GDTRSR]; |

#### Example:

1. Regenerate all entries.

Input:

```
REGENERATE-DNIT;
```

Output:

```
ADD-DNIT:DNI,88112,SA,0,"BARF SIMPSON",YES,5,64,1,0,FORB;
ADD-DNIT:GDTR,110,4075551212,88112,NOREQU;
ADD-DNIT:GDTR,111,4075551313,88333,NOREQU;
ADD-DNIT:DNI,88111,DRTD,0,"TYME MAGAZINE",NO,77777;
ADD-DNIT:DNI,44444,DRTSA,110,"TYME MAGAZINE",YES,6,64,1,0,FORB;
ADD-DNIT:GDTR,220,8005551212,44444,ANIPREF;
ADD-DNIT:GDTR,221,800555****,88222,SIDPREF;
ADD-DNIT:GDTR,222,8005552000,88111,ANIPREF;
ADD-DNIT:GDTR,255,#,44444,ANI;
CHA-DNIT:GDTRSR,1,130,FX;
CHA-DNIT:GDTRSR,1,131,INTLWATS;
CHA-DNIT:GDTRSR,1,140,INWATS;
CHA-DNIT:GDTRSR,1,150,LDS;
CHA-DNIT:GDTRSR,1,255,PPC900;
CHA-DNIT:GDTRSR,1,130,SDS;
```

2. Regenerate only DNI entries with the given internal routing directory numbers.

Input:

```
REGENERATE-DNIT:DNI,88111&&88112;
```

Output:

## DNIT - Directory Number Information and Translation

### Parameter Descriptions

```
ADD-DNIT:DNI,88112,SA,0,"BARF SIMPSON",YES,5,64,1,0,FORB;  
ADD-DNIT:DNI,88111,DRTD,0,"TYME MAGAZINE",NO,77777;
```

## 80.4 Parameter Descriptions

|          |                                                                                                                                                                                                                                                                                                     |

## DNIT - Directory Number Information and Translation

### Parameter Descriptions

Type of Input : 1 to 10 single values, concatenated with & or &&  
1. parameter of a max-1-group (DISPLAY,TBL=GDTR)  
single value, mandatory  
(ADD,TBL=GDTR / CHANGE,TBL=GDTR / DELETE,TBL=GDTR)

Possible Values : numeric,  
1-128 GDTR SID/ANI rule for SID/ANI numbers  
129-255 GDTR DNIS rule for non-sequential DNIS numbers

Default Value : none

#### INTRTDN Internal Routing Directory Number

Type of Input : 1 to 10 single values, concatenated with & or &&  
1. parameter of a max-1-group (DISPLAY,TBL=DNI / REG,TBL=DNI)  
single value, 3. parameter of a max-1-group (DISPLAY,TBL=GDTR)  
single value, mandatory  
(ADD,TBL=DNI / ADD,TBL=GDTR / CHANGE,TBL=DNI /  
CHANGE,TBL=GDTR / DELETE,TBL=DNI)

Possible Values : numeric, up to 6 digits (range 0 - 999999)

Default Value : none

#### NETSVC Symbol of desired network service

Type of Input : single value, mandatory

Possible Values : FX foreign exchange access service  
INTLWATS international long distance  
INWATS megacom/mci 800,incoming wats  
LDS long distance service  
NONE not a special device  
PPC900 multiquest, mci 900  
SDS ACCU  
TTA tie trunk access  
VPN sdn, mci vnet, private nw svc

Default Value : none

#### NEWDGTS New Digit String

Type of Input : single value, mandatory

Possible Values : 0-9,\*,#, up to 22 digits

Default Value : none

#### NEWRULE New GDTR Element with SID/ANI Rule

Type of Input : single value, mandatory

Possible Values : numeric, 1-255

Default Value : none

### Error Messages and Advisories

|               |           |                                                                          |
|---------------|-----------|--------------------------------------------------------------------------|
|               | *         | If the threshold is ever desired to be set back to the null value.       |
| Default Value | : H'FFFF' | No threshold set. Initialized by database. Not used by the craftsperson. |

## 80.5 Error Messages and Advisories

### Note:

The F04 and F36 messages are variable text; one of the text strings bounded by parenthesis will be output to suffix the main part of these error messages

### 80.5.1 Error Messages

F01: PLEASE ENTER GDTRRULE=0 FOR THE CASE ROUTING=SA (SID/ANI).

F02: PLEASE ENTER THE NUMBER OF AN EXISTING GDTR RULE (GDTRRULE>0) FOR ROUTING=DRTSA.

F03: THE INTERNAL ROUTING DIRECTORY NUMBER 'INTRTDN' OF A GDTR ENTRY WITH GDTRRULE=<rrr> POINTS TO A DNI ENTRY WITH ROUTING=<ttttt>. SUCH A DNI ENTRY MUST HOWEVER HAVE ROUTING=SA (SID/ANI).

F04: CANNOT CHANGE/DELETE RULE GDTRRULE=<rrr> - IT IS STILL BEING REFERENCED BY TABLES (AMO-ffff,pppp)

F05: NO GDTR RULE WITH GDTRRULE=<rrr> PRESENT.

F06: NO ENTRY WITH DGTSTR=<dddddddddddddd> AND GDTRRULE=<rrr> AVAILABLE.

F07: AN ENTRY WITH DGTSTR=<dddddddddddddd> AND GDTRRULE=<rrr> ALREADY PRESENT.

F08: CANNOT USE INTERNAL ROUTING DIRECTORY NUMBER TO INTRTDN=<nnnnnn> - IT MUST FIRST BE ASSOCIATED WITH DIGIT ANALYSIS RESULT DAR=STN (ADD-WABE:CD=<?>,DAR=STN;)

F09: INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=<nnnnnn> IS ALREADY IN USE.

F10: NO ENTRY WITH INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=<nnnnnn> PRESENT IN THE DNI TABLE (DISPLAY-DNIT:TBL=DNI;).

F11: CANNOT DELETE INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=<nnnnnn> - IT IS STILL BEING REFERENCED BY THE GDTR TABLE. FIND REFERENCES (DISPLAY-DNIT:TBL=GDTR,INTRTDN=<?>;) AND REMOVE THEM (DELETE-DNIT:TBL=GDTR,GDTRRULE=,DGTSTR=<?>;).

F12: INVALID DIGIT ANALYSIS RESULT FOR INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=<nnnnnn>. THE CORRECT ASSIGNMENT IS DAR=STN. (DISPLAY-WABE,TYPE=GEN,CD=<?>;)

F13: INVALID DIGIT ANALYSIS RESULT FOR <dddddddddddddd>. DAR MUST BE OF TYPE: STN, NETW, HUNT, TIE, ATND, COMBO, MILLWAT, LOOPBACK OR SILENCE. (AMO-WABE:DAR)

F15: THE ROUTE CONTROL GROUP 'RCG' HAS NOT YET BEEN CREATED. FIRST RESERVE RCG INDEX (CHANGE-ACDS:TYPE=CAFRCG,RCG=<?>,CAFDN=<?>;)

F16: FIRST A ROUTE SELECTION TABLE (RS) HAS TO BE SET UP FOR ROUTE CONTROL GROUP RCG=<aaaa>: ADD-ACDRS:TYPE=RS,RCG=<aaaa>,...

- F17: AUDIBLE SOURCE ID AUDSRCID=<sup>^</sup>audsrcid<sup>^</sup> HAS YET TO BE CREATED:  
ADD-RCSU:OPMODE=CONT,OPTYPE=RANDOM,RECAPL=ACDR,RECNUM=<?>;
- F18: THE APPLICATION TYPE ASSIGNED FOR RECORDER  
'AUDSRCID' BY AMO RCSU MUST BE RECAPL=ACDR.
- F19: RECORDER 'AUDSRCID' MUST BE CONFIGURED WITH  
CONTINUOUS OPERATIONS MODE AND RANDOM START.  
(CHANGE-RCSU,OPMODE=CONT,OPTYPE=RANDOM,RECNUM=<?>;)
- F20: WILDCARDS ALLOWED ONLY AT TRAILING POSITIONS OF COMMAND INPUT 'DGTSTR'.
- F21: EITHER A SINGLE JOKER (#) OR A DIGIT STRING WITH EVENTUAL  
TRAILING WILDCARDS (\*) MAY BE ENTERED FOR 'DGTSTR'.
- F22: DIGITS "A" ... "D" ARE NOT ALLOWED FOR 'DGTSTR'.
- F23: NO 'SVCDATA' ALLOWED FOR A SID/ANI ENTRY.
- F24: MEMORY RESERVED FOR DNI TABLE ENTRIES IS INSUFFICIENT.  
PLEASE ALLOCATE ADDITIONAL MEMORY  
(ADD-DIMSU:DNI=<?>;)
- F25: MEMORY RESERVED FOR GDTR TABLE ENTRIES IS INSUFFICIENT.  
PLEASE ALLOCATE ADDITIONAL MEMORY  
(ADD-DIMSU:GDTR=<?>;)
- F26: INSUFFICIENT MEMORY FOR DISPLAY TEXTS.
- F27: MEMORY RESERVED FOR RULO BLOCKS IS INSUFFICIENT.  
PLEASE ALLOCATE ADDITIONAL MEMORY  
(ADD-DIMSU:BLK100=<?>;)
- F28: A 'TARGET' MUST BE ENTERED FOR ACD=N.
- F29: AN RCG INDEX MUST BE ENTERED WHEN CHANGING FROM ACD=N TO ACD=Y.
- F30: THE TWO DIGIT STRINGS DELIMITING THE RANGE ENTERED FOR 'DGTSTR' MUST HAVE THE  
SAME LENGTH.
- F31: DIGITS "A" ... "D" ARE NOT ALLOWED FOR 'THRSHLD'.
- F32: THE CHARACTER "\*" MUST STAND ALONE`  
IF USED IN THE INPUT FOR 'THRSHLD'.
- F33: USE EITHER A SINGLE ASTERISK ("\*") OR A NUMBER IN THE RANGE 0-1024 AS INPUT  
FOR 'THRSHLD'.
- F34: THE TWO INTERNAL ROUTING DIRECTORY NUMBERS DELIMITING THE RANGE ENTERED FOR  
'INTRTDN' MUST HAVE THE SAME LENGTH.
- F35: CHANGE FROM ROUTING=<ttttt> TO ROUTING=<ttttt> NOT PERMITTED -  
ONLY FROM ROUTING=DRTD TO ROUTING=DRTSA OR VICE VERSA.
- F36: CANNOT CHANGE/DELETE INTERNAL ROUTING DIRECTORY NUMBER  
INTRTDN=<nnnnnn> - IT IS REFERENCED BY RULE AMO-ffff,ppppp)
- F37: THE TARGET MUST HAVE BEEN SET UP AS A SUBSCRIBER.
- F38: SUBSCRIBER NUMBERS 'TARGET' AND 'INTRTDN' MUST BE DIFFERENT.
- F39: THE TARGET MUST BE ASSOCIATED WITH AN ATTENDANT GROUP (ADD-VFGR,ATNDGR=;).
- F40: CANNOT DELETE INTERNAL ROUTING DIRECTORY NUMBER INTRTDN=<nnnnnn>  
- IT IS STILL BEING REFERENCED BY THE ACD ROUTING TABLES.  
ENTER COMMAND 'DISPLAY-ACDRT;' AND SEARCH FOR ENTRIES HAVING  
'RTAGT, RTOFF,RTEXT' IN COLUMNS 'ACTION, PARAMETER' AND THE APPROPRIATE  
DIRECTORY NUMBER IN COLUMN 'VALUE'.  
(DELETE STEPS WITH 'CHANGE-ACDRT:TYPE=DELSTEP,STEP=<?>;',  
REMOVE ACD ROUTING TABLES WITH 'DELETE-ACDRT:ART=<?>;')
- F41: CANNOT DELETE JOKER - THE GDTR RULE FOR JOKER IS REFERENCED BY A TRUNK GROUP  
CONTAINING ANI-ONLY TRUNKS.  
TRUNK GROUPS FOR ALL AFFECTED TRUNKS MUST BE CHANGED TO USE A DIFFERENT  
GDTR RULE THAT CONTAINS A JOKER (AMO BUEND,GDTRRULE; AMO TDCSU,TGRP).
- F42: CANNOT SET ALL ENTRIES IN GDTRSR TABLE TO ZERO SINCE TRUNK GROUP <ggg>  
CONTAINS GDTR PRIB TRUNK. (AMO-TDCSU,TGRP)
- F43: MEMORY RESERVED FOR DATA POOL ELEMENTS IS INSUFFICIENT.  
PLEASE ALLOCATE ADDITIONAL MEMORY  
(ADD-DIMSU:DPDNI=<?>;)

## DNIT - Directory Number Information and Translation

### Error Messages and Advisories

F44: DATA POOL RESERVED FOR AMO-DNIT HAS EXHAUSTED ITS MEMORY.  
SEE AMO-DIMSU TO ALLOCATE MORE MEMORY  
(ADD-DIMSU, DPMDNIT).

F45: TDS TEST TERMINATION ACCESS CODES CANNOT BE ASSIGNED AS A TARGET FOR A DNI  
TABLE ENTRY SET TO 'SA'.

F46: FOR TARGETS ASSOCIATED WITH TDS TEST TERMINATION ACCESS CODES THE PARAMETERS  
'ROUTING, GDTRRULE, DISPLAY' MAY NOT BE CHANGED FROM THEIR DEFAULT VALUES.

F47: NUMBER ENTERED FOR INTRTDN=<nnnnnn> IS ALREADY  
USED AS AN EXTERNAL STATION NUMBER.

F48: NUMBER ENTERED FOR INTRTDN=<nnnnnn> IS ALREADY USED  
AS AN EXTERNAL HUNTING DESTINATION (DISPLAY-SA,STNO=<?>).

F49: CANNOT DELETE DIRECTORY NUMBER INTRTADR=<nnnnnn> - THE ASSIGNMENT DAR=STN FOR  
DIGIT ANALYSIS RESULT IS MISSING.

F50: THE SPECIFIED TRUNK GROUP HAS NOT YET BEEN CREATED  
(AMO BUEND, TGRP).

F52: INSUFFICIENT MEMORY FOR SUBSCRIBERS - ALLOCATION: 'ADD-DIMSU:STN=<?>'.

F53: INSUFFICIENT MEMORY FOR DEVICES - ALLOCATION: 'ADD-DIMSU:LODEN=<?>'.

F54: THE INTERNAL ROUTING DIRECTORY NUMBER 'INTRTDN' OF A GDTR ENTRY  
WITH GDTRRULE=<rrrr> POINTS TO A DNI ENTRY WITH ROUTING=<ttttt>. SUCH A DNI  
ENTRY MUST HOWEVER HAVE ROUTING=DRTD OR DRTSA.

# 81 DPSM - Device Pair Allocation (Duplicate Recording)

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | AMO Functions         | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The option of duplicate recording exists for the purpose of increasing the data reliability and data availability. For this purpose, a duplicate area (slave HD) is assigned to the original area (master HD). The original area is copied to the duplicate area (synchronization) before starting operation. If the "logical area name" begins with the letters "RO" (read only) during duplicate recording, adjusting the duplicate area for each runup is omitted. The two areas are synchronized only when activated with DSKX (= new startup). Therefore, only those areas that are written once, that were never changed, and where successful writing can be traced by the service personnel (e.g., recorded announcements on the VMS residing on hard disk), may receive the "predicate RO".

Prerequisites for creating a pair allocation for duplicate recording by using the AMO DPSM ( *Device Pair Allocation* , Service Module):

- Two areas configured by means of the AMO DASM.
- Both areas must not be activated.
- Both areas must not belong to the same controller.
- Both areas must be created on different devices.
- Both areas must agree with respect to track, sector, and area sizes.
- 'PHY'-areas used by UNIX in previous variants will only be activated physically and cannot be double recorded, either.

## 81.1 Restrictions

This description is valid from HiPath 4000 V6.0.

## 81.2 Interrelationships

- AMO DASM : Memory areas on hard disk
- AMO DCSM : Device configuration of servers

## DPSM - Device Pair Allocation (Duplicate Recording)

### AMO Functions

- AMO DDSM : Device Display of the Server
- AMO DLSD : Hard Disk area allocation - Logical

## 81.3 AMO Functions

- [ADD-DPSM](#) : Creating pair allocation
- [DELETE-DPSM](#) : Cancelling pair allocation

### 81.3.1 ADD-DPSM

#### Procedure Overview

| Command Code | Parameter                                    |
|--------------|----------------------------------------------|
| ADD-DPSM     | [UNIT=<param>] , CNO=<number> , ANO=<param>; |

#### Example

Creating pair allocation for a duplicate recording of area G on controller 1 and area F on controller 2 of administration and data server 1.

Input:

```
ADD-DPSM: , 1-2, G-F;
```

### 81.3.2 DELETE-DPSM

#### Procedure Overview

| Command Code | Parameter                                    |
|--------------|----------------------------------------------|
| DELETE-DPSM  | [UNIT=<param>] , CNO=<number> , ANO=<param>; |

#### Example

Cancelling the pair allocation of area G on controller 1 of administration and data server 1.

Input:

```
DELETE-DPSM: , 1, G;
```

## 81.4 Parameter Description

|      |                                         |                                                        |                                        |
|------|-----------------------------------------|--------------------------------------------------------|----------------------------------------|
| ANO  | Area number                             |                                                        |                                        |
|      | Type of Input                           | : max. 2 chained (with '-') single values<br>mandatory |                                        |
|      | Possible Values                         | : E - K                                                |                                        |
| CNO  | Controller number                       |                                                        |                                        |
|      | Type of Input                           | : max. 2 chained (with '-') single values<br>mandatory |                                        |
|      | Possible Values                         | : 1 - 7                                                |                                        |
| UNIT | Functional system unit i.e. server code |                                                        |                                        |
|      | Type of Input                           | : Single value<br>optional                             |                                        |
|      | Possible Values                         | : A1                                                   | = Administration and Data Server (ADS) |
|      | Default Value                           | : A1                                                   |                                        |

## 81.5 Error Messages and Advisories

### 81.5.1 Error Messages

```

F01: CONTROLLER <:cnam:> DOES NOT EXIST

| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

*Switching of external storage devices.*

### 82.1 Restrictions

This description is valid from HiPath 4000 V6.0.

### 82.2 Interrelationships

- AMO DASM : Hard disk area allocation - physical
- AMO DCSM : Disk configuration
- AMO DPSM : Device pair allocation

### 82.3 Functions of the AMO

- [ACTIVATE-DSSM](#) : Activate an external storage device
- [DEACTIVATE-DSSM](#) : Deactivate an external storage device
- [CHANGE-DSSM](#) : Change or remove the dependability inhibit of an external storage device

#### 82.3.1 ACTIVATE-DSSM

Prerequisite for activating a hard disk (HD):

- At least one area must be defined on the hard disk
- All areas on the device must be initialized
- The device must not have a dependability inhibit

When a hard disk is activated, all areas of the hard disk are activated.

## DSSM - Device Switch for Server Moduls

Functions of the AMO

### Procedure Overview

| Command Code  | Parameter                                                        |
|---------------|------------------------------------------------------------------|
| ACTIVATE-DSSM | [UNIT=<param>], CNO=<number>, [TEST=<param>]<br>, [ANO=<param>]; |

#### Example

Activate and test area F on controller 1 of the administration and data server 1.

Input:

```
ACT-DSSM: , 1, Y, F;
```

### 82.3.2 DEACTIVATE-DSSM

All areas or specified areas of the hard disk are deactivated, and additional partitions will be displayed if they are present.

#### Procedure Overview

| Command Code    | Parameter                                    |
|-----------------|----------------------------------------------|
| DEACTIVATE-DSSM | [UNIT=<param>], CNO=<number>, [ANO=<param>]; |

#### Example

Deactivate area F and G on controller 1 of administration and data server 1.

Input:

```
DEACT-DSSM: , 1, F&G;
```

### 82.3.3 CHANGE-DSSM

When this function is called, the dependability inhibit for the peripheral storage device is removed.

#### Procedure Overview

| Command Code | Parameter                                    |
|--------------|----------------------------------------------|
| CHANGE-DSSM  | [UNIT=<param>], CNO=<number>, [ANO=<param>]; |

#### Example

Remove dependability inhibit of device 1 of administration and data server 1.

Input:

CHANGE-DSSM: , 1;

## 82.4 Parameter Description

|      |                                                                                      |                                                     |                                        |
|------|--------------------------------------------------------------------------------------|-----------------------------------------------------|----------------------------------------|
| ANO  | Area number                                                                          |                                                     |                                        |
|      | Type of Input                                                                        | : max. 8 with '&' chained single values<br>optional |                                        |
|      | Possible Values                                                                      | : E - K                                             |                                        |
| CNO  | Controller number                                                                    |                                                     |                                        |
|      | Type of Input                                                                        | : Single value<br>mandatory                         |                                        |
|      | Possible Values                                                                      | : 1 - 8                                             |                                        |
| TEST | Device test required                                                                 |                                                     |                                        |
|      | Type of Input                                                                        | : Single value<br>optional                          |                                        |

## **DSSM - Device Switch for Server Moduls**

Error Messages and Advisories

## 83 DSSU - Device switch of switching unit

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

Using AMO DSSU, devices of the switching unit (SWU) can be switched on or off (activated/deactivated). Using restart the functions deactivate and activate are combined. Additionally, devices may be signed off or signed on to a pen (Feature Autoset Relocate). In this AMO description, the term 'devices' includes station lines, terminals, and trunks.

Devices may be switched, identified by their port equipment number (TYPE = PEN) or station number (TYPE = STNO).

For configuration of devices with different services for one station number (e.g. S0-Bus) these services may be switched individual.

All functional devices for S0-Bus can only be switched together. Parameter SVC is not allowed.

For display dependability states use AMO SDSU.

### MSN station numbers:

This AMO enables the switch on and switch off for CP of MSN station numbers/MSN secondary stations numbers. To do this, the new service MSN was added. If service=MSN is used for a NON-MSN station number/MSN secondary station number the error message F23 will be displayed. Switch on is only allowed with ONTYPE=ANL, whereby the READY-Bit in CP is set. For switch off with OFFTYPE=DC the READY-Bit will be reset, with OFFTYPE=DI CP will be forced additionally to cancel all transactions of MSN station number immediately. (please see AMO-SBCSU also)

### B-channel of S0-Trunk circuit:

The second B-channel of S0-Trunk circuit can be switched individually. Switch on will be done by "activation with no loading", and switch off by "long term deactivation". If a non S0-Trunk circuit PEN is entered, message F22 will be displayed.

### 83.1 Restrictions

This description is valid from HiPath 4000 V1.0.

## 83.2 Interrelationships

- AMO-DCIC
- AMO-REFTA
- AMO-SDSU
- AMO-SCSU/SBCSU/ACSU
- AMO-TSCSU/TDCSU/TACSU
- AMO-VFGR

## 83.3 Functions of the AMO

- [ACTIVATE-DSSU](#) : Activate devices
- [DEACTIVATE-DSSU](#) : Deactivate devices
- [CHANGE-DSSU](#) : Sign on / sign off devices
- [RESTART-DSSU](#) : Reset (deactivate / activate) devices
- [EXEC-DSSU](#) : \*\*\* not available, not supported by board SLMC \*\*\*  
Execute loading of CMI Basestations

### 83.3.1 ACTIVATE-DSSU

For switch on there are the following ways:

- activation with conditional loading (ACL),
- activation with unconditional loading (AUL) or
- activation with no loading (ANL)

'Loading' means loading of trunk data on boards, not 'downloading' of SET400/500.

For activation with conditional loading, there is no loading if not required because of trunk status (e.g. pre-locked trunks).  
The trunks and all connected devices will be activated.

When activating, existing status "manual lock" or "long term lock" will be removed.

If the line or one of the terminals selected with the parameter SVC is not operational after the activation (e.g., due to 'blocked by partner system'), the status is reported to the operator in an advisory.

**DCI:**

This feature allows a second line module to be allocated to a station, to which a DCI (data communication interface) can be attached. In such a case, if the parameter TYPE is declared as STNO and SVC is not specified, then an activate job will also activate the second line module with the DCI.

**Voice compression:**

If the circuit to be activated is partner of a voice compression connection, the according VCM circuit will be activated automatically if its state is pre-blocked, and the message H24 will be displayed.

**Procedure Overview**

| Command Code  | Parameter                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACTIVATE-DSSU | [ONTYPE=<param><br>, TYPE=STNO, STNO=<number>, [SVC=<param>];<br><br>  , TYPE=PEN, PEN1=<pen>, [PEN2=<pen>];<br><br>  , TYPE=BCHAN, PEN1=<pen>, [BCHL=<number>]; |

**Examples**

1. The line module and the terminal equipment with the STNO 204 is to be activated with unconditioned loading.

Input:

```
ACTIVATE-DSSU:AUL,STNO,204;
```

Output:

```
H01: STNO 204 ACTIVATED (READY)
```

```
H01: DCI 204 ACTIVATED (READY)
```

2. Activate second B-channel for PEN 1-1-115-0

Input:

```
ACTIVATE-DSSU:,BCHAN,1-1-115-0,2;
```

Output:

```
H01: BCHAN 1-1-115-0 ACTIVATED
```

**83.3.2 DEACTIVATE-DSSU**

Deactivation can be carried out as follows:

## DSSU - Device switch of switching unit

### Functions of the AMO

- with pre-blocking (DC),
- without pre-blocking (DI) or
- long-term (L)

#### Deactivation without Pre-Blocking:

The devices are manually blocked. (Long-term blocked devices remain blocked for a long period of time.) Existing connections are released immediately.

#### Deactivation with Pre-Blocking:

Existing connections are not released, the affected devices are blocked automatically after the release.

#### Long-Term Deactivation:

The devices are deactivated immediately and will not be administrated by DEP any longer. This is similar to 'Not Equipped' (NEQ). The feature modem pooling is released.

#### Reference clock generator:

Parameter REFOFF controls deactivation of reference clock generator. If REFOFF = NO, H10 is displayed for a PEN to which a reference clock generator is assigned. This PEN won't be deactivated.

If nothing is entered for parameter REFOFF, that means PROMPT, or Y is entered, there will be a check if the trunk represents the active reference clock generator. If the entered PEN leads to the only reference clock generator, H09 prompts, whether to deactivate this PEN or not.

If there are additional reference clock generators available, H08 will be prompted. If Y = deactivate, DEP will select another trunk from the reference clock table (AMO REFTA) as the active reference clock generator.

#### Voice compression:

If the circuit to be deactivated with OFFTYPE=DC is partner of a voice compression connection, the according VCM circuit will be deactivated automatically and the message H24 will be displayed.

#### Procedure Overview

| Command Code    | Parameter                                                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------|
| DEACTIVATE-DSSU | [OFFTYPE=<param>]<br><br>, TYPE=STNO, STNO=<number>, [SVC=<param>];<br><br>  , TYPE=PEN, PEN1=<pen>, [PEN2=<pen>], [REFOFF=<param>]; |

**Command Code****Parameter**

```
|,TYPE=BCHAN,PEN1=<pen>,[BCHL=<number>];
```

**Examples**

1. The line at port 1-1-6-1 is to be deactivated regardless of the current device status.

Input:

```
DEACTIVATE-DSSU:DI,PEN,1-1-6-1;
```

Output:

```
H01: SLMA 1-1-6-1 DEACTIVATED
```

2. The FAX terminal equipment having DN's 252 to 256 and 205 are to be deactivated with pre- blocking.

Input:

```
DEACTIVATE-DSSU:DC,STNO,252&&256&205,FAX;
```

Possible Output:

```
H03: FAX 252 DEACTIVATED
F11: STNO 253 NOT CONFIGURATED
F12: STNO 254 PARAMETER SVC NOT ALLOWED
H04: FAX 256 PRE-BLOCKED
H05: FAX 205 DEACTIVATED FOR LONG PERIOD (NEQ STATE)
```

3. Deactivate second B-channel for PEN 1-1-115-0

Input:

```
DEACTIVATE-DSSU:,BCHAN,1-1-115-0,2;
```

Output:

```
H05: BCHAN 1-1-115-0 DEACTIVATED FOR LONG PERIOD (NEQ STATE)
```

4. Deactivate current reference clock at pen 1-1-37-0

Input:

```
DEACT-DSSU:,PEN,1-1-37-0;
```

Output:

```
H08: THE DEACTIVATE JOB AFFECTS THE CURRENT REFERENCE CLOCK
GENERATOR"
      PLEASE ANSWER PARAMETER REFOFF
      Y . . . . DEACTIVATE CURRENT REFERENCE CLOCK GENERATOR
      N . . . . DO NOT DEACTIVATE CURRENT REFERENCE CLOCK
GENERATOR
      *
```

Input:

```
Y;
```

Output:

```
H03: PEN 1-1-37-0 DEACTIVATED
```

### 83.3.3 CHANGE-DSSU

By means of TYPE=SIGNON, a signed off extension may be signed on to a signed off pen.

By means of TYPE=SIGNOFF, extensions, which are allowed to use AUTOSET RELOCATE, can be signed off. Therefore the extension will be cut off his pen, after all there are a signed off extension and a signed off pen.

Signed off extensions can be only signed on by means of AMO DSSU. They can not be deactivated or activated.

#### Procedure Overview

| Command Code | Parameter                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------|
| CHANGE-DSSU  | TYPE=SIGNON, STNO=<number>, PEN1=<pen>, [TSI=<number>];<br><br>  TYPE=SIGNOFF, STNO=<number>; |

#### Examples

1. Stationnumber 3170 will be signed on at pen 1-1-6-1 TSI 1.

Input:

```
CHANGE-DSSU:SIGNON,3170,1-1-6-1,1;
```

Output:

```
H19: TSI 1 NOT VALID, A VALID TSI WILL BE SEARCHED
```

```
H18: STNO 3170 SIGNED ON TO PEN 1-1-6-1 TSI 4
```

2. Stationnumber 3210 will be signed off.

Input:

```
CHANGE-DSSU:SIGNOFF,3210;
```

Output:

```
H17: STNO 3210 SIGNED OFF
```

### 83.3.4 RESTART-DSSU

This function resets devices, that means the commands DEACTIVATE and ACTIVATE are combined in one order. For ranges all devices will be deactivated first and activated afterwards. All deactivations will be done with OFFTYPE=DI, all activations will be done with ONTYPE=AUL.

For stationnumbers all services will be switched. The last reference clock generator can not be reset by means of this function, the message H10 will be displayed.

### Procedure Overview

#### Command Code

RESTART-DSSU

#### Parameter

TYPE=STNO, STNO=<number>;

| TYPE=PEN, PEN1=<pen>, [PEN2=<pen>] ;

### Example

1. The line at port 1-1-6-1 is to be reset.

Input:

RESTART-DSSU:PEN,1-1-6-1;

Output:

H01: SLMA 1-1-6-1 DEACTIVATED  
H01: SLMA 1-1-6-1 ACTIVATED (READY)

2. The devices with stationnumbers 252 to 256 and 205 are to be reset.

Input:

RESTART-DSSU:STNO,252&&256&205;

Possible outputs:

H01: STNO 252 DEACTIVATED  
H03: FAX 252 DEACTIVATED  
F12: STNO 253 NOT CONFIGURED  
F12: STNO 254 NOT CONFIGURED  
F12: STNO 255 NOT CONFIGURED  
H01: STNO 256 DEACTIVATED  
H04: FAX 256 DEACTIVATED  
H01: STNO 205 DEACTIVATED  
H05: FAX 205 DEACTIVATED  
H01: STNO 252 ACTIVATED (READY)  
H01: FAX 252 EINGEACTIVATEDSCHALTET (READY)  
F12: STNO 253 NOT CONFIGURED  
F12: STNO 254 NOT CONFIGURED  
F12: STNO 255 NOT CONFIGURED  
H01: STNO 256 ACTIVATED (READY)  
H01: FAX 256 ACTIVATED (READY)  
H01: STNO 205 ACTIVATED (READY)  
H01: FAX 205 ACTIVATED (READY)

## 83.3.5 EXEC-DSSU

\*\*\* not available, not supported by board SLMC \*\*\*

## DSSU - Device switch of switching unit

### Parameter Description

By means of this function CMI Basestations can be loaded and activated. The loadresult will be displayed. Activation of CMI Basestations without loading will be done by means of ACTIVATE.

### Procedure Overview

| Command Code | Parameter                                                    |
|--------------|--------------------------------------------------------------|
| EXEC-DSSU    | [LTG=<number>], LTU=<number>, SLOT=<number>, [CIR=<number>]; |

### Examples

1. CMI Basestation at LTG 1, LTU 1, SLOT 67, CIR 20 is to be loaded.

Input:

```
EXEC-DSSU:1,1,67,20;
```

Output:

```
H21: BASESTATION 1-1-67-20 LOADED
```

2. CMI Basestation at LTG 1, LTU 1, SLOT 67, CIR 20 is to be loaded but failed.

Input:

```
EXEC-DSSU:1,1,67,20;
```

Output:

```
F48: BASESTATION 1-1-67-20 NOT LOADED, (LW-ERROR)
```

## 83.4 Parameter Description

|      |                                   |                                      |
|------|-----------------------------------|--------------------------------------|

A suitable module must be configured to the slot addressed by PEN (AMO BCSU).

The possible LTU and Slot values for PEN depend on the systems architecture and can be found in the BCSU AMO description.

## DSSU - Device switch of switching unit

### Parameter Description

The possible Line values depend on the module type and its functionality.

They can be listed using DISP-BCSU: TYPE=PEN1 [,LTG=, LTU=, SLOT=, CCT=]; which will also output the actual PEN status (e.g. NOT CONNECTED).

## 83.5 Error Messages and Advisories

### Note

'xxxxx' in the messages designates module type and station number or module type and PEN.

### 83.5.1 Error Messages

```

F01:  PEN2 PRECEDES PEN1
F02:  LTG NUMBER <ltg> DOES NOT HAVE ADMISSIBLE VALUE, MAXIMUM VALUE: <max>
F03:  LTU NUMBER <ltu> DOES NOT HAVE ADMISSIBLE VALUE, MAXIMUM VALUE: <max>
F04:  SLOT <slot> DOES NOT HAVE ADMISSIBLE VALUE
F05:  CIRCUIT NUMBER <cir> DOES NOT HAVE ADMISSIBLE VALUE, MAXIMUM VALUE: <max>
F06:  LTG <ltg> NOT ASSIGNED (NEQ)
F07:  LTU <ltg>-<ltu> NOT ASSIGNED (NEQ)
F08:  MODULE <ltg>-<ltu>-<slot> NOT ASSIGNED (NEQ)

```

## DSSU - Device switch of switching unit

### Error Messages and Advisories

F09: STNO XXXX / PEN <ltg>-<ltu>-<slot>-<cir> NOT ACTIVATED/SIGNED ON

F10: PEN <ltg>-<ltu>-<slot> CIRCUIT NUMBER <cct> TOO LARGE  
(The specified line number is greater than the largest line number of the module.)

F11: xxxxxx NOT CONFIGURED  
(the station number is not in the station number plan)

F12: STNO xxxxxx PARAMETER SVC NOT ALLOWED

F13: STNO xxxxxx HAS NO <svc>-TERMINAL DEVICE  
(A terminal matching parameter SVC is not configured for the specified DN.)

F14: xxxxx xxxxxx WITHOUT PHYSICAL DEVICE  
(There is no line for the specified DN; the station is a 'floating' chip card user.)

F15: xxxxx xxxxxx NOT ACTIVATED (ORDER ERROR)  
(the activation job has been rejected by DC / CDC)

F16: xxxxx xxxxxx NOT DEACTIVATED (ORDER ERROR)  
(the deactivation job has been rejected by DC / CDC)

F17: STATION CALL NUMBERS <stn1> AND <stn2> HAVE DIFFERENT LENGTHS

F18: xxxxx xxxxxx CONSOLE DOES NOT BELONG TO ANY AC-GROUP  
(the terminal connection of the attendant console must first be accepted in an AC group)

F19: LAYER LOST AT PEN @@-@@-@@@-@@@ PLEASE WAIT FOR END OF SOFT LOCK OR LOCK THIS CIRCUIT HARD (DEACT-DSSU:DI,...;)

F20: STNO <stno> SVC=DTE ONLY ALLOWED FOR CTE

F21: STNO <stno> SINGLE FUNCTIONAL TERMINAL CANNOT BE SWITCHED  
(The parameter SVC may not be specified for functional terminals)

F22: ENTERED PEN IDENTIFIES NO S0-TRUNK-CHANNEL

F23: STNO <stno> IS MSN-NUMBER AND THEREFORE SVC=MSN OR SVC=ALL HAS TO BE USED

F24: STNO <stno> MSN-NUMBER NOT DEACTIVATED FOR CP (ORDER ERROR)

F25: STNO <stno> IS NO MSN-NUMBER AND THEREFORE SVC=MSN IS NOT ALLOWED

F27: DEVICE OF STNO <stno> IS NOT ALLOWED FOR SIGN OFF

F28: MAIN NUMBER <stno> HAS ALREADY SIGNED ON NUMBERS

F29: STNO <stno> IS ASSOCIATED WITH DATA DEVICE, SIGN OFF NOT POSSIBLE

F30: STNO <stno> IS ALREADY SIGNOFF

F31: STNO IS PRE-BLOCKED. REPEAT COMMAND LATER OR DEACTIVATE IMMEDIATELY BY MEANS OF DEACT-DSSU:DI,STNO,<stno>;

F32: ID CARD USER <stno> IS NOT SIGNED ON

F35: STNO <stno> IS NOT SIGNED OFF

F36: PEN IS ALREADY ASSIGNED

- F37: PEN IS AVAILABLE, BUT NOT SIGNED OFF, USE FIRST  
CHANGE-BCSU:SIGNOFF,<ltg>,<ltu>,<ebt>,<cir>,<tsi>;
- F38: BOARD <bg> AND DEVICE <ger> DO NOT MATCH
- F39: PEN <ltg>-<ltu>-<slot>-<cct> <tsi> IS BUSY WITH CALL PROCESSING, THEREFORE SIGN  
ON NOT POSSIBLE
- F40: STNO IS IN AN UNDEFINED SIGN OFF STATE. SIGN OFF FIRST:  
CHANGE-DSSU:SIGNOFF,<stno>;
- F41: STNO <stno> IS SIGNED OFF. THEREFORE IT CANNOT BE SWITCHED
- F42: SIGNON/SIGNOFF NOT POSSIBLE RIGHT NOW, REPEAT COMMAND LATER
- F43: STNO <stno> IS MSN-NUMBER, SIGN OFF NOT POSSIBLE
- F44: FOR STNO <stno> NO OPTISET-MASTER IS SIGNED ON
- F45: <block|unblock|reset> ONLY ALLOWED FOR BOARD DIUS7
- F46: B-CHANNEL <block|unblock|reset> NOT POSSIBLE, CIRCUIT STATUS MUST BE READY
- F47: RESET NOT POSSIBLE, ERROR WHEN READING THE BLOCKING DATA
- F48: BASESTATION <ltg>-<ltu>-<slot>-<cct> NOT LOADED, <loaderror>
- F49: PEN <ltg>-<ltu>-<slot> IDENTIFIES NO BASESTATION
- F50: EXEC ONLY ALLOWED FOR BOARD SIMC
- F51: B-CHANNEL <block|unblock|reset> NOT POSSIBLE, NO SUITABLE B-CHANNELS AVAILABLE
- F52: AN ACD-AGENT IS LOGGED ON STNO <stno>, SIGN OFF NOT POSSIBLE
- F53: PEN <ltg>-<ltu>-<slot> BOARD WITHOUT CIRCUITS
- F54: PEN <ltg>-<ltu>-<slot> NOT ACTIVATED  
  
CANNOT ACTIVATE ATPVC CIRCUITS WITH ONTYPE=AUL; ALL ATMSVC CIRCUITS OF THE STMA  
BOARD MUST BE LOCKED
- F55: PEN <ltg>-<ltu>-<slot> IS ONLY PRE-BLOCKED  
  
STMA CIRCUITS CANNOT BE DEACTIVATED WITH ONTYPE=AUL IN THIS STATE (DEACTIVATE  
WITH OFFTYPE=DI PREVIOUSLY)
- F56: NO PEN FOUND
- F57: NO STATION NUMBER FOUND
- F58: STNO <stno> IS USING ONE OF ITS LINE APPEARANCES, THEREFORE SIGN OFF IS NOT  
POSSIBLE
- F59: STNO <stno> SIGN OFF IS NOT POSSIBLE, BECAUSE IT'S PRIMARY LINE IS STILL IN USE  
BY STNO <stno>
- F60: CANNOT LOAD ATPVC CIRCUITS; ALL ATMSVC CIRCUITS OF THE STMA BOARD MUST BE LOCKED
- F61: <stno> THE MAXIMUM PLANNED NUMBER OF STATIONS HAS BEEN REACHED.  
  
THE NUMBER OF STATIONS ALLOWED CAN BE INCREASED WITH AMO DIMSU
- F62: <stno> INSUFFICIENT LINE MEMORY SPACE FOR VIRTUAL LINES
- F63: <stno> SIGN ON IS NOT POSSIBLE, BECAUSE AN OPTISET WITH AN API CAN  
  
ONLY BE SIGNED ON TO A PEN WITH A SIGNED OFF TSI FOR AN OPTISET AND A SIGNED OFF  
TSI FOR AN API.
- F64: SIGNON/SIGNOFF IS NOT ALLOWED FOR STNO ^tlnnu^ (AMO SDAT)

H02: xxxx xxxxxx ACTIVATED - NOT READY (<status>)  
H03: xxxx xxxxxx DEACTIVATED  
H04: xxxx xxxxxx PRE-BLOCKED (<status>)  
H05: xxxx xxxxxx DEACTIVATED FOR LONG PERIOD (NEQ STATE)  
H06: AMO DSSU INTERRUPTED  
(the AMO has been interrupted by a BREAK command or by the BREAK key.)  
H07: xxxx xxxxxx IS ONE OF THE TWO CONNECTIONS OF A MODEM  
H08: THE DEACTIVATE JOB AFFECTS THE CURRENT REFERENCE CLOCK GENERATOR  
PLEASE ANSWER PARAMETER REFOFF  
Y . . . . DEACTIVATE CURRENT REFERENCE CLOCK GENERATOR  
N . . . . DO NOT DEACTIVATE CURRENT REFERENCE CLOCK GENERATOR  
(If Y is specified, the dependability system switches to another  
reference clock generator.)  
H09: THE DEACTIVATE JOB AFFECTS THE LAST POSSIBLE REFERENCE CLOCK  
GENERATOR  
\*\*\*\*\* THE SYSTEM CANNOT ADOPT A REFERENCE CLOCK \*\*\*\*\*  
PLEASE ANSWER PARAMETER REFOFF  
Y . . . . DEACTIVATE CURRENT REFERENCE CLOCK GENERATOR  
N . . . . DO NOT DEACTIVATE CURRENT REFERENCE CLOCK GENERATOR  
(If Y is answered, all reference clock generators are deactivated)  
H10: PEN xxxxxx NOT DEACTIVATED (REFERENCE CLOCK GENERATOR)  
H11: STNO <stno> MSN-NUMBER ACTIVATED FOR CP  
H12: STNO <stno> FOR SERVICE <svc> NOT SWITCHED (MSN-NUMBER)  
H13: STNO <stno> MSN-NUMBER DEACTIVATED FOR CP

---

H14: STNO <stno> MSN-NUMBER DEACTIVATED WITH PRE-BLOCKING FOR CP

H15: MSN-NUMBERS WILL BE SWITCHED WITH ONTYPE=ANL,  
ALL OTHERS WITH ONTYPE=<ontype>

H16: MSN-NUMBERS WILL BE SWITCHED WITH OFFTYPE=DI,  
ALL OTHERS WITH OFFTYPE=<offtype>

H17: STNO <stno> SIGNED OFF

H18: STNO <stno> SIGNED ON TO PEN <ltg>-<ltu>-<slot>-<cct> xxx (<tsi>)

H19: TSI <tsi> NOT VALID, A VALID TSI WILL BE SEARCHED

H20: <block|unblock|reset> FOR PEN <ltg>-<ltu>-<slot>-<cct> INITIATED

H21: BASESTATION <ltg>-<ltu>-<slot>-<cct> LOADED

H22: BASESTATION CAN BE LOADED ONLY BY MEANS OF  
EXEC-DSSU:<ltg>,<ltu>,<slot>;

H23: B-CHANNEL <bchl> NOT ASSIGNED

H24: PEN <ltg>-<ltu>-<slot>-<cct> IS VOICE COMPRESSION PARTNER, THEREFORE THE VCM  
CIRCUIT WILL BE SWITCHED FIRST

H25: FOR OUTGOING ONLY B-CHANNEL <bchl> NO BLOCKING POSSIBLE

H26: NO ACKNOWLEDGE OF LAST MESSAGE RECEIVED TO B-CHANNEL <bchl>. NO  
<block|unblock|reset> POSSIBLE

H27: B-CHANNEL <bchl> STATE IS ALREADY <block|unblock|reset>

H28: CORDLESS ADMIN STATION MAY NOT BE SWITCHED.  
USE AMO BSSU TO SWITCH.

H29: RESTART OF STMA-CIRCUITS NOT ALLOWED. USE DEACT- AND ACT-DSSU.

H30: xxxxx xxxxxx WAS ALREADY ACTIVATED  
  
CIRCUIT DATA HAS NOT BEEN LOADED  
  
LOADING CAN BE INITIATED BY DEACTIVATION AND SUBSEQUENT ACTIVATION

H31: PEN <ltg>-<ltu>-<slot>-<cct> ACTIVATED  
  
CIRCUIT DATA LOADING INITIATED

H33: xxxxx xxxxxx WAS ALREADY DEACTIVATED

H34: ONTYPE=ANL IS TREATED LIKE ONTYPE=ACL

H35: xxxxx xxxxxx WAS ALREADY PRE-BLOCKED

## 84 DTIM1 - Device Handler Timers

The AMO DTIM1 is used to change, display and regenerate the timers for the device handler software complex.

For reasons of clarity, the timers are divided into the following categories:

- ALTA                                      Timers for Austrian branch line (alternate route)
- CO                                        Timers for central office trunk calls
- DIGITE                                   Timers for DIGITE  
The parameters ..ON and ..OFF are only valid for AUXDIGI (former DIGI260). The remaining parameters are also valid for Optiset/OptiPoint500.  
The calling timers for the Optiset/OptiPoint device family are administrated with AMO PTIME TYPE=SLMA.
- EXPTONE                                Timers for Expensive route tone supervision
- MFCDID                                 Timers for MFC indialing and test program
- MTLC                                    Timers for the main-PABX set
- STN                                      Timers for stations in general
- TCOM                                    Timers for the adapter set for special equipment  
(e.g. CC, dictation equipment)
- TIE                                       Timers for inter-PABX calls

All the tables processed with this AMO are initialized in the database, thus making the ADD action of the AMO superfluous.

### 84.1 Restrictions

This description is valid from HiPath 4000 V1.0

### 84.2 Interrelationships

- AMO TACSU                            : Configure analog trunk circuits in the SWU
- AMO TDCSU                           : Configure digital trunk circuits in the SWU
- AMO TSCSU                           : Configure special trunk circuits in the SWU

**84.3 Functions of the AMO**

- [CHANGE-DTIM1](#) : Change the timers for the device handler
- [DISPLAY-DTIM1](#) : Interrogate the timers for the device handler
- [REGENERATE-DTIM1](#) : Regenerate the timers for the device handler

**84.3.1 CHANGE-DTIM1**

**Procedure Overview**

84.3.2 DISPLAY-DTIM1

Procedure Overview

| Command Code  | Parameter       |
|---------------|-----------------|
| DISPLAY-DTIM1 | TYPEDH=<param>; |

Example

Display timers for Austrian branch line.

Input:

DISPLAY-DTIM1:ALTA;

Output:

|                                |   |          |  |
|--------------------------------|---|----------|--|
| TIMER FOR BRANCH LINE AUSTRIA: |   |          |  |
| +-----+-----+-----+-----+      |   |          |  |
| OVR                            | = | 1000 MS. |  |
| +-----+-----+-----+-----+      |   |          |  |

84.3.3 REGENERATE-DTIM1

All values are output, including the pre-initialized ones.

### Procedure Overview

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-DTIM1 | ;         |

#### Example

Regenerate the timers for the device handler.

Input:

REGENERATE-DTIM1;

Output:

```
CHANGE-DTIM1:DIGITE,1000,4000, 300, 400, 300,4000,1000,1000, 300, 400, 300,1000,

## DTIM1 - Device Handler Timers

### Parameter Description

|         |                                                                                                                                                                                                                                                                                                                              |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | Default Value : 15 s                                                                                                                                                                                                                                                                                                         |
| BUSY    | Delay between deactivating SIU type 3 and busy tone<br>(in accordance with CCITT recommendation Q.475)<br>see FuE Line Circuits                                                                                                                                                                                              |
|         | Type of Input : Single value, optional                                                                                                                                                                                                                                                                                       |
|         | Possible Values : 20 - 999 ms                                                                                                                                                                                                                                                                                                |
|         | Default Value : 75 ms                                                                                                                                                                                                                                                                                                        |
| CCMED1  | Minimum delay between 2 events on the multi-paging system.<br>The timer is allocated by means of parameter "TBT" of AMO TSCSU.                                                                                                                                                                                               |
|         | Type of Input : Single value, optional                                                                                                                                                                                                                                                                                       |
|         | Possible Values : 20 - 50000 ms                                                                                                                                                                                                                                                                                              |
|         | Default Value : 500 ms                                                                                                                                                                                                                                                                                                       |
| CCMED2  | Minimum delay between 2 events on the multi-paging system.<br>The timer is allocated by means of parameter "TBT" of AMO TSCSU.                                                                                                                                                                                               |
|         | Type of Input : Single value, optional                                                                                                                                                                                                                                                                                       |
|         | Possible Values : 20 - 50000 ms                                                                                                                                                                                                                                                                                              |
|         | Default Value : 999 ms                                                                                                                                                                                                                                                                                                       |
| CCMEOD1 | EOD delay supervision for multi-paging system (Absence/Paging)                                                                                                                                                                                                                                                               |
|         | Type of Input : Single value, optional                                                                                                                                                                                                                                                                                       |
|         | Possible Values : 1 - 9999 s                                                                                                                                                                                                                                                                                                 |
|         | Default Value : 4 s                                                                                                                                                                                                                                                                                                          |
| CCMEOD2 | EOD delay supervision for multi-paging system (Absence/Paging)                                                                                                                                                                                                                                                               |
|         | Type of Input : Single value, optional                                                                                                                                                                                                                                                                                       |
|         | Possible Values : 1 - 9999 s                                                                                                                                                                                                                                                                                                 |
|         | Default Value : 7 s                                                                                                                                                                                                                                                                                                          |
| CCSTAD  | Dialing supv. (EOD delay) for switchable (single/multi) paging system. The end-of-dial signal is delayed as a control for the two TCOM trunk modules. If no EOD signal is received during the delay time, a message is sent to the dependability system. The timer is allocated by means of parameter "STADIAL" of AMO TSCSU |
|         | Type of Input : Single value, optional                                                                                                                                                                                                                                                                                       |
|         | Possible Values : 1 - 9999 s                                                                                                                                                                                                                                                                                                 |
|         | Default Value : 300 s                                                                                                                                                                                                                                                                                                        |
| COOFF1  | Pause length for double burst ring 1 (1st pause)                                                                                                                                                                                                                                                                             |

|          | Duration of data tone                                                      |                          |
|          | Type of Input                                                              | : Single value, optional |
|          | Possible Values                                                            | : 1 - 9999 s             |
| EOD      | Default Value                                                              | : 5 s                    |
|          | Minimum delay between arrival of last pulse and sending EOD signal         |                          |
|          | Type of Input                                                              | : Single value, optional |
|          | Possible Values                                                            | : 20 - 999 ms            |
| EODACK   | Default Value                                                              | : 250 ms                 |
|          | Minimum delay between end-of-dialing and answer (acknowledgement)          |                          |
|          | Type of Input                                                              | : Single value, optional |
|          | Possible Values                                                            | : 20 - 999 ms            |
| EODBSY   | Default Value                                                              | : 250 ms                 |
|          | Time for end-of-loop-dial busy recognition by main-PABX set                |                          |
|          | Type of Input                                                              | : Single value, optional |
|          | Possible Values                                                            | : 20 - 999 ms            |
| EODDEL   | Default Value                                                              | : 250 ms                 |
|          | Delayed end of dialing, outgoing                                           |                          |
|          | Type of Input                                                              | : Single value, optional |
|          | Possible Values                                                            | : 500 - 32000 ms         |
| FEEDSUPV | Default Value                                                              | : 2000 ms                |
|          | Supervision of sub-PABX feed current for outgoing calls from main-PABX set |                          |
|          | Type of Input                                                              | : Single value, optional |
|          |                                                                            |                          |

## DTIM1 - Device Handler Timers

### Parameter Description

|         |                                                                                                  |
|---------|--------------------------------------------------------------------------------------------------|
|         | Possible Values : 20 - 999 ms                                                                    |
|         | Default Value : 700 ms                                                                           |
| HWTEST  | Time supervision for hardware settings and terminal test                                         |
|         | Type of Input : Single value, optional                                                           |
|         | Possible Values : 5 - 20 sec.                                                                    |
|         | Default Value : 10 sec.                                                                          |
| INITREQ | Zeitüberwachung für Antworten oder Option nach Einschalten bzw. Reset                            |
|         | Eingabeart : Einzelwert, wahlfrei                                                                |
|         | Mögliche Werte : 5 - 100 sek.                                                                    |
|         | Standardwert : 6 sek.                                                                            |
| LASUPV1 | Line alarm supervision time<br>The timer is allocated by means of parameter "SUPV" of AMO TSCSU. |
|         | Type of Input : Single value, optional                                                           |
|         | Possible Values : 1 - 9999 s                                                                     |
|         | Default Value : 10 s                                                                             |
| LASUPV2 | Line alarm supervision time<br>The timer is allocated by means of parameter "SUPV" of AMO TSCSU. |
|         | Type of Input : Single value, optional                                                           |
|         | Possible Values : 1 - 9999 s                                                                     |
|         | Default Value : 20 s                                                                             |
| LASUPV3 | Line alarm supervision time<br>The timer is allocated by means of parameter "SUPV" of AMO TSCSU. |
|         | Type of Input : Single value, optional                                                           |
|         | Possible Values : 1 - 9999 s                                                                     |
|         | Default Value :                                                                                  |
| LASUPV4 | Line alarm supervision time<br>The timer is allocated by means of parameter "SUPV" of AMO TSCSU. |
|         | Type of Input : Single value, optional                                                           |
|         | Possible Values : 1 - 9999 s                                                                     |
|         | Default Value : 60 s                                                                             |
| LASUPV5 | Line alarm supervision time<br>The timer is allocated by means of parameter "SUPV" of AMO TSCSU. |
|         | Type of Input : Single value, optional                                                           |
|         | Possible Values : 1 - 9999 s                                                                     |
|         | Default Value : 300 s                                                                            |
| LCRADVT | Duration of route advance delay tones (feature LCR: Expensive Route Tone)                        |
|         | Type of Input : Single value, optional                                                           |
|         | Possible Values : 100 - 2000 msec.                                                               |
|         | Default Value : 300 msec.                                                                        |
| LCRET   | Expensive route tone supervision (feature LCR: Expensive Route Tone)                             |

|         |                                                                                   |
|---------|-----------------------------------------------------------------------------------|
|         | Type of Input : Single value, optional                                            |
|         | Possible Values : 2 - 10 sec.                                                     |
|         | Default Value : 5 sec.                                                            |
| LOOPACK | Minimum time for application of loop after feeding from sub-PABX                  |
|         | Type of Input : Single value, optional                                            |
|         | Possible Values : 20 - 999 ms                                                     |
|         | Default Value : 400 ms                                                            |
| LOOPIN  | Supervision of loop start in sub-PABX after line seizure                          |
|         | Type of Input : Single value, optional                                            |
|         | Possible Values : 20 - 999 ms                                                     |
|         | Default Value : 250 ms                                                            |
| LRSUPV  | Supervision of line readiness after connection clear-down                         |
|         | Type of Input : Single value, optional                                            |
|         | Possible Values : 1 - 9999 s                                                      |
|         | Default Value : 20 s                                                              |
| MIDENT  | Time for identification of job in main-PABX<br>(TMCL in main-PABX, DEV = MAINMFC) |
|         | Type of Input : Single value, optional                                            |
|         | Possible Values : 10 - 40 s                                                       |
|         | Default Value : 20 s                                                              |
| MINGR   | Minimum delay for ground return                                                   |
|         | Type of Input : Single value, optional                                            |
|         | Possible Values : 20 - 999 ms                                                     |
|         | Default Value : 200 ms                                                            |
| MTOFF   | Pause length for multitone ring                                                   |
|         | Type of Input : Single value, optional                                            |
|         | Possible Values : 20 - 9999 ms                                                    |
|         | Default Value : 4000 ms                                                           |
| MTON    | Pulse length for multitone ring                                                   |
|         | Type of Input : Single value, optional                                            |
|         | Possible Values : 20 - 9999 ms                                                    |
|         | Default Value : 1000 ms                                                           |
| NORMOFF | Pause length for single burst ring 1                                              |
|         | Type of Input : Single value, optional                                            |
|         | Possible Values : 20 - 9999 ms                                                    |
|         | Default Value : 4000 ms                                                           |
| NORMON  | Pulse length for single burst ring 1                                              |
|         | Type of Input : Single value, optional                                            |
|         | Possible Values : 20 - 9999 ms                                                    |

## DTIM1 - Device Handler Timers

### Parameter Description

|          |                                                                          |                          |
|----------|--------------------------------------------------------------------------|--------------------------|
| OVR      | Default Value                                                            | : 1000 ms                |
|          | Override release supervision for branch lines                            |                          |
|          | Type of Input                                                            | : Single value, optional |
|          | Possible Values                                                          | : 20 - 9999 ms           |
| OVRSEP   | Default Value                                                            | : 1000 ms                |
|          | Minimum pause between 2 override pulses                                  |                          |
|          | Type of Input                                                            | : Single value, optional |
|          | Possible Values                                                          | : 20 - 999 ms            |
| PAUDIAL  | Default Value                                                            | : 200 ms                 |
|          | Minimum time between arrival of start-of-dial signal and outpulsing      |                          |
|          | Type of Input                                                            | : Single value, optional |
|          | Possible Values                                                          | : 20 - 999 ms            |
| PEODMS   | Default Value                                                            | : 200 ms                 |
|          | Pause before eod delay on did with ms trunk                              |                          |
|          | Type of Input                                                            | : Single value, optional |
|          | Possible Values                                                          | : 20 - 999 ms            |
| PRELIAL  | Default Value                                                            | : 500 ms                 |
|          | Delay before outpulsing on main-PABX set                                 |                          |
|          | Type of Input                                                            | : Single value, optional |
|          | Possible Values                                                          | : 20 - 999 ms            |
| PTNRSUPV | Default Value                                                            | : 100 ms                 |

|----------|------------------------------------------------------------------------------------------------------|
|          | Default Value : 8 s                                                                                  |
| RECAMDLY | Delay on start of answer text for recorded announcement<br>see FuE <a href="#">Announcement Unit</a> |
|          | Type of Input : Single value, optional                                                               |
|          | Possible Values : 1 - 9999 s                                                                         |
|          | Default Value : 14 s                                                                                 |
| REMBLK   | Minimum remote blockage duration on main-PABX set                                                    |
|          | Type of Input : Single value, optional                                                               |
|          | Possible Values : 20 - 999 ms                                                                        |
|          | Default Value : 600 ms                                                                               |
| REMBLKAC | Minimum remote blockage duration on AC tie-line circuit                                              |
|          | Type of Input : Single value, optional                                                               |
|          | Possible Values : 1 - 9999 s                                                                         |
|          | Default Value : 10 s                                                                                 |
| RESET1   | Outgoing line reset delay after connection clear-down                                                |
|          | Type of Input : Single value, optional                                                               |
|          | Possible Values : 20 - 9999 ms                                                                       |
|          | Default Value : 700 ms                                                                               |
| RESET2   | Outgoing line reset delay after connection clear-down                                                |
|          | Type of Input : Single value, optional                                                               |
|          | Possible Values : 20 - 9999 ms                                                                       |
|          | Default Value : 1500 ms                                                                              |
| RESET3   | Outgoing line reset delay after connection clear-down                                                |
|          | Type of Input : Single value, optional                                                               |
|          | Possible Values : 20 - 9999 ms                                                                       |
|          | Default Value : 250 ms                                                                               |
| RESET4   | Outgoing line reset delay after connection clear-down                                                |
|          | Type of Input : Single value, optional                                                               |
|          | Possible Values : 20 - 9999 ms                                                                       |
|          | Default Value : 50 ms                                                                                |
| RESET5   | Outgoing line reset delay after connection clear-down                                                |
|          | Type of Input : Single value, optional                                                               |
|          | Possible Values : 20 - 9999 ms                                                                       |
|          | Default Value : 350 ms                                                                               |
| RESTRINA | timer for restarting North America analog procedure                                                  |
|          | Type of Input : Single value, optional                                                               |
|          | Possible Values : 20 - 300 s                                                                         |
|          | Default Value : 180 s                                                                                |
| RESZ     | Minimum delay through outgoing trunk re-seize bar                                                    |

## DTIM1 - Device Handler Timers

### Parameter Description

|         |                                                                                                                           |                          |
|---------|---------------------------------------------------------------------------------------------------------------------------|--------------------------|
| RESZI   | Type of Input                                                                                                             | : Single value, optional |
|         | Possible Values                                                                                                           | : 20 - 999 ms            |
|         | Default Value                                                                                                             | : 300 ms                 |
| RESZO   | Outgoing reseize barring after an incoming CO call                                                                        |                          |
|         | Type of Input                                                                                                             | : Single value, optional |
|         | Possible Values                                                                                                           | : 1 - 9999 s             |
| RLSA    | Default Value                                                                                                             | : 10 s                   |
|         | Outgoing reseize barring after an outgoing CO call                                                                        |                          |
|         | Type of Input                                                                                                             | : Single value, optional |
| RLSB    | Possible Values                                                                                                           | : 1 - 9999 s             |
|         | Default Value                                                                                                             | : 3 s                    |
|         | Main/satellite loop set release time                                                                                      |                          |
| RLSC1   | Type of Input                                                                                                             | : Single value, optional |
|         | Possible Values                                                                                                           | : 20 - 999 ms            |
|         | Default Value                                                                                                             | : 600 ms                 |
| RLSC2   | Main/satellite loop set release time                                                                                      |                          |
|         | Type of Input                                                                                                             | : Single value, optional |
|         | Possible Values                                                                                                           | : 20 - 999 ms            |
| RLSGRD  | Default Value                                                                                                             | : 900 ms                 |
|         | Carrier frequency set release acknowledgement time                                                                        |                          |
|         | Type of Input                                                                                                             | : Single value, optional |
| RLSPUL  | Possible Values                                                                                                           | : 20 - 9999 ms           |
|         | Default Value                                                                                                             | : 1200 ms                |
|         | Carrier frequency set release acknowledgement time                                                                        |                          |
| RLSSUPV | Type of Input                                                                                                             | : Single value, optional |
|         | Possible Values                                                                                                           | : 20 - 9999 ms           |
|         | Default Value                                                                                                             | : 2500 ms                |
|         | Release guard after called party release                                                                                  |                          |
|         | Type of Input                                                                                                             | : Single value, optional |
|         | Possible Values                                                                                                           | : 20 - 999 ms            |
|         | Default Value                                                                                                             | : 200 ms                 |
|         | Forward release pulse length                                                                                              |                          |
|         | The time entered here must be at least as long as the longest time required by the various devices connected to the TCOM. |                          |
|         | Type of Input                                                                                                             | : Single value, optional |
|         | Possible Values                                                                                                           | : 20 - 999 ms            |
|         | Default Value                                                                                                             | : 500 ms                 |
|         | Release receive supervision time                                                                                          |                          |
|         | Type of Input                                                                                                             | : Single value, optional |

|          |                                                                                                                                 |
|----------|---------------------------------------------------------------------------------------------------------------------------------|
|          | Possible Values : 20 - 999 ms                                                                                                   |
|          | Default Value : 250 ms                                                                                                          |
| RNG      | Delay between deactivating SIU type 3 and ring tone<br>(in accordance with CCITT recommendation Q.475)<br>see FuE Line Circuits |
|          | Type of Input : Single value, optional                                                                                          |
|          | Possible Values : 20 - 999 ms                                                                                                   |
|          | Default Value : 500 ms                                                                                                          |
| SECDT    | Secondary dial tone supervision                                                                                                 |
|          | Type of Input : Single value, optional                                                                                          |
|          | Possible Values : 1 - 9999 s                                                                                                    |
|          | Default Value : 5 s                                                                                                             |
| SETUPULS | Trunk setup supervision, pulse signaling system                                                                                 |
|          | Type of Input : Single value, optional                                                                                          |
|          | Possible Values : 1 - 9999 s                                                                                                    |
|          | Default Value : 25 s                                                                                                            |
| SIGDEL   | Minimum delay between 2 ground signals (consultation, cons. cancel)                                                             |
|          | Type of Input : Single value, optional                                                                                          |
|          | Possible Values : 20 - 999 ms                                                                                                   |
|          | Default Value : 200 ms                                                                                                          |
| SR1OFF   | Pause length for single burst ring 2                                                                                            |
|          | Type of Input : Single value, optional                                                                                          |
|          | Possible Values : 20 - 9999 ms                                                                                                  |
|          | Default Value : 1000 ms                                                                                                         |
| SR1ON    | Pulse length for single burst ring 2                                                                                            |
|          | Type of Input : Single value, optional                                                                                          |
|          | Possible Values : 20 - 9999 ms                                                                                                  |
|          | Default Value : 1000 ms                                                                                                         |
| SR21OFF  | Pause length for double burst ring 2 (1st pause)                                                                                |
|          | Type of Input : Single value, optional                                                                                          |
|          | Possible Values : 20 - 9999 ms                                                                                                  |
|          | Default Value : 400 ms                                                                                                          |
| SR21ON   | Pulse length for double burst ring 2 (1st pulse)                                                                                |
|          | Type of Input : Single value, optional                                                                                          |
|          | Possible Values : 20 - 9999 ms                                                                                                  |
|          | Default Value : 300 ms                                                                                                          |
| SR22OFF  | Pause length for double burst ring 2 (2nd pause)                                                                                |
|          | Type of Input : Single value, optional                                                                                          |
|          | Possible Values : 20 - 9999 ms                                                                                                  |

## DTIM1 - Device Handler Timers

### Parameter Description

|         |                                                                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | Default Value : 1000 ms                                                                                                                                                                                                  |
| SR22ON  | Pulse length for double burst ring 2 (2nd pulse)<br>Type of Input : Single value, optional<br>Possible Values : 20 - 9999 ms<br>Default Value : 300 ms                                                                   |
| STADEL  | Minimum delay before start-of-dialing<br>Type of Input : Single value, optional<br>Possible Values : 20 - 999 ms<br>Default Value : 100 ms                                                                               |
| STADIAL | Start-of-dial supervision<br>Type of Input : Single value, optional<br>Possible Values : 0 and 20-999 ms<br>Default Value : 0 ms                                                                                         |
| SVCMENU | Time supervision for service menu<br>Type of Input : Single value, optional<br>Possible Values : 20 - 200 sec.<br>Default Value : 60 sec.                                                                                |
| SZACK1  | Timeout for arrival of seize acknowledgement<br>The timer is allocated by means of parameter "ACKT" of AMO TSCSU.<br>Type of Input : Single value, optional<br>Possible Values : 20 - 50000 ms<br>Default Value : 200 ms |
| SZACK2  | Timeout for arrival of seize acknowledgement<br>The timer is allocated by means of parameter "ACKT" of AMO TSCSU.<br>Type of Input : Single value, optional<br>Possible Values : 20 - 50000 ms<br>Default Value : 500 ms |
| SZAT    | Clock test before seize attempt<br>Type of Input : Single value, optional<br>Possible Values : 1 - 9999 s<br>Default Value : 1 s                                                                                         |
| SZSUPV  | Supervision time on seize acknowledgement after outgoing seize attempt<br>Type of Input : Single value, optional<br>Possible Values : 1 - 9999 s<br>Default Value : 1 s                                                  |
| TEST1   | Time for repeat of release signal if not acknowledged<br>Type of Input : Single value, optional<br>Possible Values : 20 - 999 ms<br>Default Value : 200 ms                                                               |

|        |                                                                                                                                                         |                                                                                                           |                        |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|------------------------|
| TEST2  | Time for repeat of nth test seizure                                                                                                                     |                                                                                                           |                        |
|        | Type of Input                                                                                                                                           | :                                                                                                         | Single value, optional |
|        | Possible Values                                                                                                                                         | :                                                                                                         | 1 - 9999 s             |
|        | Default Value                                                                                                                                           | :                                                                                                         | 30 s                   |
| TINT1  | control timer for terminal init procedure                                                                                                               |                                                                                                           |                        |
|        | Type of Input                                                                                                                                           | :                                                                                                         | Single value, optional |
|        | Possible Values                                                                                                                                         | :                                                                                                         | 1 - 30 s               |
|        | Default Value                                                                                                                                           | :                                                                                                         | 20 s                   |
| TRACCO | Timer for call tracing of incoming calls from central office                                                                                            |                                                                                                           |                        |
|        | - Tracer not activated if user does not answer within a specified time limit (N2 and R2)                                                                |                                                                                                           |                        |
|        | - Output of tracing data to printer when outgoing connection is released, if not cleared down                                                           |                                                                                                           |                        |
|        | by central office within specified time limit (received with R2 signaling)                                                                              |                                                                                                           |                        |
|        | - Output of message RELEASED DESPITE TRACING to printer, if central office clears down connection within specified time limit in spite of trace request |                                                                                                           |                        |
|        | see FuE TRACE Malicious Call Tracing                                                                                                                    |                                                                                                           |                        |
|        | Type of Input                                                                                                                                           | :                                                                                                         | Single value, optional |
|        | Possible Values                                                                                                                                         | :                                                                                                         | 1 - 9999 s             |
|        | Default Value                                                                                                                                           | :                                                                                                         | 50 s                   |
| TSUPV1 | Test run timer 1                                                                                                                                        |                                                                                                           |                        |

## 85 DTIM2 - Device Handler Timers 2

AMO DTIM2 can be used to change, interrogate and regenerate the *timers* for the software complex 'device handler'.

In order to give a clear overview, the timers are divided into the following groups:

- DSS1                      Timers for DSS1 protocols
- GEN                        General timers
- LNGEN                    General trunk set timers
- MKBK                     Make/break ratios (CO/tie for dial pulsing)

All tables processed by this AMO are initialized in the database, as a result of which the creation branch of the AMO is bypassed.

### 85.1 Restrictions

This description is valid from HiPath 4000 V1.0.

### 85.2 Interrelationships

- AMO TSCSU                      : Special equipment configuration for switching unit

### 85.3 Functions of the AMO

- [CHANGE-DTIM2](#)                      : Change the timers for the device handler
- [DISPLAY-DTIM2](#)                      : Interrogate the timers for the device handler
- [REGENERATE-DTIM2](#)                      : Regenerate the timers for the device handler

#### 85.3.1 CHANGE-DTIM2

##### Procedure Overview

| Command Code | Parameter                                         |
|--------------|---------------------------------------------------|
| CHANGE-DTIM2 | TYPEDH=DSS1,<br>{TCCBS1=<number>,TCCBS2=<number>} |

## 85.3.2 DISPLAY-DTIM2

### Procedure Overview

| Command Code  | Parameter       |
|---------------|-----------------|
| DISPLAY-DTIM2 | TYPEDH=<param>; |

#### Example

Interrogate the LNGEN timers.

Input:

DISPLAY-DTIM2:DSS1;

Output:

TIMER FOR DSS1 PROTOCOLS:

```

+-----+-----+-----+
| TCCBS1 = 4 SEC. | TCCBS2 = 45 MIN. | TCCBS4 = 15 SEC. |
| TCCBS5 = 60 MIN. | TCCBS6 = 60 MIN. | TACTIV = 10 SEC. |
| TDEACTIV= 4 SEC. | TINTER = 4 SEC. | TSTATUS= 4 SEC. |
+-----+-----+-----+
```

## 85.3.3 REGENERATE-DTIM2

All values are output, including the initialized values.

### Procedure Overview

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-DTIM2 | ;         |

#### Example

Regenerate the device handler timers.

Input:

## DTIM2 - Device Handler Timers 2

### Parameter Description

REGENERATE-DTIM2;

#### Output:

```
CHA-DTIM2:GEN, 10,10,10,3500,30,10,2,300,800,300,500,1000,
               15,30,60,15,10,10,2500,0,60, 3, 500;
CHA-DTIM2:LNGEN,5,25,5,25,500,800,1200,3000,400,900,1200,
               1500,300,3000,5000,1500,30;0;0;30;30;
CHA-DTIM2:MKBK, 60,40,30,30,60,40,30,30,60,40,30,
               30,60,40,40,60,60,40,30,30,60,40,
               30,30,60,40,30,30,60,40,30,30;
CHA-DTIM2:DSS1, 4,45,15,60,60,10,4,4,4;
```

## 85.4 Parameter Description

|          |                                           |
|----------|-------------------------------------------|
| ACBK1    | Break timing for tie trunk, AC signalling |
|          | Type of Input : single value, optional    |
|          | Possible Values : 20 - 999 ms             |
|          | Default Value : 60 ms                     |
| ACBK2    | Break timing for tie trunk, AC signalling |
|          | Type of Input : single value, optional    |
|          | Possible Values : 20 - 999 ms             |
|          | Default Value : 40 ms                     |
| ACKTN1   | Station dialling supervision time         |
|          | Type of Input : single value, optional    |
|          | Possible Values : 20 - 9999 ms            |
|          | Default Value : 3500 ms                   |
| ACMK1    | Make time for tie trunk, AC signalling    |
|          | Type of Input : single value, optional    |
|          | Possible Values : 20 - 999 ms             |
|          | Default Value : 40 ms                     |
| ACMK2    | Make time for tie trunk, AC signalling    |
|          | Type of Input : single value, optional    |
|          | Possible Values : 20 - 999 ms             |
|          | Default Value : 60 ms                     |
| AICSZIPT | AICS ZIP Tone                             |
|          | Type of Input : single value, optional    |
|          | Possible Values : 500 - 1600 ms           |
|          | Default Value : 1600 ms                   |
| ANATN    | Time for disconnection of tone from ANATE |
|          | Type of Input : single value, optional    |
|          | Possible Values : 1 - 9999 sec            |

|          |                                                                                                |                              |
|----------|------------------------------------------------------------------------------------------------|------------------------------|
|          | Default Value                                                                                  | : 10 sec                     |
| BKFO     | Impulse timing on exchange central office trunks (according to Telecommunications Regulations) |                              |
|          | Type of Input                                                                                  | : single value, optional     |
|          | Possible Values                                                                                | : 20 - 999 ms                |
|          | Default Value                                                                                  | : 60 ms                      |
| BKIN     | Impulse timing on exchange central office trunks (international)                               |                              |
|          | Type of Input                                                                                  | : single value, optional     |
|          | Possible Values                                                                                | : 20 - 999 ms                |
|          | Default Value                                                                                  | : 30 ms                      |
| BSGNL1   | Max. duration of busy signal 1                                                                 |                              |
|          | Type of Input                                                                                  | : single value, optional     |
|          | Possible Values                                                                                | : 1 - 9999 sec               |
|          | Default Value                                                                                  | : 15 sec                     |
| BSGNL2   | Max. duration of busy signal 2                                                                 |                              |
|          | Type of Input                                                                                  | : single value, optional     |
|          | Possible Values                                                                                | : 1 - 9999 sec               |
|          | Default Value                                                                                  | : 30 sec                     |
| BSGNL3   | Max. duration of busy signal 3                                                                 |                              |
|          | Type of Input                                                                                  | : single value, optional     |
|          | Possible Values                                                                                | : 1 - 9999 sec               |
|          | Default Value                                                                                  | : 60 sec                     |
| BSIGCONN | Time to connect a busy signal                                                                  |                              |
|          | Type of Input                                                                                  | : single value, optional     |
|          | Possible Values                                                                                | : 5 - 60 sec                 |
|          | Default Value                                                                                  | : 30 sec (for France: 5 sec) |
| BSYON    | Busy tone "on" time                                                                            |                              |
|          | Type of Input                                                                                  | : single value, optional     |
|          | Possible Values                                                                                | : 1 - 9999 sec               |
|          | Default Value                                                                                  | : 10 sec                     |
| CCBK1    | Pulse timing for code call module                                                              |                              |
|          | Type of Input                                                                                  | : single value, optional     |
|          | Possible Values                                                                                | : 20 - 999 ms                |
|          | Default Value                                                                                  | : 60 ms                      |
| CCBK2    | Pulse timing for code call module                                                              |                              |
|          | Type of Input                                                                                  | : single value, optional     |
|          | Possible Values                                                                                | : 20 - 999 ms                |
|          | Default Value                                                                                  | : 30 ms                      |
| CCMK1    | Pause time for code call module                                                                |                              |

## DTIM2 - Device Handler Timers 2

### Parameter Description

|          |                                                                                                                     |                          |
|----------|---------------------------------------------------------------------------------------------------------------------|--------------------------|
| CCMK2    | Type of Input                                                                                                       | : single value, optional |
|          | Possible Values                                                                                                     | : 20 - 999 ms            |
|          | Default Value                                                                                                       | :                        |
| CMPOBEEP | Pause time for code call module                                                                                     |                          |
|          | Type of Input                                                                                                       | : single value, optional |
|          | Possible Values                                                                                                     | : 20 - 999 ms            |
| CMPOBEEP | Default Value                                                                                                       | : 30 ms                  |
|          | cycle time of the beep cycle                                                                                        |                          |
|          | Type of Input                                                                                                       | : single value, optional |
| CRFIND   | Possible Values                                                                                                     | : 20 - 999 msec          |
|          | Default Value                                                                                                       | : 60 msec                |
|          | Time to find free code receiver<br>(or sender if none had previously been found)<br>see Voice Mail Service External |                          |
| CUTTHRUD | Type of Input                                                                                                       | : single value, optional |
|          | Possible Values                                                                                                     | : 20 - 999 ms            |
|          | Default Value                                                                                                       | : 300 ms                 |
| CUTTHRUD | Time required to connect a DTMF receiver, e.g. after seizure of a cut-through dialing line                          |                          |
|          | Type of Input                                                                                                       | : single value, optional |
|          | Possible Values                                                                                                     | : 2 - 70 sec             |
| DELTIM1  | Default Value                                                                                                       | : 15 sec                 |
|          | Timer 1 for delay time until sending of ANI codogram (CIS)                                                          |                          |
|          | Type of Input                                                                                                       | : Single value, optional |
| DELTIM2  | Possible Values                                                                                                     | : 0, 1 - 9999 msec.      |
|          | Default Value                                                                                                       | : 0 msec.                |
|          | Timer 2 for delay time until sending of ANI codogram (CIS)                                                          |                          |
| DIALPAUT | Type of Input                                                                                                       | : Single value, optional |
|          | Possible Values                                                                                                     | : 0, 1 - 9999 msec.      |
|          | Default Value                                                                                                       | : 0 msec.                |

## DTIM2 - Device Handler Timers 2

### Parameter Description

|          |                                                  |                          |
|----------|--------------------------------------------------|--------------------------|
|          | Possible Values                                  | : 20 - 9999 ms           |
|          | Default Value                                    | : 5000 ms                |
| FAUXTN1  | First burst of auxiliary tone                    |                          |
|          | Type of Input                                    | : single value, optional |
|          | Possible Values                                  | : 100 - 2000 ms          |
|          | Default Value                                    | : 500 ms                 |
| FAUXTN2  | First burst of auxiliary tone 2                  |                          |
|          | Type of Input                                    | : single value, optional |
|          | Possible Values                                  | : 100 - 2000 ms          |
|          | Default Value                                    | : 1000 ms                |
| FCO      | First burst of camp-on tone                      |                          |
|          | Type of Input                                    | : single value, optional |
|          | Possible Values                                  | : 100 - 2000 ms          |
|          | Default Value                                    | : 300 ms                 |
| FLSHSUPV | Time for return from consultation after flashing |                          |
|          | Type of Input                                    | : single value, optional |
|          | Possible Values                                  | : 1 - 9999 sec           |
|          | Default Value                                    | : 2 sec                  |
| FRNGBK   | First burst of ringback tone                     |                          |
|          | Type of Input                                    | : single value, optional |
|          | Possible Values                                  | : 100 - 2000 ms          |
|          | Default Value                                    | : 800 ms                 |
| IDGT1    | Inter digit timing for dial pulsing on lines     |                          |
|          | Type of Input                                    | : single value, optional |
|          | Possible Values                                  | : 20 - 999 ms            |
|          | Default Value                                    | : 400 ms                 |
| IDGT2    | Inter digit timing for dial pulsing on lines     |                          |
|          | Type of Input                                    | : single value, optional |
|          | Possible Values                                  | : 20 - 999 ms            |
|          | Default Value                                    | : 900 ms                 |
| IDGT3    | Inter digit timing for dial pulsing on lines     |                          |
|          | Type of Input                                    | : single value, optional |
|          | Possible Values                                  | : 20 - 9999 ms           |
|          | Default Value                                    | : 1200 ms                |
| IDGT4    | Inter digit timing for dial pulsing on lines     |                          |
|          | Type of Input                                    | : single value, optional |
|          | Possible Values                                  | : 20 - 9999 ms           |
|          | Default Value                                    | : 1500 ms                |
| MAUTO    | delay timer of auto connection                   |                          |

|          |                                                                                   |                               |
|----------|-----------------------------------------------------------------------------------|-------------------------------|
|          | Type of Input                                                                     | : single value, optional      |
|          | Possible Values                                                                   | : 1 - 255 s                   |
|          | Default Value                                                                     | : 3 s                         |
| MBK1     | Impulse time for main trunk, loop                                                 |                               |
|          | Type of Input                                                                     | : single value, optional      |
|          | Possible Values                                                                   | : 20 - 999 ms                 |
|          | Default Value                                                                     | : 60 ms                       |
| MBK2     | Impulse time for main trunk, loop                                                 |                               |
|          | Type of Input                                                                     | : single value, optional      |
|          | Possible Values                                                                   | : 20 - 999 ms                 |
|          | Default Value                                                                     | : 30 ms                       |
| MMK1     | Pause time for main trunk, loop                                                   |                               |
|          | Type of Input                                                                     | : single value, optional      |
|          | Possible Values                                                                   | : 20 - 999 ms                 |
|          | Default Value                                                                     | : 40 ms                       |
| MMK2     | Pause time for main trunk, loop                                                   |                               |
|          | Type of Input                                                                     | : single value, optional      |
|          | Possible Values                                                                   | : 20 - 999 ms                 |
|          | Default Value                                                                     | : 30 ms                       |
| NUTONE   | Duration time of nu tone connection                                               |                               |
|          | Type of Input                                                                     | : single value, optional      |
|          | Possible Values                                                                   | : 5 - 60 sec                  |
|          | Default Value                                                                     | : 10 sec (for France: 30 sec) |
| OHDELAY1 | offhook delay timer.                                                              |                               |
|          | Type of Input                                                                     | : single value, optional      |
|          | Possible Values                                                                   | : 100 - 3000 ms               |
|          | Default Value                                                                     | : 100 ms                      |
| PAUSDIAL | pause time between internal and second dial tone                                  |                               |
|          | Type of Input                                                                     | : single value, optional      |
|          | Possible Values                                                                   | : 0 - 999 msec                |
|          | Default Value                                                                     | : 0 msec                      |
| PDLY1    | Predialling delay<br>(for lines without start-of-pulsing signal and without tone) |                               |
|          | Type of Input                                                                     | : single value, optional      |
|          | Possible Values                                                                   | : 20 - 999 ms                 |
|          | Default Value                                                                     | : 500 ms                      |
| PDLY2    | Predialling delay<br>(for lines without start-of-pulsing signal and without tone) |                               |
|          | Type of Input                                                                     | : single value, optional      |

## DTIM2 - Device Handler Timers 2

### Parameter Description

|          |                                                                                   |                          |
|----------|-----------------------------------------------------------------------------------|--------------------------|
|          | Possible Values                                                                   | : 20 - 999 ms            |
|          | Default Value                                                                     | : 800 ms                 |
| PDLY3    | Predialling delay<br>(for lines without start-of-pulsing signal and without tone) |                          |
|          | Type of Input                                                                     | : single value, optional |
|          | Possible Values                                                                   | : 20 - 999 ms            |
|          | Default Value                                                                     | : 1200 ms                |
| PDLY4    | Predialling delay<br>(for lines without start-of-pulsing signal and without tone) |                          |
|          | Type of Input                                                                     | : single value, optional |
|          | Possible Values                                                                   | : 20 - 9999 ms           |
|          | Default Value                                                                     | : 3000 ms                |
| PMKFO    | Central office trunk pause time (according to Telecommunications Regulations)     |                          |
|          | Type of Input                                                                     | : single value, optional |
|          | Possible Values                                                                   | : 20 - 999 ms            |
|          | Default Value                                                                     | : 40 ms                  |
| PMKIN    | Central office trunk pause time (international)                                   |                          |
|          | Type of Input                                                                     | : single value, optional |
|          | Possible Values                                                                   | : 20 - 999 ms            |
|          | Default Value                                                                     | : 30 ms                  |
| POSTDIAL | Maximum post dialling delay for analog telephone                                  |                          |
|          | Type of Input                                                                     | : single value, optional |
|          | Possible Values                                                                   | : 1 - 9999 sec           |
|          | Default Value                                                                     | : 10 sec                 |
| REQTIM1  | Timer 1 for ANI supervision from seizure acknowledgement on (CIS)                 |                          |
|          | Type of Input                                                                     | : Single value, optional |
|          | Possible Values                                                                   | : 1 - 60 sec.            |
|          | Default Value                                                                     | : 30 sec.                |
| REQTIM2  | Timer 2 für ANI-Überwachung ab Belegungsquittung                                  |                          |
|          | Type of Input                                                                     | : Single value, optional |
|          | Possible Values                                                                   | : 1 - 60 sec.            |
|          | Default Value                                                                     | : 30 sec.                |
| RESZBLK  | Reseizure blockage for trunk                                                      |                          |

|          | Default Value                                                                                                              | : 40 ms                  |
| SMK2     | Make time for tie trunk, "simultaneous" signalling                                                                         |                          |
|          | Type of Input                                                                                                              | : single value, optional |
|          | Possible Values                                                                                                            | : 20 - 999 ms            |
|          | Default Value                                                                                                              | : 30 ms                  |
| STADIAL1 | Start dial supervision timing (for tone or signal in the case of trunks); (AMO TSCSU, parameter STADIAL) (for dial tone 1) |                          |
|          | Type of Input                                                                                                              | : single value, optional |
|          | Possible Values                                                                                                            | : 1 - 9999 sec           |
|          | Default Value                                                                                                              | : 5 sec                  |
| STADIAL2 | Start dial supervision timing (for tone or signal in the case of trunks); (AMO TSCSU, parameter STADIAL) (for dial tone 1) |                          |
|          | Type of Input                                                                                                              | : single value, optional |
|          | Possible Values                                                                                                            | : 1 - 9999 sec           |
|          | Default Value                                                                                                              | : 25 sec                 |

## DTIM2 - Device Handler Timers 2

### Parameter Description

|          |                                                                                                                                                                                                                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STADIAL3 | <p>Start dial supervision timing (for tone or signal in the case of trunks); (AMO TSCSU, parameter STADIAL) (for dial tone 2)</p> <p>Type of Input : single value, optional</p> <p>Possible Values : 3 - 100 sec</p> <p>Default Value : 5 sec</p>                                                                   |
| STADIAL4 | <p>Start dial supervision timing (for tone or signal in the case of trunks); (AMO TSCSU, parameter STADIAL) (for dial tone 2)</p> <p>Type of Input : single value, optional</p> <p>Possible Values : 20 - 300 sec</p> <p>Default Value : 25 sec</p>                                                                 |
| TACTIV   | <p>Activation timer T-ACTIVE</p> <p>This timer is started by user A, after sending a CCBS Request invoke component to network A.</p> <p>Type of Input : single value, optional</p> <p>Possible Values : 0 - 20 sec</p> <p>Default Value : 10 sec</p>                                                                |
| TBK1     | <p>Break time for tie trunk, carrier frequency signalling</p> <p>Type of Input : single value, optional</p> <p>Possible Values : 20 - 999 ms</p> <p>Default Value : 60 ms</p>                                                                                                                                       |
| TBK2     | <p>Break time for tie trunk, carrier frequency signalling</p> <p>Type of Input : single value, optional</p> <p>Possible Values : 20 - 999 ms</p> <p>Default Value : 30 ms</p>                                                                                                                                       |
| TCCBS1   | <p>Status Check Timer T-CCBS1</p> <p>The maximum time the network will wait for user A for checking for compatible terminals.</p> <p>Type of Input : single value, optional</p> <p>Possible Values : 0 - 8 sec</p> <p>Default Value : 4 sec</p>                                                                     |
| TCCBS2   | <p>CCBS Service Duration Timer T-CCBS2:</p> <p>The maximum time the network will be active within the network. The value is a network option.</p> <p>Type of Input : single value, optional</p> <p>Possible Values : 10 - 60 min</p> <p>Default Value : 45 min</p>                                                  |
| TCCBS4   | <p>Destination B idle guard timer T-CCBS4:</p> <p>The time the network will wait after destination B has become not busy before indicating a "CCBS recall" or "Indication of B idle" to user A.</p> <p>Type of Input : single value, optional</p> <p>Possible Values : 0 - 30 sec</p> <p>Default Value : 15 sec</p> |

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 86 DTSM - Device Type Service Module

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO DTSM is used for assigning device types in the database.

### 86.1 Restrictions

This description is valid from HiPath 4000 V1.0.

### 86.2 Interrelationships

- AMO DCSM : Device Configuration Service Module

### 86.3 Functions of the AMO

- [ADD-DTSM](#) : Add a device type to the database
- [DELETE-DTSM](#) : Delete a device type from the database
- [DISPLAY-DTSM](#) : Display the device types from the database
- [REGENERATE-DTSM](#) : Regenerate the device types from the database

#### 86.3.1 ADD-DTSM

If the device type has already been added with identical parameters, the advisory H1 is output followed by AMO EXECUTED.

A change branch is not considered necessary for this AMO. However, the user can achieve the same results using the DELETE and ADD branches.

#### Procedure Overview

| Command Code | Parameter                                      |
|--------------|------------------------------------------------|
| ADD-DTSM     | [UNIT=<param>], DEVTYPE=<param>, SIZE=<number> |

## DTSM - Device Type Service Module

### Functions of the AMO

| Command Code | Parameter                                        |
|--------------|--------------------------------------------------|
|              | ,GRAN=<number>,PNO=<string>,[UNITTYPE=<number>]; |

#### Examples

1. Add the hard disk HD001 to the database.

Input:

```
ADD-DTSM: ,HD,3450,123,HD001,1;
```

2. Add STDHD STD01 to the database.

Input:

```
ADD-DTSM:A1,STDHD,1221,512,STD01,2;
```

3. Add FM FM001 to the database.

Input:

```
ADD-DTSM: ,FM,1200,512,FM001,10;
```

## 86.3.2 DELETE-DTSM

Deletes a device type entry from the database, after checking whether the device type is still in use.

Must the entry remain in the database, the delete action is then rejected.

#### Procedure Overview

| Command Code | Parameter                    |
|--------------|------------------------------|
| DELETE-DTSM  | [UNIT=<param>],PNO=<string>; |

#### Examples

1. Delete a device type entry for a device type no longer in use.

Input:

```
DELETE-DTSM: ,HD001;
```

## 86.3.3 DISPLAY-DTSM

#### Procedure Overview

| Command Code | Parameter                                       |
|--------------|-------------------------------------------------|
| DISPLAY-DTSM | [UNIT=<param>],[DEVTYPE=<param>],[PNO=<string>; |

**Examples**

1. Display the device type entries in the ADS database.

Input:

DISPLAY-DTSM;

Output:

|       |       | SIZE IN    |        |      |          |
|-------|-------|------------|--------|------|----------|
| PNO   | TYPE  | 64K BLOCKS | MBYTES | GRAN | UNITTYPE |
| MO540 | HD    | 8136       | 508    | 512  | 255      |
| 500M  | HD    | 8000       | 500    | 512  | 255      |
| FM128 | STDFM | 2          | 0      | 8192 | 255      |
| 2GIGA | STDHD | 32000      | 2000   | 512  | 255      |
| STD01 | STDHD | 1221       | 78     | 512  | 2        |
| FM001 | FM    | 1200       | 77     | 512  | 10       |

**86.3.4 REGENERATE-DTSM****Procedure Overview**

| Command Code    | Parameter      |
|-----------------|----------------|
| REGENERATE-DTSM | [UNIT=<param>; |

**Example**

Input:

REGENERATE-DTSM;

Output:

```
ADD-DTSM:A1,HD,8136,512,"MO540",255;
ADD-DTSM:A1,HD,8000,512,"500M ",255;
ADD-DTSM:A1,STDFM,2,8192,"FM128",255;
ADD-DTSM:A1,STDHD,32000,512,"2GIGA",255;
ADD-DTSM:A1,STDHD,1221,512,"STD01",2;
ADD-DTSM:A1,FM,1220,512,"FM001",10;
```

## 86.4 Parameter Description

|                 |                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------|
| DEVTYPE         | Device type                                                                                          |
| Type of Input   | : Single value<br>mandatory (ADD)<br>optional (DISPLAY)                                              |
| Possible Values | : HD = Hard Disk<br>FM = Flash Memory<br>STDHD = Standard Hard Disk<br>STDFM = Standard Flash Memory |
| GRAN            | Granularity                                                                                          |
| Type of Input   | : Single value<br>mandatory                                                                          |
| Possible Values | : 1 - 65535                                                                                          |
| PNO             | Type designation from Part Number                                                                    |
| Type of Input   | : Single value<br>mandatory (ADD, DELETE)<br>optional (DISPLAY)                                      |
| Possible Values | : max. 5 chars<br>(beginning with either an alphabetical or a numerical character)                   |
| SIZE            | Size of memory medium (in blocks of 64 kByte)                                                        |
| Type of Input   | : Single value<br>mandatory                                                                          |
| Possible Values | : 1 - 32767                                                                                          |
| UNIT            | Name of service module in which the DTSM is to be loaded.                                            |
| Type of Input   | : Single value<br>optional                                                                           |
| Possible Values | : A1 = Administration- and Dataserver (ADS)                                                          |
| Default Value   | : A1                                                                                                 |
| UNITTYPE        | Internal device type number                                                                          |
| Type of Input   | : Single value<br>optional                                                                           |
| Possible Values | : max. 3 chars (0-255)                                                                               |

## **86.5 Error Messages and Advisories**

### **86.5.1 Error Messages**

F01: THE DEVICE WITH THE PART NUMBER <pno> IS STILL IN USE  
F02: THE PART NUMBER MUST BEGIN EITHER WITH AN ALPHABETICAL CHARACTER OR WITH A NUMERICAL CHARACTER  
F03: THE DEV\_TYPE\_LIST IS FULL. NO FURTHER ENTRIES POSSIBLE  
F04: A DEVICE ALREADY EXISTS WITH THE PART NUMBER <pno>.  
A CHANGE CAN ONLY BE MADE BY DELETING IT FIRST AND THEN ASSIGNING IT AGAIN.  
F05: NO DEVICE WITH THE SPECIFIED PART NUMBER <pno> HAS YET BEEN CREATED IN THE DATABASE.  
F06: A STANDARD DEVICE WITH THE DEVICE TYPE <devtype> HAS ALREADY BEEN CREATED  
F07: FOR DEVICES GREATER THEN 2 GB THE GRANULARITY MUST BE 2 \*\* N

### **86.5.2 Advisories**

H01: THE PART NUMBER <pno> IS ALREADY ASSIGNED TO THE DEVICE TYPE <devtype>.  
H02: NO DEVICE TYPES HAVE YET BEEN CREATED IN THE DATABASE.  
H03: NO DEVICE HAS YET BEEN CREATED WITH THE SPECIFIED DEVICE TYPE  
H04: NO DEVICE HAS YET BEEN CREATED WITH THE PART NUMBER <pno>  
H05: THE PART NUMBER <pno> HAS BEEN ASSIGNED TO THE DEVICE TYPE <devtype>

## 87 DUP - Duplication of mass storage devices

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | AMO Functions         | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The AMO DUP is used for duplicating a hard disk (HD), magneto-optical disk (MO) or compact flash card (CF) offline.

### Requirements

Both devices must be deactivated (for an online duplication the command COPY-DDRSM can be used). Since format of modern devices is not more needed, the destination device does not be formatted.

### Duplicating

Basically, the AMO DUP consists of two procedures, copying and (optional) verify.

- u) By one order either the complete device or RMX partitions only can be duplicated. If an error occurs during duplication, the copy will be aborted. In this case the operator must restart the AMO DUP.
- v) If the operator requests a comparison of the devices on completion of the duplication job (verify), the contents of the copied device will be compared track by track with the original. If an error occurs during comparison, the job will be aborted and the operator must restart the AMO DUP. In some cases, it may be necessary to replace the destination device.

### 87.1 Restrictions

This description is valid from HiPath 4000 V6.0.

### 87.2 Interrelationships

- AMO-complex FIDES : File and device service
- AMO DSSM : Disk Switch
- AMO DDRSM : Device Double Recording Server Modul

### 87.3 AMO Functions

- **START-DUP** : Duplicate the contents of a source device to a destination device

#### 87.3.1 START-DUP

Copying (with or without verification) a source device on a destination device .

##### Notes

If a further partition (e.g. Linux) is to be found on the hard disk, the operator must quit this state. That question can be suppressed by specifying the WARN parameter.

If the controller 1 as source device will be copied, it must be deactivated too, in order to prevent a parallel accesses.

**Warning: During copying the hard disk (controller 1) device as source device, no operation message will be stored (CGD, Hista).**

From this reason, before duplication of the device with active :PDS: the switch (or SWU unit) should be switched off (or if it is not possible, start the duplication over night).

Only devices with same sector sizes can be duplicated.

Possible combinations:

- HD/CF/MO540->HD/CF/MO540,
- MO1.3 ->MO1.3

Not possible combinations:

- MO1.3 -> HD/CF/MO540,
- HD/CF/MO540 -> MO1.3

Only used sectors of source device will be duplicated (sectors which belongs to sector ranges of partitions in partition table).  
for example: on 250 GB hard disk are only ~40 GB used, and therefore is possible duplication of this device to one 40 GB hard disk.

The source and destination devices must match the specified mnemotechnical name definitions (SDEV and DDEV). The structure of mnemotechnical names is:

:uudc1:

uu = Must be the same as the value specified for UNIT.

Possible Values: A1 for ADS

d = Device

Possible Values: H for hard disk, magneto-optical disk or compact flash

c = Controller number

Possible Values: 1 to 7

The colons are optional in the mnemotechnical names.

If the source device is larger than the destination the AMO DUP terminates abnormally with status H'002B. This message does not indicate clearly if an error has occurred during the duplication, or the destination device has insufficient space. In the second case all that areas of the destination device can be used, that were completely copied. This information can only be found in the dependability message.

If the end of the memory on the destination device is reached, the following dependability message will be displayed:

```
F7406 M4 N0016 NO ACT  A1  DRIVE  IO ERROR                      01-04-09 10:42:53
ALARM CLASS:SM-PER: 018
DRIVE:<destination device>
FORMAT:11
7F97000000xxxxxxxxxx020521xxxxxx xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
                                02:   SCSI Status,                02 = Check Condition
                                05:   Sense Key,                   05 = Illegal Request
                                21: Additional Sense Code, 21 = Logical Block
                                                Address out of
Range
```

If a different message is output, it must be regarded as a real error message, and the duplication must be repeated (possibly with a different destination medium).

### Procedure Overview

| Command Code | Parameter                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------|
| START-DUP    | [UNIT=<param>], SDEV=<string>, DDEV=<string>, [TEST=<param>], [W<br>ARN=<param>], [ANS=<param>]; |

### Example

1. Duplicate a hard disk and compare source and destination device contents on completion. The device name will be entered without ': '.

Input:

```
START-DUP:A1,A1H11,A1H21,A,Y,Y,N,N;
```

**DUP - Duplication of mass storage devices**

Parameter Description

2. Duplication of RMX partition only without comparison (verify).  
Eingabe:

```
START-DUP:A1,A1H11,A1H21,N,N,N;
```

**87.4 Parameter Description**

|                 |                                                 |

## 88 DVU - Disk verification utility

The description of this AMO is only available in html format!

## 89 FAMOS - Remote Administration and Maintenance: start of AMOs

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO "FAMOS" controls the Logical Device Unit (LDU) RAMOS by means of parameters.  
It specifies which AMOs are not to be invoked by FBT, and which actions these AMOs are not allowed to execute.  
FAMOS also serves to activate and deactivate printout and the LDU FAMOS, and to allow or forbid a HICOM system restart (soft restart) via remote A&M.  
FAMOS enters the individual parameter values in the customer table (CT) from which the LDU FAMOS obtains its information.

### 89.1 Restrictions

This description is valid from V3.4

Adjusting the callback function:

From V3.4 all the connections in the "EMS-APPLICATIONS" with the name "FAMOS2" will be excepted from the callback function.

### 89.2 Interrelationships

None

### 89.3 Functions of the AMO

- [ADD-FAMOS](#) : Adding parameters
- [DELETE-FAMOS](#) : Deleting parameters
- [DISPLAY-FAMOS](#) : Displaying parameters
- [REGENERATE-FAMOS](#) : Regenerating parameters
- [ACTIVATE-FAMOS](#) : Activating the LDU FAMOS and printout, allowing a RESTART
- [DEACTIVATE-FAMOS](#) : Deactivating the LDU FAMOS and printout, forbidding a RESTART

## 89.3.1 ADD-FAMOS

Adding an entry to the customer table. To add an entry, you must specify the NOUN and VERB parameters of that AMO that is to be barred for access from the service center. If parameter VERB is omitted, all the actions of the relevant AMO will be barred. To make additions to the scope of an existing AMO (additional verbs are to be barred), you must recreate it and state a new VERB combination.

### Procedure Overview

| Command Code | Parameter                      |
|--------------|--------------------------------|
| ADD-FAMOS    | NOUN=<string>, [VERB=<param>]; |

### Examples

1. Service center access to AMO PERSI for the actions REGENERATE and DELETE is to be barred.

Input:

```
ADD-FAMOS:PERSI, REGENERATE&DELETE;
```

Output:

```
ADD-FAMOS:PERSI, REGENERATE&DELETE;
H500: AMO FAMOS STARTED
AMO-FAMOS -...  REMOTE ADMINISTRATION & MAINTENANCE: START
OF AMOS
ADD COMPLETED
```

2. Service center access to AMO TGER for all actions is to be barred.

Input:

```
ADD-FAMOS:TGER;
```

Output:

```
ADD-FAMOS:TGER;
H500: AMO FAMOS STARTED
AMO-FAMOS -...  REMOTE ADMINISTRATION & MAINTENANCE: START
OF AMOS
ADD COMPLETED
```

## 89.3.2 DELETE-FAMOS

Deleting an entry from the customer table (CT). Possible variants:

- Deleting (enabling) some or several actions for one or more AMOs
- Deleting (enabling) some or several actions for all AMOs entered

- Deleting one or more AMOs --> enabling one or more AMOs for calling from the service center
- Deleting the entire customer table --> enabling all the entered AMOs for calling from the service center

The statuses of the printout and logical device unit (LDU) FAMOS are not changed by this operation.

### Procedure Overview

| Command Code | Parameter                                                                   |
|--------------|-----------------------------------------------------------------------------|
| DELETE-FAMOS | TYPE=AMO, NOUN=<string>, [VERB=<param>];<br><br>  TYPE=ALL, [VERB=<param>]; |

### Examples

1. Deleting the access inhibit for the actions ADD and CHANGE for both AMOs TGER and PERSI

Input:

```
DELETE-FAMOS:AMO,TGER&PERSI,ADD&CHANGE;
```

Output:

```
DELETE-FAMOS:AMO,TGER&PERSI,ADD&CHANGE;
H500: AMO FAMOS STARTED
AMO-FAMOS -...  REMOTE ADMINISTRATION & MAINTENANCE: START
OF AMOS
DELETE COMPLETED
```

2. Deleting the access inhibit for the actions CHANGE, DISPLAY and REGENERATE for all AMOs entered

Input:

```
DELETE-FAMOS:ALL,CHANGE&DISPLAY&REGENERATE;
```

Output:

```
DELETE-FAMOS:ALL,CHANGE&DISPLAY&REGENERATE;
H500: AMO FAMOS STARTED
AMO-FAMOS -...  REMOTE ADMINISTRATION & MAINTENANCE: START
OF AMOS
DELETE COMPLETED
```

3. Deleting the access inhibit for all the actions of AMOs TGER, PERSI and VBZGR

Input:

```
DELETE-FAMOS:AMO,TGER&PERSI&VBZGR;
```

Output:

FAMOS - Remote Administration and Maintenance: start of AMOs

Functions of the AMO

```
DELETE-FAMOS:AMO,TGER&PERSI&VBZGR;
H500: AMO FAMOS STARTED
AMO-FAMOS -...  REMOTE ADMINISTRATION & MAINTENANCE: START
OF AMOS
DELETE COMPLETED
```

4. Deleting the access inhibit for all the actions of all AMOs entered

Input:

```
DELETE-FAMOS:ALL;
```

Output:

```
DELETE-FAMOS:ALL;
H500: AMO FAMOS STARTED
AMO-FAMOS -...  REMOTE ADMINISTRATION & MAINTENANCE: START
OF AMOS
DELETE COMPLETED
```

89.3.3 DISPLAY-FAMOS

Displaying parameters

The current contents of the customer table (CT) are output by a DISPLAY. Output possibilities:

- Outputting the entire customer table
- Outputting the barred actions for certain AMO NOUNs
- Outputting the AMO NOUNs for a barred combination specified in the call (single value or chained single values)
- Outputting the statuses of printout and FAMOS, and RESTART allowed or forbidden (This information is always supplied automatically with the first three output possibilities.)

Procedure Overview

| Command Code  | Parameter                                                                          |
|---------------|------------------------------------------------------------------------------------|
| DISPLAY-FAMOS | [PAR=NOUN,NOUN=<string>;<br><br>  [PAR=VERB],[VERB=<param>;<br><br>  [PAR=STATUS]; |

Examples

1. Displaying the entire customer table

Input:

```
DISPLAY-FAMOS;
```

### Output:

```

DISPLAY-FAMOS;
H500: AMO FAMOS STARTED
PROT OFF ***** RAMOS ON ***** RESTART NOT ALLOWED
=====+
| NOUN | BARRED VERBS |
=====+
| PERSI | DISPLAY, OUTPUT, DUMP, ADD, ACTIVATE, |
|       | REGENERATE, RESTART |
+-----+
| VBZGR | CHANGE, OUTPUT, DEACTIVATE, ACTIVATE, EXEC |
+-----+
AMO-FAMOS -... REMOTE ADMINISTRATION & MAINTENANCE: START OF AMOS
DISPLAY COMPLETED

```

### 2. Displaying the barred actions of AMO PERSI

#### Input:

```
DISPLAY-FAMOS:NOUN,PERSI;
```

#### Output:

```

DISPLAY-FAMOS:NOUN,PERSI;
H500: AMO FAMOS STARTED
PROT OFF ***** RAMOS ON ***** RESTART NOT ALLOWED
=====+
| NOUN | BARRED VERBS |
=====+
| PERSI | DISPLAY, OUTPUT, DUMP, ADD, ACTIVATE, |
|       | REGENERATE, RESTART |
+-----+
AMO-FAMOS -... REMOTE ADMINISTRATION & MAINTENANCE: START OF AMOS
DISPLAY COMPLETED

```

### 3. Displaying the barred actions for all AMOs entered

#### Input:

```
DISPLAY-FAMOS:VERB;
```

#### Output:

```

DISPLAY-FAMOS:VERB;
H500: AMO FAMOS STARTED
PROT OFF ***** RAMOS ON ***** RESTART NOT ALLOWED
=====+
| NOUN | BARRED VERBS |
=====+
| PERSI | DISPLAY, OUTPUT, DUMP, ADD, ACTIVATE, |
|       | REGENERATE, RESTART |
+-----+
| VBZGR | CHANGE, OUTPUT, DEACTIVATE, ACTIVATE, EXEC |
+-----+
| AFR   | CHANGE, ADD |
+-----+
| IGLU  | ALL VERBS BARRED |
+-----+
AMO-FAMOS -... REMOTE ADMINISTRATION & MAINTENANCE: START OF AMOS
DISPLAY COMPLETED

```

## FAMOS - Remote Administration and Maintenance: start of AMOs

### Functions of the AMO

#### 4. Displaying the barred actions ADD and CHANGE for all AMOs entered

Input:

```
DISPLAY-FAMOS:VERB,ADD&CHANGE;
```

Output:

```
DISPLAY-FAMOS:VERB,ADD&CHANGE;
H500: AMO FAMOS STARTED
PROT OFF ***** RAMOS ON ***** RESTART NOT ALLOWED
=====+
| NOUN |   BARRED VERBS   |
+-----+
| AFR  | CHANGE, ADD      |
+-----+
| IGLU | ALL VERBS BARRED |
+-----+
AMO-FAMOS -...  REMOTE ADMINISTRATION & MAINTENANCE: START OF AMOS
DISPLAY COMPLETED
```

#### 5. Displaying the barred actions of AMOs PERSI, VBZGR, AFR and IGLU

Input:

```
DISPLAY-FAMOS:NOUN,PERSI&VBZGR&AFR&IGLU;
```

Output:

```
DISPLAY-FAMOS:NOUN,PERSI&VBZGR&AFR&IGLU;
H500: AMO FAMOS STARTED
PROT OFF ***** RAMOS ON ***** RESTART NOT ALLOWED
=====+
| NOUN |   BARRED VERBS   |
+-----+
| PERSI | DISPLAY, OUTPUT, DUMP, ADD, ACTIVATE,
|       | REGENERATE, RESTART
+-----+
| VBZGR | CHANGE, OUTPUT, DEACTIVATE, ACTIVATE, EXEC
+-----+
| AFR  | CHANGE, ADD      |
+-----+
| IGLU | ALL VERBS BARRED |
+-----+
AMO-FAMOS -...  REMOTE ADMINISTRATION & MAINTENANCE: START OF AMOS
DISPLAY COMPLETED
```

#### 6. Displaying the printout status

Input:

```
DISPLAY-FAMOS:STATUS;
```

Output:

```
DISPLAY-FAMOS:STATUS;
H500: AMO FAMOS STARTED
PROT OFF ***** RAMOS ON ***** RESTART NOT ALLOWED
AMO-FAMOS -...  REMOTE ADMINISTRATION & MAINTENANCE: START
OF AMOS
DISPLAY COMPLETED
```

## 89.3.4 REGENERATE-FAMOS

Displaying the contents of the customer table and outputting in the form of commands for regeneration

Output is in the form of position-oriented commands.

### Procedure Overview

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-FAMOS | ;         |

### Example

Regenerating the entire customer table (CT)

Input:

```
REGENERATE-FAMOS;
```

Output:

```
REGENERATE-FAMOS;
H500: AMO FAMOS STARTED
DELETE-FAMOS:ALL;
ADD-FAMOS:AFR,CHANGE;
ADD-FAMOS:AFR,ADD;
ADD-FAMOS:IGLU;
ACTIVATE-FAMOS:RAMOS;
ACTIVATE-FAMOS:PROT;
ACTIVATE-FAMOS:RESTART;
AMO-FAMOS -... REMOTE ADMINISTRATION & MAINTENANCE: START
OF AMOS
REGENERATE COMPLETED
```

## 89.3.5 ACTIVATE-FAMOS

Activating the LDU FAMOS and printout, and allowing a RESTART

### Procedure Overview

| Command Code   | Parameter     |
|----------------|---------------|
| ACTIVATE-FAMOS | TYPE=<param>; |

### Example

Activating the LDU FAMOS and printout, and allowing a RESTART

Input:

```
ACTIVATE-FAMOS:RAMOS&PROT&RESTART;
```

Output:

FAMOS - Remote Administration and Maintenance: start of AMOs

Parameter Description

```
ACTIVATE-FAMOS:RAMOS&PROT&RESTART;  
H500: AMO FAMOS STARTED  
AMO-FAMOS -...  REMOTE ADMINISTRATION & MAINTENANCE: START  
OF AMOS  
ACTIVATE COMPLETED
```

89.3.6 DEACTIVATE-FAMOS

Deactivating the LDU FAMOS and printout, or forbidding a RESTART

Procedure Overview

| Command Code     | Parameter     |
|------------------|---------------|
| DEACTIVATE-FAMOS | TYPE=<param>; |

Example

Deactivating the LDU FAMOS and printout, forbidding a RESTART

Input:

```
DEACTIVATE-FAMOS:RAMOS&PROT&RESTART;
```

Output:

```
DEACTIVATE-FAMOS:RAMOS&PROT&RESTART;  
H500: AMO FAMOS STARTED  
AMO-FAMOS -...  REMOTE ADMINISTRATION & MAINTENANCE: START  
OF AMOS  
DEACTIVATE COMPLETED
```

89.4 Parameter Description

|      |                          |                                                                                         |
|------|--------------------------|-----------------------------------------------------------------------------------------|
| NOUN | Name of AMO              |                                                                                         |
|      | Type of Input            | : Single value, chained single values,<br>mandatory (ADD, DELETE)<br>optional (DISPLAY) |
|      | Possible Values          | : AMO<br>designations                                                                   |
| PAR  | Type selection of output |                                                                                         |
|      | Type of Input            | : Single value,<br>optional (DISPLAY)                                                   |
|      | Possible Values          | : NOUN, VERB, STATUS                                                                    |

|                 |                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE            | Selection parameter                                                                                                                                                       |
| Type of Input   | : Single value, chained single values,<br>mandatory (DELETE, ACTIVATE, DEACTIVATE)                                                                                        |
| Possible Values | : RAMOS, PROT, RESTART                                                                                                                                                    |
| VERB            | AMO action or combination of actions                                                                                                                                      |
| Type of Input   | : Single value, chained single values<br>optional (ADD, DELETE, DISPLAY)                                                                                                  |
| Possible Values | : DISPLAY, CHANGE, OUTPUT, DEACTIVATE, DUMP, ADD,<br>ACTIVATE, EXEC, COPY, DELETE, TEST, REGENERATE, RESTART,<br>COLLECT, SET, START, STOP, RENAME, SWITCHOVER, INTERRUPT |

## 90 FAMUP - Remote Administration and Maintenance Update

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO "FAMUP" controls the Logical Device Unit (LDU) FAMUP (Remote Administration & Maintenance Update).

The changes in the APS and patch directory are transmitted to the service center at adjustable time intervals.

Additionally, an AMO-stapel is managed by the AMO-FAMUP at adjustable time intervals.

The following functions can be controlled with parameters:

- **FAMUP**  
Activating/deactivating the execution of AMO-stapel.
- **PROT**  
The parameter PROT defines whether printout on the service terminal is to be activated or deactivated. Data exchange can be logged at customer's request. Regardless of parameter PROT, regeneration is additionally recorded in operating file :AMD:FBT/FAMUP/NOUNCO/A. The operating files of the last three bad regeneration runs are all stored under the names :AMD:FBT/FAMUP/REGENERROR1 (or 2 and 3).
- **FTRNS**  
Activating/deactivating file transmission by file transfer to the SZ. This indicates whether the APS, PATCH-state by LDU FAMUP is to be transmitted to the SZ .
- **RUPSTT**  
Time when the AMO-stapel is to be started. In addition, the logical device unit (LDU) FAMUP searches the APS-DIR file and the patch directory for changes. The data is then transmitted to the service center by a HICOM file transfer. There will be no transmission if there have been no changes in the patch directory or the APS-DIR file since the last update.
- **RUPINT**  
This is the interval in days between the starting times. This parameter serves to set the intervals in days at which the execution of AMOCMD, respectively data transmissions at time RUPSTT are started. It must never be '0'. The longest possible interval is 31 days.

## FAMUP - Remote Administration and Maintenance Update

### Restrictions

- SCNAME  
This is the name of the destination computer in the SZ. A destination computer must be reported to the Remote A&M UPDATE in the service center for data transmission. (Parameter OSPTNR in AMO FTCSM)
- SZLOGON  
The LOGON on the destination computer (SZLOGON) consists of three different components: USERID, ACCT, PASSWORD.
- SUCCPROC  
Filename of the DO procedure for post-processing of data after successful transmission
- FAILPROC  
Filename of the DO procedure for post-processing of data after unsuccessful transmission

## 90.1 Restrictions

This description is valid from ATLANTIC-R6.3

## 90.2 Interrelationships

None

## 90.3 Functions of the AMO

- [ADD-FAMUP](#) : Adding parameters or AMO-command
- [CHANGE-FAMUP](#) : Changing parameters
- [DELETE-FAMUP](#) : Deleting certain AMOCMD-TAB entries
- [DISPLAY-FAMUP](#) : Displaying parameters or AMOCMD-TAB
- [OUTPUT-FAMUP](#) : Outputting the values entered by LDU FAMUP in the database
- [REGENERATE-FAMUP](#) : Regenerating parameters
- [ACTIVATE-FAMUP](#) : Activating FAMUP, PROT and FTRNS
- [DEACTIVATE-FAMUP](#) : Deactivating FAMUP, PROT and FTRNS
- [START-FAMUP](#) : Starting an UPDATE manually Initiation of UPDATE-Function

## 90.3.1 ADD-FAMUP

Creating the parameter list of the logical device unit (LDU) FAMUP or the selection table. The branch parameter TYPE is used for distinguishing between the FAMUP parameter list and the AMO-command table.

When creating the parameter list, remember to state all the parameters to ensure that FAMUP will work properly.

By adding AMOCMD-stapel, till 50 AMO-commands (string maximum length = **74** char) can be created. These strings will be received by the usertask. The action ADD should be reserved for just a certain privileged group of users.

The parameter SUCCPROC/FAILPROC specifies the valid partner system for the LDU FAMUP.

|   | entry     | destination                |
|---|-----------|----------------------------|
| 1 | xx.NAME * | HTS                        |
| 2 | USR       | NCC in PC MX               |
| 3 | FTH       | NCC in HICOM-ADS           |
| 4 | FTX       | NCC in the local HICOM-ADS |

\*) If the destination system is HTS, the complete post-processing procedure must be specified. This filename must have a two-character prefix (e.g. W9.). Validation of the parameter USERID, ACCOUNT and PASSWORD in relation to the destination system..

|   | USERID | ACCOUNT | PASSWORD |
|---|--------|---------|----------|
| 1 | X      | X       | X        |
| 2 | X      | ---     | X        |
| 3 | ---    | ---     | ---      |
| 4 | ---    | ---     | ---      |

Those fields marked with an X are invalueted.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                     |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-FAMUP    | TYPE=LDU,<br>,RUPSTT=<number>,RUPINT=<number>,FTSTT=<number><br>,SCNAME=<string>,USERID=<string>,ACCT=<string><br>,PASSWORD=<string>,SUCCPROC=<string><br>,FAILPROC=<string>; |

## FAMUP - Remote Administration and Maintenance Update

### Functions of the AMO

| Command Code | Parameter                     |
|--------------|-------------------------------|
|              | TYPE=AMOCMD, AMOCMD=<string>; |

#### Examples

1. Creating the parameter list of the logical device unit FAMUP  
Starting the AMO-stapel at 02.00 hours and at intervals of one day;  
Starting file transfer one hour later at 03.00 hours  
Name of the destination computer in the service center: N78H02  
and LOGON ID of the destination computer in the service center:  
FBCLUDI  
Account number: 52B42730  
Password: C 'xxxxx'  
Filename of the DO procedure after successful transmission:  
W9.FAMUP.SUCC  
Filename of the DO procedure after unsuccessful transmission:  
W9.FAMUP.FAIL

#### Input:

```
ADD-FAMUP:LDU,02-00-01-01-1987,1,03-  
00,N78H02,FBCLUDI,52B42730,C'xxxxx';  
W9.FAMUP.SUCC,W9.FAMUP.FAIL;
```

#### Output:

```
ADD-FAMUP:LDU,02-00-01-01-1987,1,03-00,N78H02,FBCLUDI,52B42730,C'xxxxx';  
W9.FAMUP.SUCC,W9.FAMUP.FAIL;  
H500: AMO FAMUP STARTED  
AMO-FAMUP -... REMOTE ADMINISTRATION & MAINTENANCE UPDATE  
ADD COMPLETED
```

2. Adding the AMO DATE in AMO-stapel

#### Input:

```
ADD-FAMUP:AMOCMD,"DISP-DATE;"
```

#### Output:

```
ADD-FAMUP:AMOCMD,"DISP-DATE;"  
H500: AMO FAMUP STARTED  
AMO-FAMUP -... REMOTE ADMINISTRATION & MAINTENANCE UPDATE  
ADD COMPLETED
```

## 90.3.2 CHANGE-FAMUP

Changing the parameter list of the logical device unit (LDU) FAMUP. At least one parameter on the list must be stated.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-FAMUP | {RUPSTT=<number>,RUPINT=<number>,FTSTT=<number><br>,SCNAME=<string>,USERID=<string><br>,ACCT=<string>,PASSWORD=<string><br>,SUCCPROC=<string>,FAILPROC=<string>; |

#### Example

Changing the AMO-stapel starting time and interval in days in the parameter list of LDU FAMUP

Input:

```
CHANGE-FAMUP:05-00-02-02-1988,10;
```

Output:

```
CHANGE-FAMUP:05-00-02-02-1988,10;
H500: AMO FAMUP STARTED
AMO-FAMUP -...  REMOTE ADMINISTRATION & MAINTENANCE UPDATE
CHANGE COMPLETED
```

### 90.3.3 DELETE-FAMUP

Deleting an entry from the AMOCMD-table.

The branch parameter SEL indicates whether one AMO or the entire AMOCMD- table is to be deleted.

With 'linenr' the line number of an entry can be deleted from the AMOCMD-table (the line number will be output by DISPLAY)

#### Procedure Overview

| Command Code | Parameter                                   |
|--------------|---------------------------------------------|
| DELETE-FAMUP | SEL=ALL;<br><br>SEL=AMOCMD,linenr=<number>; |

#### Examples

Input:

```
DELETE-FAMUP:AMOCMD,1;
```

Output:

```
DELETE-FAMUP:AMOCMD,1;
H500: AMO FAMUP STARTED
AMO-FAMUP -...  REMOTE ADMINISTRATION & MAINTENANCE UPDATE
DELETE COMPLETED
```

## FAMUP - Remote Administration and Maintenance Update

### Functions of the AMO

Deleting the entire AMOCMD table

Input:

```
DELETE-FAMUP:ALL;
```

Output:

```
DELETE-FAMUP:ALL;  
H500: AMO FAMUP STARTED  
AMO-FAMUP -... REMOTE ADMINISTRATION & MAINTENANCE UPDATE  
DELETE COMPLETED
```

### 90.3.4 DISPLAY-FAMUP

Displaying the parameter list of the logical device unit (LDU) FAMUP and the AMOCMD- table

Output possibilities (see also formats in typical output):

- a) Displaying the parameter list of AMO-FAMUP (SEL parameter: PARAM, output in format1)
- b) Outputting the status of LDU FAMUP  
Displaying the parameters FAMUP, PROT and FTRNS (SEL parameter: STATUS, output in format2)
- c) Displaying the AMOCMD table,,,. With AMOCMD, the AMO-command table will be output. The entries will be output in a table form with line number.
- d) Procedure Overview

| Command Code  | Parameter                                          |
|---------------|----------------------------------------------------|
| DISPLAY-FAMUP | SEL=PARAM;<br><br> SEL=STATUS;<br><br> SEL=AMOCMD; |

#### Examples

1. Displaying the parameter list of LDU FAMUP

Input:

```
DISPLAY-FAMUP:PARAM;
```

Output:

```
Format1  
DISPLAY-FAMUP:PARAM;  
H500: AMO FAMUP STARTED
```

## FAMUP - Remote Administration and Maintenance Update

### Functions of the AMO

|                                                    |          |   |                  |
|----------------------------------------------------|----------|---|------------------|
| UPDATE STARTTIME                                   | RUPSTT   | : | 02.00-01.01.1987 |
| INTERVAL IN DAYS                                   | RUPINT   | : | 01 DAYS          |
| FILE TRANSFER START TIME                           | FTSTT    | : | 03.00            |
| PARTNER COMPUTER IN SC                             | SCNAME   | : | N78H02           |
| LOGON ID OF DEST. COMPUTER                         | USERID   | : | FBCLUDI          |
| ACCOUNT NO. OF DEST COMP.                          | ACCT     | : | 52B42730         |
| LOGON PWD OF DEST. COMP.                           | PASSWORD | : | C'HICOM'         |
| COMMAND FOR HANDLING OF<br>SUCCESSFUL TRANSMISSION | SUCCPROC | : | W9.FAMUP.SUCC    |
| COMMAND FOR HANDLING OF<br>ERRONEOUS TRANSMISSION  | FAILPROC | : | W9.FAMUP.FAIL    |

AMO-FAMUP -... REMOTE ADMINISTRATION & MAINTENANCE UPDATE  
DISPLAY COMPLETED

### 2. Displaying the status of LDU FAMUP

#### Input:

DISPLAY-FAMUP:STATUS;

#### Output:

##### Format2

DISPLAY-FAMUP:STATUS;  
H500: AMO FAMUP STARTED  
PROT OFF \*\*\*\*\* FAMUP ON \*\*\*\*\* FTRNS ON  
AMO-FAMUP -... REMOTE ADMINISTRATION & MAINTENANCE UPDATE  
DISPLAY COMPLETED

### 3. Displaying the UPDATE authorizations for the AMOs of AMOCMD table

#### Input:

DISPLAY-FAMUP:AMOCMD;

#### Output:

##### Format3

DISPLAY-FAMUP:AMOCMD;  
H500: AMO FAMUP STARTED  
1 DISP-DATE;  
  
2 AFR,ADD&CHANGE;  
  
AMO-FAMUP -... REMOTE ADMINISTRATION & MAINTENANCE UPDATE  
DISPLAY COMPLETED

### 90.3.5 OUTPUT-FAMUP

Outputting the values entered by LDU FAMUP in the database  
(corresponds to the current status of LDU FAMUP)

#### Procedure Overview

| Command Code | Parameter |
|--------------|-----------|
| OUTPUT-FAMUP | ;         |

#### Example

Outputting the status of LDU FAMUP

Input:

```
OUTPUT-FAMUP;
```

Output:

```
OUTPUT-FAMUP;
H500: AMO FAMUP STARTED

STATUS OF LDU FAMUP :
=====

REGENERATION RUNNING           : NO
LAST REGENERATION SUCCESSFUL   : YES

FILE TRANSFER ACTIVATED        : NO

LAST MMLCMD TRANSMISSION OK    : YES
LAST APSDIR TRANSMISSION OK    : YES
LAST PATDIR TRANSMISSION OK    : YES

DISK ACCESS POSSIBLE           : YES

NUMBER OF NOUNS IN THE NOUN FILE : 1

AMO-FAMUP -...  REMOTE ADMINISTRATION & MAINTENANCE UPDATE
OUTPUT COMPLETED
```

### 90.3.6 REGENERATE-FAMUP

Displaying the parameter list of the logical device unit (LDU) FAMUP  
outputting in the form of commands for regeneration. Output is in the  
form of commands with position-oriented parameters.

#### Procedure Overview

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-FAMUP | ;         |

### Example

Regenerating the parameter list of LDU FAMUP

Input:

```
REGENERATE-FAMUP;
```

Output:

```
REGENERATE-FAMUP;
H500: AMO FAMUP STARTED
ADD-FAMUP:LDU,02-00-01-01-1987,01,03-00,"N78H02","FBCLUDI","52B42730";
        "C' HICOM' ",
        "W9.FAMUP.SUCC",
        "W9.FAMUP.FAIL";
ACTIVATE-FAMUP:FAMUP;
ACTIVATE-FAMUP:FTRNS;
DEACTIVATE-FAMUP:PROT;
AMO-FAMUP -...  REMOTE ADMINISTRATION & MAINTENANCE UPDATE
REGENERATE COMPLETED
```

## 90.3.7 ACTIVATE-FAMUP

Activating the execution of AMOCMD, printout and file transfer

### Procedure Overview

| Command Code   | Parameter    |
|----------------|--------------|
| ACTIVATE-FAMUP | SEL=<param>; |

### Example

Input:

```
ACTIVATE-FAMUP:FAMUP&PROT&FTRNS;
```

Output:

```
ACTIVATE-FAMUP:FAMUP&PROT&FTRNS;
H500: AMO FAMUP STARTED
AMO-FAMUP -...  REMOTE ADMINISTRATION & MAINTENANCE UPDATE
ACTIVATE COMPLETED
```

## 90.3.8 DEACTIVATE-FAMUP

Deactivating the execution of AMOCMD, printout and file transfer

### Procedure Overview

| Command Code     | Parameter    |
|------------------|--------------|
| DEACTIVATE-FAMUP | SEL=<param>; |

**Example**

Deactivating update function, printout and file transfer

Input:

DEACTIVATE-FAMUP:FAMUP&PROT&FTRNS;

Output:

DEACTIVATE-FAMUP:FAMUP&PROT&FTRNS;  
H500: AMO FAMUP STARTED  
AMO-FAMUP -... REMOTE ADMINISTRATION & MAINTENANCE UPDATE  
DEACTIVATE COMPLETED

**90.3.9 START-FAMUP**

An UPDATE is started manually by sending a SAVE job to the incoming mailbox of the logical device unit (LDU) FAMUP. All changes made by this time to the static database, the APS directory and the PATCH directory are transmitted to the service center SZ. FAMUP and FTRNS must be active. When the SAVE job is sent, the AMO FAMUP outputs a message.

By declaring the parameter INIT=Y, the UPDATE function is initialized. All the information stored up to this point in time is deleted, together with the data transfer version numbers. Version numbers for the transfer of database updates are then counted from 1 again. The initialization must be started immediately after the generation of the MMLCMD command batch (initial generating batch), which is then stored in the HTS. The first transfer should not take place until the generating patch has been accepted.

**Procedure Overview**

| Command Code | Parameter                                         |
|--------------|---------------------------------------------------|
| START-FAMUP  | [ INIT=N] ;<br><br>  [ INIT=Y] , [ INS=<param>] ; |

**Example**

Starting an UPDATE manually

Input:

STA-FAMUP:Y,Y;

Output:

```
START-FAMUP:Y,Y;
H500: AMO FAMUP STARTED
SAVE JOB SENT TO LDU FAMUP 87-12-31 23:59:59
AMO-FAMUP -...  REMOTE ADMINISTRATION & MAINTENANCE UPDATE
START COMPLETED
```

## 90.4 Parameter Description

|                 |                                                                |
|-----------------|----------------------------------------------------------------|
| ACCT            | Account number of destination computer                         |
| Type of Input   | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE) |
| Possible Values | : See BS2000 command language                                  |
| AMOCMD          | Specify an AMO-command                                         |
| Type of Input   | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE) |
| Possible Values | : 1 to <b>74</b> alphanumeric characters                       |
| FAILPROC        | Command for handling of erroneous transmission                 |
| Type of Input   | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE) |
| Possible Values | : See DVS restrictions for filename in BS2000                  |
| FTSTT           | File transfer start time                                       |
| Type of Input   | : Single value<br>mandatory (ADD)<br>Group parameter (CHANGE)  |
| Possible Values | : Hours - Minutes<br>Hours: 0 - 23<br>Minutes: 0 - 59          |
| INIT            | Initialising of LDU FAMUP                                      |
| Type of Input   | : Single value<br>optional (START)                             |
| Possible Values | : Y,N                                                          |

## FAMUP - Remote Administration and Maintenance Update

### Parameter Description

|                 |                                                                                                            |
|-----------------|------------------------------------------------------------------------------------------------------------|
| INS             | System to be put in service for FAMUP                                                                      |
| Type of Input   | : Single value<br>optional (START)                                                                         |
| Possible Values | : Y                                                                                                        |
| LINENR          | Line number of AMO call                                                                                    |
| Type of Input   | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE)                                             |
| Possible Values | 1 to 50                                                                                                    |
| PASSWORD        | Logon password of destination computer                                                                     |
| Type of Input   | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE)                                             |
| Possible Values | : See BS2000 command language                                                                              |
| RUPINT          | Interval (in days) at which a remote update is to occur                                                    |
| Type of Input   | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE)                                             |
| Possible Values | 1 to 31                                                                                                    |
| RUPSTT          | Remote update start time                                                                                   |
| Type of Input   | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE)                                             |
| Possible Values | : Hours - Minutes<br>Hours: 1 - 23<br>Minutes: 0 - 59<br>Day: 1 - 31<br>Month: 1 - 12<br>Year: 1980 - 9999 |
| SUCCPROC        | File name of proc. to be seen after a successfull transfer                                                 |
| Type of Input   | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE)                                             |
| Possible Values | : See DVS restriction for filenames in BS2000                                                              |

|                 |                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------|
| SCNAME          | Partner computer in service center                                                                     |
| Type of Input   | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE)                                         |
| Possible Values | : All names to be formed without special characters,<br>1 to 8 alphanumeric characters                 |
| SEL             | Selection parameter                                                                                    |
| Type of Input   | : Single value,<br>mandatory (ACTIVATE, DEACTIVATE, DELETE, DISPLAY)                                   |
| Possible Values | : PARAM, AMOCMD, STATUS (DISPLAY)<br>ALL, AMOCMD (DELETE)<br>FAMUP, PROT, FTRNS (ACTIVATE, DEACTIVATE) |
| TYPE            | Desired remote maintenance update options                                                              |
| Type of Input   | : Single value, mandatory<br>mandatory (ADD)                                                           |
| Possible Values | : LDU, AMOCMD                                                                                          |
| USERID          | Logon id of destination computer                                                                       |
| Type of Input   | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE)                                         |
| Possible Values | : See BS2000 command language                                                                          |

H09: FTRNS WAS ALREADY DEACTIVATED  
H10: THE VERB 'REGENERATE' HAS NO RELEVANCE IN THIS CONTEXT

## 91 FBTID - Remote Administration and Maintenance Identification Data

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO-FBTID is used to create data for the connection setup of *remote A & M* between Hicom and the service center (SZ). The required data are created in the administration and data server (ADS) of Hicom by means of the AMO FBTID.

The data are input by means of the following parameters: regional office (CD), contract number (NO), position number of contract (POS), password (PASSWORD), customer name (NAME) and station number of Hicom terminal (STNO)

- CD

The ZN (= regional office) code is used to identify Hicom for the SZ. This ensures an unambiguous assignment in the SZ. The identical ZN code must also be provided in the SZ (ISDN 2000). Thus, an unambiguous customer identification check is thus possible.

- NO

The contract number is used to identify Hicom for the SZ. An unambiguous assignment can be made in the SZ. The identical contract number must also be provided in the SZ (ISDN 2000). Thus, an unambiguous customer identification check is possible.

- POS

The position number of the contract is used to identify Hicom for the SZ. An unambiguous assignment can be made in the SZ. The identical position number of the contract must also be provided in the SZ (ISDN 2000). Thus, an unambiguous customer identification check is possible.

- PASSWORD

The password is used to identify Hicom for the SZ. The identification, for example, is required for AMO start when the connection is set up from the SZ to Hicom and AMOs are to be started. The password protects Hicom against unauthorized intervention from the outside; it must also be provided in the SZ (ISDN 2000).

- PRODUCT

## FBTID - Remote Administration and Maintenance Identification Data

### Restrictions

Product name of the Hicom system. If the AFS (automatic fault statistics) is in emergency operation, the product name is included in the printer output, in order to facilitate the interpretation of the fault reports at the control center.

- NAME

In order to make the unambiguous assignment of the accumulated data possible during automatic fault transfer (via RAFR), it is possible to transfer the customer name to the SZ. During emergency operation, the customer name is printed out.

- STNO

The station number of the customer of the Hicom system is transferred to the SZ during automatic fault transfer. This enables the SZ personnel in the SZ to call the customer system directly. During emergency operation, the station number is printed out directly.

- Remarks

SZ Station Number

The station number of the SZ must also be set up in Hicom. This is done by using an AMO of the CMS because the station number of the CMS is required for the connection setup and is read directly from the database by the CMS. The remote A & M also has access to these data, if required.

Processor Name of the Service Center

The processor name of the service center and the application name in the SZ are also created in the database of the ADS by an AMO of the CMS. The remote A & M has access to these data.

## 91.1 Restrictions

This description is valid from ATLANTIC-R6.3

## 91.2 Interrelationships

None

## 91.3 Functions of the AMO

- **ADD-FBTID** : Creation of the parameters
- **DISPLAY-FBTID** : Display of the parameters
- **CHANGE-FBTID** : Change of the parameters
- **REGENERATE-FBTID** : Regeneration of the parameters

### 91.3.1 ADD-FBTID

The action 'add' must be executed during the generation. All parameters must be specified to ensure the proper execution of the remote A & M.

#### Procedure Overview

| Command Code | Parameter                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------|
| ADD-FBTID    | CD=<number>,NO=<string>,POS=<string><br>,PASSWORD=<string>,PRODUCT=<string>,<br>,NAME=<string>,STNO=<string>; |

#### Example

Creating the data for the connection setup of the remote A & M between Hicom and the SZ using the following parameters:

ZN-code = 12, contract number = M299289, position number of the contract = 0001+, password = PSE3 C131, product name = PN HICOM 600, customer name = BOB\_BUDER\_AND\_HIS\_KOMMETS\_COKG and station number of the customer = 21122/432.

Input:

```
ADD-FBTID:12,M299289,0001+,PSE3 C131,PN HICOM 600,
          BOB_BUDER_AND_HIS_KOMMETS_COKG,21122/432;
```

Output:

```
ADD-FBTID:12,M299289,0001+,PSE3 C131,PN HICOM 600,
          BOB_BUDER_AND_HIS_KOMMETS_COKG,21122/432;
H500: AMO FBTID STARTED
AMO-FBTID ... REMOTE ADMINISTRATION & MAINTENANCE
IDENTIFICATION
ADD COMPLETED
```

## 91.3.2 DISPLAY-FBTID

Displaying the list AMO-FBTID and the output of all parameters in list format (DIS).

### Procedure Overview

| Command Code  | Parameter |
|---------------|-----------|
| DISPLAY-FBTID | ;         |

### Example

Displaying the parameters of list AMO-FBTID

Input:

```
DISPLAY-FBTID;
```

Output:

```
DISPLAY-FBTID;
H500: AMO FBTID STARTED

      PARAMETERS FOR THE CONNECTION SETUP
      BETWEEN HICOM SYSTEM AND SERVICE CENTER
PARAMETERS                                VALUE
-----
REGIONAL SERV. CENTER CODE : 12
NUMBER OF CONTRACT         : M299289
POSITION NO. IN CONTRACT   : 0001+
PASSWORD                   : PSE3 C133
PROD. NAME OF HICOM SYSTEM : PN HICOM 600
CUSTOMER NAME              : BOB_BUDER_AND_HIC_KOMMETS_COKG
TEL. NO. OF HICOM SYSTEM   : 21122/432

      AMO-FBTID ... REMOTE ADMINISTRATION & MAINTENANCE
IDENTIFICATION
      DISPLAY COMPLETED
```

## 91.3.3 CHANGE-FBTID

Changing the list AMO-FBTID; at least one parameter of the list must be specified.

### Procedure Overview

| Command Code | Parameter                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------|
| CHANGE-FBTID | {CD=<number>,NO=<string>,POS=<string><br>,PASSWORD=<string>,PRODUCT=<string><br>,NAME=<string>,STNO=<string>;} |

### Example

Changing the parameter ZN code, position number of contract and password in the FBTID list.

Input:

```
CHANGE-FBTID:13,,0002+,TEST;
```

Output:

```
CHANGE-FBTID:13,,0002+,TEST;
H500: AMO FBTID STARTED
AMO-FBTID ... REMOTE ADMINISTRATION & MAINTENANCE
IDENTIFICATION
CHANGE COMPLETED
```

## 91.3.4 REGENERATE-FBTID

Regeneration (SAVDB) in position-oriented commands.

### Procedure Overview

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-FBTID | ;         |

### Example

Regenerating the parameters in the list AMO-FBTID

Input:

```
REGENERATE-FBTID;
```

Output:

```
REGENERATE-FBTID;
H500: AMO FBTID STARTED
ADD-FBTID:12,M299289,0001+,PSE3 C131,PN HICOM 600,
BOB_BUDER_AND_HIS_KOMMETS_COKG,21122/432;
AMO-FBTID ... REMOTE ADMINISTRATION & MAINTENANCE
IDENTIFICATION
REGENERATE COMPLETED
```

## 91.4 Parameter Description

|               |                                                                |
|---------------|----------------------------------------------------------------|
| CD            | Regional service centre code                                   |
| Type of Input | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE) |

## FBTID - Remote Administration and Maintenance Identification Data

### Parameter Description

|          |                                                        |                                                                |
|----------|--------------------------------------------------------|----------------------------------------------------------------|
|          | Possible Values                                        | : 00 to 99                                                     |
| NAME     | Surname and christian name with additional information |                                                                |
|          | Type of Input                                          | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE) |
|          | Possible Values                                        | : 30-position alphanumeric characters                          |
| NO       | Number of contract                                     |                                                                |
|          | Type of Input                                          | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE) |
|          | Possible Values                                        | : 7-position alphanumeric characters and special characters    |
| PASSWORD | Password for identification check                      |                                                                |
|          | Type of Input                                          | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE) |
|          | Possible Values                                        | : 14-position alphanumeric characters                          |
| POS      | Position number in contract                            |                                                                |
|          | Type of Input                                          | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE) |
|          | Possible Values                                        | : 5-position alphanumeric characters and special characters    |
| PRODUCT  | Product name of Hicom system                           |                                                                |
|          | Type of Input                                          | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE) |
|          | Possible Values                                        | : 14-position alphanumeric characters                          |
| STNO     | Telephone number of Hicom system                       |                                                                |
|          | Type of Input                                          | : Single value,<br>mandatory (ADD)<br>Group parameter (CHANGE) |
|          | Possible Values                                        | : 22-position alphanumeric characters                          |

Error Messages and Advisories

## 92 FBTN - Administration of the Flag Byte Table and Trunk Number Table

|                      |                               |
|----------------------|-------------------------------|
| Interrelationships   | Parameter Description         |
| Functions of the AMO | Error Messages and Advisories |

The AMO is used to administrate the flag byte table and the trunk number table.

The flag bytes are used in the message to the DPS and can be changed to suit individual customer requirements.

The trunk number table contains the assignments of virtual CO trunk numbers to actual CO trunks.

### a) Flag byte table

The flag bytes (maximum of 2) are used in the message to the DPS and can be changed to suit customer requirements.

In flag byte 1, only the bit positions 0 to 5 can be used.

Definition of bit positions 6 and 7:

BIT 6 = 1: Output was started by a timer job.

BIT 7 = 1: Output was started by file overflow.

### b) Trunk number table

Independent of its hardware address, each CO trunk can be assigned a virtual CO trunk number.

The trunk numbers are entered in ascending order. There are a maximum of 870 entries possible.

### 92.1 Interrelationships

- AMO-FTBL : Administration of the format tables

### 92.2 Functions of the AMO

- [ADD-FBTN](#) : Create table entries
- [DELETE-FBTN](#) : Cancel table entries
- [DISPLAY-FBTN / REGENERATE-FBTN](#) : Interrogate table entries  
Regenerate table entries

**92.2.1 ADD-FBTN**

Entry of flag byte values into the flag byte table.

Assignments of virtual CO trunk numbers to CO trunks in the trunk number table. These trunk numbers can then be output in CDR format (see AMO-FTBL).

The values in the trunk number table are entered in ascending order.

For internal connections there can be made a general entry in the trunk number table. In this case the value 99 has to be entered for the parameter LTG. For internal connections this entry will be in effect.

1. Entry of a flag byte into flag byte table 1.
2. Entry of a flag byte into flag byte table 2.
3. Entry of assignment of virtual CO trunk numbers to CO trunks.

**Procedure Overview**

| Command Code | Parameter                                                                                                |     |
|--------------|----------------------------------------------------------------------------------------------------------|-----|
| ADD-FBTN     | TBL=FB1, FLAGBYTE=<number>, VAL=<number>;                                                                | (1) |
|              | TBL=FB2, FLAGBYTE=<number>, VAL=<number>;                                                                | (2) |
|              | TBL=TRKNO, LTG=<number>, LTU=<number>, SLOT=<number><br>, CCT=<number>, BCHAN=<number>, VTRKNO=<number>; | (3) |

**Examples**

1. The flag bit 1 in flag byte 2 is to be set to 1.  
Input:  
ADD-FBTN:TBL=FB2, FLAGBYTE=1, VAL=1;
2. The contents of the call detail record must identify
  - a) the 'customer' (shared system) from whom the data record originates
  - b) the type of data the call detail record contains.Possible solutions:

1. Flag byte 1 indicates the number of the shared system 'customer' (e.g.: flag bit 5 has been set).
2. Flag byte 2 indicates the type of data the contained in the record (e.g.: the customer wishes flag bit 3 to be set for flag byte 2).

Input:

```
ADD-
FBTN:TBL=FB1,FLAGBYTE=5,VAL=1;
(1)
```

Input:

```
ADD-
FBTN:TBL=FB2,FLAGBYTE=3,VAL=1;
(2)
```

3. A CO trunk is to be allocated a virtual CO trunk number.  
The CO trunk number is composed of: LTG=1, LTU=1, SLOT=1, CCT=0.  
The B-channel number is 0.  
The CO trunk number is to receive the virtual CO trunk number 05.

Input:

```
ADD-
FBTN:TBL=TRKNO,LTG=1,LTU=1,SLOT=1,CCT=0,BCHAN=0,VTRKNO=05;
```

4. A CO trunk is to be allocated a virtual CO trunk number.  
The CO trunk number is composed of: LTG=1, LTU=1, SLOT=1, CCT=0.  
The B-channels are in the range from 2 to 19.  
The CO trunk number is to receive the virtual CO trunk number 666666.

Input:

```
ADD-
FBTN:TBL=TRKNO,LTG=1,LTU=1,SLOT=1,CCT=0,BCHAN=2&&19,VTRKNO=666666;
```

## 92.2.2 DELETE-FBTN

Cancel the entries of the flag byte table or trunk number table.

If a trunk number table entry was cancelled, the remaining entries are resorted in ascending order.

1. Cancellation of a flag bit in the flag byte table 1.
2. Cancellation of a flag bit in the flag byte table 2.
3. Cancellation of a CO trunk number assignment.

## FBTN - Administration of the Flag Byte Table and Trunk Number Table

### Functions of the AMO

#### Procedure Overview

| Command Code | Parameter                                                                                  |     |
|--------------|--------------------------------------------------------------------------------------------|-----|
| DELETE-FBTN  | [TBL=FB1], [FLAGBYTE=<number>];                                                            | (1) |
|              | [TBL=FB2], [FLAGBYTE=<number>];                                                            | (2) |
|              | [TBL=TRKNO], LTG=<number>, LTU =<number><br>, SLOT=<number>, CCT=<number>, BCHAN=<number>; | (3) |

#### Example

1. Cancel flag bit 1 in flag byte table 2.

Input:

```
DELETE-FBTN:TBL=FB2, FLAGBYTE=1;
```

### 92.2.3 DISPLAY-FBTN / REGENERATE-FBTN

- Interrogate the entries of the flag byte tables or trunk number table with output on screen in tabular form (DISPLAY).
- Interrogate the entries of the flag byte tables or trunk number table with generation of a command listing for the action ADD-FBTN (REGENERATE).
- Interrogate or regenerate the Flag Byte Table 1
- Interrogate or regenerate the Flag Byte Table 2
- Interrogate or regenerate the allocation of trunk numbers to virtual trunk numbers.

#### Procedure Overview

| Command Code    | Parameter                                                                                          |     |
|-----------------|----------------------------------------------------------------------------------------------------|-----|
| DISPLAY-FBTN    | [TBL=FB1];                                                                                         | (1) |
|                 | [TBL=FB2];                                                                                         |     |
|                 | [TBL=TRKNO], [LTG=<number>], [LTU=<number>]<br>, [SLOT=<number>], [CCT=<number>], [BCHAN=<number>; |     |
| REGENERATE-FBTN | [TBL=FB1];                                                                                         | (2) |
|                 | [TBL=FB2];                                                                                         |     |

### Command Code

### Parameter

```
| [TBL=TRKNO], [LTG=<number>], [LTU=<number>]  
  , [SLOT=<number>], [CCT=<number>], [BCHAN=<number>];
```

### Examples

#### 1. Interrogate the trunk number table.

Input:

```
DISPLAY-FBTN:TBL=TRKNO;
```

Output:

```
TRUNK-NUMBER-TABLE
```

| ENTRY | LTG | LTU | SLOT | CCT | ISDN-B-CHANNEL | VIRT.TRUNK CIRC. NO |
|-------|-----|-----|------|-----|----------------|---------------------|
| 1     | 1   | 1   | 1    | 0   | 0              | 05                  |
| 2     | 1   | 1   | 1    | 0   | 2 -19          | 666666              |

#### 2. Interrogation of flag byte table 2.

Input:

```
DISPLAY-FBTN:TBL=FB2;
```

Output:

```
FLAG - BYTE - TABLE 2
```

| FLAGBYTE | VAL |
|----------|-----|
| 1        | 0   |
| 2        | 0   |
| 3        | 1   |
| 4        | 0   |
| 5        | 0   |
| 6        | 0   |
| 7        | 0   |
| 8        | 0   |

#### 3. Interrogate the trunk number table for regeneration.

Input:

```
REGENERATE-FBTN:TBL=TRKNO;
```

Output:

```
ADD-FBTN:TRKNO,1,1,1,0,0,05;  
ADD-FBTN:TRKNO,1,1,1,0,2&&19,666666;
```

### 92.3 Parameter Description

|                                                                                                           |                                                |                                                                                        |  |
|-----------------------------------------------------------------------------------------------------------|------------------------------------------------|----------------------------------------------------------------------------------------|--|
| BCHAN                                                                                                     | Number of the ISDN B-channel                   |                                                                                        |  |
|                                                                                                           | Type of Input                                  | : single value, range, mandatory (ADD, DELETE ) optional (DISPLAY, REGENERATE)         |  |
|                                                                                                           | Possible Values                                | : 0 to 30                                                                              |  |
| CCT                                                                                                       | Circuit number                                 |                                                                                        |  |
|                                                                                                           | Type of Input                                  | : single value, mandatory (ADD, DELETE ) optional (DISPLAY, REGENERATE)                |  |
|                                                                                                           | Possible Values                                | : 0 to 121                                                                             |  |

### 92.4.2 Advisories

none

## 93 FEACG - SMDR/DMDR Feature List

|                    |                               |
|--------------------|-------------------------------|
| Interrelationships | Parameter Description         |
| AMO Functions      | Error Messages and Advisories |

"SMDR/DMDR" is elsewhere described as "Call Detail Recording" or "CDR".

The task of this AMO is to administer the bit string of call charge registration. The individual elements in the bit string can be set and cancelled; the setting of the bit string can be interrogated.

A set "bit" ensures that the other AMOs can be used to generate the outputs required for an SMDR feature.

A "bit" that is not set prohibits the creation of a feature.

If no "bit" is set (empty set), SMDR is deactivated.

Procedure to activate and deactivate SMDR or an SMDR feature:

- Activation of SMDR  
At least one feature bit must be set.
- Activation of an SMDR feature.  
Set the corresponding feature bit using AMO-FEACG. Additionally, selection groups and tables (AMO-SELG) or dialog fields (AMO-GEZAB) must be created for the corresponding call charge data output.
- Deactivation of SMDR  
All feature bits must be cancelled.
- Deactivation of an SMDR feature.  
Cancel the corresponding feature bit using AMO-FEACG. Additionally, the selection group (AMO-SELG) or the dialog field (AMO-GEZAB) for the corresponding call charge data output must be cancelled. New creation of the corresponding output is prevented by the feature bit that is not set.

### Note:

Call charge data output should be deactivated for a brief time (because of maintenance or change), using AMO-SELS.

In fast output mode, AMO-GEZAB can not be started.

All features must be activated before generating. After generating, those features not immediately required can be deactivated.

Proceed as follows:

## FEACG - SMDR/DMDR Feature List

### Interrelationships

1. Activate all features
2. Regenerate
3. Generate
4. Deactivate features not required

## 93.1 Interrelationships

- AMO-SELG : Administration of selection groups and tables
- AMO-GEZAB : Administration of dialogs for the forms output
- AMO-SELS : Administration of the operating states of selection groups

## 93.2 AMO Functions

- [ADD-FEACG](#) : Set one or more elements of bit string
- [DELETE-FEACG](#) : Cancel one or several elements of bit string
- [DISPLAY-FEACG / REGENERATE-FEACG](#) : Interrogate bit string  
Regenerate bit string

### 93.2.1 ADD-FEACG

Create elements of bit string.

The AMO receives one or more elements of the bit string from the input side. These are entered in the database, unless they have already been set.

Setting the element CDRCDIS and CDRFAST requires that the element CDRCDUMP is either already set in the database or that it must also be transferred from the input side in order to set it.

Setting the element CDRFAST all selection groups > 1 will be switched off. (AMO-SELS)

#### **Note:**

At setting of the value "CDRFAST" is possible only by following bit string :

- CDRCDUMP activated

- CDRCDIS, CDRATND, CDRSPR deactivated.

### Procedure Overview

#### Command Code

ADD-FEACG

#### Parameter

CM=<param>;

#### Example

1. Create call charge registration at the Hicom attendant terminal.

Input:

ADD-FEACG:CDRATND&CDRCDUMP&CDRSPR;

## 93.2.2 DELETE-FEACG

Cancel elements of the bit string.

The AMO receives one or more elements of the bit string from the input side.

These are cancelled in the database, unless this has already been done.

Cancelling the element CDRCDUMP requires that the elements CDRCDIS and CDRFAST is either already cancelled in the database or that it must be transferred from the input side in order to be cancelled.

Cancelling the CDRFAST-value requires no startup of the selection groups. They have to be switched on with AMO-SELS.

### Procedure Overview

#### Command Code

DELETE-FEACG

#### Parameter

CM=<param>;

#### Example

1. Cancel SMDR at the Hicom attendant terminal (CDRATND).

Input:

DELETE-FEACG:CDRATND;

93.2.3 DISPLAY-FEACG / REGENERATE-FEACG

- 1. Interrogate the bit string with output in list format (DISPLAY).
- 2. Interrogate the bit string with output in position-related commands for regeneration (REGEN).

Procedure Overview

| Command Code     | Parameter |
|------------------|-----------|
| DISPLAY-FEACG    | ; (1)     |
| REGENERATE-FEACG | ; (2)     |

Examples

- 1. Interrogate the bit string and output in list format.

Input:

DISPLAY-FEACG;

Output:

CALL DATA REGISTRATION AT ATTENDANT CONSOLE :  
DEACTIVATED;

CALL DATA REGISTRATION ON ADD. DEVICE, IMMEDIATE OUTPUT :  
ACTIVATED;

CALL DATA REGISTRATION ON ADDITIONAL DEVICE, CALL UP :  
DEACTIVATED;

CALL DATA REGISTRATION PER STATION, PRINTER OUTPUT :  
ACTIVATED;

CALL DATA REGISTRATION ON FAST OUTPUT DEVICE :  
DEACTIVATED;

- 2. Example of an output in command format.

Input:

REG-FEACG;

Output:

ADD-FEACG:CDRCDUMP&CDRSPR;

## 93.3 Parameter Description

## 93.4 Error Messages and Advisories

### 93.4.1 Error Messages

F01: APPLICATION "CHARGING" HAS TO BE SWITCHED ON WITH THE AMO APC  
F02: ELEMENT CDRCDUMP IS ONLY DELETED IF ELEMENT @@@@@@@@ IS DELETED  
F03: ELEMENT @@@@@@@@ IS ONLY SET IF ELEMENT CDRCDUMP IS SET  
F04: ELEMENT CDRFAST IS ONLY SET IF ELEMENTS CDRCDIS AND CDRSPR ARE NOT SET

### 93.4.2 Advisories

H01: ELEMENT <xxxxxxxx> IS ONLY SET IF ELEMENT CDRCDUMP IS SET  
H02: ELEMENT CDRCDUMP IS ONLY DELETED IF ELEMENT <xxxxxxxx> IS DELETED  
H03: not in use  
H04: ELEMENT CDRFAST IS ONLY SET IF ELEMENTS CDRCDIS, CDRATND AND CDRSPR ARE NOT SET  
H05: FAST MODE IN PROGRESS. ALL SELECTION GROUPS, EXCEPT THE FIRST ONE, ARE SWITCHED OFF

## 94 FEASU - Features (Bit String) in the SWU

By means of AMO FEASU, customer-specific features (CM) can be released (activated) or blocked (deactivated). The features are represented by symbolic abbreviations (8 characters maximum). A somewhat longer description (50 characters max) for these abbreviations may be obtained by entering `CHANGE-FEASU:TYPE=A,CM=?;`.

The order of appearance for the values of parameter CM listed there was fixed by the evolution of the AMO. A list of them is given here under the title "[Parameter Description](#)" in alphabetical order of their English names. Feature bits that are activated in the standard customer package are especially designated there by an asterisk in the first column of the table.

### 94.1 Restrictions

This description is valid from HiPath 4000 V2.0.

### 94.2 Interrelationships

- All AMOs in which the handled features are processed.

### 94.3 Functions of the AMO

- [CHANGE-FEASU](#) : Activate or deactivate features by specifying the appropriate symbolic abbreviations (see parameter description for CM)
- [DISPLAY-FEASU](#) : Display lists of all activated features as well as of all deactivated ones
- [REGENERATE-FEASU](#) : Generate CHANGE-FEASU commands for all activated&deactivated features

#### 94.3.1 CHANGE-FEASU

Activating and deactivating features

## FEASU - Features (Bit String) in the SWU

### Functions of the AMO

By means of the function CHANGE FEASU features can be activated or deactivated. If the input for parameter 'TYPE' is equal to 'A', the specified features will be activated. If the input for parameter 'TYPE' is equal to 'D', the features will be deactivated.

There are pairs within the allowed values of parameter CM which form exclusive pairs, i.e. pairs of feature bits both of which may not be activated at one time. At present the values PININT and PINNW (internal PIN<sup>1</sup> and network wide PIN) as well as the values XFBACALL and XFBADIAL (Transfer before Answer from Call State and Transfer before Answer from Dial State) constitute such exclusive pairs.

#### Procedure Overview

| Command Code | Parameter                                    |
|--------------|----------------------------------------------|
| CHANGE-FEASU | TYPE=A, CM=<param>;<br>  TYPE=D, CM=<param>; |

#### Examples

1. The features central speed dialing, individual speed dialing, and hunting group are to be activated.

Input:

CHANGE-FEASU: TYPE=A, CM=SPDC&SPDCI&HTVCE;

2. The features central speed dialing, individual speed dialing, and hunting group are to be deactivated.

Input:

CHANGE-FEASU: TYPE=D, CM=SPDC&SPDCI&HTVCE;

## 94.3.2 DISPLAY-FEASU

By calling DISPLAY-FEASU we obtain a list of all the features treated by the AMO divided into two groups: the first group shows the features that are activated (if any), the second shows those that are deactivated (if any).

#### Procedure Overview

| Command Code  | Parameter |
|---------------|-----------|
| DISPLAY-FEASU | ;         |

---

1. PIN: Personal Identification Number

**Example**

The state (on/off) of all features is to be shown.

Input:

```
DISPLAY-FEASU;
```

Output:

```
DISPL-FEASU;
```

```
H500:  AMO FEASU STARTED
```

```
ACTIVATED FEATURES
```

```

```

**94.4 Parameter Description**

Only some characteristic command parameters are shown in the penultimate column, so the commands thus given are not directly applicable. Abbreviations for parameter input types: num: number, pm: symbolic value (parm), sg: string.

The links shown underlined with (blue) capitals can be accessed via Ctrl-Alt-mouseclick. The last column shows the German name of the symbolic value.

Parameters, which are relicts of previous versions and have not yet been removed but are not used any more, are shown without bold type and with smaller characters.

|    |                                                              |        |
|----|--------------------------------------------------------------|--------|
| CM | The features to be activated or deactivated                  |        |
|    | Type of input: single value or linked single value, required | German |

## FEASU - Features (Bit String) in the SWU

### Parameter Description

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                              |             |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|-------------|
| CDRIC    | <b>Call detail recording for incoming network and trunk calls</b><br>See use case Call Data Recording - Standard Settings                                                                                                                                                                                                                                                                                                                                               |                              | GEBK        |
| CDRINH   | <b>Call detail recording for in-house calls</b><br>The cost parameters for on-node connections are assigned to the connection groups (ITR groups: internal traffic restriction groups). The AMO VBZGR assigns the ZONE cost parameter (INT01 to INT09, EMPTY) to the ITR groups, and the cost parameters of the ITR group of the user who is paying the bill are used for call data recording. The ZONE must be created beforehand with the AMO TTBL.<br>See also CDRIC |                              | GEBINT      |
| CDROGNW  | <b>Call detail recording for outgoing network calls</b><br>Cross traffic, see also CDROGTR                                                                                                                                                                                                                                                                                                                                                                              |                              | GEBGNW      |
| CDROGTR  | <b>Call detail recording for outgoing trunk calls</b><br>Call data recording for outgoing calls (trunk and tie-line calls) is always set by means of Least Cost Routing (LCR) parameters. As far as call data recording is concerned, no distinction is made between the VOICE/FAX and DATA services. LCR can be configured separately for specific services, so a different cost parameter can be assigned to each service.<br>See use case INFO 2000 Outcalls         |                              | GEBGAMT     |
| CLIP     | <b>Calling Line Identification Presentation</b><br>Clip for analog subscribers                                                                                                                                                                                                                                                                                                                                                                                          |                              | <b>CLIP</b> |
| COSXATND | <b>COS</b> changeover from <b>attendant</b><br>Changeover of the standard class-of-service of subscriber groups to an alternative class-of-service can be carried out by any operator (from the night AC). A patch allows a class-of-service changeover which has been carried out by a user to be barred from being changed again from the AC.<br>(For details see CM=DCOSX)                                                                                           | BERUM:<br>TYPE=STN/<br>COSX; | BERUMV      |
| COSXCD   | <b>COS</b> changeover with <b>code</b><br>(For details see CM=DCOSX)                                                                                                                                                                                                                                                                                                                                                                                                    | BERUM:<br>TYPE=STN/<br>COSX; | BERUMC      |
| COSXDP   | <b>COS</b> changeover from computer ( <b>data processing equipment</b> )<br>(For details see CM=DCOSX)                                                                                                                                                                                                                                                                                                                                                                  | BERUM:<br>TYPE=STN/<br>COSX; | BERUMD      |
| COSXKEY  | <b>COS</b> changeover with <b>key</b><br>(For details see CM=DCOSX)                                                                                                                                                                                                                                                                                                                                                                                                     | BERUM:<br>TYPE=STN/<br>COSX; | BERUMS      |

## FEASU - Features (Bit String) in the SWU

### Parameter Description

|       |                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |        |

|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| DCBB   | System level <b>D</b> isable of Automatic <b>C</b> allback-on- <b>B</b> usy (See DCBNOA below)<br>The Callback feature (see CBK above) can be activated at system level (Base initialization: deactivated), for cases of free and busy state and for Voice Mail. This can be restricted by the parameter values DCBB/DCBNOA from V3.3 on. If not locked at system level, it can be deactivated at subscriber-level by AMOs SCSU and SBCSU for the busy/free states. This lock is then valid for the station called giving it the capability to protect itself from callback assignments.                                                                                                                          | RRB                                                                                                                     |
| DCBNOA | To avoid malfunctions, parameter MB (Mailbox - authorization to read mail) in AMO-COSSU must not be set in case of parameter DCBNOA ( <b>D</b> isable of Automatic- <b>C</b> allback-on- <b>N</b> o- <b>A</b> nswer for entire system) is set in AMO-FEASU                                                                                                                                                                                                                                                                                                                                                                                                                                                        | RRF                                                                                                                     |
| DCOSX  | <b>D</b> eactivation <b>C</b> OS changeover from station<br>Each subscriber has two classes-of-service: a standard and an alternative class-of-service. The classes-of-service are assigned by means of the administration and maintenance operation. Changeover between the two classes-of-service can be effected from the telephone set or from a centralised location. If a telephone set is programmed for centralised class-of-service changeover (i.e. member of a COSX group) and COSX is not activated by locking the telephone (Key-COSX), it is always switched over, even if class-of-service changeover from the telephone set is additionally possible.<br>See use case Class of Service Switchover | BERUM:<br>TYPE=STN/<br>COSX;<br>PERSI:<br>COSXCD=string;<br>SCSU:<br>COSX=num;<br>ZAND:<br>COSIND=yes/<br>no;<br>BERUMA |

| HTNW    | <b>Hunt</b> groups, <b>network wide</b><br>In E V1.0 and higher, all internal, network-wide and external destinations of a hunting group subscriber will be considered as call forwarding destinations if the forwarding-in-hunting-group parameter FWD of AMO SA is enabled. In order to do this, the forwarding feature must first be enabled at system level by AMO FEASU.<br>See use case Hunting Groups                                                                                                                                                                                          |                                                    | SANW   |
| HTVCE   | <b>Hunt</b> groups, <b>voice</b><br>Stations (voice and non-voice terminals) can be combined to form a hunting group. Hunting groups are accessed via a special hunting group number, namely by a code or by the call number of the leading user in the hunting group. Hunting groups can equally be accessed by internal users, attendants, external parties through DID, in inter-PBX traffic. Each station in the hunting group can also be accessed directly under its own call number (with the exception of the first user if his call number is the hunting group number).<br>(See HTNW above) | SA:TYPE=VCE;<br>SA:TYPE=STN,<br>SVC=VCE            | SAS    |
| ICPTDID | <b>Intercept</b> of <b>Direct Inward Dialing</b> calls<br>Depending on communication type and the status of the dialed destination, unsuccessful DID calls are diverted to a specific permanently connected destination. Alternatively, music or an announcement can be applied to the waiting user. If call forwarding on DID calls is not activated, the external user receives audible tones. Station terminals which are to be obtainable by direct inward dialing are given DID authorisation.<br>See use case Attendant Intercept                                                               | COT:<br>PAR=IDND/<br>IONS;<br>ZAND:<br>CP=ANNICPT; | ABDUWA |

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                               |

| ISTR    | <p><b>Internal self-dial traffic restriction</b></p> <p>When this feature is activated, the station users of a particular subscriber group can reach other subscribers in their group only with the assistance of the operator, i.e. the subscribers of the group are protected from calls by users in the same group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>ACTD:FEATCD= ESI<br/>DNDGR;</p>                                                                                                                                                                                                                            |
| LCRET   | <p><b>LCR (Least Cost Routing) expensive route tone</b></p> <p>Hicom's LCR mechanism is used for setting up connections via ISDN, in order to realise the least expensive data connection. The corresponding LCR classmarks assigned to the WAML<sup>2</sup> and transferred to call processing during call setup. Time Based Routing is included.</p> <p>Within Hicom 300 E systems, the Expensive Route Tone feature is available for networked Hicom systems with LCR. This feature can be set up individually per station. The expensive route tone warns users if a normally cheap route cannot be switched, e.g. due to congestion in busy hours, and the call has to be switched via a more expensive route element instead.</p> <p>The Least Cost Routing feature has a set of Schedules that are used when configuring route elements with AMO LDAT. Using the AMO LSCHD up to 8 schedules, identified by the letters A to H, can be defined. These will typically cover the week in bands corresponding to call charging rates.</p> <p>See use case LCR Least Cost Routing</p> | <p>COSSU: LCRET</p> <p>LCROPTS=LCRE<br/>T/NONE;<br/>CTIME:<br/>LCRET=num;<br/>LDAT:<br/>LSCHED=A/.../<br/>H/ AE/.../HE/<br/>NONE;<br/>LSCHD:<br/>ITR=num,<br/>DAY=<br/>SU/MO/TU/WE/<br/>TH/FR/SA,<br/>HOUR=num,<br/>{SCHED=A/.../<br/>H,<br/>MINUTE=num};</p> |

## FEASU - Features (Bit String) in the SWU

### Parameter Description

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                   |         |

| ONHKTRNS | <p><b>On-hook transfer</b></p> <p>An authorized user (functional terminal units<sup>4</sup> excepted), who has dialed the complete extension number of an external user (via S0/S2), can perform a consultation hold before receiving acknowledgement for that first connection. This authorized user can then set up a consultation call to a user in the network (via S0/S2) or to an internal user, in order to subsequently connect the two calls with each other, as soon as one of the called parties has already answered.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                | UML    |
| OVR      | <p><b>Override</b></p> <p>Station users with busy override authorisation calling a busy station can break into the call in progress:</p> <ul style="list-style-type: none"> <li>-- override on stations</li> <li>-- override for a personal call at an attendant console (P key)---</li> </ul> <p>busy override with continuous check for free line: If the desired party has released his line, the call is automatically switched through, provided the calling party has not gone on-hook in the meantime.</p> <p>Once the override has been terminated, the station user who initiated busy override can initiate other services (e.g. callback). Users can only intrude on hunting group calls if all stations in the hunting group are busy, and the hunting group call queue is full (if configured). Users cannot choose which of the hunting group members to intrude on; the first connection in the hunting group in one of the above states is overridden. Users can intrude on connections if a waiting call is being signaled (camp-on, knocking). Variant b) must be configured in the A&amp;M system in order to do this. The camp-on or knocking signal is then terminated. Users cannot intrude on or override a connection which is already being intruded on.</p> | <p>COSSU:<br/>[A/E]VCE=<br/>ANBTR/AUTOV/<br/>RKOABS/<br/>REOVR;<br/>COS:<br/>PAR=OVR;<br/>COT:<br/>PAR=<br/>KNOR/OVRE/<br/>IONS;<br/>LWPAR:<br/>TYPE=<br/>NWLOOP/<br/>NWWTK/NWZS,<br/>SDAT:<br/>TYPE=ATTRIBUT,<br/>AATTR/<br/>DATTR=KNOVR;</p> | AUFS   |
| PININT   | <p><b>PIN, internal</b> (See PINNW below)</p> <p>From version EV3.0, internal PIN allows to enter the PIN in consultation state. A short PIN is only valid for the consultation call and is automatically deleted at end of call. A long PIN entered in consultation state is valid for the consultation call and the following calls, as long as the PIN is activated.</p> <p>Only one of the two features PININT and PINNW may be activated at once.</p> <p>See use case Personal Identification Number</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>ZAND:<br/>PIN=num;</p>                                                                                                                                                                                                                      | PININT |

## FEASU - Features (Bit String) in the SWU

### Parameter Description

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                               |          |

| RSVCO    | <p><b>Reservation of Central Office trunks</b></p> <p>The attendant can block a certain definable number of external lines for outgoing seizure by internal users. this operation does not seize the trunks. The trunks can then be accessed only by the attendant, external users and certain internal users. Both the set of external lines (tie trunks, cross trunks) and the set of users authorized fro accessing them can be controlled with the aid of administration and maintenance.</p>                                                                                                                                                                                                                                                                                 | RES                                                                    |
| SER      | <p><b>Serial calling</b></p> <p>An external call is signaled at the attendant console as an automatic recall after the internal user, to whom the call was extended, goes on-hook, provided the attendant pressed the serial call key before connecting the first user. Serial calls are possible for incoming calls, outgoing calls, trunk calls and tie trunk calls. A system or even an attendant terminal may handle more than one serial call at any one time.</p>                                                                                                                                                                                                                                                                                                           | KET                                                                    |
| SMARTCRD | <b>Smartcard</b> application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | SMARTCRD                                                               |
| SNR      | <p><b>Saved number redial</b></p> <p>Any external or internal call number dialed with the pushbutton set, by speed dialing or with repertory or DSS keys can be stored for subsequent redialing as long as the connection is still alive. For telefax devices, only the call number is stored and repeated, not the telefax code.</p> <p>Maximum number of digits per number redial destination:</p> <ul style="list-style-type: none"> <li>— external destinations: 22 digits including trunk group access code</li> <li>— internal destinations: 6 digits.</li> </ul> <p>All dialing information entered on the pushbutton set, including * and #, can be stored. Every station can store the dialing information for one connection only. See use case Redial Saved Number</p> | WW                                                                     |
| SPDC     | <p><b>Speed calling, central</b></p> <p>SPDC is conceived for up to 1000 destinations that can be distributed as desired among a maximum of 16 SPD lists by way of Each terminal port can be allocated up to two lists with the AMO SCSU or SBCSU. These are list 0 and one of the lists 1 to 15. See use case Speed dialing</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>LRNGZ:<br/>LST=num,<br/>SPDMIN=num,<br/>SPDMAX=num;</p> <p>RNGZ</p> |

## FEASU - Features (Bit String) in the SWU

### Parameter Description

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                      |         |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| SPDI     | <b>Speed calling, individual</b> (see SPDC above)<br>This feature permits individual storing of a maximum of 10 arbitrary digit sequences each comprising up to 22 digits, at any ANATE, DIGITE, but not at the attendant terminal. Destinations are stored in a memory which is set up with the AMOs SCSU/SBCSU, by declaring parameter SPDI=Y when the port is assigned.                                                                                                                                                                                                                                                                                                                                                                                                             | SBCSU/<br>SSCSU:<br>SPDI=yes;<br>ZIEL:<br>TYPE=SPDI;                                                                                                                                                 | RNGI    |
| SPLIT    | <b>:Split</b> / alternating calls (toggling)<br>A station user can switch back and forth between two connections (internal or external) as often as desired; during this procedure one party is always on hold.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                      | MAK     |
| SYNCANN  | <b>Synchronously started recorded announcements</b><br>Synchronized announcements are used for providing callers with a specific sequence of information prompts in order to achieve specific reactions.<br>The prompts/announcements are achieved by connecting external announcement units to TMOM2 boards. Each prompt or announcement is heard from the beginning. Up to 50 callers can listen to an announcement at any one time. If more than 50 callers are to be able to listen to the same announcement or, if the time callers spend waiting for an announcement to begin is to be minimized, then the appropriate number of additional announcement units of the required announcement type must be configured.<br>See use case Help for Setting Synchronized Announcements | COP:PAR=AANT;<br>COT:PAR=ANOD<br>;<br>SYNCA:<br>TABTYPE=ANNT<br>T, ANNAME=sg,<br>ANNTYPE=num,<br>ANSTATE=on/<br>off;<br>ZAND:<br>ANSES/<br>ISYNCCCM/<br>ISYNCHG/<br>ISYNCAC/<br>SYNCACCM=yes<br>/no; | SYNCANN |
| TIMEDREM | <b>Timed reminder</b><br>Through entering of reminder data from his phone device, the station user can arrange for timed reminder service, which consists of automatic calls at pre-specified times accompanied by a message from the system about the appointment. The reminder data refers to the 24 hour period following input of the data (automatic daily repetition is not possible).                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                      | TERMIN  |
| TRACCO   | <b>Tracing of Central Office</b> calls (see CM=TRACE)<br>See use case Malicious Call Tracing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | SBCSU/SSCSU:<br>TYPE=TRACE,<br>TRACE=YES/<br>NO;                                                                                                                                                     | AMTFANG |
| TRACE    | <b>Trace</b> malicious calls<br>The tracing feature can be used to record the extension number of an annoying caller on an outprint.<br>See use case Malicious Call Tracing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | COSSU:<br>VCE=ANICT/<br>TRACE;                                                                                                                                                                       | FANGEN  |

| VARCONF | <p><b>Variable conference</b></p> <p>A user dials, under consultation-hold, an internal or external user and when the consultatio-hold party replies, first start a conference with three users. To do this, he presses, in the call status of consultation-hold, the conference-key. If the user has no conference-key he can also start the conference by pressing the consultation-key. The original route-relationships between the initiator, the waiting parties and party in consultation-hold are terminated The conference-chairperson can then enable additional internal and external users by initiating the consultation-hold from the conference, dialing the desired user and switching him into the conference on his response by pressing the conference- or the consultation-key.</p> <p>See use case Station Controlled Conference</p> | VARCONF                                     |
| VMSDP   | <p>Analog <b>voice mail service</b> by <b>dial pulsing</b></p> <p>Enables the control of Voice Mail Service by devices using the old analog impulse technique (Switzerland feature, ComTel devices)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>SCSU:<br/>DHPAR=VMSDP;</p> <p>VMSEWV</p> |

Error Messages and Advisories

## 95 FETA - Administration of Holiday Tables

|                                    |                                               |
|------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a>         |
| <a href="#">AMO Functions</a>      | <a href="#">Error Messages and Advisories</a> |

The AMO FETA makes it possible to administer the holiday tables for the SMDR.

The following three tables exist:

- One table with 16 entries for fixed holidays
- One table with 50 entries for variable holidays
- One table for that day in the week which is destined for a free day (e.g. sunday)

Holidays are considered free days in the cost computation (see AMO TABT).

The fixed holidays are entered with day and month, the variable holidays are entered with day, month, and year.

### 95.1 Interrelationships

- AMO-TABT : Administration of the Rate Period Tables

### 95.2 AMO Functions

- [ADD-FETA](#) : Entering holidays in the tables
- [DELETE-FETA](#) : Deleting holidays
- [DISPLAY-FETA / REGENERATE-FETA](#) : Displaying holiday tables  
Regenerating holidays

#### 95.2.1 ADD-FETA

Entering holidays in the table of fixed or variable holidays.

1. Entering fixed holidays.
2. Entering variable holidays.

3. Entering that day of the week which is a free day

Procedure Overview

| Command Code | Parameter                                             |     |
|--------------|-------------------------------------------------------|-----|
| ADD-FETA     | TBL=FIX, DAY=<number>, MONTH=<number>;                | (1) |
|              | TBL=VAR, DAY=<number>, MONTH=<number>, YEAR=<number>; | (2) |
|              | TBL=REDDAY, REDDAY=<string>;                          | (3) |

Examples

1. Adding the fixed holiday 15. August.

Input:

ADD-FETA:FIX,15,8;

2. Adding the variable holiday 5. April 1999.

Input:

ADD-FETA:VAR,5,4,99;

3. Adding Sunday as that day of the week which is a free day

Input:

ADD-FETA:REDDAY,SUNDAY;

95.2.2 DELETE-FETA

Deleting an entire table or all tables, or deleting one entry.

- 1. Deleting the fixed holiday table.
- 2. Deleting the variable holiday table.

Procedure Overview

| Command Code | Parameter                                                          |     |
|--------------|--------------------------------------------------------------------|-----|
| DELETE-FETA  | [TBL=FIX], [DAY=<number>], [MONTH=<number>;                        | (1) |
|              | [TBL=VAR], [DAY=<number>], [MONTH=<number>]<br>[, [YEAR=<number>]; | (2) |

**Examples**

1. Deleting the fixed holiday 15. August.

Input:

```
DEL-FETA:FIX,15,8;
```

2. Deleting the variable holiday 5. April 1999.

Input:

```
DEL-FETA:VAR,5,4,99;
```

**95.2.3 DISPLAY-FETA / REGENERATE-FETA**

Display of the holiday tables with output in list format (DISPLAY) or in position-oriented commands for regeneration (SAVDB).

1. Displaying fixed holidays.
2. Displaying variable holidays.
3. Displaying that day of the week which is a free day
4. Regenerating fixed holidays.
5. Regenerating variable holidays.
6. Regenerating that day of the week which is a free day

**Procedure Overview**

| Command Code    | Parameter     |     |
|-----------------|---------------|-----|
| DISPLAY-FETA    | [TBL=FIX];    | (1) |
|                 | [TBL=VAR];    | (2) |
|                 | [TBL=REDDAY]; | (3) |
| REGENERATE-FETA | [TBL=FIX];    | (4) |
|                 | [TBL=VAR];    | (5) |
|                 | [TBL=REDDAY]; | (6) |

**Examples**

1. Displaying the table of fixed holidays.

Input:

**FETA - Administration of Holiday Tables**  
Parameter Description

DISP-FETA:FIX;  
Output:

| HOLIDAY TABLE OF FIXED HOLIDAYS |     |       |      |
|---------------------------------|-----|-------|------|
| ENTRY NUMBER                    | DAY | MONTH | YEAR |
| 1                               | 15  | 8     | --   |

2. Displaying the table of variable holidays.  
Input:

DISP-FETA:VAR;  
Output:

| HOLIDAY TABLE OF VARIABLE HOLIDAYS |     |       |      |
|------------------------------------|-----|-------|------|
| ENTRY NUMBER                       | DAY | MONTH | YEAR |
| 1                                  | 05  | 04    | 99   |

3. Displaying that day of the week which is a free day  
Input:

DISP-FETA:REDDAY;  
Output:

HOLIDAYS ARE HANDLED LIKE  
SUNDAY

4. Displaying the fixed and variable holidays and that day which is the free day for regeneration  
Input:

REG-FETA;  
Output:  
ADD-FETA:FIX,15,8;  
ADD-FETA:VAR,5,4,99;  
ADD-FETA:REDDAY,SUNDAY;

**95.3 Parameter Description**

DAY                    Day of the week

|        |                                    |                                                                                                                                                     |
|--------|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
|        | Type of Input                      | : Single value, mandatory (ADD)<br>optional (DELETE, DISPLAY, REGENERATE)                                                                           |
|        | Possible Values                    | : 1 - 31                                                                                                                                            |
| MONTH  | Date - Month                       |                                                                                                                                                     |
|        | Type of Input                      | : Single value, mandatory (ADD)<br>optional (DELETE, DISPLAY, REGENERATE)                                                                           |
|        | Possible Values                    | : 1 - 12                                                                                                                                            |
| REDDAY | Day of the week which is a red day |                                                                                                                                                     |
|        | Type of Input                      | : Single value, mandatory (ADD)<br>optional (DELETE, DISPLAY, REGENERATE)                                                                           |
|        | Possible Values                    | : MONDAY = Monday<br>TUESDAY = Tuesday<br>WEDNESDAY = Wednesday<br>THURSDAY = Thursday<br>FRIDAY = Friday<br>SATURDAY = Saturday<br>SUNDAY = Sunday |
|        | Default Value                      | : SUNDAY                                                                                                                                            |

| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO formats the entire hard disk.

### 97.1 Restrictions

This description is valid from HiPath 4000 V6.0.

### 97.2 Interrelationships

- AMO complex FIDES : file and device service
- AMO INIT : Disk Controller Definition and Installation
- AMO DCSM : Disk Configuration
- AMO DASM : Hard Disk Area Allocation - Physical
- AMO DSSM : Disk Switchover

### 97.3 AMO Functions

- [START-FORM](#) : Format the hard disk

#### 97.3.1 START-FORM

If there is an additional partition (e.g. Linux) on the disk, the user have to confirm that this partition is to be deleted. This question can be switched off by using the parameter WARN.

If an area is reserved by an external application, the formatting will be rejected.

FORM - Hard Disk Formatting

Parameter Description

Procedure Overview

| Command Code | Parameter                                                                         |
|--------------|-----------------------------------------------------------------------------------|
| START-FORM   | [UNIT<param>],DEVNAME=<string>,[WARN=<param>]<br>,[VERIFY=<param>],[ANS=<param>]; |

Example

Format the hard disk, controller 1.

Input:

START-FORM:A1," :A1H11:";

97.4 Parameter Description

|                 |                                                       |
|-----------------|-------------------------------------------------------|
| ANS             | Answer (Requested when user reply required)           |
| Type of Input   | : Single value<br>optional                            |
| Possible Values | : Y = format hard disk<br>N = do not format hard disk |
| DEVNAME         | Device name (storage device formatting)               |
| Type of Input   | : Single value<br>mandatory                           |
| Possible Values | : Mnemonic device name, max. 32 positions             |
| UNIT            | Functional system unit i.e. server code               |
| Type of Input   | : Single value<br>optional                            |
| Possible Values | : A1 = Administration and Data Server (ADS)           |
| Default Value   | : A1                                                  |
| VERIFY          | Perform verify read                                   |
| Type of Input   | : Single value<br>optional                            |
| Possible Values | : Y = yes, verify<br>N = no, don't verify             |
| Default Value   | : Y                                                   |

WARN            Ask question if additionally partitions will be deleted

          Type of Input            : Single value  
                                         optional

          Possible Values        : Y                        = yes, ask  
                                         N                        = no, don't ask

          Default Value         : Y

## 97.5 Error Messages and Advisories

### 97.5.1 Error Messages

F01: PARAMETER UNIT IS NOT EQUAL TO THE UNIT OF THE NAMED AREA  
 F02: FORMAT ONLY ALLOWED FOR ADMINISTRATION AREA !  
 F03: DEVICE <devname> CANNOT BE RESERVED  
      AS IT IS ALREADY ACTIVATED  
 F04: <devname> ERROR ON FORMATTING H'status  
 F05: SCSI-BUS RESET OCCURED, PLEASE REPEAT ORDER.  
 F06: NO VOLUME IN DEVICE <devname>  
 F07: VOLUME IN DEVICE <devname> IS WRITE PROTECTED  
 F08: REJECTED BECAUSE THE AREA <:area:> IS USED BY THE EXTERNAL APPLICATION  
      <appl>; START-FORM NOT POSSIBLE UNTIL AREA IS DEACTIVATED BY THE EXTERNAL  
      APPLICATION

### 97.5.2 Advisories

H01: PARTITION FOR sysname FILESYSTEM  
      SYSTEM ID H'sysid WILL BE DELETED FROM HARD DISK  
      CONTINUE FORMATTING (Y/N)?  
 H02: FORMATTING FINISHED

### 97.5.3 Settings

Error Messages and Advisories

## 98 FTBL - Administration of the Output Format Tables

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

It is the task of this AMO to administer the output layout for call charge registration. The AMO enters the output formats and the description of any variable fields into the format tables.

The customer-specific formats are made up of text and data elements.

The names of the text elements can be freely selected by the user.

The possible data elements are allocated under FLDNAME (identification of the variable fields).

### NOTE:

Maximal 255 elements per format are permitted.

The new names of the variable output fields GLOBLV0, GLOBLV1, GLOBLV2, GLOBSEQ, THRELV0, THRELV1, THRELV2 and THRESEQ are used starting from HiPath 4000 V1.0 for all Hicom monitoring applications.

The old names of the variable output fields LEGLV0, LEGLV1, LEGLV2, LEGSEQ, GLOBLV0, GLOBLV1, GLOBLV2, GLOBSEQ are maintained due to the downward compatibility.

| <b>old name<br/>til HiPath 4000 V1.0</b> | <b>new name<br/>from HiPath 4000 V1.0</b> |
|------------------------------------------|-------------------------------------------|
| GLOBLV0                                  | THRELV0                                   |
| GLOBLV1                                  | THRELV1                                   |
| GLOBLV2                                  | THRELV2                                   |
| GLOBSEQ                                  | THRESEQ                                   |
| LEGLV0                                   | GLOBLV0                                   |
| LEGLV1                                   | GLOBLV1                                   |
| LEGLV2                                   | GLOBLV2                                   |
| LEGSEQ                                   | GLOBSEQ                                   |

Table 18 Interrelationship of the variable output fields

## 98.1 Interrelationships

- AMO-GEZAB : Output of Call Charges to Optional Equipment
- AMO-SELG : Administration of Selection Groups
- AMO-FBTN : Administration of the Flag Byte and Trunk Number Table
- AMO-TEXT : Administration of the Text Tables

## 98.2 Functions of the AMO

- [ADD-FTBL](#) : Create a Format
- [CHANGE-FTBL](#) : Change a Format or a Field Description
- [DELETE-FTBL](#) : Cancel a Format
- [DISPLAY-FTBL / REGENERATE-FTBL](#) : Interrogate the Formats / Regenerate Formats

### 98.2.1 ADD-FTBL

Create a user-specific format.

The format can contain any number of variable field elements.

The AMO enters the format and the description of any variable fields into the format tables.

A format consists of texts and variable fields. The variable fields start with the character '#'. ('#' means: variable field with one character.)

The number of '@' characters indicates how many characters the variable field contains plus 1 (character '#'). (##### means: variable field with 4 characters.)

Based on this code, the AMO determines whether variable fields are included in the format to be generated and then requests the field description for each variable field (e.g., alignment, comma character).

Since the following DIALOG activities cannot be taken into account during the generation process for ADD-FTBL, a branch parameter TYPE (input mode) was included in the parameter tree. If the value D (dialog) is declared for the parameter TYPE, then the field descriptions in the DIALOG are reloaded. If, however, the value B (batch) is declared, then no DIALOG activities are carried out, i.e. the user then carries the responsibility for ensuring that all the entries have been made (no operator prompting).

**Formats 1 to 16: standard formats**

These are formats that can be specifically selected by means of the parameters FORMBAS (format of base output device) and FORMRES (format of reserve output device) in AMO-SELG and AMO-GEZAB. All variable fields can occur in these formats.

**Formats 17 to 24: formats for the start-of-block (basic device)**

In AMO-SELG, the parameters BLBAS (block size of base device) and BLRES (block size of reserve device) can be used to define the block sizes for output. The block size indicates how many call data records are grouped into a continuous output. For each start of this type of block, formats 17-24 are entered into the corresponding selection groups 1 to 4 (format 17 in selection group 1, format 18 in selection group 2, etc.).

**Formats 25 to 32: formats for the start-of-block (reserve device)**

See formats 17-24, but only for reserve devices.

**Formats 33 to 40: formats for the end-of-block (basic device)**

See formats 17-24, but only for end-of-block and basic devices.

**Formats 41 to 48: formats for the end-of-block (reserve device)**

See formats 17-24, but only for end-of-block and reserve devices.

By formats (17-48) for the selection groups remain gaps because the number of the selection groups are limited to 4.

**Formats 49 to 56: formats for start-of-block (dialog/output by means of a call)**

In AMO-GEZAB, the parameter BLKSIZE (block size, number of records per output block) can be used to define block sizes for output in interactive mode. Formats 49-56 are output at each start of this type of block for the corresponding dialog fields 1 to 8 (format 49 in dialog field 1, etc.).

**Formats 57 to 64: formats for end-of-block (dialog/output by means of a call).**

See formats 49-56, but only for end-of-block.

**Formats 65 to 72: formats for end-of-data in a file (dialog/output by means of a call)**

These formats are output when the actual call data output is ended.

**Formats 73 to 80: formats for "empty files" (dialog/output by means of a call)**

These formats are output when the selected file is empty.

## FTBL - Administration of the Output Format Tables

### Functions of the AMO

Formats 81 to 88: formats for "deleted files" (dialog/output by means of a call)

The formats are output if the file is deleted after a delete job.

Formats 89 to 96: formats for ending the output

These formats are output if the system wishes to end the data output.

Formats 97 to 109: formats for station CDR output

These formats are needed for CDR output.

Only the variable data elements 'time of output', 'block length', and 'number of records per block' are permitted in formats 17 to 96.

### Procedure Overview

| Command Code | Parameter                                                                                                                          |     |

|              | ,TBL=CTRL,NO=<number>,END=Y/N,CTLCHARS=<param>;                                                                                    | (3) |
|              | ,TBL=FIELD,NOFELD=<number>,FLDNAME=<param><br>,FILLTYPE=CHAR,FILLER=<string><br>,FLDALIGN=L/R;<br>,FLDALIGN=LC/RC,COMPOS=<number>; | (4) |
|              | ,FILLTYPE=NONE,FLDALIGN=L/R;<br>,FLDALIGN=LC/RC,COMPOS=<number>;                                                                   | (5) |

### NOTE:

The value B (batch) should only be declared for the branch parameter TYPE (input mode) when using command stacks. For manual applications, the operator should continue to use the DIALOG procedure (TYPE=D).

Control characters can also be entered in the branch B (batch). However, care should be taken that they are entered in the correct position of the format.

The following example shows the function of the input.

### Example:

Input of format 50 with a command batch.

The format should look like this:

```
+-----+
|       |
+-----+
```

The individual lines should be terminated with a carriage return, and there should be a page feed at the start of the format.

Input:

```
ADD-FTBL:FORMNO=50,TYPE=B,TBL=CTRL,NO=1,END=N,CTLCHARS=FF;
ADD-FTBL:FORMNO=50,TYPE=B,TBL=FORM,NO=2,END=N,FORMAT=" +-----
-----+";
ADD-FTBL:FORMNO=50,TYPE=B,TBL=CTRL,NO=3,END=N,CTLCHARS=CR;
ADD-FTBL:FORMNO=50,TYPE=B,TBL=CTRL,NO=4,END=N,CTLCHARS=LF;
ADD-FTBL:FORMNO=50,TYPE=B,TBL=FORM,NO=5,END=N,FORMAT=" |
|";
ADD-FTBL:FORMNO=50,TYPE=B,TBL=CTRL,NO=6,END=N,CTLCHARS=CR;
ADD-FTBL:FORMNO=50,TYPE=B,TBL=CTRL,NO=7,END=N,CTLCHARS=LF;
ADD-FTBL:FORMNO=50,TYPE=B,TBL=FORM,NO=8,END=N,FORMAT=" +-----
-----+";
ADD-FTBL:FORMNO=50,TYPE=B,TBL=CTRL,NO=9,END=N,CTLCHARS=CR;
ADD-FTBL:FORMNO=50,TYPE=B,TBL=CTRL,NO=10,END=Y,CTLCHARS=LF;
```

### Branch: DIALOG FTBL

This procedure is a job for requesting the field description of the individual variable fields of the entered format.

The AMO checks to determine if the character '#' occurs in the entered format. If so, then variable fields are included in the format, and the AMO uses the prompt to request the field descriptions for the variable fields.

### Example

Create format table 4 with the following fixed and variable data elements:

- Trunk Number 4 characters, fill character "0", aligned to the right.
- Paying Party 6 characters, fill character "0", aligned to the left.
- Units 4 characters, fill character "0", aligned to the right.
- Destination with 7 characters, fill character " ", aligned to the right.

The AMO requests the prompt that the parameters for the variable data fields be entered. The sequence is shown in the section for the command ADD-FTBL.

Input:

```
ADD-FTBL:FORMNO=4,TYPE=D,FORMAT=" SETNO.:#@@@ COSTNO.:#@@@@@
UNIT:#@@@ DESTNO.:#@@@@@@";
```

Output:

## FTBL - Administration of the Output Format Tables

### Functions of the AMO

H01: ENTER FIELD DESCRIPTION FOR THE 1ST VARIABLE FIELD  
FLDNAME =

Input:

RECNO

Output:

FILLTYPE =

Input:

CHAR

Output:

FILLER =

Input:

0

Output:

FLDALIGN =

Input:

R

Output:

COMPOS =

Input:

<carriage return>

Output:

H01: ENTER FIELD DESCRIPTION FOR THE 2ND VARIABLE FIELD  
FLDNAME =

Input:

CHRGEE

Output:

FILLTYPE =

Input:

CHAR

Output:

FILLER =

Input:

0

Output:

FLDALIGN =

**Input:**

L

**Output:**

COMPOS =

**Input:**

<carriage return>

**Output:**

H01: ENTER FIELD DESCRIPTION FOR THE 3RD VARIABLE FIELD  
FLDNAME =

**Input:**

CHRGUNIT

**Output:**

FILLTYPE =

**Input:**

CHAR

**Output:**

FILLER =

**Input:**

0

**Output:**

FLDALIGN =

**Input:**

L

**Output:**

COMPOS =

**Input:**

<carriage return>

**Output:**

H01: ENTER FIELD DESCRIPTION FOR THE 4TH VARIABLE FIELD  
FLDNAME =

**Input:**

DESTPTY

**Output:**

FILLTYPE =

**Input:**

CHAR

Output:

FILLER =

Input:

" "

Output:

FLDALIGN =

Input:

R

Output:

COMPOS =

Input:

<carriage return>

**NOTE:**

The connection durations HOUR, MINUTE, and SECOND are entered right-justified with the fill character 0.

The parameters for the end-of-connection MONTH, DAY, HOUR, and MINUTE are entered right-justified and with the fill character 0.

### 98.2.2 CHANGE-FTBL

When changing a format, the user can choose between changing the format itself or changing only the field description of a variable field in a format.

If the format is changed, the field descriptions for the variable fields are requested in interactive mode.

#### Procedure Overview

| Command Code | Parameter                                                                                              |     |
|--------------|--------------------------------------------------------------------------------------------------------|-----|
| CHANGE-FTBL  | FORMNO=<number>                                                                                        |     |
|              | ,TBL=FIELD,FLDNAME=<param>,{ (min 1),FILLTYPE=CHAR,FILLER=<string>,FLDALIGN=L/R/LC/RC,COMPOS=<number>; | (1) |
|              | { (min 1),FILLTYPE=NONE,FLDALIGN=L/R/LC/RC,COMPOS=<number>;                                            | (2) |

### Example

In format table 4, the fill character in the variable data field for the call charge units should be changed to a " ".

Input:

```
CHAN-FTBL:FORMNO=4,TBL=FIELD,FLDNAME=CHRGUNIT,FILLER=" ";
```

## 98.2.3 DELETE-FTBL

Cancellation of a format. If a format is cancelled, the descriptions of the variable fields used in this format are also cancelled.

Only one format can be cancelled.

### Procedure Overview

| Command Code | Parameter        |
|--------------|------------------|
| DELETE-FTBL  | FORMNO=<number>; |

### Example

Cancel format table 4.

Input:

```
DEL-FTBL:FORMNO=4;
```

## 98.2.4 DISPLAY-FTBL / REGENERATE-FTBL

1. Interrogate the format tables with output in list format (DISPLAY).
2. Interrogate the format tables with output in position-oriented commands for regeneration (REGENERATE).

### Procedure Overview

| Command Code    | Parameter         |     |
|-----------------|-------------------|-----|
| DISPLAY-FTBL    | [FORMNO=<number>; | (1) |
| REGENERATE-FTBL | [FORMNO=<number>; | (2) |

### Examples

1. Interrogate format table 4 with output in list format.

Input:

```
DISP-FTBL:FORMNO=4;
```

FTBL - Administration of the Output Format Tables

Parameter Description

Output:

|                                                  |          |        |          |        |
|--------------------------------------------------|----------|--------|----------|--------|
| FORMAT NUMBER : 4                                |          |        |          |        |
| SETNO.:#### COSTNO.:##### UNIT:### DESTNO.:##### |          |        |          |        |
| VARIABLE FIELDS                                  |          |        |          |        |
| FLDNAME                                          | FILLTYPE | FILLER | FLDALIGN | COMPOS |
| RECNO                                            | CHAR     | "0"    | RIGHT    | 000    |
| CHRGEE                                           | CHAR     | "0"    | LEFT     | 000    |
| CHRGUNIT                                         | CHAR     | " "    | LEFT     | 000    |
| DESTPTY                                          | CHAR     | " "    | RIGHT    | 000    |

2. Interrogate format 4 for regeneration.

Input:

REG-FTBL:FORMNO=4;

Output:

ADD-FTBL:4,B,FORM,1,N," SETNO.:#### COSTNO.:##### UNIT:###  
DESTNO.:####";  
ADD-FTBL:4,B,FORM,2,Y,"###";  
ADD-FTBL:4,B,FIELD,1,RECNO,CHAR,"0",R;  
ADD-FTBL:4,B,FIELD,2,CHRGEE,CHAR,"0",L;  
ADD-FTBL:4,B,FIELD,3,CHRGUNIT,CHAR," ",L;  
ADD-FTBL:4,B,FIELD,4,DESTPTY,CHAR," ",R;

98.3 Parameter Description

|                 |                                                                                                                   |                              |  |
|-----------------|-------------------------------------------------------------------------------------------------------------------|------------------------------|--|
| COMPOS          | Comma position when alignment is carried out according to the comma.                                              |                              |  |
| Type of Input   | : single value, mandatory (ADD)<br>optional (prompted DIALOG)<br>optional, 4. parameter of a min-1-group (CHANGE) |                              |  |

## FTBL - Administration of the Output Format Tables

### Parameter Description

|          |                                                                                                                                                                                                                                                                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GLOBSEQ  | = Global id; A new global id may be produced only, in case of a new connection. (8 digits)<br>Use <b>till</b> HiPath 4000 V1.0<br><a href="#">Table 18 on page 1079</a>                                                                                                                                                                 |
| HOLDDUR  | = Calculation of the hold duration total in 1/10 of a second (6 digits)                                                                                                                                                                                                                                                                 |
| IDPP     | = Output of the station CDR chargees as a text string, only GET functionality (10 digits), (see AMO-TEXT)                                                                                                                                                                                                                               |
| INFOTYPE | = Type of information (10 digits)<br>If charging of the OFFICE, then units or amounts (see AMO-TEXT)                                                                                                                                                                                                                                    |
| INTNBCHA | = B-channel of the real trunk number of the non record point (2 digits)                                                                                                                                                                                                                                                                 |
| INTNLIST | = imaginary trunk number created of INTREAL (10 digits), (see AMO FBTN)                                                                                                                                                                                                                                                                 |
| INTNREAL | = Real trunk number of the non-recording point (see TKNOREAL) (5 digits) :<br>outgoing connection : A-Subscriber trunk or incoming trunk number<br>incoming connection : B-Subscriber trunk or outgoing trunk number<br>internal connection :<br>same PBX : B-Subscriber trunk<br>network : A-Subscriber trunk or incoming trunk number |
| INTNTRGR | = Trunk number group, assigned to INTNREAL (the real trunk number of non recording point), (3 digits)<br>Value 0 means line device                                                                                                                                                                                                      |
| KEYLV0   | = Node number of key line used party (3 digits)                                                                                                                                                                                                                                                                                         |
| KEYLV1   | = Subdomain number of key line used party (3 digits)                                                                                                                                                                                                                                                                                    |
| KEYLV2   | = Domain number of key line used party (2 digits)                                                                                                                                                                                                                                                                                       |
| KEYPTY   | = Key line used party; The selected line (number) on a key phone providing multiple lines. (22 digits)<br>Infos about the right/left justified output field see description of item CALLEPTY on page 1091.                                                                                                                              |
| LCALLENO | = Length of the called party (2 digits)                                                                                                                                                                                                                                                                                                 |
| LDESTNO  | = Length of the destination number (2 digits)<br>Use starting <b>till</b> HiPath 4000 V1.0<br><a href="#">Table 18 on page 1079</a>                                                                                                                                                                                                     |
| LEGLV0   | = Node number of leg id (3 digits)<br>Use <b>till</b> HiPath 4000 V1.0<br><a href="#">Table 18 on page 1079</a>                                                                                                                                                                                                                         |
| LEGLV1   | = Subdomain number of leg id (3 digits)<br>Use <b>till</b> HiPath 4000 V1.0<br><a href="#">Table 18 on page 1079</a>                                                                                                                                                                                                                    |

|          |                                                                                                                                                                                                                                                                                          |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LEGLV2   | = Domain number of leg id (2 digits)<br>Use <b>till</b> HiPath 4000 V1.0<br><a href="#">Table 18 on page 1079</a>                                                                                                                                                                        |
| LEGSEQ   | = Leg id; If a targetuser may be changed with an existing connection, a new leg id will be generated, the global call id itself wouldn't be changed. (8 digits)                                                                                                                          |
| LISTTYPE | = Output of the type of station CDR list type as a text string, only GET functionality (16 digits), (see AMO-TEXT)                                                                                                                                                                       |
| MOBUCLV0 | = Node number of mobile user calling party (3 digits)                                                                                                                                                                                                                                    |
| MOBUCLV1 | = Subdomain number of mobile user calling party (3 digits)                                                                                                                                                                                                                               |
| MOBUCLV2 | = Domain number of mobile user calling party (2 digits)                                                                                                                                                                                                                                  |
| MOBUCPTY | = Mobile user calling party; User identifies at calling station with PIN (22 digits).<br>Infos about the right/left justified output field see description of item CALLEPTY on page 1091.                                                                                                |
| MSGNO    | = Consecutive number of message (5 digits) by S&F connection                                                                                                                                                                                                                             |
| NCT      | = Indicates call in which NCT was successfully invoked (indicator "N", otherwise "-"), (1 digit)                                                                                                                                                                                         |
| NETCARA  | = Access codes of the network carrier providing the trunk, whereas NETCARA is assigned to the BREAKIN trunk (maximum 4 digits with numeric values), (4 digits)                                                                                                                           |
| NETCARB  | = Access codes of the network carrier providing the trunk whereas NETCARB is assigned to the BREAKOUT trunk (maximum 4 digits with numeric values), (4 digits)                                                                                                                           |
| NETPULS  | = Pulses; charge info from net (5 digits)                                                                                                                                                                                                                                                |
| NETSVCA  | = Contain values that represent the type of service for a long distance carrier that:<br>a) delivered the PRI-Rate call (in case of calls terminating to the PBX),<br>b) was used or requested when making an outgoing PRI-Rate call. (depending on DB_M_NW_CALLING_SVC_SET), (2 digits) |
| NETSVCB  | = Contain values that represent the type of service for a long distance carrier that:<br>a) delivered the PRI-Rate call (in case of calls terminating to the PBX),<br>b) was used or requested when making an outgoing PRI-Rate call. (depending on DB_M_NW_CALLING_SVC_SET), (2 digits) |

## FTBL - Administration of the Output Format Tables

### Parameter Description

|                  |                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NETTYPE          | = Output of the network description as a text string (10 digits),<br>(see AMO-TEXT)                                                                                              |
| OSAA             | = Operator system access (range 0 - 2), not yet supported by CP (1 digit)                                                                                                        |
| OSAB             | = Operator system access (range 0 - 2), (1 digit)                                                                                                                                |
| OUTDAYC          | = Current date of the output name of the day (10 digits),<br>(see AMO-TEXT)                                                                                                      |
| OUTDAYN          | = Current date of the output day (2 digits)                                                                                                                                      |
| OUTHOUR          | = Current date of the output hour (2 digits)                                                                                                                                     |
| OUTMIN           | = Current date of the output minute (2 digits)                                                                                                                                   |
| OUTMONN          | = Current date of the output month (2 digits)                                                                                                                                    |
| OUTMONC          | = Current date of the output name of the month (10 digits)                                                                                                                       |
| OUTSEC           | = Current date of the output second (2 digits)                                                                                                                                   |
| OUTDAY           | = Current date of the output day of the year (3 digits)                                                                                                                          |
| OUTYEAR          | = Current date of the output year (4 digits)                                                                                                                                     |
| PIN              | = Personal ID (12 digits)                                                                                                                                                        |
| PINLEN           | = Length of the personal ID (2 digits)                                                                                                                                           |
| PPLV0            | = Node number of paying party (3 digits)                                                                                                                                         |
| PPLV1            | = Subdomain number of paying party (3 digits)                                                                                                                                    |
| PPLV2            | = Domain number of paying party (2 digits)                                                                                                                                       |
| QUEUEDUR         | = Total queuing duration in 1/10 seconds (5 digits)                                                                                                                              |
| RECNO            | = Consecutive number of the record to be output (1 to 9999) for each selection group (4 digits)                                                                                  |
| RECPT            | = record point (1 digit)                                                                                                                                                         |
| possible values: | 0 = Transit between systems<br>1 = Breakout to central office<br>2 = Recording direct at origin<br>3 = Recording direct at origin and breakout to central office<br>4 = Incoming |
| RECTYPE          | = Record type (no text will be assigned in AMO-TEXT) (1 digit)                                                                                                                   |
| possible values: | 1 = empty<br>2 = CDR-e only<br>3 = PM only<br>4 = CDR-e and PM                                                                                                                   |
| RING10           | = Output of the ring duration of part 1/10 seconds with format minute:second:1/10second (1 digit)                                                                                |

## FTBL - Administration of the Output Format Tables

### Parameter Description

|          |                                                                                                                                                                           |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RINGDUR  | = Output of the ring duration in format 1/10 seconds (5 digits)                                                                                                           |
| RINGMIN  | = Output of the ring duration of part minutes with format minute:second:1/10second (2 digits)                                                                             |
| RINGSEC  | = Output of the ring duration of part seconds with format minute:second:1/10second (2 digits)                                                                             |
| ROUTCC   | = Output of the route code as a text string (10 digits) see AMO-TEX)                                                                                                      |
| ROUTCN   | = Route code (6 digits)                                                                                                                                                   |
| RTINGLV0 | = Node number of redirecting party (3 digits)                                                                                                                             |
| RTINGLV1 | = Subdomain number of redirecting party (3 digits)                                                                                                                        |
| RTINGLV2 | = Domain number of redirecting party (2 digits)                                                                                                                           |
| RTINGPTY | = Redirecting party; Party that redirects a call. (22 digits)<br>Infos about the right/left justified output field see description of item CALLEPTY on page 1091.         |
| RTIONLV0 | = Node number of redirection party (3 digits)                                                                                                                             |
| RTIONLV1 | = Subdomain number of redirection party (3 digits)                                                                                                                        |
| RTIONLV2 | = Domain number of redirection party (2 digits)                                                                                                                           |
| RTIONPTY | = Redirection party; Party where a call is redirected to. (22 digits)<br>Infos about the right/left justified output field see description of item CALLEPTY on page 1091. |
| RURAL    | flag if rural call (1 digit)<br>value 0 = rural<br>value 1 = other terminal device.                                                                                       |
| SELGRUNO | = Output of the selection group number (1 digit)                                                                                                                          |
| SERVICE  | = Output of the service as a text string, (10 digits), (see AMO-TEXT)                                                                                                     |
| SIDANI   | = Text string related to the calling (ANI) (24 digits)                                                                                                                    |
| SIGDATA  | = Indicates whether the output data record is correct / incorrect or double (10 digits), (see AMO-TEXT)                                                                   |
| STDAY    | = Start-of-connection day (2 digits)                                                                                                                                      |
| STHOUR   | = Start-of-connection hour (2 digits)                                                                                                                                     |
| STMIN    | = Start-of-connection minute (2 digits)                                                                                                                                   |
| STMONTH  | = Start-of-connection month (2 digits)                                                                                                                                    |
| STNID    | = Output of the station ID as a text string (10 digits), (see AMO-TEXT)                                                                                                   |
| STYDAY   | = Start-of-connection day of the year (3 digits)                                                                                                                          |
| STYEAR   | = Start-of-connection year (4 digits)                                                                                                                                     |
| STSEC    | = Start-of-connection second (2 digits)                                                                                                                                   |
| ST10     | = Start-of-connection 1/10 of a second (1 digit)                                                                                                                          |

## FTBL - Administration of the Output Format Tables

### Parameter Description

|           |                                                                                                                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SUPLSERV  | = Output of the supplement service as a text string (10 digits),<br>(see AMO-TEXT)                                                                                                                                                                 |
| SWP       | = Call phases (10 digits),<br>(see AMO-TEXT)                                                                                                                                                                                                       |
| SWULOAD   | = Processor load in SWU in 1/10 percent (4 digits)                                                                                                                                                                                                 |
| THRELV0   | = Node number of thread call id (3 digits)<br>Use starting <b>from</b> HiPath 4000 V1.0<br><a href="#">Table 18 on page 1079</a>                                                                                                                   |
| THRELV1   | = Subdomain number of thread call id (3 digits)<br>Use starting <b>from</b> HiPath 4000 V1.0<br><a href="#">Table 18 on page 1079</a>                                                                                                              |
| THRELV2   | = Domain number of thread call id (2 digits)<br>Use starting <b>from</b> HiPath 4000 V1.0<br><a href="#">Table 18 on page 1079</a>                                                                                                                 |
| THRESEQ   | = Global call id; A new thread call id may be produced only, in case of a new connection. (8 digits)<br>Use starting <b>from</b> HiPath 4000 V1.0<br><a href="#">Table 18 on page 1079</a>                                                         |
| TKNOBCHA  | = B-channel of the real trunk number of the record point (2 digits)                                                                                                                                                                                |
| TKNOLIST  | = Imaginary trunk number created of TKNOREAL (10 digits),<br>(see AMO-FBTN)                                                                                                                                                                        |
| TKNOREAL  | = Real trunk number of recording point (5 digits):<br>outgoing connection : outgoing trunk number<br>incoming connection: incoming trunk number<br>internal connection:<br>same PBX : A-Subscriber trunk number<br>network : outgoing trunk number |
| TKNOTRGR  | = Trunk number group, assigned to TKNOREAL (the real trunk number of recording point) (3 digits)<br>Value 0 means line device                                                                                                                      |
| TRANSFLV0 | = Node number of transferring party (3 digits)                                                                                                                                                                                                     |
| TRANSFLV1 | = Subdomain number of transferring party (3 digits)                                                                                                                                                                                                |
| TRANSFLV2 | = Domain number of transferring party (2 digits)                                                                                                                                                                                                   |
| TRANSFPTY | = Transferring party; party that transferred a call. (22 digits)<br>Infos about the right/left justified output field see description of item CALLEPTY on page 1091.                                                                               |
| TRANSCNT  | = Number of passed through transit nodes (2 digits)                                                                                                                                                                                                |
| UNANS     | = Through connect / no through connect (10 digits),<br>(see AMO-TEXT)                                                                                                                                                                              |

|          |                                                                                                                                 |
|----------|---------------------------------------------------------------------------------------------------------------------------------|
| UNITERAS | = Output of deletion of the station CDR resettable counter after output , only GET functionality (22 digits),<br>(see AMO-TEXT) |
| ZONE     | = Output of the distance zone as a text string (10 digits),<br>(see AMO-TEXT)                                                   |

**Note:**

For incoming connections the fieldset is as follows:

|          |                                                                                    |
|----------|------------------------------------------------------------------------------------|
| ATNDGRNO | = Groupnumber of the attendant console which has accepted and supplied the call.   |
| CARRIER  | = Carrier which can be assigned to an incoming bundle (AMO TACSU/TDCSU).           |
| CHOFCON  | = always „DISTANT“.                                                                |
| CONNTYPE | = „INCOMING“.                                                                      |
| ROUTCN   | = empty (filler).                                                                  |
| ROUTCC   | = empty (filler).                                                                  |
| STNID    | = Subscriber identification of the called subscriber.                              |
| ZONE     | = Zone which can be assigned to an incoming bundle ANK01 - ANK09 (AMO TACSU/TDCSU) |

For internal connections are the fields as follows:

|          |                                                             |
|----------|-------------------------------------------------------------|
| CARRIER  | = always „0“.                                               |
| CHRGUNIT | = empty (filler).                                           |
| CONNTYPE | = „INTERNAL“.                                               |
| CHOFCON  | = always „LOCAL“.                                           |
| ROUTCN   | = empty (filler).                                           |
| ROUTCC   | = empty (filler)).                                          |
| RINGDUR  | = Is „0“ if ZAND-parameter CDRRINGB = NO (AMO ZAND).        |
| ZONE     | = From VBZ-Group determined zone INT01 - INT09 (AMO VBZGR). |

|        |                                                                                                 |
|--------|-------------------------------------------------------------------------------------------------|
| FORMAT | Actual format description                                                                       |
|        | Type of Input : single value, mandatory (ADD, CHANGE)                                           |
|        | Possible Values : max. 80 characters (limited by the input buffer of CMS)                       |
| FORMNO | Format number                                                                                   |
|        | Type of Input : single value, mandatory (ADD, CHANGE, DELETE)<br>optional (DISPLAY, REGENERATE) |
|        | Possible Values : 1 to 101                                                                      |
| NO     | Format line number, the format and control character description is related to.                 |

**FTBL - Administration of the Output Format Tables**

Parameter Description

|        |                                                                   |                                            |
|--------|-------------------------------------------------------------------|--------------------------------------------|
|        | Type of Input                                                     | : single value, mandatory (ADD)            |
|        | Possible Values                                                   | : 1 to 99                                  |
| NOFELD | Number of variable field, the field description is related to.    |                                            |
|        | Type of Input                                                     | : single value, mandatory (ADD)            |
|        | Possible Values                                                   | : 1 to 999                                 |
| TBL    | Indicates whether the format or the field description is changed. |                                            |
|        | Type of Input                                                     | : single value, mandatory (ADD, CHANGE)    |
|        | Possible Values                                                   | : CTRL = control character (ADD only)      |
|        |                                                                   | FIELD = field description (ADD and CHANGE) |
|        |                                                                   | FORM = format (ADD only)                   |
| TYPE   | Input mode                                                        |                                            |
|        | Type of input                                                     | : single value, mandatory (ADD)            |
|        | Possible Values                                                   | : D = dialog                               |
|        |                                                                   | B = batch                                  |

**NOTE:**

Only the variable data elements "output time" (OUTXXX), "block length" (BLENBYT), and "number of records per block" (BLENREC) are permitted in formats 17-96.

If the following separators are used in a format (text string),

|       |        |
|-------|--------|
| ' :   | ' ?'   |
| ' !'  | ' &'   |
| ' ;'  | ' / *' |
| ' ,'  | ' * /' |
| ' ='  | ' -'   |
| ' \$' |        |

or if the control characters 'return', 'line feed' (Ampex terminals), etc., are used, then the complete text string must be started with "" and closed with "".

Input: ""TEXTSTRING""

The elements CTRDIFF, CTRTOT, IDPP, LISTTYPE are used only in the formats for GET-Output (formats 97 - 106) and must not be used in the other formats.

**Meaning of the values for the element CAUSE:**

| Value | Meaning                                      |
|-------|----------------------------------------------|
| 000   | no cause                                     |
| 001   | unallocated (unassigned) number              |
| 002   | no route to specified transit network        |
| 003   | no route to destination                      |
| 006   | channel unacceptable                         |
| 016   | normal call clearing                         |
| 017   | user busy                                    |
| 018   | no user responding                           |
| 019   | no answer from user (user alerted)           |
| 021   | call rejected                                |
| 022   | number changed                               |
| 026   | non-selected user clearing                   |
| 027   | destination out of order                     |
| 028   | invalid number format (address incomplete)   |
| 029   | facility rejected                            |
| 030   | response to STATUS ENQUIRY                   |
| 031   | normal, unspecified                          |
| 033   | circuit out of order                         |
| 034   | no circuit/channel available                 |
| 038   | network out of order                         |
| 041   | temporary failure                            |
| 042   | switching equipment congestion               |
| 043   | access information discarded                 |
| 044   | requested circuit/channel not available      |
| 047   | resource unavailable, unspecified            |
| 049   | Quality of Service not available             |
| 050   | requested facility not subscribed            |
| 052   | outgoing call barred                         |
| 053   | outgoing call barred with CUG                |
| 054   | incoming call barred                         |
| 055   | incoming call barred with CUG                |
| 057   | bearer capability not authorized             |
| 058   | bearer capability not presently available    |
| 063   | service or option not available, unspecified |
| 065   | bearer capability not implemented            |

Table 19      *Meaning of the values for the element CAUSE*

## FTBL - Administration of the Output Format Tables

### Parameter Description

| Value | Meaning                                                                                |
|-------|----------------------------------------------------------------------------------------|
| 066   | channel type not implemented                                                           |
| 069   | requested facility not implemented                                                     |
| 070   | only restricted digital information bearer capability is available                     |
| 079   | service or option not implemented, unspecified                                         |
| 081   | invalid call reference value                                                           |
| 082   | identified channel does not exist                                                      |
| 083   | a suspended call exists, but this call identity does not                               |
| 084   | call identity in use                                                                   |
| 085   | no call suspended                                                                      |
| 086   | call having the requested call identity has been cleared                               |
| 088   | incompatible destination                                                               |
| 091   | invalid transit network destination                                                    |

| 127   | interworking, unspecified                                                              |

Table 19      *Meaning of the values for the element CAUSE*

The not listed values are "not defined".

For further information on the element cause look at the CorNet-N Protocol Specification Volume 1, Part C, Chapter 3.4 Coding of Information Elements.

#### **Meaning of the values for the element BAUD:**

| Value | Meaning       | Value | Meaning        |
|-------|---------------|-------|----------------|
| 000   | 0 Baud        | 005   | 600 Baud       |
| 006   | 2400 Baud     | 007   | 4800 Baud      |
| 008   | 9600 Baud     | 009   | 48000 Baud     |
| 010   | 64000 Baud    | 011   | variable       |
| 012   | X25 2400 Baud | 013   | X25 4800 Baud  |
| 014   | X25 9600 Baud | 015   | X25 48000 Baud |

Table 20      *Meaning of numeric value for BAUD*

| Value | Meaning                 | Value | Meaning                    |
|-------|-------------------------|-------|----------------------------|
| 016   | X25 64000 Baud          | 017   | X25 variable               |
| 024   | 300 Baud                | 025   | 3600 Baud                  |

| 054   | 16800 Baud              | 055   | 19200 Baud                 |
| 056   | 56000 Baud              | 069   | 600 Baud asynchronous      |
| 070   | 2400 Baud asynchronous  | 071   | 4800 Baud asynchronous     |
| 072   | 9600 Baud asynchronous  | 075   | variable Baud asynchronous |
| 081   | 50 Baud asynchronous    | 082   | 75 Baud asynchronous       |
| 083   | 100 Baud asynchronous   | 084   | 110 Baud asynchronous      |
| 085   | 134,5 Baud asynchronous | 086   | 150 Baud asynchronous      |
| 087   | 200 Baud asynchronous   | 088   | 300 Baud asynchronous      |
| 089   | 3600 Baud asynchronous  | 090   | 12000 Baud asynchronous    |
| 113   | 900 Baud asynchronous   | 114   | 1200 Baud asynchronous     |
| 115   | 1800 Baud asynchronous  | 116   | 7200 Baud asynchronous     |
| 117   | 14400 Baud asynchronous | 118   | 16800 Baud asynchronous    |
| 119   | 19200 Baud asynchronous |       |                            |

Table 20                      Meaning of numeric value for BAUD

Values not listed here are "not defined".

## 98.4 Error Messages and Advisories

### 98.4.1 Error Messages

F01: VARIABLE ELEMENT @@@@@@@@ IS NOT ALLOWED IN THE FORMAT 17 - 96.

F02: VARIABLE ELEMENT @@@@@@@@ IS NOT CONTAINED IN FORMAT.

## FTBL - Administration of the Output Format Tables

### Error Messages and Advisories

F03: FORMAT DOES NOT EXIST.  
F04: FORMAT IS ALREADY CREATED.  
F05: NO MORE SPACE AVAILABLE IN THE TABLE.  
F06: MAXIMAL 255 ELEMENTS PER FORMAT ARE PERMITTED.  
F07: VARIABLE ELEMENT @@@@ is NOT ALLOWED IN THE FORMAT 1 - 96.  
F08: IF FILLER TYPE IS NONE, NO FILLER CAN BE SPECIFIED.  
F09: IF ALIGNMENT IS LEFT OR RIGHT, NO DECIMAL POSITION CAN BE SPECIFIED.  
F10: PROBLEMS OCCURED ON WRITING/READING AT HARD DISK AT AREA G (A1H1G OR A1H6G)  
F11: FORMAT IS NOT YET READY. FIELD DESCRIPTION COULD NOT BE STORED.  
F12: STRINGS WITH MORE THAN 255 CHARACTERS ARE NOT ALLOWED.  
F13: FIELD ALREADY WITH SMALLER LENGTH AVAILABLE. PLEASE EXCHANGE SEQUENCE.  
F14: FORMAT STRING CAN NOT INLUDE ONLY @ SIGNS (FIELD MASK FOR EXAMPLE : #@@@@).  
F15: ALL FIELDS FROM 1 TO @@@@ CAN BE ENTERED ONLY IN ORDER.

## 98.4.2 Advisories

H01: ENTER FIELD DESCRIPTION FOR THE @@@@TH VARIABLE FIELD.  
H02: not in use  
H03: not in use  
H04: THE ELEMENT "CONCHRG" "CONCHRN" "DISPCHRG" RESP. "DISPCHRN" MUST HAVE A COMMA  
POSITION. IS CHANGED TO THE STANDARD VALUES (ALIGNMENT TO THE RIGHT AND COMMA  
POSITION(S)).  
H05: ATTENTION! FORMAT IS NOT COMPLETE.  
H06: ELEMENT RTIONLV0, RTIONLV1 AND RTIONLV2 ARE ALWAYS FILLED WITH 'X'.

## 99 FTCSM - File Transfer Configuration

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO FTCSM (file transfer configuration service module) is an administration interface for changing system parameters. The AMO processes the parameters in the data base which are required for the host connection and thus required for the file transfer , and sends the appropriate message to the file transfer following every such alteration.

### 99.1 Restrictions

This description is valid from SP300-Rel6.3

### 99.2 Interrelationships

None

### 99.3 Functions of the AMO

- [ADD-FTCSM](#) : Add the file tranfer parameters
- [CHANGE-FTCSM](#) : Change the file tranfer parameters
- [DELETE-FTCSM](#) : Delete the file tranfer parameters
- [DISPLAY-FTCSM](#) : Display the file tranfer parameters
- [REGENERATE-FTCSM](#) : Regenerate the data base for the file transfer parameters

#### 99.3.1 ADD-FTCSM

Depending on which branch parameter TTYPE is given, the following takes place :

1. the network book data is added,
2. the task book data is added,
3. the file transfer is either activated (START), terminated (STOP) or executed (RUN).

## FTCSM - File Transfer Configuration

### Functions of the AMO

Because there is no delete of the task book, it is possible to add though there are configurations existing. If there is no value of a parameter entered, the default value will be added.

#### Procedure Overview

| Command Code | Parameter                                |
|--------------|------------------------------------------|
| ADD-FTCSM    | [UNIT=<param>]                           |
|              | , TTYPE=NCF, NCFNO=<number>              |
|              | , OSPTNR=<string>, HPID=<string>         |
|              | , DPAPPL=<string>, FEPROC=<string>       |
|              | , [DPTYPE=<param>];                      |
|              |                                          |
|              | , TTYPE=FTTF, [RSTIME=<number>]          |
|              | , [FILNAM=<string>], [TASKMAX=<number>]  |
|              | , [TASKIN=<number>], [TASKOUT=<number>]; |
|              |                                          |
|              | , TTYPE=STATE, STATE=<param>;            |

#### Examples

1. Add the parameters for the network book

Input:

```
ADD-FTCSM:A1,NCF,16,"EMSAPPL1","DVAPROZ1","DVAAPPL1","N78H02",BS2000;
```

2. Add the parameters for the task book

Input:

```
ADD-FTCSM:A1,FTTF,8,"DBD:FTV1",4,3,2;
```

3. Terminate the file transfer

Input:

```
ADD-FTCSM:A1,STATE,STOP;
```

## 99.3.2 CHANGE-FTCSM

Depending on which branch parameter TTYPE is given, the following takes place :

1. the network book data is changed,
2. the task book data is changed,

3. the file transfer is either activated (START), terminated (STOP) or executed (RUN).

### Procedure Overview

| Command Code | Parameter                                |
|--------------|------------------------------------------|
| CHANGE-FTCSM | [UNIT=<param>]                           |
|              | , TTYPE=NCF, NCFNO=<number>              |
|              | , [OSPTNR=<string>], [HPID=<string>]     |
|              | , [DPAPPL=<string>], [FEPROC=<string>],  |
|              | , [DPTYPE=<param>];                      |
|              |                                          |
|              | , TTYPE=FTTF, [RSTIME=<number>]          |
|              | , [FILNAM=<string>], [TASKMAX=<number>]  |
|              | , [TASKIN=<number>], [TASKOUT=<number>]; |
|              |                                          |
|              | , TTYPE=STATE, STATE=<param>;            |

### Examples

1. Change the time interval of the restart

Input:

```
CHANGE-FTCSM:A1,FTTF,1;
```

2. Change data having the network book number 16

Input:

```
CHANGE-FTCSM:A1,NCF,16,"EMSAPPL1","DVAPROZ2";
```

3. Activate the file transfer

Input:

```
CHANGE-FTCSM:A1,STATE,START;
```

## 99.3.3 DELETE-FTCSM

Branching to STATE here serves no purpose, since only the STOP state comes into question for deleting anyway.

### Procedure Overview

| Command Code | Parameter                         |
|--------------|-----------------------------------|
| DELETE-FTCSM | [UNIT=<param>], [NCFNO=<number>]; |

## FTCSM - File Transfer Configuration

### Functions of the AMO

#### Examples

1. Delete all network book data

Input:

```
DELETE-FTCSM:A1;
```

2. Delete data having the network book number 4

Input:

```
DELETE-FTCSM:A1,4;
```

### 99.3.4 DISPLAY-FTCSM

Depending on which branch parameter TTYPE is entered, the following is displayed :

1. the network book data
2. the task book data

If no TTYPE entry is made, all data relevant for the file transfer is output. Branching to STATE is also redundant, since the state of the file transfer is already entered in the task book.

#### Procedure Overview

| Command Code  | Parameter                        |
|---------------|----------------------------------|
| DISPLAY-FTCSM | [UNIT=<param>], [TTYPE=<param>]; |

#### Examples

1. Output all file transfer parameters

Input:

```
DISPLAY-FTCSM:A1;
```

Output:

```
NETWORK BOOK ENTRIES:
```

```
+-----+-----+-----+-----+-----+-----+
|NETW. | BS-   | PROZESSOR| DP-   | FEPROC  | DPTYPE |
|BK.NO.| PARTNER | ID      | APPL  |          |        |
+-----+-----+-----+-----+-----+-----+
|  1   | EMSAPPL1 | DVAPROZ1 | DVAAPPL1 | N78H02 | BS2000 |
+-----+-----+-----+-----+-----+-----+
```

```
GLOBAL DATA:
```

```
STATUS           : RUN
TIME PERIOD       : 1
ORDER BOOK NAME   : :DBD:FTA1
```

```

MAX. FT-EXEC      : 4
MAX. INBOUND      : 2
MAX. OUTBOUND     : 3

```

## 2. Output the network book data

Input:

```
DISPLAY-FTCSM:A1,NCF;
```

Output:

NETWORK BOOK ENTRIES:

| NETW.  | BS-      | PROZESSOR | DP-      | FEPROC | DPTYPE |
|--------|----------|-----------|----------|--------|--------|
| BK.NO. | PARTNER  | ID        | APPL     |        |        |
| 1      | EMSAPPL1 | DVAPROZ1  | DVAAPPL1 | N78H02 | BS2000 |

## 3. Output the task book data

Input:

```
DISPLAY-FTCSM:A1,FTTF;
```

Output:

GLOBAL DATA:

```

STATUS           : RUN
TIME PERIOD      : 1
ORDER BOOK NAME  : :DBD:FTA1
MAX. FT-EXEC     : 4
MAX. INBOUND     : 2
MAX. OUTBOUND    : 3

```

# 99.3.5 REGENERATE-FTCSM

## Procedure Overview

| Command Code     | Parameter      |
|------------------|----------------|
| REGENERATE-FTCSM | [UNIT=<param>; |

### Example

Output all data as position-oriented input commands

Input:

```
REGENERATE-FTCSM:A1;
```

Output:

```

ADD-
FTCSM:A1,NCF,16,"EMSAPPL1","DVAPROZ1","DVAAPPL1","N78H02",BS2000
;
ADD-FTCSM:A1,FTTF,8,":DBD:FTA1",4,3,2;

```

**FTCSM - File Transfer Configuration**

Parameter Description

```
ADD-FTCSM:A1, STATE, STOP;  
.  
.  
.
```

**99.4 Parameter Description**

|        |                                                                                                                                                                                         |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DPAPPL | Data processing application<br>Type of Input : Single value, mandatory (ADD)<br>optional (CHANGE)<br>Possible Values : Application name (1 - 8 chars, 1st char /= ' ')                  |
| DPTYPE | DATA Processing<br>Type of Input : Single value, optional<br>Possible Values : BS2000<br>OTHER<br>Default Value : BS2000                                                                |
| FEPROC | BCAM name of the front-end processor<br>Type of Input : Single value, mandatory (ADD)<br>optional (CHANGE)<br>Possible Values : Front-end processor name (1 - 8 chars, 1st char /= ' ') |
| FILNAM | File name of the file transfer task list<br>Type of Input : Single value, optional<br>Possible Values : Hard disk file name (max 32 chars)<br>Default Value : :DBD:FTyy (yy=UNIT)       |

# 100 FTRNS - File Transfer between BS2000 and Hicom

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">AMO Functions</a>         | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO FTRNS (File Transfer) can be used to transfer files between HICOM and a BS2000 system. The AMO FTRNS is used as the interface between the user and the system module FT-HICOM.

## 100.1 Restrictions

This description is valid from SP300-V3.1

## 100.2 Interrelationships

None

## 100.3 AMO Functions

- [START-FTRNS](#) : Entering a file transfer task into job book
- [DELETE-FTRNS](#) : Delete a file transfer task out of job book
- [DISPLAY-FTRNS](#) : List of all waiting file transfer tasks

### 100.3.1 START-FTRNS

Entering a file transfer task into the job book.

#### Note

AMO FTRNS cannot be started multiple.

#### Procedure Overview

(\*2) Parameter valid from SP300-V3.2

### Example

Starting a file transfer.

Input:

```
STA-FTRNS:DVAPROC1,"PNEA424T","52B30720","C'FILETRNS'",":PDS:ADM/FILE",
"BS2.FILE",RCV,,HD;
```

## 100.3.2 DELETE-FTRNS

Delete a file transfer task out of job book

### Note

AMO FTRNS cannot be started multiple.

### Procedure Overview

| Command Code | Parameter         |  |
|--------------|-------------------|--|
| DELETE-FTRNS | TRANSID=<string>; |  |

### Example

Delete a file transfer task.

Input:

```
DEL-FTRNS:1;
```

100.3.3 DISPLAY-FTRNS

List of all waiting file transfer tasks

Note

AMO FTRNS cannot be started multiple.

Procedure Overview

|               |                    |
|---------------|--------------------|
| Command Code  | Parameter          |
| DISPLAY-FTRNS | [TRANSID=<string>; |

Example

Query a file transfer task. The transfer direction can have the values RECEIVE or SEND, the state of transfer can be ACTIVE, WAIT or LOCKED. The file name can have a maximum of 32 chars.

Input:

DIS-FTRNS;

Output:

|    |          |           |        |                 |
|----|----------|-----------|--------|-----------------|
| NR | TRANS-ID | DIRECTION | STATE  | HICOM-FILE-NAME |
| 1  | 22       | SEND      | ACTIVE | :PRS:TESTDATEI  |

100.4 Parameter Description

|                 |                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------|
| BLOLEN          | Blocklength on tape                                                                               |
| Type of Input   | : Single value, optional                                                                          |
| Possible Values | : max. 2 chars.                                                                                   |
| BSACCNO         | BS2000 account number                                                                             |
| Type of Input   | : Single value, optional                                                                          |
| Possible Values | : All BS2000 account numbers possible<br>(must be entered with inverted commas, i.e. "<account>") |
| BSFAILPR        | Command text to follow on failed FTRNS run                                                        |
| Type of Input   | : Single value, optional                                                                          |
| Possible Values | : Textstring, max. 80 chars.<br>complete BS2000 command (i.e. "<command>")                        |

|          |                                                         |                                                                                                           |
|----------|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|

## FTRNS - File Transfer between BS2000 and Hicom

### Parameter Description

|                 |                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DRCTN           | Direction system -> BS2000 or BS2000 -> system                                                                                                                                                                               |
| Type of Input   | : Single value, mandatory                                                                                                                                                                                                    |
| Possible Values | : SEND = system -> BS2000<br>RCV = BS2000 -> system<br>SENDNMC = system -> NMC<br>RCVNMC = NMC -> system                                                                                                                     |
| FAILPR          | Command text to follow on failed FTRNS run on system                                                                                                                                                                         |
| Type of Input   | : Single value, optional                                                                                                                                                                                                     |
| Possible Values | : Textstring, max. 80 chars<br>complete MML command (i.e. "<command>")                                                                                                                                                       |
| OPNMOD          | Openmode of destination file                                                                                                                                                                                                 |
| Type of Input   | : Single value, optional                                                                                                                                                                                                     |
| Possible Values | : NEW = new<br>E = extend<br>O = overwrite                                                                                                                                                                                   |
| Default Value   | : O                                                                                                                                                                                                                          |
| SUCCPR          | Command text to follow on successful FTRNS run on system                                                                                                                                                                     |
| Type of Input   | : Single value, optional                                                                                                                                                                                                     |
| Possible Values | : Textstring, max. 80 chars.<br>complete MML command (i.e. "<command>")<br>" - signs within MML-commands have to be replaced<br>by % resp. poundcharacter.<br>A maximum of 2 MML-commands are allowed,<br>separated by '- '. |
| SYSDEV          | System device                                                                                                                                                                                                                |
| Type of Input   | : Single value, mandatory for DRCTN = RCV<br>in other case optional                                                                                                                                                          |
| Possible Values | : HD = Hard disk<br>CT = Cartridge<br>TA = Tape                                                                                                                                                                              |
| Default Value   | : HD                                                                                                                                                                                                                         |
| SYSFILE         | System file                                                                                                                                                                                                                  |
| Type of Input   | : Single value, mandatory                                                                                                                                                                                                    |
| Possible Values | : Textstring, max. 32 chars.<br>Name of file on hard disk                                                                                                                                                                    |

(must be entered with inverted commas, i.e. "<file>")

|                 |                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SYSFSIZE        | System file size (in Bytes)                                                                                                                                            |

## **100.5.2 Advisories**

H01: FILE TRANSFER TASK WITH TRANSID: <xxxx> HAS BEEN COMPLETED CORRECTLY  
H02: FILE TRANSFER TASK WAS ADDED TO JOB BOOK. ACTUAL TRANSID: <xxxx>  
H03: FILE TRANSFER STILL ACTIVE  
H04: AMO FTRNS HAS BEEN INTERRUPTED  
H05: NO TASK IN JOB BOOK  
H09: CANCEL OF FILE TRANSFER TASK INITIATED

## **FTRNS - File Transfer between BS2000 and Hicom**

### Error Messages and Advisories

# 101 FUNCT - System switches

This AMO is used to actuate the switches with which the following functions are deactivated or activated:

- No display of command echoing, the end message and the echoing of headers
- the language of AMO-calls
- switches of routine test organisation in some parts of ISp (Administration, TFS and VMS)
- splitting of CC (Common Control)
- new loading of subsystem UBGDAT (data of ports), when the SIT (signalisation task) uses this data.

Also it is possible to setup a time, in which the XENIX server has to be active, if the IHS is out of service (XENIX retention time).

If an externally attached power supply is present, it can also be configured depending on it's type (e.g. AC/DC Without redundancy).

Besides it is possible to configure the type of SS7 controller attached to the switch : Telephone user part controller / ISDN user part controller / no controller attached.

Futher it is possible to set a session specific AMO Text Language (German or English).

It is even possible to control the REGEN output using three new switches.

In addition, it is possible to display and regenerate the current switch settings.

It is possible to switch off logging of certain AMOs.

The user interface for the AMO-FUNCT is in English. Text output for the AMOs is also in English, even if the system is set to operate in a different language.

## 101.1 Restrictions

This description is valid from HiPath 4000 V2.0.

## 101.2 Interrelationships

none

## 101.3 Functions of the AMO

- [CHANGE-FUNCT](#) : Change functions (switch settings)
- [DISPLAY-FUNCT](#) : Display functions (switch settings)
- [REGENERATE-FUNCT](#) : Regenerate functions (switch settings)

### 101.3.1 CHANGE-FUNCT

Changes the functions (switch settings).

If a parameter value is given for a certain switch during command input, this switch is set to the specified value, even if this value was already set.

If a switch position is skipped over during command input, the switch in question remains unchanged.

#### Note

- Default during initialization:  
Switch for subsystem UBGDAT and for CC/decoupled mode or "splitting mode" to OFF, Type of power supply to AC/DC without redundancy and all other switches to ON.
- A check is made during switching of the RTOs for VMS and TCS as to whether the RTO in question is present.
- If you changed the system language (parameter LANG) for terminal input/output, this change will only take effect after a soft restart of the ISP (EXECUTE-REST:UNIT,A1,SOFT,;). However, a soft restart is not required when changing the session-specific administration language (parameter SLANG)!
- A change to the power supply type is done without checking to see if this type of power supply is present.
- A change to the pfi type is done without checking to see if the PFI (power fail interrupt) is read on this switch.
- A change of SS7 controller type is done without checking whether this controller is really attached.

- The function "switch off logging of certain AMOs" is possible from Hipath V2.0 inclusively onward.
- Procedure Overview.

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-FUNCT | [CMDECHO=<param>], [AMOOK=<param>], [AMOHDR=<param>]<br>, [SUSY=<param>], [RTOADS=<param>], [RTOTFS=<param>]<br>, [RTOVMS=<param>], [LANG=<param>], [SPLIT=<param>]<br>, [RETENT=<number>], [POWERSYS=<param>], [PFI=<param>]<br>, [SS7CTR=<param>], [SLANG=<param>], [REGIN=<param>]<br>, [REGKEY=<param>], [REGLN=<param>]<br>, [LOGBKOFF=<number>], [CONFREST=<param>]; |

## 101.3.2 DISPLAY-FUNCT

Display functions (switch settings).

All parameters are displayed with their current values.

### Procedure Overview

| Command Code  | Parameter        |
|---------------|------------------|
| DISPLAY-FUNCT | [VALUE=<param>]; |

### Example 1

Display switch settings.

Input:

```
DISPLAY-FUNCT;
```

Output:

```

(CMDECHO) -COMMAND ECHO .....ON
(AMOOK ) -AMO PERFORMANCE DISPLAY .....ON
(AMOHDR ) -AMO PROTOCOL HEADER DISPLAY .....ON
(SUSY ) -UBGDAT SUBSYSTEM SWITCH IN SIT .....OFF
(RTOADS ) -ADS ROUTINE TEST SWITCH .....ON
(RTOTFS ) -TFS ROUTINE TEST SWITCH .....NPR
(RTOVMS ) -VMS ROUTINE TEST SWITCH .....ON
(LANG ) -AMO TEXT LANGUAGE
.....GERMAN
(SPLIT ) -SPLIT MODE SWITCH .....OFF
(RETENT ) -XENIX RETENTION TIME IN SECONDS .....10
(POWERSYS) -TYPE OF POWER SYSTEM
.....ACDCWOR
(PFI ) -TYPE OF POWER FAIL INTERRUPT
.....WOUTPFI
(SS7CTR ) -SS7 CONTROLLER TYPE CONNECTED TO HICOM
```

**FUNCT - System switches**  
Functions of the AMO

```
.....ISUP
(REGIN  ) -REGEN OUTPUT INPUT USABLE .....N
(REGKEY ) -REGEN OUTPUT DISPLAY CONTAINING KEYWORDS .....Y
(Reglen) -REGEN OUTPUT LENGTH FOR MAX. INPUT LENGTH .....N
(LOGBKOFF)-SWITCH OFF LOGGING .....1 3
```

**Example 2**  
Display several switch settings.

Input:

```
DISPLAY-FUNCT:VALUE=CNDECHO&SPLIT&SLANG&REGKEY;
```

Output:

```
(CMDECHO) -COMMAND ECHO .....ON
(SPLIT  ) -SPLIT MODE SWITCH .....OFF
(SLANG  ) -SESSION SPECIFIC AMO TEXT LANGUAGE
.....GERMAN
(REGKEY  ) -REGEN OUTPUT DISPLAY CONTAINING KEYWORDS .....Y
```

**Example 3**  
Display bits set for logging off certain AMOs.

Input:

```
DISPLAY-FUNCT:LOGBKOFF;
```

```
(LOGBKOFF)-SWITCH OFF LOGGING .....1 3
```

Remark:

That is the commands DISPLAY-BUEND; and REGEN-CPTP are not logged.

**101.3.3 REGENERATE-FUNCT**

Regenerate Xenix Retention Time.

**Procedure Overview**

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-FUNCT | ;         |

**Example**  
Regenerate Xenix Retention Time.

Input:

```
REGENERATE-FUNCT;
```

Output:

```
CHANGE-FUNCT:,,,,,,10,ACDCWOR,,,GER,N,Y,N,"1","3";
```

## 101.4 Parameter Description

|          |                                                             |
|----------|-------------------------------------------------------------|
| AMOHDR   | Name of switch: echoing the header                          |
|          | Type of Input : Single value, optional                      |
|          | Possible Values : ON, OFF                                   |
|          | Default Value : ON                                          |
| AMOOK    | Name of switch: test "AMO COMPLETED"                        |
|          | Type of Input : Single value, optional                      |
|          | Possible Values : ON, OFF                                   |
|          | Default Value : ON                                          |
| CMDECHO  | Name of switch: echoing of het AMO input on/off             |
|          | Type of Input : Single value, optional                      |
|          | Possible Values : ON, OFF                                   |
|          | Standard : ON                                               |
| CONFREST | Name of switch: Suppress execution confirmation of AMO-REST |
|          | Type of Input : Single value, optional                      |
|          | Possible Values : ON, OFF                                   |
|          | Standard : ON                                               |
| LOGBKOFF | Name of switch: Switch off logging                          |
|          | Type of Input : Single value, optional                      |
|          | Possible Values : 0 till 8                                  |
|          | 0 NONE                                                      |
|          | 1 EXEC-UPLO/UPLO2                                           |
|          | 2 DISPLAY( ABFRAGEN) -BUEND                                 |
|          | 3 REGEN-CPTP                                                |

| SLANG  | Name of switch: Select Session specific AM'O language<br>Type of Input : Single value, optional<br>Possible Values : GER: German<br>ENG: English<br>Default Value : GER                                                                                                                                                                                     |
| SPLIT  | Name of switch: split mode<br>Type of Input : Single value, optional<br>Possible Values : ON, OFF<br>Default Value : OFF                                                                                                                                                                                                                                    |
| SS7CTR | Name of switch: Type of SS7 controller attached to the Hicom<br>Type of Input : Single value, optional<br>Possible Value : NO : No controller connected<br>TUP : Telephone user part controller connected<br>ISUP : ISDN user part controller connected<br>Default Value : NO                                                                               |
| SUSY   | Name of switch : Loading indication for SIT<br>Type of Input : Single value, optional<br>Possible Values : ON, OFF<br>Default Value : OFF                                                                                                                                                                                                                   |
| VALUE  | Optional parameter VALUE introduced to up to now parameterles action DISPLAY. Parameter VALUE can be set with up to 14 single values (all parameters of action change) concatenated with ampersant (&). Standard set of parameter VALUE, when not given, equals all values except SLANG..<br>Type of Input : Single value ore concatenated with &, optional |

## **FUNCT - System switches**

### Error Messages and Advisories

Possible Value : CMDECHO: command echo switch  
AMOOK: amo performance display switch  
AMOHDR: amo protocol header switch  
SUSY: loading indication switch for UBGDAT subsystem in SIT  
RTOADS: ADS routine test switch  
RTOTFS: TFS routine test switch  
RTOVMS: VMSroutine test switch  
LANG: AMO text language switch  
SPLIT: splitting mode switch  
RETENT: XENIX retention time in seconds  
POWERSYS: Type of power system  
PFI: Interpretation of PFI in power system  
SS7CTR: SS7 controller type connected to hicom  
SLANG: select session specific amo language  
REGIN: regen output input usable  
REGKEY: regen output display containing keywords  
REGLN: check regen output length for max. input length

## **101.5 Error Messages and Advisories**

### **101.5.1 Error Messages**

F1: TEXT TABLES NOT FOUND

(The AMO texts cannot be output in the desired foreign language since the necessary test subsystems are not present.)

F2: RTO<TFS/VMS> NOT PRESENT

(The RTO for the TFS/VMS is not present and thus cannot be switched on.)

F4: INACTIVE CC IS NOT IN STATE STAND ALONE

(The AMO was started with SPLIT=ON, but the inactive CC half is not in state "stand alone").

### **101.5.2 Advisories**

none

## 102 FUNSU - System Switches in the switching unit

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error messages and advisories |
| Interrelationships | Parameter Description |                               |

The AMO *FUNSU* processes jobs for the *RTO* (Routine Test Organisation) of the SWU for

- starting and stopping of individual routine tests,
- changing the start frequency of routine tests,
- changing time parameters,
- displaying the status and outputting the control data.

In addition, the switches 'Load from hard disc' and 'Flash memory to be loaded' can be set to load the peripheral loadware and/or flash memory respectively from the HD.

### **RTO test options in the SWU.**

The following test configurations are available;

- All SWU routine tests,
- All routine tests in all or specific CC halves,
- All routine tests in all or specific LTG halves,
- Specific groups of routine tests.

The default value set by the AMO is 'TRUE', which means that the RTO tests may be started.

### **Changing the start frequency of some routine tests.**

The start frequency of individual routine tests can be controlled with the parameter (*RJFREQ*).

| <b>RJFREQ</b> | <b>Meaning</b>                   |
|---------------|----------------------------------|
| 0             | Test is never started            |
| 1             | Test is started in every run     |
| 2             | Test is started in every 2nd run |
| .             | .                                |
| .             | .                                |

Table 21 Routine tests

| <b>RJFREQ</b> | <b>Meaning</b>                     |
|---------------|------------------------------------|
| 255           | Test is started in every 255th run |

Table 21 Routine tests

**Changing time parameters.**

The following time parameters can be changed for each group of routine tests using the AMO FUNSU:

- Test group start time ( *RJSTART* );
- Time at which this test group will not be restarted after having paused between runs ( *RJSTOP* );
- Pause time between two test runs ( *RJPAUSE* );

**Displaying the status and control data.**

The following RTO status can be displayed;

- *AM* (administration and maintenance) start authorization for the RTO of a unit (CC or LTG);
- *FA* (fault analysis) start authorization for the RTO of a unit (CC or LTG);
- AM start authorization for a test group;
- RTO status of a test group;
- Start frequency of individual routine tests.

The following can also be displayed for each test group;

- start time,
- end time and
- pause time between tests.

**Basic initialization of the static RTO memory**

|            |                        |     |
|------------|------------------------|-----|
| Entire RTO | Start authorization AM | YES |
|            | Start authorization FA | YES |

Table 22 Basic initialization

(\*1) At EC HW these tests concern the DDCL module

### Microprocessor checks in the LTUC.

Sporadic errors cause a hardware reset of the LTUC . This subsequently causes the shelf concerned to go out of service. This operation failure is not reported to the dependability system, so that the latter cannot respond appropriately. Only when the microprocessor is tested by the RTO the LTUC is put back into service. The test cycle of the RTO microprocessor tests has thus been stepped up so that a failure of the LTUC microprocessor is detected as rapidly as possible.

In order to avoid the system load it creates, the LTUC microprocessor test will not be contained in the universal microprocessor test routine UPAREQ, but rather will be implemented as a separate routine, LTUCUPRQ .

The repeat time (test intervals or test cycle) will be preset at 3 minutes. Users may alter the test cycle as required. However, it is advisable to leave no more than 3 minutes between the test routines, i.e. RJPAUSE of the group RJP1 multiplied by RJFREQ of the LTUCUPRQ routine should not exceed 180 (seconds).

The action SET is used to set the tests to be carried out by the RTO. However, the changes made by the action SET will only become active after the action EXEC has been called to execute the changes.

### **Setting the Switch 'Load From Hard Disc'**

The loadware is loaded into the LTG RAM during the first system boot and saved there for restarts.

The boards are then supplied with loadware exclusively from the LTG alone and not, as they were previously, from the hard disc. Exchanging loadware on the hard disc basically has no effect at all in the peripherals, unless an LTG is reloaded.

To allow loadware to be exchanged selectively by plugging in and pulling out boards, the central peripheral initialization task (PIT) defines an SW switch which, if set, causes the LW to be loaded from the hard disc when a board is plugged in or an LTG HR occurs.

### **Setting the Switch 'Flash memory to be loaded'**

After a hard restart (without reload) all flash memory modules are, like any other restartable module, not explicitly reloaded. A newly configured module has to be explicitly marked as having to be reloaded. This is done using the parameter 'Flash memory to be loaded'. When set, all flash memory modules will be reloaded with new loadware the next time a load job takes place (Restart or reload).

## **102.1 Restrictions**

This description is valid from SP300-EV3.0.

## **102.2 Interrelationships**

None.

**102.3 Functions of the AMO**

- **SET FUNSU** : Switching the RTO tasks in the SWU.
- **CHANGE FUNSU** : Type PIT: Setting the switch 'Load from hard disc' for peripheral loadware or the switch to load all flash memory modules.
- **EXEC FUNSU** : Activating the RTO tasks in the SWU (See SET-FUNSU).
- **DISPLAY FUNSU** : Displaying the status of the RTO SWU and the RTO control data.

**102.3.1 SET FUNSU**

Setting the RTO SWU and changing RTO control data.

All data concerning the RTO of the SWU (test authorization, time parameters, etc.) is stored in the static database. Each time an update job is performed this database memory is output, changed and rewritten. However, the RTO is only advised of the changes by a message sent to the interface task in the active base processor after the action EXEC has been called.

If none of the optional parameters is specified, the RTO tests will be set to default values.

It is also possible to change the RTO control data of LTGs which are out of service.

**Note**

The default values are obtained from basic initialization of the RTO memory.

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SET-FUNSU    | UNIT=<param>,<br>COMPLEX=UNIT,STARTAUT=<param>;<br><br> COMPLEX=RJGRP,RJGRP=<param>,{[STARTAUT=<param>],<br>[RJSTART=<number>],[RJSTOP=<number>],<br>[RJPAUSE=<number>]};<br> COMPLEX=RJ,RJ=<param>,RJFREQ=<number>; |

**Examples**

1. Issuing the start authorization for LTG1.

Input:

```
SET-FUNSU:GP1A,UNIT,Y;
```

2. Changing the control parameters for a routine job group.

Input:

```
SET-FUNSU:BPA,RJGRP,RJC,Y,18,24,60;
```

3. Changing the test frequency for a test job.

Input:

```
SET-FUNSU:GP1B,RJ,IPREQ,2;
```

Output:

```
H04: RTO OF GP1B IS NOT STARTED BECAUSE THERE IS NO FA START
AUTHORIZATION
```

**102.3.2 CHANGE FUNSU**

- Setting the switch 'Load loadware from hard disc'.

The switch is set with the aid of a message to the central peripheral initialization task ( *PIT* ).

- Setting the switch 'Load flash memory modules'.

The switch is set in the database immediately.

**Note**

Once the switch for 'Load loadware from hard disc' has been set it cannot be unset.

**Procedure Overview**

| Command Code | Parameter                                                                           |
|--------------|-------------------------------------------------------------------------------------|
| CHANGE-FUNSU | PIT=LWLOAD;<br>  PIT=FLASH, [PARTNO=<param>], [FCTID=<param>],<br>[ACTION=<param>]; |

**Examples**

4. Setting the switch 'Load loadware from HD'.

Input:

```
CHANGE-FUNSU:PIT=LWLOAD;
```

- 5. Setting the switch 'Load flash memory modules' for board Q2144-X with funftion identification 0 to 'load'.

Input:

```
CHANGE-FUNSU:PIT=FLASH,Q2144-X,0,LOAD;
```

- 6. Reset the switch 'Load flash memory modules' for all flash boards with the funftion identification 1.

Input:

```
CHANGE-FUNSU:PIT=FLASH,,1,RESET;
```

**102.3.3 EXEC FUNSU**

Advising the RTO SWU about changed RTO control data.

The RTO is advised by a message sent to the interface task in the active base processor. Finally, acknowledgment from the main task of the unit concerned is sent back to the AMO. This must be done to activate the changes made by the action SET.

**Procedure Overview**

| Command Code | Parameter     |
|--------------|---------------|
| EXEC-FUNSU   | UNIT=<param>; |

**Examples**

- 1. Advising the LTG1 (A half) of RTO changes.

Input:

```
EXEC-FUNSU:GP1A;
```

Output:

```
H03: RTO OF GP1A IS STARTED WITH NEW DATA.
```

- 2. Advising the BP (A half) of RTO changes.

Input:

```
EXEC-FUNSU:BPA;
```

Output:

```
H03: ROUTINE TEST OF PROCESSOR BPA WILL BE STOPPED
```

- 3. Advising the LTG1 (B half) of RTO changes.

Input:

```
EXEC-FUNSU:GP1B;
```

Output:

H04: RTO OF GP1B IS NOT STARTED BECAUSE THERE IS NO FA START  
AUTHORIZATION

## 102.3.4 DISPLAY FUNSU

Used to display the status of the RTO SWU and RTO control data.

### Procedure Overview

| Command Code  | Parameter                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-FUNSU | UNIT=<param>,<br>COMPLEX=UNIT, [OUTPUT=<param>];<br>  COMPLEX=RJGRP, RJGRP=<param>, [OUTPUT=<param>];<br>  COMPLEX=RJ, [RJ=<param>]; |

### Examples

1. Displaying the test frequency of test jobs.

Input:

DISPLAY-FUNSU:CC,RJ,IPREQ&CCHREQ&MBUAREQ;

Output:

| UNIT | ROUTINE JOB | START FREQ. |
|------|-------------|-------------|
| BPA  | IPREQ       | 1           |
|      | CCHREQ      | 0           |
|      | MBUAREQ     | 1           |
| BPB  | IPREQ       | 1           |
|      | CCHREQ      | 2           |
|      | MBUAREQ     | 1           |

2. Displaying the status of routine job groups.

Input:

DISPLAY-FUNSU:BPA,RJGRP,RJC&RJP1,STATUS;

Output:

| UNIT | RJ GROUP | START AUTH<br>(AM) | STATUS<br>(RTO) |
|------|----------|--------------------|-----------------|
| BPA  | RJC      | NO                 | NOT ALLOWED     |
|      | RJP1     | YES                | READY           |

## FUNSU - System Switches in the switching unit

### Functions of the AMO

#### 3. Displaying all the data of routine job groups.

Input:

DISPLAY-FUNSU:BPA,RJGRP,RJC,ALL;

Output:

|                           |                  |                 |       |
|---------------------------|------------------|-----------------|-------|
| +-----+-----+-----+-----+ |                  |                 |       |
|                           | UNIT             | :               | BPA   |
| +-----+-----+-----+-----+ |                  |                 |       |
|                           | RJ GROUP         | :               | RJC   |
|                           | PAUSE (S)        | :               | 60    |
|                           | START AUTH. (AM) | :               | YES   |
|                           | START (HH)       | :               | 18    |
|                           | STATUS (RTO)     | :               | READY |
|                           | STOP (HH)        | :               | 24    |
| +-----+-----+-----+-----+ |                  |                 |       |
|                           | ROUTINE JOB      |                 |       |
| +-----+-----+-----+-----+ |                  | START FREQUENCY |       |
|                           | IPREQ            |                 |       |
|                           | CCHREQ           |                 |       |
|                           | MBUAREQ          |                 |       |
|                           | IOCCAREQ         |                 |       |
|                           | IOCGREQ          |                 |       |
|                           | DCLREQ           |                 |       |
|                           | MBUATEST         |                 |       |
|                           | IOCCATST         |                 |       |
|                           | CCHIECBS         |                 |       |
|                           | IPTEST           |                 |       |
| +-----+-----+-----+-----+ |                  |                 |       |
| -+                        |                  |                 |       |

#### 4. Displaying the start authorization of RTOs.

Input:

DISPLAY-FUNSU:CC,UNIT,STATUS;

Output:

|                           |      |  |             |
|---------------------------|------|--|-------------|
| +-----+-----+-----+-----+ |      |  |             |
|                           | UNIT |  | START AUTH. |
|                           |      |  | (AM)        |
|                           |      |  | (FA)        |
| +-----+-----+-----+-----+ |      |  |             |
|                           | BPA  |  | YES         |
|                           | BPB  |  | NO          |
| +-----+-----+-----+-----+ |      |  |             |

#### 5. Displaying all the data of RTOs.

Input:

DISPLAY-FUNSU:BPA,UNIT,ALL;

Output:

|                           |                        |                 |                        |
|---------------------------|------------------------|-----------------|------------------------|
| +-----+-----+-----+-----+ |                        |                 |                        |
|                           | UNIT                   | : BPA           |                        |
|                           | START AUTH. (AM) : YES |                 | START AUTH. (FA) : YES |
| +-----+-----+-----+-----+ |                        |                 |                        |
|                           | RJ GROUP               | : RJC           |                        |
|                           | START AUTH. (AM) : YES |                 | STATUS (RTO) : READY   |
|                           | PAUSE (S) : 60         | START (HH) : 18 | STOP (HH) : 24         |
| +-----+-----+-----+-----+ |                        |                 |                        |
|                           | ROUTINE JOB            |                 | START FREQ.            |
| +-----+-----+-----+-----+ |                        |                 |                        |
|                           | IPREQ                  |                 | 1                      |
| +-----+-----+-----+-----+ |                        |                 |                        |

## FUNSU - System Switches in the switching unit

### Parameter Description

|                           |                 |                        |                        |  |
|---------------------------|-----------------|------------------------|------------------------|--|
|                           | CCHREQ          |                        | 2                      |  |
|                           | MBUAREQ         |                        | 1                      |  |
|                           | IOCCAREQ        |                        | 0                      |  |
|                           | IOCGREQ         |                        | 0                      |  |
|                           | DCLREQ          |                        | 1                      |  |
|                           | MBUATEST        |                        | 1                      |  |
|                           | IOCCATST        |                        | 1                      |  |
|                           | CCHIECBS        |                        | 6                      |  |
|                           | IPTEST          |                        | 1                      |  |
| +-----+-----+-----+-----+ |                 |                        |                        |  |
|                           | UNIT : BPA      | START AUTH. (AM) : YES | START AUTH. (FA) : YES |  |
| +-----+-----+-----+-----+ |                 |                        |                        |  |
|                           | RJ GROUP : RJP1 | START AUTH. (AM) : YES | STATUS (RTO) : READY   |  |
|                           | PAUSE (S) : 60  | START (HH) : 18        | STOP (HH) : 24         |  |
| +-----+-----+-----+-----+ |                 |                        |                        |  |
|                           | ROUTINE JOB     |                        | START FREQ.            |  |
| +-----+-----+-----+-----+ |                 |                        |                        |  |
|                           | DPTIMOUT        |                        | 1                      |  |
|                           | DPWDCTR0        |                        | 1                      |  |
|                           | DPWDCTR1        |                        | 1                      |  |
|                           | DPRDYREQ        |                        | 2                      |  |
|                           | DCLTEST         |                        | 2                      |  |
|                           | IOCGTEST        |                        | 0                      |  |
|                           | MEMACEA         |                        | 1                      |  |

## 102.4 Parameter Description

|         |                                                   |                           |                              |
|---------|---------------------------------------------------|---------------------------|------------------------------|
| ACTION  | Loading type of board                             |                           |                              |
|         | Type of Input                                     | : Single value, optional  |                              |
|         | Possible Values                                   | : LOAD                    | forced loading for the board |
|         |                                                   | RESET                     | reset of the forced loading  |
|         | Default Value                                     | : LOAD                    |                              |
| COMPLEX | RTO complex.                                      |                           |                              |
|         | Type of Input                                     | : Single value, mandatory |                              |
|         | Possible Values                                   | : UNIT                    | RTO of a unit,               |
|         |                                                   | RJGRP                     | Test group,                  |
|         |                                                   | RJ                        | Individual routine test.     |
| FCTID   | Function identification for multi function boards |                           |                              |

## FUNSU - System Switches in the switching unit

### Parameter Description

|        |                                                                     |                                                                                                                    |                                |
|--------|---------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|--------------------------------|
|        | Type of Input                                                       | : Single value, optional                                                                                           |                                |
|        | Possible Values                                                     | : 0 - 255                                                                                                          |                                |
|        | Default Value                                                       | : 0                                                                                                                | ( 0=non multi function board)  |
| OUTPUT | Output mode.                                                        |                                                                                                                    |                                |
|        | Type of Input                                                       | : Single value, optional                                                                                           |                                |
|        | Possible Values                                                     | : STATUS                                                                                                           | Outputting the status,         |
|        |                                                                     | ALL                                                                                                                | Outputting all data.           |
|        | Default Value                                                       | : STATUS                                                                                                           |                                |
| PARTNO | Part number of board                                                |                                                                                                                    |                                |
|        | Type of Input                                                       | : Single value, optional                                                                                           |                                |
|        | Possible Values                                                     | : any text string, max. 10 characters                                                                              |                                |
|        | Default Value                                                       | : Code number in accordance with the table of permissible modul types, eg., "Q2057-X..."                           |                                |
| PIT    | Peripheral Interface Task.                                          |                                                                                                                    |                                |
|        | Type of Input                                                       | : Single value, mandatory                                                                                          |                                |
|        | Possible Values                                                     | : LWLOAD                                                                                                           | Load loadware from Hard disk,  |
|        |                                                                     | FLASH                                                                                                              | Load all flash memory modules. |
| RJ     | Routine job.                                                        |                                                                                                                    |                                |
|        | If the parameter is not specified, all routine jobs will be output. |                                                                                                                    |                                |
|        | Type of Input                                                       | : Linked single values, mandatory (SET)<br>Linked single values, optional (DISPLAY)                                |                                |

|        | IOCGREQ                                                             | Displaying the input/output controller GP (IOCG) or the input/output controller (IOC)                              | RJC                            |
|        | DCLREQ                                                              | Displaying the data comm. link (DCL) or the double communication link (DDCL)                                       | RJC                            |
|        | MBUATEST                                                            | Testing all message buffer units (MBU)                                                                             | RJC                            |
|        | IOCCATST                                                            | Testing all input/output controllers, central (IOCC) or the input/output control central switching network (IOCSN) | RJC                            |

## FUNSU - System Switches in the switching unit

### Parameter Description

|          |                                                                                                                    |      |
|----------|--------------------------------------------------------------------------------------------------------------------|------|
| CCHIECBS | Testing the IEC bus between the RJP1 CCH modules                                                                   | RJC  |
| IPTEST   | Interface processor (IP) test                                                                                      | RJC  |
| DPTIMOUT | HW monitor circuit to be used for initiating multibus timeouts on the DP module                                    | RJP1 |
| DPWDCTR0 | HW monitor circuit to be used for starting watchdog counter 0 on the DP module                                     | RJP1 |
| DPWDCTR1 | HW monitor circuit to be used for starting watchdog counter 1 on the DP module                                     | RJP1 |
| DPRDYREQ | Displaying the +ready+ line of the partner data processor                                                          | RJP1 |
| DCLTEST  | Testing the data communication link (DCL) or the double communication link (DDCL)                                  | RJP1 |
| IOCGTEST | Testing the input/output controller group (IOCG) or the input/output controller (active) performs test on standby) | RJP1 |
| MEMACEA  | Reading all memory cells on all M8M and DPML286 memory modules (parity check)                                      | RJP1 |
| MEM1AREQ | Displaying 1-bit errors on all M2M memory modules                                                                  | RJP1 |
| GSNMTSCM | Testing the MTS/GSN in the standby section by reading any TSL on every component in MTS64 modules                  | RJP1 |
| LTUCUPRQ | Displaying all microprocessors of the LTUC module in an LTG                                                        | RJP1 |
| SYMCHKAL | Testing the SLMO board to see if the Symphony device is still alive.                                               | RJP1 |
| CONWADP  | Testing connection between WAML and ADP                                                                            | RJP1 |
| CIRA     | Testing all circuits on a specific line circuit module                                                             | RJP2 |
| CIRAENDA | Testing all terminals on all circuits of a specific line circuit module                                            | RJP2 |
| UPAREQ   | Displaying all microprocessors in the periphery of an LTG                                                          | RJP3 |
| LTUAHWYA | Testing all time slots on all highways leading to all LTU mod. Testing the LTG shelf (without the service unit)    | RJP3 |
| STBYWYA  | Standby Highway A                                                                                                  | RAP3 |
| BDHWYTST | Board Highway Test                                                                                                 | RAP1 |
| SIUTSTTR | Echoing any test transmitter on the associated test receiver                                                       | RJP3 |
| SIUDTO   | Echoing a continuous tone on any SLC of any dial tone receiver                                                     | RJP3 |
| SIUPTO   | Echoing a cadenced tone on any SLC of a dial tone receiver                                                         | RJP3 |

## FUNSU - System Switches in the switching unit

### Parameter Description

|         |                                              |                                                                                                         |      |
|---------|----------------------------------------------|---------------------------------------------------------------------------------------------------------|------|
|         | SIUCSCR                                      | Echoing any code transmitter of an SIU periphery (SIU type 2) on all code receivers of the standard SIU | RJP3 |
|         | SIUPCSCR                                     | Echoing all code transmitters on all code receivers of the SIU periphery module (SIU type 2/3)          | RJP3 |
|         | SURVPATA                                     | Survivability Path test                                                                                 | RJP1 |
|         | LTUCCCBM                                     | LTUCC Central Byte Manipulation test loop                                                               | RJP3 |
|         | SIUPTDSA                                     | TDS loopback test event DSC                                                                             | RJP3 |
|         | SIUTDSA                                      | TDS loopback test event DSCX                                                                            | RJP3 |
| RJFREQ  | Start frequency of single routine test jobs. |                                                                                                         |      |
|         | Type of Input                                | : Single value, mandatory                                                                               |      |
|         | Possible Values                              | : 0 to 255                                                                                              |      |
|         | 0                                            | Never tested,                                                                                           |      |
|         | 1                                            | Start at every run,                                                                                     |      |
|         | 2                                            | Start at every 2nd run,                                                                                 |      |
|         | .                                            |                                                                                                         |      |
|         | .                                            |                                                                                                         |      |
|         | x <= 255                                     | Start at every xth run.                                                                                 |      |
| RJGRP   | Routine job groups.                          |                                                                                                         |      |
|         | Type of Input                                | : Linked single values, mandatory                                                                       |      |
|         | Possible Values                              | : RJC                      Display firmware,                                                            |      |
|         |                                              | RJP1                      Test central units,                                                           |      |
|         |                                              | RJP2                      Test interface circuits,                                                      |      |
|         |                                              | RJP3                      Test peripheral units.                                                        |      |
| RJPAUSE | Pause time between two tests (seconds).      |                                                                                                         |      |

## 103 GEFE - Administering the Charge Registration Parameters

The description of this AMO is only available in html format!

## 104 GENDB - Generate Data Base with MML Command File

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO GENDB is used to generate the system databases (DBs) in batch operation. Before first-time generation, a database must be initialised for configuration data (CFIGDA) and customer data (CUSTDA). Databases which have been thus initialized can be loaded with the aid of the AMO LDB, if present on the hard disk.

AMO GENDB can only be started, if the APS numbers entered into the directory files are identical to those in the MML command file. The numbers in the MML command file can be changed on the hard disk with the aid of the AMO ASPIK. The current APS numbers in the system can be interrogated via the DISPLAY action of the AMO VEGAS, parameter FLIST=LONG.

If the AMO-TEXT-APS-NO in the MML command file are not the same as those in the system, the GENDB will close with an error message, the status 'FREE' will remain in the VEGAS file. If the RES-CODE-APS-NO or the AMO-CODE-APS-NO are different the status will be set to 'ABORTED'.

If an interrupted generation is to be continued via the CONT parameter of the AMO GENDB, the partially generated database must correspond to the MML command file. The AMO checks that the system number entered in the database is identical to that in the MML command file. Continue GENDB is only possible, if the status in the VEGAS file is set to 'INTRUPTD' or 'SYBRO'(system crash).

During generation, a sorted file of MML commands is read sequentially, and the DBs generated with the aid of the respective AMOs. The sequence in which the AMOs are called up during generation can be seen in the generating sequence control file. When creating the MML command file with DAGEN, the AMOs are automatically sorted in the correct sequence. The generation sequence is logged in an error and execution file.

AMO GENDB permits parallel generating runs for the DBs in the SWU and ADS. For parallel generation, the AMO must be started separately for each server (single value for parameter UNIT). Otherwise, the generating runs will be executed sequentially.

Generating (or regenerating) runs on the system are coordinated by the AMO VEGAS. The system access status for each HW module is entered in the VEGAS file (control file). The AMO GENDB can only be started if all the modules to be generated are entered in the file as 'FREE', or have been reserved for the AMO GENDB by the user

## GENDB - Generate Data Base with MML Command File

### Restrictions

(status='RESERVED').

With the DELETE action of the AMO VEGAS, the operator can set all module operating state entries in the VEGAS file to 'FREE', thus enabling a successful start of the AMO GENDB. After a correct run of GENDB the status is set to 'FINISHED'. The operator can interrogate the state of the generating (or regenerating) run on the system by calling up the DISPLAY action of the AMO VEGAS.

If DBHOLD=N (no) was entered, then the DBs are loaded from the hard disk on completion of the generating run. When the system is restarted after a generating run, the operating state entries for all (re)generated modules in the VEGAS file are automatically set to 'FREE'.

GENDB can be executed if no system number is entered. If SYSNO is already added (e.g. from a previous GENDB), it can be cleared with the following command:

```
ADD-ANSU:TYPE=SYSNO,SYSNO="NO-ENTRY-IN-DBASE";
```

---

**NOTE:** If SWU is cleared with the AMO DBC parameter RESSWUDB, also CODEW is lost and must be re-added via license activation or a previously saved REG-CODEW.

---

## 104.1 Restrictions

This description is valid from SP300-V3.1

## 104.2 Interrelationships

- AMO ASPIK : Change System Program Number in MML Command File on Hard Disk
- AMO LDB : Load Data Base from Hard Disk
- AMO REGEN : Regenerate Customer Data from Data Base
- AMO VEGAS : Administrate Generation Runs on Support System

## 104.3 Functions of the AMO

- [START-GENDB](#) : Start batch processing

## 104.3.1 START-GENDB

Start sequential processing of command batches.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                           |      |

(\*2) Parameter valid from SP300-V3.2

(\*3) Parameter valid from SP300-V3.4

### Example

Generate SWU module with MML command file :PAS:L31111/  
S1111X11111/0000/MML.

Input:

```
START-GENDB: ":PAS:L31111/S1111X11111/0000/MML",MEIER,SWU;
```

Display/hardcopy output at service terminal/printer:

```
H01: START OF GENDB GENERATION
H02: GENERATION OF HW-MODULE SWU HAS BEEN STARTED
H25: NOUN: UCSU   MML-CMDS: 6      STARTED   :6      EXECUTED :6
H27: GENERATION WITH NOUN BCSU   STILL IN PROGRESS
H25: NOUN: BCSU   MML-CMDS: 51     STARTED   :51     EXECUTED :51
H27: GENERATION WITH NOUN WABE   STILL IN PROGRESS
H27: GENERATION WITH NOUN WABE   STILL IN PROGRESS
H27: GENERATION WITH NOUN WABE   STILL IN PROGRESS
H25: NOUN: WABE   MML-CMDS: 214    STARTED   :214    EXECUTED :214
H25: NOUN: ZAND   MML-CMDS: 1      STARTED   :1      EXECUTED :1
.
```

## Functions of the AMO

```

Output in result file <Format short>

If PROT=N was entered, then only MML command errors are output in the result file after the result file header (see Format long), together with the appropriate error messages.

## 104.4 Parameter Description

BSACCNO            Account number for BS2000  
                   Type of Input            : Single value, mandatory

## GENDB - Generate Data Base with MML Command File

### Parameter Description

|         |                                                                                           |                                                                               |
|---------|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
|         | Possible Values                                                                           | : Any BS2000 account number (max. 8 chars.)                                   |
| BSLOGID | User ID for BS2000                                                                        |                                                                               |
|         | Type of Input                                                                             | : Single value, mandatory                                                     |
|         | Possible Values                                                                           | : Any BS2000 user IDs (max. 8 chars.)                                         |
| BSPSWD  | BS2000 password                                                                           |                                                                               |
|         | Type of Input                                                                             | : Single value, mandatory                                                     |
|         | Possible Values                                                                           | : Valid BS2000 password (max. 10 chars.)<br>prefixed by "c", e.g. c'1234abcd' |
| BSPTNR  | Symbolic name of BS2000 host                                                              |                                                                               |
|         | Type of Input                                                                             | : Single value, mandatory                                                     |
|         | Possible Values                                                                           | : Symbolic name of connected BS2000 host,<br>(max. 8 chars) e.g.: DVAPROC1    |
| CONT    | Continuation required                                                                     |                                                                               |
|         | Type of Input                                                                             | : Single value, optional                                                      |
|         | Possible Values                                                                           | : Y, N                                                                        |
|         | Default Value                                                                             | : N                                                                           |
| DBHOLD  | Retention of DB in main memory after an error free generation, and if DBSAVE=Y also on HD |                                                                               |
|         | Type of Input                                                                             | : Single value, optional                                                      |
|         | Possible Values                                                                           | : Y, N                                                                        |
|         | Default Value                                                                             | : Y                                                                           |
| DBSAVE  | Updating of database during generation                                                    |                                                                               |
|         | Type of Input                                                                             | : Single value, optional                                                      |
|         | Possible Values                                                                           | : Y, N                                                                        |
|         | Default Value                                                                             | : N                                                                           |

# 105 GETAB - CM charge data display from CDRS files (CDR station)

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The task of this AMO is to call up data for partial or complete output of the GET-file on add-on devices and to store this in a dialog field in the database. Data can be output for stations or for lines.

The actual output time can be determined by the user himself, as opposed to immediate output. A choice of three possible start times and the option of entering a periodic cycle length for cyclic, iterative output permits a number of combinations and a wide range of applications.

A maximum of 8 dialog fields are available for calling up the GET file.

## 105.1 Interrelationships

- AMO-TTBL : SMDR/DMDR tariff table
- AMO-GEZU : SMDR/DMDR device allocation
- AMO-FEACG : SMDR/DMDR Feature List

## 105.2 Functions of the AMO

- [ADD-GETAB](#) : Set timer jobs (short or long dialog)
- [DELETE-GETAB](#) : Delete timer job
- [OUTPUT-GETAB](#) : Immediate output
- [STOP-GETAB](#) : Stop immediate output
- [DISPLAY-GETAB / REGENERATE-GETAB](#) : Interrogate dialog field(s) with on-screen output /  
Interrogate the dialog field(s) with output of position-oriented command listing for regeneration

### 105.2.1 ADD-GETAB

Long dialog is the original form for setting a timer job and can subsequently be replaced by short dialog.

A prerequisite for starting a short dialog is that a dialog field has been set up previously by means of long dialog and that it contains all the values necessary for output (e.g. tariff, output device). In short dialog it is then only necessary to specify the current subscriber number, a subscriber list or a line list and the delete flag.

Immediate output takes place after a short dialog has been created.

When setting timer jobs the user can select between the following 4 possibilities:

- a) one-off timer job single  
This is a timer job for a single output at an output time defined by the user. To obtain a correct output, the year, month, day, hour and minute of the starting time must be specified.
- b) one-off timer job multiple  
This is a timer job in which the user can define up to 3 outputs in advance, but with the restriction that all outputs must be within a month, since for the second output and the third (if one is specified) the year, month and minutes defined for the first output date are taken, and thus only the day and hour parameters are variable. The first start time must be entered in the same way as described in a). Start times 2 and 3 can then be defined either by simply indicating the day (the hour is then taken from the 1st start time), or by indicating the hour (the day is then taken from the 1st start time). Another possibility is to give a separate day and hour entry both for start time 2 and start time 3. However, in this case the day and hour must be stated for all start times, otherwise the entry is rejected.
- c) periodic timer job single  
This is a timer job that results in output at periodic intervals (intervals can be months, days or hours). In addition to the first start time which must be stated in the same way as in a), a period must be entered after which the next output will take place. This period must be expressed in months (1-12), days (1-31) or hours (1-24).
- d) periodic timer job multiple  
This is a timer job with which up to 3 different output dates can be defined; a period length is defined additionally. The up to 3 different start times are entered in the same manner as described in b), the period length as in c). To avoid output overlapping, however, the following restrictions must be observed:

1. If the interval between the individual outputs is greater than one day (i.e. different days were specified for the start times), then the shortest possible period that can be entered is 1 month. (Days and hours are not possible. If they are entered, an error message is issued.)
2. If the interval between the individual outputs is only in hours (the same day was chosen for the output), the smallest possible period is 1 day (if hours are entered, an error message is issued).

## Procedure Overview

### Command Code

ADD-GETAB

### Parameter

TYPE=L, DIAFNO=<number>, DEV=<string>, TAR=<string>  
 , STAT=<string>, [STADAY2=<string>], [STADAY3=<string>]  
 , [STAHR2=<number>], [STAHR3=<number>]  
 , [PERIOD=<string>], STNO=<string>, DEL=<string>;  
 |TYPE=S, DIAFNO=<number>, STNO=<string>, DEL=<string>;

### Example

1. Create a dialog field

Parameter STAT=0 means current start time.

Input:

ADD-GETAB:L,1,DEV1,TAR01,0,15,20,8,16,1M,STN,N;

## 105.2.2 DELETE-GETAB

It is only possible to delete a dialog field that has been set up. The contents are changed to standard values and the dialog field marked as free.

## Procedure Overview

### Command Code

DELETE-GETAB

### Parameter

DIAFNO=<number>;

### Example

1. Delete a dialog field

Input:

DELETE-GETAB:1;

**105.2.3 OUTPUT-GETAB**

Immediate output of a dialog field is only possible if a dialog field has been set up. The contents are taken over and an immediate output initiated without the start times or the period in the dialog field being changed.

At this Action there is no use of the parameter "DEL". That means that the data will not be deleted even if the parameter "DEL" is set to "YES".

**Procedure Overview**

| Command Code | Parameter        |
|--------------|------------------|
| OUTPUT-GETAB | DIAFNO=<number>; |

**Example**

1. Immediate output via dialog field 1  
Input:  
OUTPUT-GETAB:1;

**105.2.4 STOP-GETAB**

Output is aborted. The abort flag is entered in the dialog field by GETAB and the current output is aborted.

**Procedure Overview**

| Command Code | Parameter        |
|--------------|------------------|
| STOP-GETAB   | DIAFNO=<number>; |

**Example**

1. Stop the immediate output via dialog field 1  
Input:  
STOP-GETAB:1;

**105.2.5 DISPLAY-GETAB / REGENERATE-GETAB**

1. Interrogating the dialog fields with output in list form (DISPLAY).
2. Interrogating the dialog fields with output in position-oriented commands for regeneration (REGENERATE).

### Procedure Overview

| Command Code     | Parameter          |     |
|------------------|--------------------|-----|
| DISPLAY-GETAB    | [DIAFNO=<number>]; | (1) |
| REGENERATE-GETAB | [DIAFNO=<number>]; | (2) |

### Examples

#### 1. Interrogate dialog field 1

Input:

DISPLAY-GETAB:1;

Output:

|                |            |                 |                     |
|----------------|------------|-----------------|---------------------|
| DIALOG FIELD : | 1          | STATUS :        | TIMED ORDER RUNNING |
| FILE :         | GET        | DEV :           | DEV1                |
| FORMAT :       | GETFORM    | BLOCK SIZE :    | 1                   |
| DELETE :       | N          | ABORT :         | Y                   |
| START TIME 1 : | 9909150803 | PERIOD :        | 01M                 |
| START TIME 2 : | 9909201603 | START TIME 3 :  | 9910061403          |
| TARIFF :       | TAR01      | SINGLENO/LIST : | STN                 |

#### 2. Regenerate dialog field 1

Input:

REGENERATE-GETAB:1;

Output:

ADD-GETAB: L,1,DEV1,TAR01,9909150803,20,06,16,14,01M,STN,N;

## 105.3 Parameter Description

**DEL** Delete

Type of Input : Single value, mandatory (ADD)

Possible Values : Y = Yes  
N = No

**DEV** Symbolic Output device, Device Type (DH)

Type of Input : Single value, mandatory (ADD)

Possible Values : DEV1 = Device 1  
DEV2 = Device 2  
DEV3 = Device 3  
DEV4 = Device 4

## GETAB - CM charge data display from CDRS files (CDR station)

### Parameter Description

|                 |                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------|
| DIAFNO          | Number of dialog field                                                                  |
| Type of Input   | : Single value, mandatory (ADD, DELETE, OUTPUT, STOP)<br>optional (DISPLAY, REGENERATE) |
| Possible Values | : 1 - 8                                                                                 |
| PERIOD          | Timing of periodic output                                                               |
| Type of Input   | : Single value, optional (ADD)                                                          |
| Possible Values | : max. of 3 Positions                                                                   |
|                 | 01M - 12M = mounth                                                                      |

## GETAB - CM charge data display from CDRS files (CDR station)

### Parameter Description

Type of Input : Single value, mandatory (ADD)  
Possible Values : 0 = current start time  
10 positions = YYMMDDHHmm  
00 - 99 = Year (YY),  
01 - 12 = Month (MM),  
01 - 31, 0U, 1U, = Day (DD),  
2U, 3U  
00 - 23 = Hour (HH),  
00 - 59 = Minute (mm)  
N = Preset only , without start of output.  
0U = Starting on the last day of month  
1U = Starting on the next to last day of month  
2U = Starting on the second to last day of month  
3U = Starting on the third to last day of month

STNO Telephone number of system switch

Type of Input : Single value, mandatory (ADD)

Possible Values : max. of 22 Positions

ALL = Any station number  
AMT = Central office station number  
HAS = PBX set  
STN = Station number  
VF = Attendant

TAR Tariff used for call charge computations

Type of Input : Single value, mandatory (ADD)

Possible Values : TAR01 = Tariff list 1  
TAR02 = Tariff list 2  
TAR03 = Tariff list 3  
TAR04 = Tariff list 4  
TAR05 = Tariff list 5  
TAR06 = Tariff list 6  
TAR07 = Tariff list 7  
TAR08 = Tariff list 8  
TAR09 = Tariff list 9

TYPE Input Mode (Short or Long Dialog)

Type of Input : Single value, mandatory (ADD)

Possible Values : L = Long dialog  
S = Short dialog

## **105.4 Error Messages and Advisories**

### **105.4.1 Error Messages**

F01: SPECIFIED DIALOG FIELD FREE, PLEASE START LONG DIALOG FIRST  
F02: DIALOG FIELD INDICATED HAS ALREADY BEEN WRITTEN  
F03: SPECIFIED COMBINATION OF START TIME 2 AND START TIME 3 NOT POSSIBLE

## 106 GETPD - CM deletion of CDRS files

|                      |                               |
|----------------------|-------------------------------|
| Interrelationships   | Parameter Description         |
| Functions of the AMO | Error Messages and Advisories |

In order to be able to erase a station with CDRS access from the CDRS file, the selection needs a rub-out indicator (delete mark) for the station number. The task of the AMO is to pass one or more station numbers to the selection, in order to place the delete marks.

### 106.1 Interrelationships

None

### 106.2 Functions of the AMO

- **DELETE-GETPD** : Defines the station number(s) to be forwarded for deletion

#### 106.2.1 DELETE-GETPD

One or more station numbers are entered with the AMO (the MMI limits this to 62 chained single values) or the sum of all possible numbers (i.e. SGLNO=N). The AMO now forwards these station numbers to the selection. The deletion itself will be performed by the data selection.

#### Procedure Overview

##### Command Code

DELETE-GETPD

##### Parameter

SGLNO=Y, STNO=<number>;  
| SGLNO=N;

##### Example:

Input:

DELETE-GETPD:Y,234567&123&45;

**GETPD - CM deletion of CDRS files**

# 107 GEZAB - Call Charge Data Request Output to Options

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

In contrast to immediate output, the output on request provides the system user with the option to select the time at which the call charge data is to be output.

The action ADD-GEZAB is divided into long dialog and short dialog branches. The long dialog defines all parameters of the call charge data request. Individual parameters can be modified via the short dialog with CHANGE-GEZAB.

By using a long dialog, a timer job can be defined, i.e., automatic start of call charge data output for a CDRC file at a specified time.

Prerequisite for starting of action ADD-GEZAB via short dialog, is that a timer job has already been defined previously via ADD-GEZAB (in long dialog).

Prerequisite:

For the application of AMO-GEZAB a GEZ file must be defined as output device with AMO-SELG and the assigned selectiongroup must be activated.

## 107.1 Interrelationships

- AMO-DAGR : Administration of file parameter in CDR
- AMO-FEACG : SMDR/DMDR feature list
- AMO-FTBL : Administration of the output format tables
- AMO-SELG : Administration of selection groups and selection tables

## 107.2 Functions of the AMO

- [ADD-GEZAB](#) : Creating a dialog field for a call charge data request
- [DELETE-GEZAB](#) : Deleting timer jobs
- [STOP-GEZAB](#) : Abort output

## GEZAB - Call Charge Data Request Output to Options

Functions of the AMO

- [OUTPUT-GEZAB](#) : Immediate output
- [DISPLAY-GEZAB / REGENERATE-GEZAB](#) : Displaying dialog fields / Regenerating dialog fields
- [CHANGE-GEZAB](#) : Changing of short dialog

### 107.2.1 ADD-GEZAB

#### Long dialog

This is the original format for setting a timer job. It can be changed to short dialog later.

All parameters are always displayed for the long dialog.

When setting timer jobs the user can select from the 4 following options:

#### Onetime timer job, single:

This is a timer job for a onetime output at an output time specified by the user.

In order to obtain correct output, the year, month, day, hour, and minute of the starting time have to be specified. The time of output is defined via parameter STAT. The contents of parameter FILEEND specify the time up to which the stored call data will be output.

It should be noted that a date can be specified as end-of-file for a onetime timer job, single.

#### Onetime timer job, multiple:

This is a timer job which can be used to predefine up to 3 outputs.

These 3 output starting times must be placed within one month because the year, month, and minute information of the initial, output time is selected for the second or perhaps even a third output.

Thus, only the day and hours information can be selected optionally for the 2nd and 3rd starting time.

The first starting time is to be entered analogously to "onetime timer job, single".

Starting time 2 and 3 now can be defined either by only specifying the day (the hour is selected from the 1st starting time), or by specifying the hour (the day is selected from the 1st starting time).

Another option is to enter separate information for the day and hour for starting time 2 as well as for starting time 3. In this case, however, the day and hour is to be specified for all starting times because the input is rejected otherwise.

In contrast to the "onetime timer job, single", '0' for the end-of-file is required input for all other timer jobs. Output then occurs from the beginning of the file up to and including the respective last date at the time of output. Subsequently, the end-of-file is marked as the new beginning of a file.

**Periodic timer job, single:**

This is a timer job that results in file output at periodic intervals (months, days, or hours are considered intervals).

In addition to the first starting time, a time period must be entered after which the next output occurs. This period is to be specified in months (1-12), days 1-31), or hours (1-24).

**Periodic timer job, multiple:**

This is a timer job which can be used to define up to three different output starting times.

However, the duration of the time period is also defined.

Up to three different starting times are entered analogously to "onetime timer job, multiple".

The duration of the time period is entered analogously to "periodic timer job, single".

However, in order to prevent output overlaps, the following restrictions must be observed:

- If the distance between the individual output times is more than one day (i.e., different days were specified for the starting times), then the shortest possible time period that can be specified is 1 month; days and hours are not possible. (If such an entry is made, an error message is received.)
- Is the difference between the individual output times only in hours (the same day was selected for the output), the shortest possible time period is one day. (If hours are entered for this time period, an error message is received again.)

The following branches are possible:

- Creation of a short dialog.
- Creation of a long dialog.

After the successful ADD-GEZAB action, the job for the call charge data request is stored in a dialog field.

There are 8 dialog fields (parameter DIAFNO), therefore, a maximum of 8 different jobs can be created for call charge data requests.

## GEZAB - Call Charge Data Request Output to Options

Functions of the AMO

### Mandatory output / Write around:

With parameters

DEV=NODEV, DEL=Y, FOUT=Y

the GEZ data records are "written around", this means that the oldest 20% of GEZ data records are deleted automatically.

### Short dialog

When starting the action ADD-GEZAB with mode "S" (short dialog) all parameters are changed, except the two parameters CALLUP and PERIOD.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                 |     |

|              | DEV=NODEV, DEL=<Y/N>, FOUT=<Y/N>;                                                                                                                                                                                                                                                                                                                         | (4) |
|              | DEV=<DEV1/DEV2/DEV3/DEV4/TAPE/FT>, DEL=<Y/N><br>, FORM=<string>, BLKSIZE=<number>, FOUT=<Y/N><br>, STAT=<string><br>, MULTOUT=N, PERIOD=<string>, SELSTOP=<Y/N>;                                                                                                                                                                                          | (5) |
|              | MULTOUT=Y, { (min 1) STADAY2=<string>, STADAY3=<string><br>, STAHR2=<string>, STAHR3=<string>}<br>, PERIOD=<string>, SELSTOP=<Y/N>;                                                                                                                                                                                                                       | (6) |

**Examples**

1. The customer request is as follows:

Monthly evaluation,  
Output of data from 12. April 2000, 00:00 a.m. to 19. April 11:59 p.m.  
Time of output: 7. September 2000, 10:00 a.m.  
The immediate output is to be blocked during output.  
Subsequently, the data are to be deleted.

**Input:**

```
ADD-
GEZAB:TYPE=L,DIAFNO=1,FILE=CDRC1,FILESTA=0004120000,FILEEND=
0004192359,DEV=DEV1

,DEL=Y,FORMAT=FORM01,BLKSIZE=50,FOUT=Y,STAT=0009071000,MUL
TOUT=N,PERIOD=0
,SELSTOP=Y;
```

2. Same as example 1, except output is to occur at the 1st of each month.

**Input:**

```
ADD-
GEZAB:TYPE=L,DIAFNO=2,FILE=CDRC1,FILESTA=0004120000,FILEEND=
0,DEV=DEV1,DEL=Y

,FORMAT=FORM01,BLKSIZE=50,FOUT=Y,STAT=0010011000,MULTOUT=N
,PERIOD=01M
,SELSTOP=Y;
```

3. Output is to occur at the 1st and 15th of each month

**Input:**

```
ADD-
GEZAB:TYPE=L,DIAFNO=3,FILE=CDRC1,FILESTA=0004120000,FILEEND=
0,DEV=DEV1,DEL=Y

,FORMAT=FORM01,BLKSIZE=50,FOUT=Y,STAT=0010011000,MULTOUT=Y
,STADAY2=15
,STAHR2=08,PERIOD=01M,SELSTOP=Y;
```

**Short dialog**

If a timer job has been activated for a dialog field, the dialog field can be rewritten only if the current timer job is stopped (STOP-GEZAB). In that way the state of the dialog field changes from TIMED ORDER RUNNING to state BUSY.

**Examples**

- 1. Preparation: Creation of dialog field 1 with long dialog.  
Input:  

```
ADD-  
GEZAB:TYPE=L,DIAFNO=1,FILE=CDRC1,FILESTA=0,FILEEND=0,DEV=DEV  
1,DEL=Y  
  
,FORMAT=FORM01,BLKSIZE=1,FOUT=Y,STAT=0,MULTOUT=Y,STADAY2=30  
,STahr2=12  
,PERIOD=01M,SELSTOP=Y;
```
- 2. Stopping of state TIMED ORDER RUNNING for dialog field 1.  
Input:  

```
STOP-GEZAB:DIAFNO=1;
```
- 3. Modifying some values in the dialog field 1 with short dialog.  
Input:  

```
ADD-  
GEZAB:TYPE=S,DIAFNO=1,FILESTA=0004121200,STAT=0,MULTOUT  
=N;
```

**107.2.2 DELETE-GEZAB**

The dialog field assigned to the job is deleted and identified as available.  
If a file is being output for the dialog field, the action DELETE-GEZAB is rejected.

**Procedure Overview**

**Command Code**  
DELETE-GEZAB

**Parameters**  
DIAFNO=<number>;

**Example**

- 1. Deleting dialog field 1.  
Input:  

```
DEL-GEZAB:DIAFNO=1;
```

**107.2.3 STOP-GEZAB**

The current file output is interrupted. In this case, GEZAB enters the abort code in the dialog field.

## Procedure Overview

### Command Code

STOP-GEZAB

### Parameters

DIAFNO=<number>;

### Example

1. Stop output from dialog field 1.

Input:

STOP-GEZAB:DIAFNO=1;

## 107.2.4 OUTPUT-GEZAB

If a dialog field has been written previously, the action OUTPUT-GEZAB enables the user to initiate output at any time without changing the dialog field. Immediate output is activated by selecting the action OUTPUT in the dialog and by specifying the corresponding dialog field number. If a file has been incorrectly output (i.e., the output could not be executed properly), the purpose of this action is to output this file as soon as possible at the time most favorable for the user) without affecting the existing timer job.

**Note:** At this Action there is no use of the parameters "FILESTA" and "FILEEND" and the parameter "DEL". That means that the data will not be deleted even if the parameter "DEL" is set to "YES". Also all stored records will be output not just those within the file start and file end.

## Procedure Overview

### Command Code

OUTPUT-GEZAB

### Parameters

DIAFNO=<number>;

### Example

1. Output dialog field 1.

Input:

OUTPUT-GEZAB:DIAFNO=1;

107.2.5 DISPLAY-GEZAB / REGENERATE-GEZAB

Depending on the parameters provided in the dialog command, either one specific, or all dialog fields are displayed on the dialog device. In contrast to the remaining actions provided to the user by GEZAB, not only one but several fields can be addressed in the case of parameter DIAFNO.

- 1. Display of the dialog fields with output in list format (DISPLAY).
- 2. Display of the dialog fields with output in position-oriented commands for the regeneration (REGENERATE).

Procedure Overview

| Command Code     | Parameter         |     |
|------------------|-------------------|-----|
| DISPLAY-GEZAB    | [DIAFNO=<number>; | (1) |
| REGENERATE-GEZAB | [DIAFNO=<number>; | (2) |

Examples

- 1. Display of dialog field 2 with output in list format.

Input:

DISPLAY-GEZAB:DIAFNO=2;

Output:

|                           |                   |   |        |
|---------------------------|-------------------|---|--------|
| DIALOG FIELD : 2          | STATUS            | : | TIMED  |
| ORDER RUNNING             |                   |   |        |
| FILE : CDRC1              | STOP IMMED.OUTPUT | : | YES    |
| HEAD OF FILE : 0004120000 | DEVICE            | : | DEV1   |
| END OF FILE : 0004120000  | FORM              | : | FORM01 |
| BLOCK SIZE : 50           | FORCED OUTPUT     | : | YES    |
| DELETION : YES            | ABORTION          | : | NO     |
| START TIME : 0010011000   | PERIOD            | : | 01M    |
| START TIME2 :             | START TIME 3      | : |        |
| DP - CALL : NO            |                   |   |        |

- 2. Regenerating the timer job for dialog field 2.

Input:

REGENERATE-GEZAB:DIAFNO=2;

**Output:**

```
ADD-
GEZAB:L,2,CDRC1,0004120000,0004120000,DEV1,Y,FORM01,50,Y,N,N,
01M,Y;
```

**Note:**

If parameter STAT=0 (immediate output) was added with ADD-GEZAB, a regeneration will produce STAT=N. Therefore the call of this regenerated command causes no immediate output.

In addition with generating, the value of parameter FILEEND is set automatically to the value of the parameter FILESTA, if the period is in the past.

## 107.2.6 CHANGE-GEZAB

**Short dialog**

If a timer job has been activated for a dialog field, the dialog field can be rewritten only if the current timer job is stopped (STOP-GEZAB). In that way the state of the dialog field changes from TIMED ORDER RUNNING to state BUSY.

With the action CHANGE-GEZAB all parameters can be written new, without the parameter PERIOD.

**Procedure Overview**

**Command Code**

CHANGE-GEZAB

**Parameter**

```
DIAFNO=<number>, { (min 1) FILE=<character>
, FILESTA=<string>, FILEEND=<string>
, DEV=<string>, CALLUP=<Y/N>, DEL=<Y/N>
, FORM=<string>, BLKSIZE=<number>
, FOUT=<Y/N>, STAT=<string>
, MULTOUT=N}, [SELSTOP=<Y/N>];
|MULTOUT=Y, { (min 1) STADAY2=<string>, STADAY3=<string>
, STAHR2=<string>, STAHR3=<string>}, [SELSTOP=<Y/N>];
```

**Examples**

1. The name of file of dialog field 1 to be transmitted is to be modified to CDRC2.

**Input:**

```
CHANGE-GEZAB:DIAFNO=1, FILE=CDRC2;
```

**GEZAB - Call Charge Data Request Output to Options**

Parameter Description

2. The output device (DEV) of dialog field 2 is to be modified from NODEV to DEV1. The value of multiple output (selected: MULTOUT=N) must be set also.

Preperation:

```
ADD-
GEZAB:TYPE=L,DIAFNO=2,FILE=CDRC1,FILESTA=0,FILEEND=0,DEV=NODE
V,DEL=Y,FOUT=Y;
```

Input:

```
CHANGE-GEZAB:DIAFNO=2,DEV=DEV1,MULTOUT=N;
```

Output:

```
F24: PLEASE ENTER VALUE FOR PARAMETER FORM
FORM = input <string>
F24: PLEASE ENTER VALUE FOR PARAMETER BLKSIZE
BLKSIZE = input <string>
F24: PLEASE ENTER VALUE FOR PARAMETER STAT
STAT = input <string>
F24: PLEASE ENTER VALUE FOR PARAMETER SELSTOP
SELSTOP = input <J/N>
```

**107.3 Parameter Description**

|         |                              |                                                                                                                                            |
|---------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| BLKSIZE | Block size                   |                                                                                                                                            |
|         | Type of Input                | : Single value,<br>required (ADD with long dialog)<br>optional (ADD with short dialog)<br>optional, 8. parameter of a min-1-group (CHANGE) |
|         | Possible Values              | : 1 - 128                                                                                                                                  |
| CALLUP  | Call up via data processing  |                                                                                                                                            |

# 108 GEZU - SMDR/DMDR Device Allocation

|                      |                               |
|----------------------|-------------------------------|
| Interrelationships   | Parameter Description         |
| Functions of the AMO | Error Messages and Advisories |

The function of this AMO is to administer *device allocation* tables.

These contain the allocation of symbolic device names (call charge registration device names) to physical device names.

Each symbolic device name may be used once only.

The device allocation table for TTY devices contains a maximum of 4 entries; the table output device DP contains only one entry.

## 108.1 Interrelationships

- AMO-SELG : Administration of selection groups and tables
- AMO-GEZAB : Call Charge Data Request Output to Options
- AMO-GETAB : CM charge data display from CDRS files (CDR station)
- AMO-CPSM : Communication parameters of the data link

## 108.2 Functions of the AMO

- [ADD-GEZU](#) : Add device allocations
- [CHANGE-GEZU](#) : Change device allocations
- [DELETE-GEZU](#) : Delete table entries or tables
- [DISPLAY-GEZU / REGENERATE-GEZU](#) : Display table entries or tables / Regenerate table entries

### 108.2.1 ADD-GEZU

Add device allocations to the device allocation tables.

There are 2 tables: one for TTY and one for DP.

1. Entries for TTY devices.
2. Entries for DP devices.

**Procedure Overview**

| Command Code | Parameter                                                                                                           |
|--------------|---------------------------------------------------------------------------------------------------------------------|
| ADD-GEZU     | TBL=TTY,NAMEOUT=<string>,PHDEV=<string> (1)<br>,DEVCL=<string>;                                                     |
|              | TBL=DP,NAMEOUT=<string>,PHDEV=<string> (2)<br>,DEVCL=<string>,EMSAPPL=<string>,DPNAME=<string><br>,DPAPPL=<string>; |

**Example**

Input:  
  
ADD-GEZU:TTY,DEV1,TTY,TERM3;

**108.2.2 CHANGE-GEZU**

1. Change an entry in the device allocation tables. Either the device designation, the device class or both parameters may be changed. Change TTY entries.
2. Change DP entries.

**Procedure Overview**

| Command Code | Parameter                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------|
| CHANGE-GEZU  | TBL=TTY,NAMEOUT=<string>,{PHDEV=<string> (1)<br>,DEVCL=<string>;                                                     |
|              | TBL=DP,NAMEOUT=<string>,{PHDEV=<string> (2)<br>,DEVCL=<string>,EMSAPPL=<string>,DPNAME=<string><br>,DPAPPL=<string>; |

**Example**

In the table for TTY devices the symbolic device name DEV1 should be allocated to device class TERM2.  
  
Input:  
  
CHANGE-GEZU:TTY,DEV1,TTY,TERM2;

**108.2.3 DELETE-GEZU**

Delete an entry for an entire device allocation table, or for all device allocation tables.

Procedure Overview

| Command Code | Parameter                     |
|--------------|-------------------------------|
| DELETE-GEZU  | [TBL=TTY], [NAMEOUT=<string>; |
|              | [TBL=DP], [NAMEOUT=<string>;  |

Example

In the table for TTY devices the symbolic device name DEV1 should be deleted.

Input:

DELETE-GEZU:TTY,;

108.2.4 DISPLAY-GEZU / REGENERATE-GEZU

- 1. Display the entries for device allocation tables with output in list form (DISPLAY).
- 2. Display the entries for device allocation tables with output in position-oriented commands for regeneration (REGEN).

The user may select whether one entry only, a table, or both tables should be output.

Procedure Overview

| Command Code    | Parameter                         |
|-----------------|-----------------------------------|
| DISPLAY-GEZU    | [TBL=TTY], [NAMEOUT=<string>; (1) |
|                 | [TBL=DP], [NAMEOUT=<string>;      |
| REGENERATE-GEZU | (2)                               |

Examples

- 1. Display device allocation tables

Input:

DISPLAY-GEZU:TTY;

Output:

**GEZU - SMDR/DMDR Device Allocation**  
Parameter Description

| DEVICE ALLOCATION TABLE FOR TTY |                  |                |
|---------------------------------|------------------|----------------|
| SYM. DEVICE NAME                | PHY. DEVICE NAME | DEVICE CLASS   |
| DEV1                            | TELETYPE         | ADM_TERMINAL_2 |
| DEV2                            | NO_SERVICE       | NO_DEVICE      |

# 111 GRA - Get Reset Alarm

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

AMO GRA (Get Reset Alarm) is used to request the alarm mirror or to delete the different alarms.

## 111.1 Restrictions

This description is valid from Hicom 300 E V1.0.

## 111.2 Interrelationships

None

## 111.3 Functions of the AMO

- [DISPLAY-GRA](#) : Request of the alarm mirror for one or all processors
- [DELETE-GRA](#) : Reset of alarm for definitely device classes

### 111.3.1 DISPLAY-GRA

With this function it is possible to request the alarm mirror for one or all processors.

At monoprocessing and the statement for the parameter unit = all, only the alarm mirror for the BP (SWU) is issued. The AMO is terminated with a corresponding message to the operator.

The alarm mirror of following processors can be displayed:

- ALL (All Processors)
- A1 (Administration and data server 1)
- BP (Switching unit)

## GRA - Get Reset Alarm

Functions of the AMO

### Procedure Overview

| Command Code | Parameter     |
|--------------|---------------|
| DISPLAY-GRA  | UNIT=<param>; |

#### Example

Display of the alarm mirror for processor A1.

Input:

```
DISPLAY-GRA:A1;
```

### 111.3.2 DELETE-GRA

With this function it is possible to delete the alarm of particular device classes. At monoprocessing only SWU-alarm and some ISP-alarms are allowed to delete.

In dependent on the processor at most 8 device classes can be given.

The alarm of following processors can be deleted:

- A1 (Administration and data server 1)
- BP (Switching unit)

All the central alarms of ISP an SWU can be deleted.

- 0 LTG RESTARTS
- 1 LTG FAILURE
- 2 LTU FAILURE
- 3 PHONEMAIL ALARM
- 4 LTU STANDBY CABLE
- 5 CC RESTARTS
- 6 STBY-CC FAILURE
- 8 RMS FAILURE
- 15 EXTERNAL SERVER
- 16 LTG CENTRAL CONTROL
- 17 CC CENTRAL CONTROL
- 18 SWITCHING NETWORK
- 19 CLOCKING SYSTEM
- 20 SIGNAL UNIT
- 23 SW ERRORS

- 24 SYSTEM MESSAGES
- 25 POWER SUPPLY
- 26 SM FAILURE
- 29 MAINTENANCE NOTE
- 32 ACCESS POINT FAILURE
- 33 BAD IP CONNECTIVITY
- 34 LW-SW VERSION CONFLICT

- SM-CENTRAL ALARMS

- 5 CC RESTARTS
- 9 CHARGE COMPUTER
- 10 IS RESTARTS
- 13 ALTERNATE LOAD AREA
- 17 CC CENTRAL CONTROL
- 21 IS CENTRAL CONTROL
- 22 SM CENTRAL CONTROL
- 23 SW ERRORS
- 24 SYSTEM MESSAGES
- 25 POWER SUPPLY
- 27 LINUX FAILURE
- 28 SYSTEM TIME FAILURE
- 29 MAINTENANCE NOTE
- 30 SWITCHING UNIT FAILURE

- All alarms which can be deleted (SWU&ADP) ordered after parameter ALARMNR:

- 0 LTG RESTARTS
- 1 LTG FAILURE
- 2 LTU FAILURE
- 3 PHONEMAIL ALARM
- 4 LTU STANDBY CABLE
- 5 CC RESTARTS
- 6 STBY-CC FAILURE
- 8 RMS FAILURE
- 9 CHARGE COMPUTER
- 10 IS RESTARTS
- 13 ALTERNATE LOAD AREA
- 15 EXTERNAL SERVER
- 16 LTG CENTRAL CONTROL

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                                                      |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DELETE-GRA   | UNIT=<param><br>,ALARMNO1=<number>,<br>[ALARMNO2=<number>],[ALARMNO3=<number>],<br>[ALARMNO4=<number>],[ALARMNO5=<number>],<br>[ALARMNO6=<number>],[ALARMNO7=<number>],<br>[ALARMNO8=<number>; |

**Example**

Reset of several alarm in the SWU.

Input:

DEL-GRA:BP,0,5,8,17,19,24;

**111.3.3 Interface to Dependability (DEP)**

The orders to delete or display the alarm will be passed on to the DEP. For delete orders the operator only gets the normal error/alarm handling of the DEP.

## 111.4 Parameter Description

|                       |                                                       |                                                               |                                    |

## 112 GRZW - CDR Connection Limits

|                      |                               |
|----------------------|-------------------------------|
| Interrelationships   | Parameter Description         |
| Functions of the AMO | Error Messages and Advisories |

The function of this AMO is to administer the limit values for call detail registration.

There are 5 different limit values per dialed number prefix (routing code) possible and there are 10 entries for carriers. That means there are limit values for 4 different routing codes. The 5th entry is for all other routing codes. The routing code is the routing code which is created by AMO-RCUT. If no transformation took place, the selected number prefix (routing code) is evaluated.

These limit values are

- the limit value for call charge units (in call charge units)
- the limit value for call duration (in hours/minutes/seconds)
- the limit value for call amount units (in call amount units<sup>1</sup>)
- the limit value for hour for artificial section to fixed time-of-day.  
Daily to the indicated hour for all existing connections an artificial section is executed.

If one of these limit values is exceeded, the result is an "artificial call section", i.e. the connection block is terminated and transferred to unit record preparation and a new connection block set up for this call.

For the call charge limit value, this is 4000 call charge units. For the call duration limit value the maximum is more than 18 hours 12 minutes and 15 seconds (=65535 seconds). For the call amount limit value, this is 0 call amount units (that means it is not set) and for the hour limit value, this is 255 (that means no limit).

The parameter CALLT (call duration limit) cannot be applied to internal connections. In this case therefore for internal connections no "artificial call section" is produced.

### 112.1 Interrelationships

- AMO-RCUT : Routing code conversion table

---

1. The explanation of the amount units see appendix in description for AMO-TTBL

112.2 Functions of the AMO

- ADD-GRZW : Add the limit value for artificial section
- CHANGE-GRZW : Change the limit value for artificial section
- DELETE-GRZW : Delete the limit value for artificial section
- DISPLAY-GRZW / REGENERATE-GRZW : Display the limit values for artificial section / Regenerate the limit values for artificial section

112.2.1 ADD-GRZW

Adding a call charge limit value or a call duration limit value or a call amount limit value for a routing code or a carrier or adding a hour limit for all entries. There is a maximum of 5 entrys for 5 different routing codes. The 6th entry is for all other routing codes. If there is no value for the parameter routing code, then the following limit values are for all other routing codes.  
If no value for parameter "hour limit", "call charge unit limit" or "call amount unit limit" is specified, the limit value is set to its default value.

Procedure Overview

| Command Code | Parameters                                                                                                                                                                                                                |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-GRZW     | TBL=RCD, [CDRCODE=<number>], [CDRULT=<number>],<br>[CALLT=<number>], [AMOUNTLT=<number>];<br>  TBL=CAR, CARRIER=<number>, [CDRULT=<number>],<br>CCALLT=<number>], [AMOUNTLT=<number>];<br>  TBL=HOUR, [HOURLIM=<number>]; |

Example

1. Create the call charge limit with 500 charge units, call duration limit value with 10 hours, 30 minutes and 15 seconds, call amount limit with 1000 amont units and the hour limit value with 10 hours for the routing code 1 .  
Input:  
ADD-GRZW:RCD,1,500,103015,1000;  
ADD-GRZW:HOUR,10;
2. Create the call charge limit with 100 charge units, call duration limit value with 10 hours, 30 minutes and 15 seconds, call amount limit with 100 amont units and the hour limit value with 10 hours for the carrier 1 .

Input:

```
ADD-GRZW:CAR,1,100,103015,100;
ADD-GRZW:HOURLIM,10;
```

## 112.2.2 CHANGE-GRZW

Change a call charge limit value or a call duration limit value.

If no parameter is specified in RCD branch, the limit value is set to its default value.

If no value for parameter "hour limit", "call charge unit limit" or "call amount unit limit" is specified, the limit value is set to its default value.

### Procedure Overview

#### Command Code

CHANGE-GRZW

#### Parameters

```
TBL=RCD, [CDRCODE=<number>],
    [LTTYPER=TIME], [CALLT=<number>];
| [LTTYPER=CHRG], [CDRULT=<number>];
| [LTTYPER=AMOUNT], [AMOUNTLT=<number>];
TBL=CAR, CARRIER=<number>,
    [LTTYPER=TIME], [CALLT=<number>];
| [LTTYPER=CHRG], [CDRULT=<number>];
| [LTTYPER=AMOUNT], [AMOUNTLT=<number>];
TBL=HOURLIM, [HOURLIM=<number>];
```

### Example

1. Change the connection time limit to 5 hours 0 minutes 0 seconds for the routing code 1.

Input:

```
CHANGE-GRZW:RCD,1,TIME,050000;
```

2. Change the call amount limit value to 800 amount units for the routing code 1.

Input:

```
CHANGE-GRZW:RCD,1,AMOUNT,800;
```

3. Change the hour limit to 5 o'clock .

Input:

```
CHANGE-GRZW:HOURLIM,5;
```

4. Change the call charge limit to 2000 for the carrier 1.

Input:

```
CHANGE-GRZW:CAR,1,CHRG,2000;
```

**112.2.3 DELETE-GRZW**

Delete a call charge limit value , a call duration limit value, a call amount limit value per routing code or per carrier or delete the hour limit value for all enties.  
If there is no value for the parameter routing code or for the carrier, then all limit values will be deleted. That means that the limit values are set to its default value.

**Procedure Overview**

| Command Code | Parameters                                                                               |
|--------------|------------------------------------------------------------------------------------------|
| DELETE-GRZW  | [TBL=RCD] , [CDRCODE=<number>] ;<br>  [TBL=CAR] , [CARRIER=<number>] ;<br>  [TBL=HOUR] ; |

**Example**

1. Delete limit values for routing code 1;  
Input:  
DELETE-GRZW:RCD,1;
2. Delete limit values for carrier 1.  
Input:  
DELETE-GRZW:CAR,1;
3. Delete hour limit for all enties.  
Input:  
DELETE-GRZW:HOUR;

**112.2.4 DISPLAY-GRZW / REGENERATE-GRZW**

1. Interrogate the limit values for on-screen output in list form (DISPLAY)
2. Interrogate the limit values for output in the form of a command listing for the action CHANGE-GRZW (REGENERATE)

**Procedure Overview**

| Command Code | Parameters         |
|--------------|--------------------|
| DISPLAY-GRZW | [TBL=RCD] ;<br>(1) |

**Command Code**

REGENERATE-GRZW

**Parameters**

```
| [TBL=CAR];
| [TBL=HOURL];
[TBL=RCD];
(2)
| [TBL=CAR];
| [TBL=HOURL];
```

**Examples****1. Display the limit values in list form****Input:**

DISPLAY-GRZW;

**Output:**

LIMIT VALUES OF THE CALL DATA REGISTRATION PER ROUTING CODE

| ROUTE CODE<br>CODE | CHARGE LIMIT<br>(UNITS) | CONN. TIME LIMIT<br>(IN HH:MM:SS) | AMOUNT LIMIT<br>(CURRENCY) |
|--------------------|-------------------------|-----------------------------------|----------------------------|
| 1                  | 500                     | 05:00:00                          | 800                        |
| ELSE               | 4000                    | 18:12:15                          | 0                          |

LIMIT VALUES PER CARRIER

| CARRIER | CHARGE LIMIT<br>(UNITS) | CONN. TIME LIMIT<br>(IN HH:MM:SS) | AMOUNT LIMIT<br>(CURRENCY) |
|---------|-------------------------|-----------------------------------|----------------------------|
| 0       | 4000                    | 18:12:15                          | 0                          |
| 1       | 2000                    | 10:30:15                          | 100                        |
| 2       | 4000                    | 18:12:15                          | 0                          |
| 3       | 4000                    | 18:12:15                          | 0                          |
| 4       | 4000                    | 18:12:15                          | 0                          |
| 5       | 4000                    | 18:12:15                          | 0                          |
| 6       | 4000                    | 18:12:15                          | 0                          |
| 7       | 4000                    | 18:12:15                          | 0                          |
| 8       | 4000                    | 18:12:15                          | 0                          |
| 9       | 4000                    | 18:12:15                          | 0                          |

HOUR LIMIT OF THE CALL DATA REGISTRATION (IN HH) : 5

**2. Interrogate the limit value table for regeneration****Input:**

REGENERATE-GRZW;

**Output:**

```
ADD-GRZW:RCD,1,500,050000, 800;
ADD-GRZW:RCD,,4000,181215, 0;
ADD-GRZW:CAR,0,4000,181215, 0;
ADD-GRZW:CAR,1,2000,103015, 100;
```

## GRZW - CDR Connection Limits

### Parameter Description

```
ADD-GRZW:CAR, 2, 4000, 181215, 0;  
ADD-GRZW:CAR, 3, 4000, 181215, 0;  
ADD-GRZW:CAR, 4, 4000, 181215, 0;  
ADD-GRZW:CAR, 5, 4000, 181215, 0;  
ADD-GRZW:CAR, 6, 4000, 181215, 0;  
ADD-GRZW:CAR, 7, 4000, 181215, 0;  
ADD-GRZW:CAR, 8, 4000, 181215, 0;  
ADD-GRZW:CAR, 9, 4000, 181215, 0;  
ADD-GRZW:HOURLIM, 5;
```

## 112.3 Parameter Description

|                 |                                                     |
|-----------------|-----------------------------------------------------|
| AMOUNTLT        | Call amount unit limit *                            |
| Type of Input   | : Single value, optional                            |
| Possible Values | : max. 8 digits, 0 to 9                             |
| Default Value   | : 0                                                 |
| CALLT           | Call duration limit, Input hhhmmss                  |
|                 | <b>Note:</b> Not for internal connections           |
| Type of Input   | : Single value, optional                            |
| Possible Values | : 000001 to 181215                                  |
| Default Value   | : 181215 (= 65535 sec. = H'FFFF)                    |
| CARRIER         | Number of carrier of a connection                   |
| Type of Input   | : Single value, optional<br>required (ADD, CHANGE)  |
| Possible Values | : 0 to 9                                            |
| CDRCODE         | Route Code (dialed number prefix)<br>(see AMO-RCUT) |
| Type of Input   | : Single value, optional                            |
| Possible Values | : max. 6 digits, 0 to 9                             |
| CDRULT          | Call charge unit limit                              |
| Type of Input   | : Single value, optional                            |
| Possible Values | : 0 to 4000                                         |
| Default Value   | : 4000                                              |
| HOURLIM         | Hour value to fixed time-of-day, Input: hh          |
| Type of Input   | : Single value, optional                            |

|         |                      |                                                    |
|---------|----------------------|----------------------------------------------------|
|         | Possible Values      | : 0 to 23, or no input, if no fixed time-of-day    |
| LTTYPER | Limit type           |                                                    |
|         | Type of Input        | : Single value, optional                           |
|         | Possible Values      | : AMOUNT = Call amount unit limit                  |
|         |                      | CHRG = Call charge unit limit                      |
|         |                      | TIME = Call duration limit                         |
| TBL     | Designation of table |                                                    |
|         | Type of Input        | : Single value, optional<br>required (ADD, CHANGE) |
|         | Possible Values      | : CAR = Carrier                                    |
|         |                      | HOURL = Hour limit                                 |
|         |                      | RCD = Routing code                                 |

\* The explanation of the amount units see appendix in description for AMO-TTBL.

## 112.4 Error Messages and Advisories

### 112.4.1 Error Messages

F01: CONNECTION TIME LIMIT VALUE IS TOO LARGE (MAX. VALUE IS 181215)  
 F02: CONNECTION TIME LIMIT VALUE 000000 IS NOT ALLOWED  
 F03: NO MORE ENTRY POSSIBLE  
 F04: PLEASE ENTER VIRTUAL ROUTE CODE WITH ACTION "ADD"  
 F05: CONNECTION TIME LIMIT VALUE IS NOT POSSIBLE

### 112.4.2 Advisories

H01: HOURL LIMIT IS SET FOR ALL ROUTING CODES AND CARRIERS  
 H02: HOURL LIMIT WAS DELETED FOR ALL ROUTING CODES AND CARRIERS  
 H03: NO HOURL LIMIT ADDED

## 113 HIDMP - Creation and Output of HIDUMP Control Data

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

In Hicom-System at field trial, system test and at customers use still occur some uncorrected faults which can only be pinpointed if the necessary diagnostic data is provided. The program package HIDUMP (consisting of the resident HIDUMP software and AMO HIDMP) provides the service engineer with a tool for saving diagnostic data onto hard disk (HD) in case of a HICOM system restart.

Administration and modification of control data as well as communication with the service terminal is accomplished by means of AMO HIDMP. This AMO is exclusively used to define, (de-)activate, delete and output the required HIDUMP control data. Without the AMO, the HIDUMP is able to operate only with control data already stored in the control segment to select its diagnostic data.

The control data are contained in a control segment and are made up of individual control strings. In the case of a HICOM system restart, HIDUMP processes all active control strings in ascending order (as regards their number).

Before control strings can be activated or deactivated for the resident HIDUMP, they must be defined stating the conditions and the associated actions. Control strings that are no longer required can be deleted (irrespective of whether they are active or inactive). It is possible to output information on the defined control strings.

### Note

The AMO HIDMP runs exclusively in the CC part of the SWU. The resident HIDUMP part can operate in all processors of the SWU containing a dependability.

### Function Overview

The following functions are implemented in the AMO:

- a. Change the control segment (control data) to be processed using the P command  
It is possible to process control data for CC or LTG.
- b. Define control data using the DEF command  
This command defines the control data and stores it in the control segment. A maximum of 1 kbyte of control data can be defined. The control data is stored in the individual control strings (each of which has been created by a DEF command) in ascending order of their numbers.

## HIDMP - Creation and Output of HIDUMP Control Data

### Interrelationships

- c. Activate control strings using the ON command  
This command is used to ACTIVATE (enable) control data and to determine how many times a control string may be processed.
- d. Deactivate control strings using the OFF command  
This command is used to DEACTIVATE (disable) control data.
- e. Output control data using the LST command  
This command is used to output control data information.
- f. Delete control data using the DEL command  
This command is used to delete control strings.
- g. Terminate the AMO using the END command

## 113.1 Interrelationships

The AMO HIDMP communicates with the (resident) HIDUMP.

## 113.2 Functions of the AMO

- EXEC-HIDMP : Start of AMO HIDMP
- INPUT-HIDMP : Request of input commands in interactive mode

### 113.2.1 EXEC-HIDMP

#### Notes

- a) By entering the parameter MDL it is determined, which control segment (i.e. CC or LTG control data) is processed.
- b) AMO HIDMP is started. Then, INPUT-HIDMP is called up automatically (hidden instruction). The AMO is now in interactive mode.
- c) The AMO remains in dialog mode for several minutes awaiting input. If no input is made, the AMO terminates automatically.

#### Procedure Overview

| Commandcode | Parameter   |
|-------------|-------------|
| EXEC-HIDMP  | MDL=<param> |

### Examples

Input:

```
<EXEC-HIDMP:CC;
```

Output:

```
AMO-HIDMP VARIANT/VERSION 100/004 OF 1993-09-24
PLEASE HIDUMP INPUT FOR CC:
*
```

Input:

```
*END;
```

```
/* * = Command input request */
```

Output::

```
EXEC COMPLETED;'
<
```

## 113.2.2 INPUT-HIDMP

### Notes

The verb INPUT-HIDMP is called up automatically (hidden instruction) once the AMO has been started using EXEC-HIDMP. The next command is to be input after the asterisk (\*). The AMO is in interactive mode. After execution of a command, the system again issues the input request:

```
PLEASE HIDUMP INPUT FOR <processor name>:
*
```

This AMO message also indicates that the previous command has been properly processed. If it is accompanied by an error message, the command has not been executed.

### Note

Again, the asterisk (\*) is used as a user prompt. In our example it precedes the actual user input.

The following commands are defined:

```
CMD= P,MDL=<param>;
```

This command enables HIDUMP control segments that associated with other hardware modules to be processed in interactive mode, i.e. without having to exit the AMO. Following this command, the newly selected control data can be processed.

The parameter MDL is used to select the HW module.

## HIDMP - Creation and Output of HIDUMP Control Data

### Functions of the AMO

#### Example

Changeover to processing of HIDUMP control data for LTG.

Input:

\*P,LTG;

Output:

PLEASE HIDUMP INPUT FOR LTG:  
\*

CMD= DEF,NUMBER=<param>,COND=<string>,ACTION=<string>;

This command defines the control data and stores it in the control segment. A maximum of 1 kbyte of control data can be defined. The control data is stored in single control strings (each of it has been created by a DEF command) in the ascending order of their numbers.

A control string consists of a identification number (it defines the processing sequence by the HIDUMP, that means the control string with the lowest number will be processed first), some conditions and the associated actions.

The parameter COND defines the conditions.

The parameter ACTION determines the actions that are carried out when the conditions are met

After input the control string is deactive, its execution counter is zero (0).

The ON command is used to activate it and to enter an execution counter.

#### Note regarding the parameter COND:

The parameter COND comprises at least one term. Each term consists of three parts:

- |                             |                                                |                          |
|-----------------------------|------------------------------------------------|--------------------------|
| 1. Variable to be compared; | C ...                                          | Call code                |
|                             | E ...                                          | Exception code           |
|                             | I ...                                          | Interrupt no.            |
|                             | N ...                                          | NMI no.                  |
|                             | O ...                                          | OS sev.                  |
| 2. Mathematical operator;   | = ...                                          | equal to                 |
|                             | > ...                                          | greater than             |
|                             | >= ...                                         | greater than or equal to |
|                             | < ...                                          | less than                |
|                             | <= ...                                         | less than or equal to    |
|                             | /= ...                                         | not equal to             |
| 3. Reference value;         | (hexadecimal, up to four characters in length) |                          |

Example of terms: I<=9 , N=10 , C/=A7D;

It is possible to link several of these terms by means of logical operators (OR, AND) or to make use of parentheses. Terms or parenthesized expressions are negated by a preceding NOT.

The parameter COND must be delimited, i.e. preceded and succeeded, by the character "'".

**Note**

The condition NOT C=5000 initiates execution of the specified actions for any fault except C=5000 (even for NMI, aso. ...). If a dump is required only for each call code (C) that is not equal to 5000, the condition needs to be formulated as follows:

a. C>=0 AND NOT C=5000 AND C<FFFF

or

b. C/=5000

The first variant offers the additional possibility to define an upper limit and a lower limit.

**Note regarding the parameter ACTION:**

Only the following actions and syntax interpretation will be accepted.

a) DUMP\_BCA( <len> )

b) DUMP\_MEM\_LOG( <offset> : <base> / <len> )

c) DUMP\_MEM\_LOG(<selector>:<offset>/<len> )

In the case of DUMP\_MEM\_LOG, base / selector and offset must be separated by a colon ':'. Each of the two values may be up to four characters in length.

d) DUMP\_MEM\_PHYS( <phys.addr.> / <len> )

In the case of DUMP\_MEM\_PHYS, the physical address may be up to 6 characters in length.

e) DUMP\_DPR( <value for DPR> / <len> )

In the case of DUMP\_DPR, a code for the Dual Port Ram (DPR) to be dumped must be specified for the first parameter. The following codes are permitted:

0 for IP-DPR, 1 for MIP-DPR, 2 for CCH-DPR, 3 for MBU\_1-DPR, 4 for MBU\_2-DPR, 5 for MBU\_3-DPR, 6 for MBU\_4-DPR, 7 for IOCG-DPR, 8 for DCL-DPR .

f) DUMP\_STACK( <len> )

g) DUMP\_RNGT

h) DUMP\_001

i) DUMP\_002

j) DUMP\_003

## HIDMP - Creation and Output of HIDUMP Control Data

### Functions of the AMO

- k) DUMP\_004
- l) DEBUG\_001
- m) DEBUG\_002
- n) DEBUG\_003
- o) DEBUG\_004
- p) DEBUG\_005
- q) DEBUG\_006
- r) DEBUG\_007
- s) DEBUG\_008

In all cases, the parameter <len> may be up to 4 characters in length. It is treated as a hexadecimal value.

If several actions are specified, these must be separated by means of '&'. If the actions used include a parameter, the parameter must be enclosed in parentheses and must immediately follow the action itself. If several parameters are specified, they must be separated by a slash '/'.

The parameter ACTION must be delimited, i.e. preceded and succeeded, by the character '" '.

### Examples

1. If exception code  $\geq 3A$  and exception code  $\leq 50$ , AND NOT call code = 17 OR interrupt = 18, the actions DEBUG\_005 DUMP-BCA(200) DUMP\_DPR(MBU-DPR,30) are to be carried out. The control string number is 4.

Input:

```
*DEF,4,"(E=>3A AND E<=50) AND NOT C=17 OR I=18","DEBUG_005&DUMP_BCA(200)&DUMP_DPR(2/30)";
```

Output:

```
PLEASE HIDUMP INPUT FOR LTG:
*
```

2. If exception code 123 or call code 240 turn out to be the cause of a restart, the actions DUMP\_MEM\_LOG with the logical address (base = 39A8 / selector = 39A8, offset = 14F), length = 75 and DUMP\_MEM\_PHYS with the physical address 1C863E, length = 140 are to be executed. The control string number is 174.

**Input:**

```
*DEF,174,"E=123 OR C=240","DUMP_MEM_LOG(14F:39A8/75) &
DUMP_MEM_PHYS(1C863E/140)";
*DEF,174,"E=123 OR C=240","DUMP_MEM_LOG(39A8:14F/75) &
DUMP_MEM_PHYS(1C863E/140)";
```

**Output:**

```
PLEASE HIDUMP INPUT FOR LTG:
*
```

```
CMD= ON,TYPE=NO,NUMBER=<param>,CNT=<param>;
      ON,TYPE=ALL,CNT=<param>;
```

This command is used to set defined control strings to ACTIVE, i.e. the control string will be identified as being active, and processed by HIDUMP (resident) in the case of a restart. It is possible to activate either all (TYPE=ALL) or only a certain (TYPE=NO) control string. The parameter CNT determines how many times a control string may be executed by HIDUMP. Activation is independent of the status previously held.

**Examples**

1. All defined control strings are to be activated and processed 5 times by HIDUMP.

**Input:**

```
*ON,ALL,5;
```

**Output:**

```
PLEASE HIDUMP INPUT FOR LTG:
*
```

2. Control string no. 38 is to be activated and processed once by HIDUMP.

**Input:**

```
*ON,NO,38,1;
```

**Output:**

```
PLEASE HIDUMP INPUT FOR LTG:
*
```

```
CMD= OFF,TYPE=NO,NUMBER=<param>;
      OFF,TYPE=ALL;
```

This command is used to DEACTIVATE defined control strings, which means that the control string will not be processed by HIDUMP in the case of a restart. It is possible to deactivate either all (TYPE=ALL) or a particular (TYPE=NO) control string. Deactivation is independent of the status previously held.

## HIDMP - Creation and Output of HIDUMP Control Data

### Functions of the AMO

#### Examples

1. All defined control strings are to be deactivated.

Input:

```
*OFF,ALL;
```

Output :

```
PLEASE HIDUMP INPUT FOR LTG:  
*
```

2. Control string no. 2 is to be deactivated.

Input:

```
*OFF,NO,2;
```

Output:

```
PLEASE HIDUMP INPUT FOR LTG:  
*
```

```
CMD= LST,TYPE=NO,NUMBER=<param>,[CNT=<param>],[ACTION=<string>];  
LST,TYPE=ALL,[CNT=<param>],[ACTION=<string>];  
LST,TYPE=ACT,[CNT=<param>],[ACTION=<string>];  
LST,TYPE=DEACT,[CNT=<param>],[ACTION=<string>];
```

This command is used to output control data information. It is possible to specify several selection criteria. Parameter TYPE (mandatory) determines whether a particular, all, all active, or all deactivate control strings are to be processed for output. The parameters CNT (optional) and ACTION (optional) can be used to make a selection for output processing.

#### NOTE

As the processing of parameter ACTION is not implemented in this version of AMO HIDMP, the parameter will simply be ignored by the AMO.

#### Examples

1. All active control strings are to be output.

Input:

```
*LST,ACT;
```

Output: :

```
-----  
-----  
DUMP NO: 3      CNT: 3      STATUS: ACT  
N<66D OR NOT(O=4))  
DUMP_MEM_LOG(E435:1B48/1000)  
DUMP_MEM_LOG(1B48:E435/1000)
```

## HIDMP - Creation and Output of HIDUMP Control Data

Functions of the AMO

```
DUMP NO: 9      CNT: 1      STATUS: ACT
N/=FFF2
DUMP_STACK(160)
DUMP NO: 40     CNT: 3      STATUS: ACT
((C=7F2 AND (O/=55E AND I<EE2)) OR C>A3)
DUMP_MEM_PHYS(28FAC1/50)
DUMP NO: 61     CNT: 4      STATUS: ACT
(E>442A OR NOT( I=5))
DEBUG_001, DUMP_DPR(8/20)
DUMP NO: 204    CNT: 3      STATUS: ACT
( I<A41 OR C=1000)
DEBUG_005, DUMP_BCA
-----
PLEASE HIDUMP INPUT FOR LTG:
*
```

2. All control strings with CNT = 3 are to be output.

Input:

```
*LST,ALL,3;
```

Output:

```
-----
DUMP NO: 3      CNT: 3      STATUS: ACT
(N<66D OR NOT(O=4))
DUMP_MEM_LOG(E435:1B48/1000)
DUMP_MEM_LOG(1B48:E435/1000)
DUMP NO: 7      CNT: 3      STATUS: DEACT
C>=3F
DUMP_DPR(6/200), DUMP_RNGT, DUMP_003
DUMP NO: 10     CNT: 3      STATUS: DEACT
NOT(C=EE3 AND O<6)
DEBUG_007, DUMP_STACK(70), DUMP_001
DUMP NO: 40     CNT: 3      STATUS: ACT
((C=7F2 AND (O/=55E AND I<EE2)) OR C>A3)
DUMP_MEM_PHYS(28FAC1/50)
DUMP NO: 119    CNT: 3      STATUS: DEACT
N=2
DUMP_004
DUMP NO: 204    CNT: 3      STATUS: ACT
( I<A41 OR C=1000)
DEBUG_005, DUMP_BCA
-----
PLEASE HIDUMP INPUT FOR LTG:
*
```

Input:

```
*LST,NO,40;
```

Output:

## HIDMP - Creation and Output of HIDUMP Control Data

### Parameter Description

```
-----  
DUMP NO: 40      CNT: 3      STATUS: ACT  
((C=7F2 AND (O/=55E AND I<EE2)) OR C>A3)  
DUMP_MEM_PHYS(28FAC1/50)  
-----
```

```
-----  
PLEASE HIDUMP INPUT FOR LTG:  
*
```

CMD=      CMD= DEL,TYPE=NO,NUMBER=<param>;  
          DEL,TYPE=ALL;

This command is used to delete control data (control strings). The parameter TYPE specifies whether all control strings (TYPE=ALL) or whether one particular control string (TYPE=NO) is to be deleted-

#### Examples

1. All control strings are to be deleted.

Input:

\*DEL,ALL;

Output: :

```
PLEASE HIDUMP INPUT FOR LTG:  
*
```

2. Control string no. 2 is to be deleted.

Input:

\*DEL,NO,2;

Output::

```
PLEASE HIDUMP INPUT FOR LTG:  
*
```

CMD=      END;

This command terminates the AMO.

## 113.3 Parameter Description

|               |                                                                    |
|---------------|--------------------------------------------------------------------|
| ACTION        | Used in the commands: DEF, LST;<br>To input the action procedures. |
| Type of Input | : String, mandatory in DEF                                         |

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | <p>optional in LST</p> <p>Possible Values : Character string up to 1019 characters in length</p> <p>Admissible actions : DUMP_BCA(&lt;len&gt;), DUMP_STACK(&lt;len&gt;),<br/> DUMP_MEM_PHYS(&lt;phys.addr&gt;/&lt;len&gt;), DUMP_DPR(&lt;value for DPR&gt;/&lt;len&gt;),<br/> DUMP_MEM_LOG(&lt;offset&gt;:&lt;base&gt;/&lt;len&gt;), DUMP_RNGT, DUMP_001,<br/> DUMP_MEM_LOG(&lt;selector&gt;:&lt;offset&gt;/&lt;len&gt;)<br/> DUMP_002, DUMP_003, DUMP_004, DEBUG_001, DEBUG_002, DEBUG_003<br/> DEBUG_004, DEBUG_005, DEBUG_006, DEBUG_007, DEBUG_008</p> |
| CNT    | <p>Used in the commands: ON, LST;<br/> Specifies how many times a HIDUMP control string is executed.</p> <p>Type of Input : Single value, mandatory in ON<br/> optional in LST</p> <p>Possible Values : 0 - 255</p>                                                                                                                                                                                                                                                                                                                                        |
| COND   | <p>Used in the commands: DEF;<br/> To input the conditions.</p> <p>Type of Input : String, mandatory in DEF</p> <p>Possible Values : Character string up to 1019 characters in length</p>                                                                                                                                                                                                                                                                                                                                                                  |
| CMD    | <p>Branch parameter,<br/> Specifies the AMO-HIDMP command.</p> <p>Type of Input : Single value, mandatory</p> <p>Possible Values : DEF, DEL, END, LST, OFF, ON, P<br/> (The meaning of these values is explained in the Function Overview.)</p>                                                                                                                                                                                                                                                                                                            |
| MDL    | <p>Used in the commands: P, EXEC-HIDMP;<br/> Specifies the HW module for which the HIDUMP control segment is processed.</p> <p>Type of Input : Single value, mandatory</p> <p>Possible Values : CC, LTG</p>                                                                                                                                                                                                                                                                                                                                                |
| NUMBER | <p>Used in the commands: DEF, DEL, LST, OFF, ON<br/> Specifies the number (ID) of the control string.</p> <p>Type of Input : Single value, mandatory</p> <p>Possible Values : 0 - 255</p>                                                                                                                                                                                                                                                                                                                                                                  |
| TYPE   | <p>Used in the commands: DEL, LST, OFF, ON<br/> Branch parameter; specifies which control strings are to be processed.</p> <p>Type of Input : Single value, mandatory</p>                                                                                                                                                                                                                                                                                                                                                                                  |

## 114 HISTA - Output history file

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO HISTA is used for setting up and searching through the fault report archive.

### 114.1 Restrictions

### 114.2 Interrelationships

HISTA-FUNCTION requires a cyclic file ( C-FBTHIST ) in which the error messages are written.

The installation of this file can be made by AMO ASSGN ( assignment of the symbolic output device DPT4 to the logic device C-file ) The assignment of error messages to the corresponding output device can be made by AMO SIGNAL ( assignment of error messages to output device DPT4 ).

### 114.3 Functions of the AMO

- [ACTIVATE-HISTA](#) : Activate the error message statistic
- [ADD-HISTA](#) : Setting up the history archive
- [CHANGE-HISTA](#) : Change the configuration of an entry
- [DEACTIVATE-HISTA](#) : Deactivate the error message statistic
- [DELETE-HISTA](#) : Deleting the history archive
- [DISPLAY-HISTA](#) : Displaying the current archive data
- [OUTPUT-HISTA](#) : Displaying the error messages for any c-file
- [REGENERATE-HISTA](#) : Regenerating the ADD command
- [START-HISTA](#) : Searching through the history archive

### 114.3.1 ACTIVATE-HISTA

With this verb the configuration table at first start will be initialized with standard values and the statistic will be activated.

#### Procedure Overview

| Command Code   | Parameter      |
|----------------|----------------|
| ACTIVATE-HISTA | RESET=<param>; |

#### Parameter description

|       |                                                                                     |
|-------|-------------------------------------------------------------------------------------|
| RESET | Reset = YES means the configuration table will be initialized with standard values. |
|       | Reset = NO means the function continues with existing entries.                      |

### 114.3.2 ADD-HISTA

The verb ADD is used to set up the history archive structure.

#### Procedure Overview

| Command Code | Parameter                             |
|--------------|---------------------------------------|
| ADD-HISTA    | FSIZE=<number> ,<br>ALARMING=<param>; |

#### Parameter description

|          |                                                                                                         |
|----------|---------------------------------------------------------------------------------------------------------|
| FSIZE    | The size of the text archive is specified in kB (500kB - 10000kB) .                                     |
| ALARMING | By activating the parameter alarming, maintenance alarm is output in the case of history file overflow. |

### 114.3.3 CHANGE-HISTA

This verb is used to change the configuration of the HW-Error statistic.

#### Procedure Overview

| Command Code | Parameter                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-HISTA | ENTRY=STALARM, [STATUS=<param>] ;<br>ENTRY=NEW/OLD, [NUM=<number>], [THRESH=<number>],<br>[DECTH=<number>], [DECTM=<number>],<br>[ALARM=<param>; |

### Parameter description

|               |                                                        |                                                                |
|---------------|--------------------------------------------------------|----------------------------------------------------------------|
| ENTRY         | IS A branch parameter                                  |                                                                |

|               | DECTM                                                  | The time interval to decrement the error counter (max. 60min.) |
|               |                                                        |                                                                |
|               | ALARM                                                  | Alarming in case to exceed the threshold                       |

### 114.3.4 DEACTIVATE-HISTA

This function deactivates the error statistic completely.

**Procedure Overview**

| Command Code     | Parameter |
|------------------|-----------|
| DEACTIVATE-HISTA | ;         |

**114.3.5 DELETE-HISTA**

Deleting the history archive structure. This function should be used also to delete all statistic tables. Additional a separate delete of single entries of the HWES-configuration table.

**Procedure Overview**

| Command Code | Parameter                                                                         |
|--------------|-----------------------------------------------------------------------------------|
| DELETE-HISTA | CLEAR=ALL ;<br>CLEAR=HWESCONF, [NUM=<number>] ;<br>CLEAR=HWENTRY, [NUM=<number>]; |

**Parameter description**

|          |                                                        |
|----------|--------------------------------------------------------|
| CLEAR    | Is a branch parameter                                  |
| ALL      | Delete the history file and the error statistic tables |
| HWESCONF | Delete an entry from hwes-configuration table          |
| NUM      | Error message number                                   |
| HWENTRY  | Delete an entry from hwes table                        |
| NUM      | Error message number                                   |

**114.3.6 DISPLAY-HISTA**

The verb DISPLAY is used to output the current archive data.

### Procedure Overview

| Command Code  | Parameter                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-HISTA | TAB=OVIEW/FSTALL/HWES/SWES;<br>TAB=HWES<br>,   [TTYTYPE=CONFIG, CONFIG=<param>];<br>,   [TTYTYPE=HWALL, HWALL=<param>];<br>,   [TTYTYPE=COMPLETE, COMPLETE=<param>];<br>,   [TTYTYPE=ALARMS, ALARMS=<param>];<br>,   [TTYTYPE=FNO, NUM=<number>]; |

DISPLAY COMPLETED;

### Parameter description

The parameter TAB specifies the error statistic tables.

|        |                                                  |                                                                 |

| OVVIEW | History overview                                 |                                                                 |
| FSTALL | Hwes, swes and the configuration table for hwes. |                                                                 |
| HWES   | TTYPE                                            | Table type                                                      |
|        | CONFIG                                           | Configuration table for hwes                                    |
|        | HWALL                                            | HW error statistic and configuration table for hwes             |
|        | COMPLETE                                         | Complete hw error statistic (without config)                    |
|        | ALARM S                                          | Display of all the hwes entries where the threshold is exceeded |
|        | FNO                                              | All f-no. related error statistic entries                       |
| SWES   | FNO=NUM                                          | Error message number                                            |
|        | SW-error statistic                               |                                                                 |

## 114.3.7 OUTPUT-HISTA

This function serves to output files (Hicom Teleservice protocol files) written cyclically

by the FILE TASK.

Cyclic organization means that when writing a file of limited length, the system

returns to start of file as soon as the file is complete.

The old contents are then overwritten from the beginning.

### Procedure Overview

| Command Code | Parameter                                                                                  |
|--------------|--------------------------------------------------------------------------------------------|
| OUTPUT-HISTA | FILENAME=<string>,<br>[ADDR=<number>], [LEN=<number>]<br>, [BOTTOM=<param>], [ANS=<param>; |

### Parameter description

|          |                                                                                                                                                                                                                                                                                                              |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILENAME | The name of the C file must begin with "C-", the AMO adds the prefix :AMD:. If no file is specified, ":AMD:C-FBTHIST" will be used as the file name.                                                                                                                                                         |
| ADR      | If the parameter ADR is specified, output starts at this fault message.                                                                                                                                                                                                                                      |
| LEN      | If the parameter LEN is specified, the number of fault messages to be output corresponds to the number specified by LEN, output either starts at the most recent fault report in the file, or if ADR has been specified, at the fault message which lies ADR positions before the most recent message.       |
| BOTTOM   | If the parameter BOTTOM is specified (BOTTOM=YES), the number of oldest fault messages which was specified by LEN will be output, output either starts at the oldest fault message in the file, or if ADR has been specified, at the fault message which is offset by ADR positions from the oldest message. |
| ANS      | Determines whether the user is to be prompted to "Continue (Y/N)" the output of long blocks.                                                                                                                                                                                                                 |

## 114.3.8 REGENERATE-HISTA

The verb REGENERATE is used to output the current AMO HISTA command.

### Procedure Overview

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-HISTA | ;         |

## 114.3.9 START-HISTA

The verb START is used to output all error and alarm messages recorded within any given period of time or within the last two hours. In the case of searches, it is used to output error messages from the history archive which were qualified by a given search criterion.

## HISTA - Output history file

Functions of the AMO

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RTYPE | <p>Branch parameter for output format:</p> <p>If RTYPE=MIRROR is specified, the current alarm mirror is output in the form of a table. The AMO HISTA uses the requested alarm mirror for preparing the layout of the table.</p> <p>If RTYPE=SEARCH is specified, a branch is made to the search mode.</p> <p>The error messages are output with the sequence, the oldest to the newest.</p> <p>If RTYPE=SEARCHB is specified, a branch is made to the search mode.</p> <p>The error messages are output with the sequence, the newest to the oldest.</p> |
| STIME | <p>Start time for selection of error messages.</p> <p>Input format : YY-MM-DD/<br/>hh:mm</p> <p>Default value : system time - 2 hours</p>                                                                                                                                                                                                                                                                                                                                                                                                                |

|          |                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ETIME    | End time for selection of error messages.<br>Input format : YY-MM-DD/<br>hh:mm<br>Default value : system time                                                                                                                                                                                                                                                                                                        |
| ANS      | This parameter specifies whether the output of long blocks will be interrupted by the prompt "Continue (Y/N/C)".                                                                                                                                                                                                                                                                                                     |
| CONTEXT  | Branch parameter for output format:<br>CONTEXT= MID Search by error/alarm number<br>CONTEXT= ALARM Search by alarm class<br>CONTEXT= PEN Search by PEN (LTG/LTU/SLOT/CCT)<br>CONTEXT= STNO Search by station number<br>CONTEXT= PRI Search by priority<br>CONTEXT= FUNCT Search by function complex<br>CONTEXT= EC Search by exception code<br>CONTEXT= CC Search by call code<br>CONTEXT= UA Search by user address |
| NUM      | The error/alarm number is used as a criterion for selecting the messages. e.g.: MID=AL<br>NUM=9001 means "MAJOR ALARM ON" messages                                                                                                                                                                                                                                                                                   |
| ALARMTYP | The alarm type can be specified to select fault reports which belong to a specific alarm class.                                                                                                                                                                                                                                                                                                                      |
| CENTRAL  | central alarms.                                                                                                                                                                                                                                                                                                                                                                                                      |
| SWUPERI  | swu peripheral alarms.                                                                                                                                                                                                                                                                                                                                                                                               |
| LOGSPEC  | swu logical special alarms.                                                                                                                                                                                                                                                                                                                                                                                          |
| LOGDIR   | swu logical direction related alarms.                                                                                                                                                                                                                                                                                                                                                                                |
| LOGPERS  | swu logical personal alarms.                                                                                                                                                                                                                                                                                                                                                                                         |
| SMPERI   | sm peripheral alarms.                                                                                                                                                                                                                                                                                                                                                                                                |
| PEN      | HW data is used as a search criterion.                                                                                                                                                                                                                                                                                                                                                                               |
| STNO     | Search by station number (which is translated into a PEN by the AMO).                                                                                                                                                                                                                                                                                                                                                |

## HISTA - Output history file

### Functions of the AMO

|        |                                                                                                                                                                                                                                                                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRI    | Search by message priority (M1-M8,E1-E8)                                                                                                                                                                                                                                                                                                                    |
| FUNCT  | The following function complexes are used as search criteria.                                                                                                                                                                                                                                                                                               |
| SWUPER | <p>SWU periphery</p> <p>All error messages assigned to the alarm classes of</p> <p>SWU-periphery alarm groups(0-31) and of SWU LOGICAL alarm groups (0-583) and which are assigned to the following central alarms:</p> <p>LTU FAILURE (2),</p> <p>PHONEMAIL ALARM (3),</p> <p>LTU HW STATUS BUS (4),</p> <p>LTUR RESTARTS (7),</p> <p>RMS FAILURE (8).</p> |

#### SWU\_CENTRAL Central SWU modules

All error messages assigned to the following central alarm classes:

LTG RESTARTS (0),  
LTG FAILURE (1),  
CC RESTARTS (5),  
CC STBY FAILURE (6),  
LTG CENTRAL CONTROL (16),  
CC CENTRAL CONTROL (17),  
SWITCHING NETWORK (18),  
CLOCKING SYSTEM (19),  
SIGNAL UNIT (20).

|          |                                                                                                                                                   |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| SW_ERROR | <p>SW errors</p> <p>All error messages assigned to the following central alarm classes:</p> <p>SW ERRORS (23),</p> <p>XENIX/LINUX ALARM (27).</p> |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------|

|        |                                                                                                                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| SYSTEM | <p>SYSTEM error</p> <p>All error messages assigned to the following central alarm classes:</p> <p>SYSTEM MESSAGES (24),</p> <p>POWER SUPPLY (25),</p> |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

SM FAILURE  
(26),  
SYSTEM TIME FAILURE (28),  
MAINTENANCE NOTE (29).

SM\_PER ..... SM periphery  
All error messages assigned to SM-periphery alarm group (0-23) and central alarm class 9.

SM\_CENTRAL ... Central SM modules  
All error messages assigned to the following central alarm classes:  
IS RESTARTS (10),  
SM RESTARTS (13),  
IS CENTRAL CONTROL (21),  
SM CENTRAL CONTROL (22).

EC Search by exception code

CC Search by call code

UA Search by user address

### Examples:

STA-HISTA:MIRROR; results in the following output:

# 115 HOTLN - Hotline/Offhook Intercept Destinations

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

AMO HOTLN ( Internal Traffic Relations groups and Hotline/Offhook Intercept ) assigns the corresponding destinations for offhook intercept and hotline (voice and data) to a hotline index which is entered in the line table of each device by AMO SCSU.

- Offhook Intercept = Automatic call setup if dialing is not continued after a specific time period.
- Hotline = Immediate call setup.

Max. up to 22 digits can be entered as destinations. Only the following are recommended:

- for internal hotlining to voice devices
  - Subscriber DNs
  - Attendant console personal key (personal DN)
  - Attendant console general operator key (operator access code)
  - External DNs ( applies to hotline only )
  - Hunting group ( applies to hotline only )
  - Pickup group member
  - Internal DNI numbers

- for internal hotlining to data devices
  - Subscriber DNs
  - Hunting group

- for trunk hotlining to voice, data, or fax devices

When setting up a trunk to direct connect to a device, use ADD-HOTLN:TYPE=HOTDEST.

- Subscriber DNs (voice,data, or fax)
- Hunting group (voice, data, or fax)
- Attendant console personal key
- Attendant console general operator key

## **HOTLN - Hotline/Offhook Intercept Destinations**

### **Restrictions**

- Internal DNI numbers

## **115.1 Restrictions**

This description is valid from HiPath 4000 V1.0

## **115.2 Interrelationships**

The interrelationship between this AMO and other AMOs in the generation sequence is fully described in the administration document AMO SEQUENCE.

- AMO SCSU : assigns hotline indices to devices
- AMO TACSU : assigns hotline indices to trunks
- AMO DNIT : configures internal DNI numbers
- AMO SA : configures hunt groups
- AMO SDAT : configures subscriber attributes

## **115.3 Functions of the AMO**

- [ADD-HOTLN](#) : Create/change destinations
- [DELETE-HOTLN](#) : Cancel destinations
- [DISPLAY-HOTLN](#) : Display destinations
- [REGEN-HOTLN](#) : Regenerate destinations

### **115.3.1 ADD-HOTLN**

Create one of the following destinations for hotline indices:

1. Offhook Intercept destination for voice
2. Hotline destination for voice
3. Hotline destination for data terminal

## Procedure Overview

| Command Code | Parameter                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-HOTLN    | TYPE=OFRCEST, HTLNIDX=<number>, DEST=<key-num>;<br><br>  TYPE=HOTDEST, HTLNIDX=<number>, DEST=<key-num>;<br><br>  TYPE=DTEDEST, HTLNIDX=<number>, DEST=<key-num>; |

### Examples

#### Example 1

Create hotline destination voice DN = 2360 for hotline indices 1 to 5. (The hotline destinations DN=2000 and DN=4000 are already existing for hotline indices 2 and 5, respectively ).

Input:

```
ADD-HOTLN:TYPE=HOTDEST,HTLNIDX=1&&5,DEST=2360;
```

Output:

```
ADD-HOTLN:TYPE=HOTDEST,HTLNIDX=1&&5,DEST=2360;
```

```
H500: AMO HOTLN STARTED
```

```
H1: OVERWROTE DESTINATION 2000 FOR HOTDEST IN HOTLINE INDEX 2
```

```
H1: OVERWROTE DESTINATION 4000 FOR HOTDEST IN HOTLINE INDEX 5
```

```
AMO-HOTLN ... HOTLINE/OFFHOOK INTERCEPT
```

```
ADD COMPLETED
```

#### Example 2

Assign the hunting group access code = \*550 as hotline destination voice to hotline index 100.

(The hotline destination 2222 exists already for hotline index 100.)

Input:

```
ADD-HOTLN:TYPE=HOTDEST,HTLNIDX=100,DEST=*550;
```

Output:

```
ADD-HOTLN:TYPE=HOTDEST,HTLNIDX=100,DEST=*550;
```

```
H500: AMO HOTLN STARTED
```

```
H1: OVERWROTE DESTINATION 2222 FOR HOTDEST IN HOTLINE INDEX 100
```

```
AMO-HOTLN ... HOTLINE/OFFHOOK INTERCEPT
```

```
ADD COMPLETED
```

#### Example 3

Assign the pickup group member 2200 as hotline destination voice to hotline indices 200 and 250.

**HOTLN - Hotline/Offhook Intercept Destinations**  
Functions of the AMO

Input:

ADD-HOTLN:TYPE=HOTDEST,HTLNIDX=200&250,DEST=2200;

Output:

ADD-HOTLN:TYPE=HOTDEST,HTLNIDX=200&250,DEST=2200;

H500: AMO HOTLN STARTED

AMO-HOTLN ... HOTLINE/OFFHOOK INTERCEPT

ADD COMPLETED

**115.3.2 DELETE-HOTLN**

- Cancel one of the following destinations for hotline indices:
- 1. Offhook Intercept destination for voice
  - 2. Hotline destination for voice
  - 3. Hotline destination for data terminal
  - 4. All types of the specified hotline indices

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DELETE-HOTLN | TYPE=OFRCDDEST, [HTLNIDX=<number>];<br><br>  TYPE=HOTDEST, [HTLNIDX=<number>];<br><br>  TYPE=DTEDEST, [HTLNIDX=<number>];<br><br>  TYPE=ALLDEST, [HTLNIDX=<number>]; |

**Examples**

**Example 1**

Cancel hotline destination voice of hotline indices 3 to 5.

Input:

DELETE-HOTLN:TYPE=HOTDEST,HTLNIDX=3&&5;

Output:

DELETE-HOTLN:TYPE=HOTDEST,HTLNIDX=3&&5;

H500: AMO HOTLN STARTED

AMO-HOTLN ... HOTLINE/OFFHOOK INTERCEPT

DELETE COMPLETED

**Example 2**

Cancel hotline destination voice of hotline index 250.

Input:

```
DELETE-HOTLN:TYPE=HOTDEST,HTLNIDX=250;
```

Output:

```
DELETE-HOTLN:TYPE=HOTDEST,HTLNIDX=250;
```

```
H500: AMO HOTLN STARTED
```

```
AMO-HOTLN ... HOTLINE/OFFHOOK INTERCEPT
```

```
DELETE COMPLETED
```

**115.3.3 DISPLAY-HOTLN**

Display the destinations of hotline indices with output in list format:

1. Offhook Intercept destination for voice
2. Hotline destination for voice
3. Hotline destination for data terminal
4. All types of the specified hotline indices

Those destinations that are specified in parameter TYPE are output. When destinations for hotline indice are displayed, only those hotline indice for which at least one destination is found are output.

**Procedure Overview**

| Command Code  | Parameter                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-HOTLN | TYPE=OFRCDDEST, [HTLNIDX=<number>];<br><br> TYPE=HOTDEST, [HTLNIDX=<number>];<br><br> TYPE=DTEDEST, [HTLNIDX=<number>];<br><br> TYPE=ALLDEST, [HTLNIDX=<number>]; |

**Example**

Display all types for hotline indices 1 to 250.

Input:

```
DISPLAY-HOTLN:TYPE=ALLDEST,HTLNIDX=1&&250;
```

Output:

**HOTLN - Hotline/Offhook Intercept Destinations**

Functions of the AMO

```
DISPLAY-HOTLN:TYPE=ALLDEST,HTLNIDX=1&&250;
H500: AMO HOTLN STARTED
H6: NO DESTINATIONS ARE CREATED AT DTEDEST (FOR THE SPECIFIED
HOTLINE INDEX)

+-----+
| HTLNIDX HOTDEST |
+-----+
| 1      2360      |
| 2      2360      |
| 100    *550      |
| 200    2200      |
+-----+

+-----+
| HTLNIDX OFRCDEST |
+-----+
| 1      *2512      |
+-----+
AMO-HOTLN ... HOTLINE/OFFHOOK INTERCEPT
DISPLAY COMPLETED
```

**115.3.4 REGEN-HOTLN**

Display the destinations of the hotline indices with output in position-oriented commands for regeneration:

- 1. Offhook Intercept destination for voice
- 2. Hotline destination for voice
- 3. Hotline destination for data terminal
- 4. All types of the specified hotline indices

Those destinations that are specified in parameter TYPE are output.

The command "REGENERATE-HOTLN;" regenerates all HOTLN configured data.

**Procedure Overview**

| Command Code     | Parameter                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REGENERATE-HOTLN | [TYPE=OFRCDEST] , [HTLNIDX=<number>] ;<br><br>  [TYPE=HOTDEST] , [HTLNIDX=<number>] ;<br><br>  [TYPE=DTEDEST] , [HTLNIDX=<number>] ;<br><br>  [TYPE=ALLDEST] , [HTLNIDX=<number>] ; |

**Example**

Regenerate the offhook intercept destinations for hotline index 90-100.

Input:

```
REGENERATE-HOTLN:TYPE=OFRCDDEST,HTLNIDX=90&&100;
```

Output:

```
REGENERATE-HOTLN:TYPE=OFRCDDEST,HTLNIDX=90&&100;
```

```
H500: AMO HOTLN STARTED
```

```
ADD-HOTLN: OFRCDDEST,100,*2512;
```

```
AMO-HOTLN ... HOTLINE/OFFHOOK INTERCEPT
```

```
REGENERATE COMPLETED
```

**115.4 Parameter Description**

|                 |                                                                                                                                                                 |

# 116 INFO - File Information

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

This AMO provides information regarding files located on hard disk, cartridge, DAT, flash memory or tape.

The amount of information can be controlled via parameter TYPE with the possible values: small, medium, or large.

Information regarding entire groups of files is possible also by specifying a partly qualified name.

## Contents of the File Description:

Small amount of information:

- File name

Medium amount of information - in addition to above:

- Type of file: dir file, data file
- Size of file in bytes
- Record length (SAM files)
- fixed or variable record length (SAM files)

Large amount of information - in addition to above:

- File granularity
- File connections
- Read connections
- Write connections
- Open share
- Owner (user ID)
- Number of volume blocks of the file (occupied space)
- Volume name
- Size of volume in bytes
- Access rights (read, write, append, delete)

RMX Named Area Information

- Area size

- Amount of free space in the area

116.1 Restrictions

The description is valid from SP300 E V3.0.

116.2 Interrelationships

- AMO-complex FIDES : File and device service  
(see System AMO Section 'ISY startup system')

116.3 Functions of the AMO

- [START-INFO](#) : Information regarding files of hard disk, DAT, flash memory, cartridge or tape

116.3.1 START-INFO

Starting an information display of files.

If a HD area name is entered, the size of the area and the available capacity is output.

Procedure Overview

| Command Code | Parameter                                                                                |
|--------------|------------------------------------------------------------------------------------------|
| START-INFO   | FILENAME=<string>,TYPE=<param>,[SEL=<param>]<br>,[ANS=<param>],[DIALOG=Y],[UNIT=<param>; |

Examples

1. Output file status of file APSN/S/DATE@/ to the logical area PDS in small mode.

Input:

START-INFO:":PDS:APSN/S/DATE@/",S;

Output:

```
< :PDS:APSN/S/DATE@/D >  
  
< :PDS:APSN/S/DATE@/C >  
  
FSTAT ENDED  
STATUS = H'0000
```

2. The size of the area :A1H1E: is required

Input:

```
START-INFO":A1H1E:",S;
```

Output:

```
AREA NAME      : :A1H1E:  
AREA SIZE      : H'003E0000  
FREE ON AREA   : H'00005000  
FILES ON AREA: H'00004711  
  
FSTAT ENDED  
STATUS = H'0000
```

116.4 Parameter Description

## 117 INIT - Hard Disk Area initializing

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

INIT Initialize the Hard Disk

Hard disk areas are initialized with the files required for operation as RMX\_Named\_File\_Disc.

### 117.1 Restrictions

This description is valid from HiPath 4000 V6.0.

### 117.2 Interrelationships

- AMO complex FIDES : file and device service
- AMO FORM : Formatting Hard Disk
- AMO DCSM : Device Configuration of Service Modules
- AMO DASM : Area Configuration of Service Modules
- AMO DSSM : Device and Area Switch of Service Modules

### 117.3 Functions of the AMO

- [START-INIT](#) : Initialize areas of a hard disk
- [CHANGE-INIT](#) : Changing the name of a hard disk area
- [DISPLAY-INIT](#) : Interrogate the areas on a hard disk

#### 117.3.1 START-INIT

If there is an additional partition (e.g. Linux) on the disk, the user have to confirm before the partition will be deleted. This question could be switched off by using the parameter WARN.

If an area is reserved by an external application, the initialization will be rejected.

## INIT - Hard Disk Area initializing

### Functions of the AMO

Note: If after a successful initialization of an MO the disk cannot be removed, the problem can be solved by deactivating the MO with AMO DSSM.

#### Procedure Overview

| Command Code | Parameter                                                                            |
|--------------|--------------------------------------------------------------------------------------|
| START-INIT   | [UNIT=<param>],DEVNAME=<string><br>,[MAXFILE=<number>],[WARN=<param>],[ANS=<param>]; |

#### Examples

1. Initialize the second user area on the HD at controller 1

Input:

```
START-INIT:A1,":A1H1F:";
```

2. Initialize all user areas on the HD on controller 1, which have not yet been initialized.

Input:

```
START-INIT:,":A1H11:";
```

3. Initialize areas G, H and I on the HD on controller 1 of the ADS.

Input:

```
START-INIT:A1,A1H1G&A1H1H&A1H1I;
```

4. Initialize area G on the HD on controller 4 with 5000 file nodes.

Input:

```
START-INIT:A1,V1H4G,5000;
```

## 117.3.2 CHANGE-INIT

This command can change the logical name of an area.

#### Procedure Overview

| Command Code | Parameter                                        |
|--------------|--------------------------------------------------|
| CHANGE-INIT  | [UNIT=<param>],DEVNAME=<string>,LANAME=<string>; |

#### Examples

Changing the logical name of the Administration area from A1H2E to ":PDS:".

Input:

```
CHANGE-INIT:,A1H2E,":PDS:";
```

### 117.3.3 DISPLAY-INIT

Interrogate the areas on a hard disk.

#### Procedure Overview

| Command Code | Parameter                                       |
|--------------|-------------------------------------------------|
| DISPLAY-INIT | [UNIT=<param>], DEVNAME=<string>, [ANS=<param>] |

#### Example

Interrogate the areas on the hard disk A1H11

Input:

DISPLAY-INIT:,A1H11;

Output:

|            | HARD DISK   | DATABASE    |
|------------|-------------|-------------|
| SECTOR     | H' 0200     | H' 0200     |

# 118 JOB - Administration of the JOB Task

|                                    |                                      |                                             |                                              |
|------------------------------------|--------------------------------------|---------------------------------------------|----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">System Overview</a>      | <a href="#">Parameter Description</a>       | <a href="#">Conventions and Restrictions</a> |
| <a href="#">Interrelationships</a> | <a href="#">Functions of the AMO</a> | <a href="#">Error and advisory messages</a> |                                              |

The purpose of AMO JOB is the administration of the JOB table. Handling MML-batch files originating from DMS the JOB Task enters informations concernig the request of DMS in the JOB Table. The following data are stored in the JOB Table:

- validity flag
- CRON Tab index
- EXE ..... type of execution
- name of the Batch -Protocol file
- name of the Batch-Protocol file remote
- partner name
- login name and password at the partner system
- data concerning the file transfer ( JOB Task <-----> DMS )
- counter for attempts to send the protocol to DMS
- batch job state

## 118.1 Restrictions

This description is valid from Hicom 300 E V3.0

## 118.2 Interrelationships

- JOB-TASK : Task handling batch jobs from DMS
- CRON-TASK : Task handling time dependent commands
- AMO-CRON AMO administrating the CRON Tab
- FT-HICOM File Transfer receiving Batch Jobs from DMS
- BATCH-TASK Task executing received batch jobs
- DMS DMS application sending Batch Jobs via file transfer

118.3 System Overview

Figure 1: AMO JOB in the system

From Hicom E V3.0 onward the JOB Task on ADP provides **ONLY for DMS** ( Domain Mangement System ) the entry point to execute HICOM AM-Batch files ( the integrated LINUX will not be delivered any more ) .

**Short Description**

- The JOB-Task receives messages from DMS containing MML-Batch Jobs via FT-SINIX - FT-HICOM.
- Data concerning the received Batch Job are entered into the JOB Tab and in case of a periodical job into the CRON Tab.
- In case of an immediate Batch Job the JOB Task triggers an immediate execution of the Batch Job by the BATCH Task.
- In case of a periodical Batch Job the CRON Task triggers a periodical ( according to the time stamp contained in the CRON Tab entry ) execution of the Batch Job by the BATCH-Task.
- After an execution of a Batch Job by the BATCH Task the JOB-Task receives a protocol from the Batch Task. This protocol is forwarded via FT-HICOM - FT-SINIX to the DMS application.
- If the execution mode of the Batch Job is "O" .... once or "I" .... immediate the corresponding entry of the Batch Job in the JOB-Tab is deleted by the JOB Task immediately after a successful execution of the Batch Job by the BATCH Task.
- Periodical Batch Jobs can either be deleted by a DELETE ORDER from the DMS application or by a DELETE COMMAND via AMO JOB.

**118.4 Functions of the AMO**

- [DELETE-JOB](#) : Deleting a singular or several entries of the JOB Table
- [DISPLAY-JOB](#) : Displaying one or all entries of the JOB Table

**118.4.1 DELETE-JOB**

If MODE=INIT etc..

**Procedure Overview****Command Code**

DELETE-JOB

**Parameter**

JOB=<param>;

Example

- 1. Deleting the entry with JOB index 10 from the JOB Table.

Input:

DELETE-JOB:10;

Output:

DEL-JOB:10;  
H500: AMO JOB GESTARTED  
H02: ENTRY WITH INDEX 10 DELETED  
AMO-JOB -204 ADMINISTRATION OF THE JOB-TABLE  
DELETE COMPLETED

- 2. Deleting entry 3 till 7 from the JOB Table

Input:

DELETE-JOB:3&&7;

Output:

LOE-JOB:3&&7;  
H500: AMO JOB GESTARTED  
H02: ENTRY WITH INDEX 3 DELETED  
H02: ENTRY WITH INDEX 4 DELETED  
H02: ENTRY WITH INDEX 5 DELETED  
H02: ENTRY WITH INDEX 6 DELETED  
H02: ENTRY WITH INDEX 7 DELETED  
AMO-JOB -204 ADMINISTRATION OF THE JOB-TABLE  
DELETE COMPLETED

118.4.2 DISPLAY-JOB

Entries of the JOB Table are displayed.

Procedure Overview

Command Code  
DISPLAY-JOB

Parameter  
JOB=<param>;

Examples

- 1. Displaying a singular entry of the JOB table

Input:

DISPLAY-JOB:7;

Output:

| JOB-TABLE |     |     |   |     |     |     |           |  |  |
|-----------|-----|-----|---|-----|-----|-----|-----------|--|--|
| JOB       | EXE | MIN | H | DAY | MNT | WDY | FILE NAME |  |  |
| -----     |     |     |   |     |     |     |           |  |  |
| -----     |     |     |   |     |     |     |           |  |  |

| PARTNER |                   | JOB-STATUS |    |    |    | ATTEMPTS |  | USER ID                   |  |
|---------|-------------------|------------|----|----|----|----------|--|---------------------------|--|
| USER ID |                   |            |    |    |    |          |  |                           |  |
| 7       | R                 | 20         | 13 | 01 | 04 | *        |  | :DMS:BATCH/C009AN160094.C |  |
| MXFCEN  | BATCH_JOB_WAITING |            |    |    | 0  |          |  | ncc                       |  |

The entry with the JOB Table index 7 is displayed.

## 2. Displaying the whole JOB table

Input:

DISPLAY-JOB;

Output:

The whole JOB Table is displayed.

## 3. Displaying entries of the JOB Table from JOB Table index m till JOB Table index n.

Input:

DISPLAY-JOB:1&&7;

Output:

The JOB Table elements from JOB Table index 8 till index 14 are displayed.

**118.6.1 Error Messages**

The value of the insertion <status> may be as follows:

- F01: FUNCTION NOT AVAILABLE
- F02: ENTRY TO BE DELETED WITH INDEX @@@ DOES NOT EXIST
- F03: THE ELEMENT TO BE DELETED WITH INDEX @@@ HAS AN INVALID STATE

**118.6.2 Advisories**

- H01: NO VALID JOB TAB ENTRY FOUND
- H02: ENTRY WITH INDEX @@@ DELETED

## 118.7 Conventions and Restrictions

- From Hicom E V3.0 onward the JOB Task on ADP provides **ONLY for DMS** ( Domain Mangement System ) the entry point to execute HICOM AM-Batch files ( the integrated LINUX will not be delivered any more ) .
- The name of the Batch File has to consist of **capital letters**.
- A **modification of an entry into the JOB Table** is only possible by a DELETE of the JOB by a DELETE ORDER from the DMS application with a subsequent new BATCH- ORDER( send of a message to JOB Task, containing the Batch File).
- Name convention for the Batch File: the second colon has to be the fifth character.  
e.g.: :DMS:BATCH/C009AN160094.C
- If the JOB-Table is full ( 256 entries ) further Batch Jobs will be discarded without acknowledgement.
- If the file containing the JOB Table is deleted with AMO-DEL, it is created with the next Batch Job. Entries of the CRON Table belonging to the former JOB Table ( entries with JOB Index  $\neq 0$  ) will be deleted.
- A DELETE Order concerning a Batch Job, which has a state different from BATCH\_JOB\_WAITING and TRANSFERE\_TERMINATED, will be discarded, if it originates from the DMS application. The DELETE Order will be discarded and acknowledged negatively if it originates from AMO JOB.
- BATCH Jobs staying in the state BATCH\_JOB\_RUNNING **CANNOT be canceled** by the JOB Task.
- Regular Batch Jobs or Singular Batch Jobs, which are to be executed in the future, are rounded off to 10 min because of the logics of the CRON Task.

- During the startup the JOB Task checks the new **format of the CRON Table** ( from EV3.0 onward ). If the CRON Table has an old format, i.e. it has only max. 32 entries, it is deleted and an empty CRON Table with the new format is created.

Appendix: An Example for the System Installation

## 119 KCSU - Keysystem Configuration in Switching Unit

The description of this AMO is only available in html format!

## 120 KDEV - Creation and administration of customer files

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The task of this AMO is to administer and add the entries for the customer file "PPCF". It is possible for the user to set up, change or delete a file in accordance with his or her individual wishes.

The task of the file is to define the sequence of organizational units, station numbers and personal numbers and their relation to one another, and to keep them ready for data retrieval.

Up to 3,000 elements may be entered, an element being an organization name (e.g. 'EA'), a station number or a PIN.

An element basically consists of two parts, a

- name and
- name identification.

The name consists of alphanumeric characters and can be a maximum of 12 characters in length. The maximum length of the station number is 6 digits.

The name identification tells whether an organizational unit, a station number or a personal number is involved.

The generic term for a customer file is the name PPCF, and it is given the highest rank in the hierarchy (see also Figure 1). It is the same for every customer.

There are four hierarchy levels under the PPCF:

- ORG1
- ORG2
- ORG3
- T/P

T/P is the hierarchy level for the PP (station) or PIN, and is the lowest level.

The following points should be noted when setting up a customer file:

- Stations and PINs can stored mixed within an organizational unit.
- Stations, PINs or an organizational unit which is lower in the hierarchy can be subordinate to an organizational unit.

- Organizational units can not be subordinate to a T/P level.
- Organizations names, station numbers and PINs may occur once only in the file, i.e. a station number may be used, for example, as the PP number, but the same designation may be used as a PIN and/or ORG unit.
- An ORG unit need not necessarily be allocated a station number or PIN.

Figure 8 Sample Structure of a Customer File as a Hierarchy Tree

PPCF (generic term for every file) is assigned the highest hierarchy level.

Directly subordinate to this is the EA department on ORG level 1.

Under EA are departments EA21, EA22 on ORG level 3 and departments EA1, EA2 and EA3 on ORG level 2.

EA21 has two subordinate stations 103 and 105 on the T/P level.

EA22 has no subordinate stations/PINs.

Department EA01 on ORG level 3 is subordinate to EA1.

EA01 has two subordinate stations 109 and 111 on the T/P level.

EA2 has no subordinate units.

PIN 117 on the T/P level is subordinate to EA3.

Using DISPLAY-KDEV, the following printout would result for this example:

```
ENTRIES FOR      ORG PPCF      8 .7
.1999

(1) EA           (3) EA21       (T) 103
(1) "           (3) "         (T) 105
```

```

(1) "          (3) EA22
(1) "          (2) EA1          (3) EA01
(T) 109
(1) "          (2) "          (3) "
(T) 111
(1) "          (2) EA2
(1) "          (2) EA3          (P) 117

12 ENTRIES IN CDR CUSTOMER FILE (PPCF)

```

The sequence in the file is from left to right and from top to bottom.  
The values in parentheses refer to the level.

## 120.1 Interrelationships

None

## 120.2 Functions of the AMO

- [ADD-KDEV](#) : Create the PPCF or add new entries
- [CHANGE-KDEV](#) : Change entries
- [RENAME-KDEV](#) : Rename entries
- [DELETE-KDEV](#) : Delete the PPCF or parts of the PPCF
- [DISPLAY-KDEV / REGENERATE-KDEV](#) : Display the PPCF or parts of the PPCF / Regenerate the PPCF or parts of the PPCF

### 120.2.1 ADD-KDEV

With the ADD function, the user selects whether an "ORG", a station or a "PIN" should be added to the PPCF.

A maximum of 8 entries with the same name identification can be chained with one order, i.e. using an input command an organizational unit can be assigned a maximum of 8 stations or "PINs" with the same ORG level.

#### Procedure Overview

##### Command Code

ADD-KDEV

##### Parameters

POS=<param>, IDOLD=<param>, OLDNAME=<string>  
, IDNEW=<param>, NEWNAME=<string>;

## KDEV - Creation and administration of customer files

### Functions of the AMO

Position specifications and the following instructions define how the entries are filed in terms of organization of the "PPCF".

#### Example

Add the customer file shown at the beginning

1. On ORG level 1, the organizational designation "EA" should be the absolute first entry.

Input:

```
ADD-KDEV:U,ORG,PPCF,ORG1,EA;
```

Under ORG unit "EA", add an ORG level with the organizational designations "EA21" and "EA22".

Input:

```
ADD-KDEV:U,ORG,EA,ORG3,EA21&EA22;
```

2. Add an ORG2 level with organizational designations "EA1", "EA2" and "EA3" under ORG unit "EA22".

Input:

```
ADD-KDEV:A,ORG,EA22,ORG2,EA1&EA2&EA3;
```

3. Add stations "103" and "105" under ORG unit "EA21".

Input:

```
ADD-KDEV:U,ORG,EA21,STN,103&105;
```

4. Assign ORG unit "EA1" subordinate to ORG3 level with the organizational designation "EA01".

Input:

```
ADD-KDEV:U,ORG,EA1,ORG3,EA01;
```

5. Add stations "109" and "111" under ORG unit "EA01".

Input:

```
ADD-KDEV:U,ORG,EA01,STN,109&111;
```

6. Add PIN 117 under ORG unit "EA3".

Input:

```
ADD-KDEV:U,ORG,EA3,PIN,117;
```

## 120.2.2 CHANGE-KDEV

With this function it is possible for the user to move an entry, whether it is an ORG unit, a station or a PIN, from an existing structure column to another. (This is only possible with REN-KDEV). This means that when the CHANGE function is run, in order to prevent mix-ups the parameter IDNEW does not differentiate between different ORG levels. Simply enter "ORG" for IDNEW.

### Procedure Overview

#### Command Code

CHANGE-KDEV

#### Parameters

POS=<param>, IDOLD=<param>, OLDNAME=<string>  
, IDNEW=<param>, NEWNAME=<string>;

### Examples

These refer to the customer file shown at the beginning.

1. The already existing ORG unit "EA01" with its assigned stations is added under the already existing ORG unit "EA2".

Input:

```
CHANGE-KDEV:U,ORG,EA2,ORG,EA01;
```

2. The already existing ORG unit "EA22" is added under the already existing ORG unit "EA2". But since the ORG unit "EA01" has already been added as a subordinate by the preceding order, "EA22" is appended at the end. There are two alternative procedures available for this situation.

Either input:

```
CHANGE-KDEV:U,ORG,EA2,ORG,EA22;
```

Or input:

```
CHANGE-KDEV:A,ORG,EA01,ORG,EA22;
```

After execution of change procedures 1 and 2:

Input:

```
DISPLAY-KDEV:ORG,PPCF;
```

Structure of the customer file in output format

Output:

```
ENTRIES FOR   ORG PPCF                               8 .7 .1999

(1) EA          (3) EA21          (T) 103
(1) "           (3) "            (T) 105
```

12      ENTRIES IN CDR CUSTOMER FILE (PPCF)

Figure 9      Structure of the Customer File as Hierarchy Tree

120.2.3    RENAME-KDEV

Change an existing name and/or an ORG unit to a new, non-existent name or to a new ORG level.

Procedure Overview

Command Code

RENAME-KDEV

Parameters

IDOLD=<param>,OLDNAME=<string>  
, { (min1) IDNEW=<param>,NEWNAME=<string>;

Both old parameters can be renamed to a single command, but either only IDOLD or only OLDNAME can be changed.  
Stations and PINs can not be renamed.  
For reasons related to administration, the name PPCF can not be renamed.

## Examples

These refer to the customer file shown at the beginning.

1. The name is to be changed. It must be noted that the group parameter is not to be entered, but the space for the parameter must be kept free (2 commas). IDNEW may be entered, but must correspond to the original identification.

Change the name of ORG unit "EA21" to "EA11".

Input:

```
RENAME-KDEV:ORG,EA21,,EA11;
```

2. Change the ORG level. The group parameter "NEWNAME" need not be given.

Change the ORG level for ORG unit "EA2" to "ORG3".

Input:

```
RENAME-KDEV:ORG,EA2,ORG3;
```

3. Rename the ORG level and the name. Both group parameters IDNEW and NEWNAME are required in this case.

Rename the ORG level for ORG unit "EA22" to "ORG2" and the name to "EA33".

Input:

```
RENAME-KDEV:ORG,EA22,ORG2,EA33;
```

Following execution of the procedures:

## Structure of the customer file in output form

Figure 10      Structure of the Customer File as Hierarchy Tree

### 120.2.4 DELETE-KDEV

With this function the user can delete sections of the customer file or the entire customer file. Since in addition to the customer file a further file with the CDBs (call charge data records) for the stations and/or PINs exists on the hard disk, it must be specified whether the cost carrier should be deleted despite the presence of any CDBs. For an ORG level which is to be deleted, it must be specified whether only the entry for this level is to be deleted, or whether any levels assigned subordinate to this level are also to be deleted in the process. In the latter case, it must then be specified whether any CDBs present for stations or PINs are to be deleted.

#### Procedure Overview

**Command Code**

DELETE-KDEV

**Parameter**

IDOLD=ORG, SUBLEV=Y, DEL=<param>  
          , OLDNAME=<string>;  
| IDOLD=ORG, SUBLEV=N, OLDNAME=<string>;  
  
| IDOLD=STN, DEL=<param>, OLDNAME=<string>;  
  
| IDOLD=PIN, DEL=<param>, OLDNAME=<string>;

### Examples

These refer to the customer file shown at the beginning.

1. Delete an ORG unit including subunits and despite the presence of any CDBs (see ORG unit "EA21" as example).

Input:

```
DELETE-KDEV:ORG,Y,Y,EA21;
```

2. Delete a station or PIN only if CDBs not present ("PIN 117" as example)

Input:

```
DELETE-KDEV:PIN,N,117;
```

3. Delete an ORG unit without subunits (ORG unit "EA1" as example).

Input:

```
DELETE-KDEV:ORG,N,EA1;
```

4. Delete the entire customer file despite presence of CDBs

Input:

```
DELETE-KDEV:ORG,Y,Y,PPCF;
```

Following execution of delete procedures 1-3:

Structure of the customer file in output format

```

## 123 KNFOR - Administration of Node Format table

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| AMO checks         | Functions of the AMO  | Error messages and advisories |
| Interrelationships | Parameter description |                               |

If an external node requires that the "calling number" (e.g. number of the A-subscriber) be changed to a specific format (type of number, TON) or if a specific check attribute (screening indicator, SCRE) is expected for the "calling number", an entry must be created for this destination node in the node format table.

The TON is splitted into TONIN for the incoming end traffic and TONOUT for the outgoing traffic.

In this context node numbers are defined as "virtual node numbers". The own virtual node numbers are defined at own node by AMO KNDEF,TYPE=OWN. For DNNO both kind of nodes are allowed: Own virtual nodes and foreign virtual nodes. The foreign (remote) nodes can but need not be defined by AMO KNDEF. Therefore DNNO is not checked against the KNDEF-Entries (but advisory H03).

When an own virtual node number is entered into the format table, the display format for the "calling number" is controlled on all the terminals of the local virtual node. If more virtual nodes share the own physical node, it is possible to have individual display formats at each virtual node.

As a rule, no entries are required in the node format table.  
In this case:

- The "calling number" is always transmitted in the highest format (e.g. international);
- The "calling number" is displayed in the lowest possible format (e.g. only the direct inward dialing number) on all the terminals of the local node;
- The value of SCRE is set to NOT DEFINED in the source node;
- In transit nodes, SCRE is passed transparently.

Note:

The "calling number" is any number that is not the "called number" (e.g.: number of the A-subscriber, number of the answering subscriber, forwarding number).

### DNNO parameter:

The destination foreign (remote) node numbers are defined by the AMOs RICHT resp. LDAT (Parameter DNNO), they depict always the end nodes of connections. In AMO KNFOR also the own node numbers are allowed (AMO KNDEF, TYPE=OWN, parameter NODECD).

### TONIN / TONOUT parameters:

The TON parameters TONIN and TONOUT define the conversion by call processing of an explicit "calling number" to a desired format before the number is transmitted to a destination node (TONOUT) or displayed on the terminals of the local node (TONIN).

If a virtual destination node number extends over the own and foreign physical nodes, TONIN and TONOUT may both be set for the same virtual destination node whereby TONIN and TONOUT may be set to different values.

For the format dependent calling number modification, which is based on the numbering plans ISDN and PRIVATE of the ETSI-E.164/189 standard, the corresponding codes of the KNDEF-Table (AMO KNDEF) and the prefixes defined in node prefix table (AMO KNPRES) are used.

Note: The former circuit specific TDCSU-Codes are no longer configured by AMO TDCSU. They are now subscriber specific and assigned by AMO KNDEF, TYPE=OWN (in special cases also TYPE=FOREIGN). KNPRES-Entries must always be configured!

### NPI parameter:

The numbering plan of a calling number is always derived from LCR-Outdial Rules (AMO LODR) and is valid both for calling and called numbers. This determines which branch in AMO KNFOR is to be used for modification.

The parameter values for TONIN / TONOUT depend on the particular NPI and have the following effect on the format of the "calling number":

| <b>NPI = ISDN<br/>(ISDN exchange numbering<br/>plan to ETSI-E.164)</b><br><br><b>Values of TONIN / TONOUT<br/>parameter</b> | <b>'Calling number' format<br/>( 'Calling number' comprises: )</b>                                                                                                                 |

| LEVEL2                                                                                                                                     | Level 2 code (L2C)<br>+ level 1 code (L1C)<br>+ local subscriber number<br>e.g. 9 8 732386<br><br>Display always includes trunk access code and prefix:<br>e.g. 1 3 9 8 732386 |
| LEVEL1                                                                                                                                     | Level 1 code (L1C)<br>+ local subscriber number<br>e.g. 8 732386<br><br>Display always includes trunk access code and prefix:<br>e.g. 1 2 8 732386                             |
| LOCAL                                                                                                                                      | Local subscriber number<br>e.g. 732386<br><br>Display always includes trunk access code:<br>e.g. 1 732386                                                                      |
| UNKNOWN                                                                                                                                    | Implicit number, can be dialed<br>e.g. 32386, 1 732386, 1 2 8 732386,<br>1 3 9 8 732386                                                                                        |

In the examples above:

Trunk access code=1, level 2 prefix=3, level 1 prefix=2, level 2  
code=9,  
level 1 code=8, local code=7

### **SCORE parameter:**

If an external node requires a specific SCORE, it can be defined in the  
node format table for this destination node.

A SCORE entry for the local node number has no meaning.

| <b>Values of SCORE parameter</b> |                                                                    |
|----------------------------------|--------------------------------------------------------------------|
| NETWPROV                         | The station number is generated by network                         |
| TRANSP                           | The screening indicator remains unchanged<br>(transparent)         |
| USERNSCR                         | The station number is not checked by user                          |
| USERVF                           | The station number is checked by user - the result was<br>negative |
| USERVP                           | The station number is checked by user - the result was<br>positive |

**Parameter SENDCALL:**

This parameter controls how to send the *Calling Number*:

| Values of SENDCALL parameter |                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| SEND0                        | No <i>Calling Number</i> will be send.                                                                                            |
| SEND1                        | The available <i>Calling Number</i> will be send.                                                                                 |
| SEND2                        | "Two Number Delivery Option"<br>In case of this option the <i>Calling Number</i> and the <i>Calling Node Number</i> will be send. |

**Parameter SENDCONN:**

This parameter controls how to send the *Connected Number*:

| Values of SENDCONN parameter |                                                     |
|------------------------------|-----------------------------------------------------|
| SEND0                        | No <i>Connected Number</i> will be send.            |
| SEND1                        | The available <i>Connected Number</i> will be send. |

**Parameter OVRDCAT:**

With *Override Category* it's possible to control the presentation of restricted *Calling-* or *Connected Numbers* (*Presentation Indicator (PI)* = *RESTRICTED*).

| Values of OVRDCAT parameter |                                                                                                                                                                                      |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| YES                         | <i>Calling Numbers</i> with PI=RESTRICTED will be send nevertheless to the Called Party.<br><i>Called Numbers</i> with PI=RESTRICTED will be send nevertheless to the Calling Party. |
| NO                          | Restricted <i>Calling-</i> and <i>Called Numbers</i> will be not send. They will stay restricted.                                                                                    |

**Parameter ERROPT:**

By configuring the *Error Options* the format of the *Calling / Connected Numbers* is affected in the special case, that the desired format, configured by parameter TONOUT, cannot be built up properly. This can occur for example, if the *Country Code* which is part of the calling number is not known in the system (e.g. call forwarding of an external international call to another .terminal in the local area). Usually the default value IGNOR should be chosen. This avoids inconsistencies between *Calling / Connected Number* and the correlated *Type of Number* (TON)..

| Values of ERROPT parameter |                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| IGNOR                      | If the desired format of the <i>Calling / Connected Number</i> as configured by parameter TONOUT cannot be built up, TONOUT is <i>ignored</i> . |

| Values of ERROPT parameter |                                                                                                                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DOMIN                      | If the desired format of the Calling / Connected Number as configured by parameter TONOUT cannot be built up, the <i>Type of Number</i> is nevertheless overwritten by TONOUT, i.e. TONOUT is <i>dominant</i> . This equals the "old" functionality before HiPath4000. |
| IMPL                       | If the desired format of the Calling / Connected Number as configured by parameter TONOUT cannot be built up, an <i>implicit</i> number (TON=UNKNOWN) with prefixes is sent.                                                                                           |

## 123.1 AMO checks

1. The permissible values for the TONIN / TONOUT parameter depend on the numbering plan and are already checked by the command interpreter when entered.
  - NPI = PRIVATE:  
TONIN / TONOUT = LEVEL2 or LEVEL1 or LOCAL or UNKNOWN
  - NPI = ISDN:  
TONIN / TONOUT = INTERNAT or NATIONAL or SUBSCR or UNKNOWN

A check is performed for ADD and CHANGE.

2. A destination node number with a value of 0 (0, 0-0, 0-0-0) is invalid. In such a case, error message F01 is output.

A check is performed for ADD, CHANGE, DELETE, DISPLAY and REGENERATE.

3. Destination node numbers can comprise up to 3 levels; each level has its own permissible range of values:
  - LEVEL0: 0 - 999
  - LEVEL1: 0 - 253
  - LEVEL2: 0 - 29

The range of values for level 0 is checked by the command interpreter. The AMO checks levels 1 and 2 and issues error message F02 in the event of incorrect values.

The value 0 is also invalid for level 1 if level 0 and level 2 of the destination node number are greater than 0 (e.g. 3-0-5). This error is indicated by error message F03.

Checks are performed for ADD, CHANGE, DELETE, DISPLAY and REGENERATE.

4. The following dependencies exist between the local physical node number and the virtual destination node number:

The destination node number must not be identical with the physical node number defined by AMO ZAND, parameter PNNO (F09). Different levels between DNNO and ZAND/PNNO are allowed..

A check is performed for ADD.

- DNNOs are no longer adjusted to ZAND/PNNO.
5. TONIN / TONOUT - dependencies: At least 1 parameter has to be specified. If a parameter is reset (by action CHANGE) and both parameters would be left reset, the command is rejected by F10.
  6. If a valid value for parameter TONIN has been entered (by action ADD or CHANGE), the entered DNNO should be member of the OWN part of KNDEF table. If KNFOR does not find DNNO in KNDEF table, H04 is displayed and the command is nevertheless performed.

## 123.2 Interrelationships

- AMO COT : Class of Trunk for Call Processing
  - PAR value LINO
- AMO LODR : Configuration of LCR-Outdial Rules
  - Parameter CMD=NPI,  
NPI=numbering plan identifier
- AMO KNPRES : Setting of node prefix table
- AMO KNDEF : Configuration of own virtual node numbers and assign codes to them
- AMO TDCSU : Configuration of digital circuits
- AMO ZAND : Administration of central system data;
  - Addition of local physical node number by means of PNNO parameter in branch TYPE=ALLDATA

Order of generation:  
ZAND --> KNFOR

**123.3 Functions of the AMO**

- **ADD-KNFOR** : For a destination node number, adds TONIN/TONOUT and attributes (SCRE...) to the node format table.
- **CHANGE-KNFOR** : Changes and resets the values TONIN/TONOUT, changes the attributes (SCRE...) for a destination node number entered in the node format table.
- **DELETE-KNFOR** : For a destination node number, deletes the entry from node format table.
- **DISPLAY-KNFOR** : Displays entries of node format table for one or all destination node numbers for one or both numbering plans.
- **REGENERATE-KNFOR** : Regenerates entries of node format table for one or all destination node numbers for one or both numbering plans.

**123.3.1 ADD-KNFOR**

This command allows you to enter a specific TONIN/TONOUT, SCRE, SENDCALL, SENDCONN und OVRDCAT into the node format table for a destination node number in a numbering plan (NPI =PRIVATE or ISDN).

**Procedure overview**

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-KNFOR    | <div>DNNO=&lt;number&gt;</div> <div> ,NPI=ISDN,{ (min=1) TONIN=&lt;param&gt;,TONOUT=&lt;param&gt;}</div> <div>  ,[SCRE=&lt;param&gt;],[SENDCALL=&lt;param&gt;],[SENDCONN=&lt;param&gt;]</div> <div>  ,[OVRDCAT=&lt;param&gt;],[ERROPT=&lt;param&gt;;</div> <div> ,NPI=PRIVATE,{ (min=1) TONIN=&lt;param&gt;,TONOUT=&lt;param&gt;}</div> <div>  ,[SCRE=&lt;param&gt;],[SENDCALL=&lt;param&gt;],[SENDCONN=&lt;param&gt;]</div> <div>  ,[OVRDCAT=&lt;param&gt;],[ERROPT=&lt;param&gt;;</div> |

**Examples**

1. Add a 3-level destination node number for the ISDN numbering plan.

Input:

ADD-KNFOR:DNNO=3-1-20,NPI=ISDN,TONOUT=NATIONAL,SCRE=USERNSCR;

## 123.3.2 CHANGE-KNFOR

This command allows you to change the values of TONIN/TONOUT, SCRE, SENDCALL, SENDCONN and OVRDCAT for a destination number that has already been defined. You must specify at least one of the parameters. The value of the parameter for which no entry is made is retained in the database unchanged. TONIN/TONOUT values can also be reset.

### Procedure overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-KNFOR | DNNO=<number><br> ,NPI=ISDN,{TONIN=<param>,TONOUT=<param>,SCRE=<param><br>,SENDCALL=<param>,SENDCONN=<param>,OVRDCAT=<param><br>,ERROPT=<param>};<br> ,NPI=PRIVATE,{TONIN=<param>,TONOUT=<param>,SCRE=<param><br>,SENDCALL=<param>,SENDCONN=<param>,OVRDCAT=<param><br>,ERROPT=<param>}; |

### Example

1. Change the value of the TONIN parameter for a destination node number that has already been added and reset the TONOUT value.

Input:

```
CHANGE-KNFOR:DNNO=3-1-20,NPI=ISDN,TONIN=UNKNOWN,TONOUT=RESET;
```

## 123.3.3 DELETE-KNFOR

This command allows you to delete a destination node number from the format table. If the type of numbering plan is specified for the NPI parameter, only this specific destination node number entry is deleted.

### Procedure overview

| Command Code | Parameter                    |
|--------------|------------------------------|
| DELETE-KNFOR | DNNO=<number>,[NPI=<param>]; |

### Example

1. Delete a destination node number for the PRIVATE numbering plan.

Input:

```
DELETE-KNFOR:DNNO=3-1-20,NPI=PRIVATE;
```

- 2. Delete a destination node number for both the PRIVATE and ISDN numbering plans.

Input:

```
DELETE-KNFOR:DNNO=3-1-20;
```

123.3.4 DISPLAY-KNFOR

If you enter this command without parameters, all destination node numbers are output, sorted by numbering plan type. However, you can limit output to the destination node numbers of a specific numbering plan or to a specific destination node number.

Procedure overview

| Command Code  | Parameter                       |
|---------------|---------------------------------|
| DISPLAY-KNFOR | [DNNO=<number>], [NPI=<param>]; |

Example

- 1. Output all destination node numbers for the PRIVATE numbering plan.

Input:

```
DISPLAY-KNFOR:NPI=PRIVATE;
```

Output:

|                |  |         |  |         |  |          |  |       |  |
|----------------|--|---------|--|---------|--|----------|--|-------|--|
| -----          |  |         |  |         |  |          |  |       |  |
| NUMBERING PLAN |  |         |  |         |  |          |  |       |  |
| PRIVATE        |  |         |  |         |  |          |  |       |  |
| +-----+        |  |         |  |         |  |          |  |       |  |
| DNNO           |  | TONIN   |  | TONOUT  |  | SCRE     |  | SEND  |  |
|                |  |         |  |         |  |          |  | CALL  |  |
|                |  |         |  |         |  |          |  | CONN  |  |
|                |  |         |  |         |  |          |  | CAT   |  |

## 123.3.5 REGENERATE-KNFOR

If you enter this command without parameters, all destination node numbers are regenerated, sorted by numbering plan type. However, you can limit output to the destination node numbers of a specific numbering plan or to a specific destination node number.

### Procedure overview

| Command Code     | Parameter                       |
|------------------|---------------------------------|
| REGENERATE-KNFOR | [DNNO=<number>], [NPI=<param>]; |

### Example

1. Regenerate all the destination node numbers entered in the format table.

Input:

```
REGENERATE-KNFOR;
```

Output:

```
ADD-KNFOR:3-1-6,ISDN,INTERNAT,,TRANSP,SEND1,SEND1,YES,IGNOR;
ADD-KNFOR:3-1-7,ISDN,,INTERPRE,NETWPROV,SEND0,SEND0,YES,IGNOR;
ADD-KNFOR:3-1-
8,ISDN,NATIONAL,NATIONAL,TRANSP,SEND1,SEND1,NO,IGNOR;
ADD-KNFOR:3-1-9,ISDN,NATIOPRE,,USERNSCR,SEND2,SEND0,YES,IGNOR;
```

**KNFOR - Administration of Node Format table**

Parameter description

```
ADD-KNFOR:3-1-10, ISDN, , SUBSCR, USERVF, SEND0, SEND1, NO, IGNOR;  
ADD-KNFOR:3-1-  
11, ISDN, UNKNOWN, UNKNOWN, USERVP, SEND1, SEND0, YES, IGNOR;  
ADD-KNFOR:1, PRIVATE, LEVEL1, , NETWPROV, SEND0, SEND1, NO, IGNOR;  
ADD-KNFOR:2-1, PRIVATE, , LEVEL2, NOTDEF, SEND1, SEND0, YES, IGNOR;  
ADD-KNFOR:18-18-  
18, PRIVATE, LOCAL, , USERNSCR, SEND2, SEND0, YES, IGNOR;  
ADD-KNFOR:22-0-  
0, PRIVATE, UNKNOWN, UNKNOWN, USERVF, SEND1, SEND1, NO, IGNOR;
```

## 123.5 Error messages and advisories

### 123.5.1 Error messages

F01: THE DNNO MAY NOT BE OF VALUE 0.  
 F02: LEVEL<#> OF DNNO MAY NOT EXCEED <max>.  
 F03: LEVEL1 OF DNNO MAY NOT BE VALUE 0  
 IF LEVEL2 AND LEVEL0 ARE NOT VALUE 0.  
 (EXAMPLE: 1-0-1 IS NOT POSSIBLE)  
 F05: THE DNNO <level2>-<level1>-<level0> DOES ALREADY EXIST IN NPI <npi>.  
 F06: THE DNNO <level2>-<level1>-<level0> DOES NOT EXIST IN NPI <npi>.  
 F07: THERE IS NO FREE MEMORY ELEMENT TO STORE THE NEW DNNO.  
 DELETE AN UNUSED DNNO OR ENLARGE THE NUMBER OF  
 DNNO MEMORY ELEMENTS WITH THE FOLLOWING COMMAND:  
 ADD-DIMSU:TYPE=CC,FORMTAB=<?>;  
 F09: FOR DNNO THE OWN PHYSICAL NODE ID (AMO ZAND) IS NOT ALLOWED.  
 ONLY VIRTUAL NODE ID'S ARE ALLOWED.  
 F10: TONIN AND TONOUT MUST NOT BOTH BE RESET

### 123.5.2 Advisories

H02: DNNO NOT FOUND IN NPI <npi>.  
 H03: DNNO IS AN OWN VIRTUAL NODE ID (SEE AMO KNDDEF,TYPE=OWN)  
 H04: THE TONIN PARAMETER FOR THE ENTERED DNNO BECOMES ONLY EFFECTIVE IF DNNO IS  
 ADDED TO KNDDEF-TABLE, TYPE=OWN. PLEASE CONFIGURE WITH COMMAND:  
 ADD-KNDDEF:TYPE=OWN,NNO=...;

## 124 KNLCR - Administration Source Dependent Routing

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Descriptions</a>        |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The AMO KNLCR administers the class-of-service powersets which are used to modify the Least Cost Routing Access Rights for the path selection only. This feature enables to choose a different LCR route depending on originating (source) and destination node defined via AMO RICHT. For this particular purpose, the node defined by AMO LDAT does not overwrite the DNNO of AMO RICHT.

The LCR route is controlled by the enabled Least Cost Routing Access Rights. These enabled LCR classes-of-service (LCR in LCOSV/LCOSD) are administered by the AMO COSSU. It is possible to modify these enabled LCR classmark subset as a function of source and destination node. Two LCR class-of-service powersets are used for this modification. One access right powerset is used for reducing access rights from LCR classmark subset and the other for adding specified rights. Using the modified LCR access rights as usual enables choosing one route and prevent choosing another route depending on source/destination information. The modification is working for the current connection only, without permanent changes in LCOSV/LCOSD of the calling party.

Both LCR class-of-service powersets are administered using the AMO KNLCR. The class-of-service powersets can be created and deleted, changed, displayed and regenerated. If a change is made the existing class-of-service powersets are changed by adding and removing or by a new size definition of classes-of-service. A table entry is removed on action DELETE. The created class-of-service powersets can be displayed by using the actions "DISPLAY" and "REGENERATE".

The 3-level source and destination node number is used for addressing the connection, for which the LCR Access Rights are supposed to be modified. A 3-level node number can be fully qualified (1-2-45) or partial qualified (1-0-0). In a partial qualified node number "0" is to be interpreted as "don't care". If the same LCR class-of-service powersets are to be used for all nodes in the own subdomain, the entry is made under the node number n-m-0. If individual nodes are to be selectively excluded, entries must be made for these specifying node number n-m-a.

The source and destination node number must be virtual node ID's. The virtual node ID's must be different to the physical node id of the own node (of AMO ZAND).

The AMO does not perform any logical check on the source and destination node number.

## 124.1 Interrelationships

- AMO COSSU : Administration of the classes of service (LCR in LCOSV/LCOSD)
- AMO Kndef : Administration of the virtual node numbers (source node)
- AMO LDAT : Administration of LCR directions (with LAUTH)
- AMO RICHT : Administration of the trunk routing (destination node)
- AMO ZAND : Administration of the system data (physical node number of the own node)

## 124.2 Functions of the AMO

- [ADD-KNLCR](#) : Create the classes-of-service for the modification of the enabled LCR Access Rights
- [CHANGE-KNLCR](#) : Change the classes-of-service for the modification of the enabled LCR Access Rights
- [DELETE-KNLCR](#) : Delete the classes-of-service for the modification of the enabled LCR Access Rights
- [DISPLAY-KNLCR](#) : Display the classes-of-service for the modification of the enabled LCR Access Rights
- [REGENERATE-KNLCR](#) : Regenerate the classes-of-service for the modification of the enabled LCR Access Rights

### 124.2.1 ADD-KNLCR

This function is used to create the classes-of-service for the modification of the LCR Access Rights.

With the parameter ADDSLCOS, access rights are defined that are added to the enabled LCR Access Rights.

With the parameter REDSLCOS, access rights are defined with which the enabled LCR Access Rights are reduced.

### Procedure Overview

| Command Code | Parameter                                                                  |
|--------------|----------------------------------------------------------------------------|
| ADD-KNLCR    | SNNO=<number>, DNNO=<number>,<br>[ADDSLCOS=<number>], [REDSLCOS=<number>]; |

#### Example

For the connection SNNO=1-1-10 to DNNO=1-1-800 for all users out of SNNO the second ways - for that LCOS 10 is required - are not supposed to be used within the own node.

Input:

```
ADD-KNLCR:SNNO=1-1-10, DNNO=1-1-800, REDSLCOS=10;
```

## 124.2.2 CHANGE-KNLCR

The function CHANGE makes it possible to modify the parameters defined during creation. When a change is made the existing classes-of-service are changed by adding and removing or by a new size definition.

### Procedure Overview

| Command Code | Parameter                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------|
| CHANGE-KNLCR | SNNO=<number>, DNNO=<number><br>, FUNCT={ADD/DEL/ND},<br>{ [ADDSLCOS=<number>], [REDSLCOS=<number>] }; |

## 124.2.3 DELETE-KNLCR

With the action DELETE the entry for the connection, defined by SNNO and DNNO, is removed from table.

### Procedure Overview

| Command Code | Parameter                     |
|--------------|-------------------------------|
| DELETE-KNLCR | SNNO=<number>, DNNO=<number>; |

**124.2.4 DISPLAY-KNLCR**

This function makes it possible to output the classes-of-service which are used to modify the Least Cost Routing Access Rights.

Following possibilities exists:

- a) SNNO and DNNO are entered: display of the classes-of-service of the defined connection\*)
- b) SNNO is entered: display of all connections related on the defined source node and the classes-of-service of these connections
- c) DNNO is entered: display of all connections related on the defined destination node and the classes-of-service of these connections
- d) SNNO and DNNO not entered: display of the classes-of-service of all connections

\*) If the same LCR class-of-service powersets are used for the modification of the classmark subset of all subdomaines or nodes (addressed by a partial qualified node) and the entered connection is not selectively excluded, the entry of the partial qualified node is issued.

**Procedure Overview**

| Command Code  | Parameter                         |
|---------------|-----------------------------------|
| DISPLAY-KNLCR | [SNNO=<number>], [DNNO=<number>]; |

**Example**

The data for the connection SNNO=1-1-5 and DNNO=1-2-3 is to be displayed. For this connection, no explicit entry exists. However an entry exists, that is used for the modification for all nodes in the subdomain (1-1-0) and is displayed.

Input:

DISPLAY-KNLCR:SNNO=1-1-5,DNNO=1-2-3;

Output:

| SOURCE | DESTINATION | ADDSLCOS       | REDSLCOS |
|--------|-------------|----------------|----------|
| 1-1-0  | 1-2-3       | 15 17 23 35 40 | 10       |

## 124.2.5 REGENERATE-KNLCR

### Procedure Overview

| Command Code | Parameter                         |
|--------------|-----------------------------------|
| REGEN-KNLCR  | [SNNO=<number>], [DNNO=<number>]; |

#### Example

Regenerating the LCR classmark modification for the connection  
SNNO=1-1-10 and DNNO=1-1-800.

Input:

REGEN-KNLCR:SNNO=1-1-10,DNNO=1-1-800;

Output:

ADD-KNLCR:1-1-10,1-1-800,,10;

## 124.3 Parameter Descriptions

|                 |                                                                                                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDSLCOS        | Class-of-service that is added to the enabled LCR classmark subset                                                                                               |
| Type of Input   | : 1 to 5 single values, concatenated with & or &&, optional                                                                                                      |
| Possible Values | : 1-64                                                                                                                                                           |
| DNNO            | virtual destination node number                                                                                                                                  |
| Type of Input   | : 1 to 3 single values, concatenated with -<br>mandatory (ADD, CHANGE, DELETE)<br>optional (DISPLAY, REGENERATE)                                                 |
| Possible Values | : Level2 (left value):0 - 29<br>Level1 (middle value):0 - 253<br>Level0 (right value):0 - 999                                                                    |
|                 | A 3-level node number can be fully qualified (1-2-45) or partial qualified (1-0-0). In a partial qualified node number "0" is to be interpreted as "don't care". |
| FUNCT           | whether LCR class-of-service are to be added or removed                                                                                                          |
|                 | Branch parameter for the parameters ADDSLCOS and REDSLCOS                                                                                                        |
| Type of Input   | : Single value, mandatory (CHANGE)                                                                                                                               |
| Possible Values | : ADD = Add to created classmarks that modify enabled LCR classmark subset                                                                                       |
|                 | : DEL = Delete from created classmarks that modify enabled LCR classmark subset                                                                                  |

# 125 KNMAT - Administer node connection matrix

|             |                      |                               |
|-------------|----------------------|-------------------------------|
| Definitions | Interrelationships   | Parameter description         |
| Functions   | Functions of the AMO | Error messages and advisories |

The AMO KNMAT administers the node connection matrix which is responsible for

- restricting connections (for example for preventing network loops) and
- modifying station numbers.

The node connection matrix is set individually at each network node: it is not identical across the entire network. These two separate functions are briefly explained below. The only thing they have in common is that both are based on the "node numbers". For KNMAT 2 kind of node numbers are to be used:

- Virtual node numbers, which are configured by AMO KNDEF. Virtual nodes can extend over several physical nodes. Moreover, one physical node can comprise several virtual nodes.
- Fictitious node numbers of PBXs which cannot handle the node numbers. These numbers are assigned to a circuit using one of the AMOs TDCSU, TACSU or TSCSU.

Physical node numbers as configured by AMO ZAND, parameter PNNO at each network node, are not to be used for the AMO KNMAT.

## Note:

This AMO is used for network configuration. Reconfiguration measures during live operation can temporarily lead to implausibilities which, in turn, can disrupt operation.

For further definitions of network-relevant addresses and for examples of network configurations and cases where KNMAT applies for station number modification and the prevention of network loops, refer to the Service Manual (AMO Usage Examples/Networking). The explanation of the several kind of node numbers (e.g. virtual node number) can be found in chapter 'General Networking Terminology' in the service manual.

## 125.1 Definitions

Station numbering plans:

The introduction of QSIG/DSS1 extends the options available for station numbering plans:

NPI = UNKNOWN: Hicom-specific station numbering plan

NPI = ISDN: ISDN-E.164 numbering plan

NPI = PRIVATE: private numbering plan (PNP) as defined in the ETSI standard.

In most cases, station number modification need only be set for numbering plan UNKNOWN. For the other NPI's, a second method (Format Depending Modification), configured by using AMO's TDCSU, KNFOR, KNPRES and KNDEF is normally used (see Service Manual / AMO Usage Examples).

#### **Note:**

KNMAT entries for NPI = ISDN or PRIVATE override the Format Depending Modification.

NPI is interpreted only where station numbers are modified, but not when connections are restricted. However, all the necessary information is contained in the output screens.

#### Originating Node Number:

Normally the Originating Node Number ONNO is taken from incoming messages of networking protocol (e.g. Cornet-NQ). If protocol is not containing ONNO (e.g. Central Office protocols), ONNO is taken from circuit configuration of incoming circuit (AMO TDCSU, parameter NNO) if this is activated by the appropriate COT parameters (see cross reference to AMO COT). For transit ONNO is passed from incoming connection (protocol or TDCSU) to outgoing connection. If the own node is originator of the connection, ONNO is the virtual node number of the calling station. All virtual node numbers of the own physical node are defined in a so called KNDEF-Table (administered by AMO KNDEF,TYPE=OWN). The assignment to the subscriber is done by the configuration AMOs (SCSU/SSCSU/SBCSU set only the default node number) or by AMO SDAT. The virtual node number of the calling station is then inserted into the appropriate protocol elements, if networking protocol allows transfer of originating node numbers (e.g. Cornet-NQ).

#### Destination Node Number:

The destination node number DNNO is defined by the AMOs RICHT resp. LDAT for number modification purpose; it depicts always the end node of a connection.

#### Levels:

The introduction of 3-level node numbers has given rise to the LEVEL parameter in KNMAT:

- LEVEL = 0: Lowest level of the node number hierarchy. Only this level was available up to and including SP300 V3.4. Level 0 node numbers correspond to node numbers used in KNMAT up to and including SP300 V3.4.
- LEVEL = 1: First level of the node number hierarchy; corresponds to the national level where NPI = ISDN, for example. A level 1 region number comprises all level 0 node numbers within that region.
- LEVEL = 2: Highest level of the node number hierarchy; corresponds to the international level where NPI = ISDN, for example. A level 2 region number comprises all subordinated level 1 regions.

Figure 12      Example: 3-Level PBX Network

A node is identified uniquely in the network by a node number with up to three levels. This number is displayed in other AMOs (RICHT, LDAT, KNFOR etc.) in the form aa-bbb-ccc:

## KNMAT - Administer node connection matrix

### Definitions

aa = level 2 region number  
bbb = level 1 region number  
ccc = level 0 node number

Node numbers are not visible at station display. Dialed and displayed are the station numbers, structured level oriented corresponding to the node numbers (see [Figure 12](#)).

In [Figure 12](#) for example the shaded node has the number 1-20-100. Region/node codes are part of the station number in open numbered networks. The station in [Figure 12](#) connected to node 1-20-100 has the phone number 7-81-911-4711.

KNMAT administers the network levels separately. For this reason, a modification point is addressed by a combination of the layer and node numbers (region numbers). One level is handled independently from another.

Figure 13 Modification Matrices and Modification Points in a 3-Level Network

Each NPI has a separate node connection matrix for each level, which means there are 9 individual node connection matrices in all (see [Figure 13](#)). The network levels are assigned individual node connection matrices, based on which reductions are applied sequentially from the highest to the lowest level and extensions from the lowest to the highest level:

- Number reduction: Modification sequence is Modification Point 3, 2, 1 (up-down)
- Number extension: Modification sequence is Modification Point 1, 2, 3 (down-up)

The restriction of connection is also level based. Therefore connections between regions can be allowed / denied too.

Logical nodes:

Logical nodes simplify the task of administration and result in less entries in the node connection matrix. They must not be used for the restriction of connection. The following logical nodes exist:

- CDR: Charge Data Recording
- OWN: Own nodes as they are specified by AMO KNDEF, TYPE=OWN
- ROW: Rest Of World (all virtual nodes in system)

The logical node OWN is always converted into the virtual node numbers as defined by the AMO KNDEF, TYPE=OWN. This is only possible for the numbering plan UNKNOWN and LEVEL=0.

Any entry for ROW will **not** be converted into several entries for the existing physical nodes. The logical node ROW is only modified if the direct entry for the physical node (ONNO/DNNO) does not contain a modification. In this way, multiple modifications within one and the same level can be avoided.

Modification conditions:

Each point in the modification matrix is assigned a modification condition. These conditions describe the call processing context in which modification will take place. A modification condition can only be assigned, if a modification (NUMRED, NUMEXT) is either valid in the command or in the matrix.

Modification condition can be divided into

- call processing context depending modification conditions (IN, OUT, TRANSI, TRANSH, ALL)
- special modification conditions (REPEXT, RES1, RES2)
- modification condition disable switch (NOMOD)

## 125.2 Functions

### 125.2.1 Restricting connections

This function of the AMO KNMAT can be used to restrict connections between certain combinations of origin and destination nodes. This can, for example, be used:

- to prevent network loops by blocking transit nodes for certain connections and/or
- to control the load on trunks i.e. - a restriction can be made based purely on incoming/outgoing node destination to prevent the trunks of a route becoming bottle necked from one particular destination; as result of call barring. The reroute will fallback to previous PBX/node where a different path will be checked.

The system date (see the ACCHECK parameter for the AMO ZAND) can be used for the attendant console telephone to suspend the restriction of connections by the node connection matrix.

## 125.2.2 Modifying station numbers

### 125.2.2.1 Effect on station number display and network-wide features

This function enables station numbers (calling numbers, connected numbers, but **not** called numbers) signaled in the context of internode traffic to be modified. It thus supports network-wide features in networks with open numbering plans. For example, the function can be used to ensure the "correct" display of the caller's station number on the called subscriber's station. For instance, if number extensions are set in the originating node and if no modification takes place at the transit node, this means that the station number can be extended (e.g. by means of the node code) irrespective of the call route. However, to operate a network with nodes that cannot handle station number modification (such as variants earlier than SP300 V3.3), it may be necessary for numbers to be extended or reduced in transit nodes or destination nodes. Central Office trunk accesses necessitate the option of modifying station numbers even on the "inbound" side.

---

**NOTE:** In the case of analog circuits, the originating node number (a fictitious node number) must be assigned to the circuit with the AMO TACSU (the NNO parameter). The same applies for digital circuits or systems of variants earlier than SP300 V3.3. For trunk circuits the AMO TDCSU must be used (with the NNO parameter) and actuated by COT parameter (see cross reference to AMO COT).

---

### 125.2.2.2 Effect on call detail recording

The node connection matrix is also used for call detail recording, to ensure that a unique station number is obtained within the network. For this purpose it is necessary to make an entry in the matrix modifying a virtual node to the logical destination node "CDR" (see AMO Usage Examples/Networking in the Service Manual for the relevant rules). However, this entry will only be interpreted if NPI = UNKNOWN.

### 125.2.2.3 Standard configuration

- For NPI=ISDN, PRIVATE Format Depending Modification is to be configured, using the AMO's KNFOR, KNPRE, TDCSU and KNDEF.
- The logical node OWN is replaced by all own virtual node numbers as configured by AMO KNDEF, TYPE=OWN.
- For NPI=UNKNOWN in most cases a standard configuration is sufficient using KNMAT logical nodes. For example, in a 1 level open numbered network, a node with node/region code 911 (corresponds to station numbers 911xxxxx, where xxxxx means a local station number) should be configured with:

Input:

```
CHANGE-KNMAT:UNKNOWN,0,,OWN,,ROW,,OUT,911; /* level 0 node code
= 911 */
CHANGE-KNMAT:UNKNOWN,0,,ROW,,OWN,,IN&TRANSI,,911;
```

Output, if for example only 1 own virtual node (=15) is configured in KNDEF-Table (message 1 for command 1 and message 2 for command 2)

```
H08: ONNOL=OWN WAS CONVERTED ACCORDING TO KNDEF-TABLE INTO
ONNO=15.
H08: DNNOL=OWN WAS CONVERTED ACCORDING TO KNDEF-TABLE INTO
DNNO=15.
```

### 125.2.2.4 Code-Extraction from KNDEF

If the own physical node comprises more virtual nodes with different codes, the parameters NUMEXT/NUMRED can be supplied with ##### instead of explicit codes. In this case, all codes are extracted automatically from KNDEF-Table. The so called Skip Digits have to be considered.

Example:

**KNMAT - Administer node connection matrix**

CHANGE -  
KNMAT:NPI=UNKNOWN,L

K

-----  
-----  
---  
NODE MATRIX FOR NPI =  
UNKNOWN, LEVEL = 0  
-----  
-----  
---  
ONNO/ | DNNO/ |

**Output:**

H09: DNNOL=OWN WAS CONVERTED ACCORDING TO KNDEF-TABLE INTO DNNO=1.  
EXTRACTED NUMBER: NUMRED=9 (SKIP DIGITS HAVE BEEN CONSIDERED)

H09: DNNOL=OWN WAS CONVERTED ACCORDING TO KNDEF-TABLE INTO DNNO=10.  
EXTRACTED NUMBER: NUMRED=66 (SKIP DIGITS HAVE BEEN CONSIDERED)

H09: DNNOL=OWN WAS CONVERTED ACCORDING TO KNDEF-TABLE INTO DNNO=21.  
EXTRACTED NUMBER: NUMRED=445 (SKIP DIGITS HAVE BEEN CONSIDERED)

H10: PLEASE NOTE THAT ENTRIES, WHICH ARE EXTRACTED FROM KNDEF-TABLE, ARE NOT  
AUTOMATICALLY ADAPTED, IF KNDEF-TABLE IS CHANGED.

The Skip Digits specify how many digits are to be copied from the KNDEF-Table. KNDEF-Table entries are only considered if they contain a node code (NODECD) and Skip Digits /= 0 (NODECDSK). This is the reason why in the example above no entries are generated for DNNO 2 and 3.

Note: The extraction of the KNDEF-Table is only allowed in numbering plan UNKNOWN and in level 0. If the KNDEF-Table contains node numbers with multiple levels, only level 0 is evaluated. Therefore the KNDEF-Table must be unique for level 0 entries (e.g. codes cannot be extracted if entries for NNO 1-1-2 and 1-3-2 exist).

**125.3 Interrelationships**

- AMO ACSU : Parameter NNO: Assigns (fictitious) originating node numbers to attendant consoles  
Assignment of a display suppression attribute to attendant console (SATNDNO=ONLYEXT)

- AMO COT : Parameter PAR: The values LWNC, DFNN are assigned for trunk circuits which do not transmit usable originating node codes incoming / outgoing.
- AMO DIMSU : Parameter RSTCON: Sets the number of originating nodes from which connections are to be restricted.  
: Parameter DSPMOD and DPDSPMOD: Sets the number of originating/destination node combinations for which station number modification is to be set.
- AMO KNDEF : Definition of the virtual nodes within the own physical node (TYPE=OWN, parameter NNO)  
Per virtual node the node codes and the skip digits for the node codes for the numbering plan UNKNOWN are configurable (parameters NODECD and NODECDISK)
- AMO KNFOR : Sets the node format table
- AMO KNPRE : Sets the node prefix table
- AMO LDAT : Parameter DNNO: Assigns an individual virtual destination node number for each routing element
- AMO LODR NPI : Branch CMD=NPI: Assigns NPI and TON in the outdial rule / TON
- AMO RICHT : Parameter DNNO: Assigns the individual virtual destination node number (not a transit node number) for each route
- AMO SDAT : Change the virtual node number of a station and regenerate it  
Change the display suppression attribute (SSTNO= ONLYEXT)
- AMO SBSCSU : Assignment of a default virtual node number (taken from KNDEF-Table) to a subscriber when configuring a new station (not visible at user interface). For display and regenerate action AMO SDAT has to be used.  
Assignment of a display suppression attribute (SSTNO=ONLYEXT)
- AMO SCSU
- AMO SSUSU
- AMO TACSU : Parameter NNO: Assigns (fictitious) originating node numbers for incoming trunk circuits which do not transmit an ONNO (e.g. trunk circuits)
- AMO TDCSU : Parameter NNO: Assigns (fictitious) originating node numbers for incoming trunk circuits which do not transmit an ONNO (e.g. trunk circuits)  
Parameter ISDNxx, PNPxx: Configuration of prefixes for digital trunk circuits if KNPRE prefixes cannot be used
- AMO TSCSU : Parameter NNO: Assigns (fictitious) originating node numbers for special equipment and special networks
- AMO WABE : Branch TYPE=DNNO, parameter DNNO: Displays destination nodes and destination system numbers  
Parameter DAR=OWNNODE: Assigns own node codes

## 125.4 Functions of the AMO

- [CHANGE-KNMAT](#) : Changes the node connection matrix
- [DISPLAY-KNMAT](#) : Displays the node connection matrix
- [REGENERATE-KNMAT](#) : Regenerates the node connection matrix

No add command is implemented because the node connection matrix is always "logically" present. The matrix is initialized with:

- No station number modification
- All connections are allowed

No delete command is implemented. The CHANGE command is used as the delete function (set to initialization values).

### 125.4.1 CHANGE-KNMAT

Changes the node connection matrix, which consists of two independent parts: the restrict connection component and the station number modification component. An entry is addressed with NPI, LEVEL, ONNO (or ONNOL) and DNNO (or DNNOL).

All combinations ONNO/ONNOL and DNNO/DNNOL are considered. For example, if all node number parameters are present in command, the modification is done for:

ONNO - DNNO  
ONNO - DNNOL  
ONNOL - DNNO  
ONNOL - DNNOL

In the station number modification component, the delete function is implemented by means of NUMEXT=\*\*\*\*\* or NUMRED=\*\*\*\*\*.

In the restrict connection component, the delete function is implemented by means of CONN=A.

NPI, ONNOL, DNNOL, MODCON, NUMEXT and NUMRED are valid only for the station number modification component.

CONN is valid only for the restrict connection component.

LEVEL, ONNO and DNNO are valid for both components.

If an entry can no longer be made in the node connection matrix owing to insufficient memory (see cross-references: AMO DIMSU), an error message is displayed.

MODCON is only an attribute of an entry in the node connection matrix and is therefore only valid in combination with an entry. This means that an empty entry with MODCON=NOMOD is not possible (NUMEXT or NUMRED have to be specified or have to exist in this case too)

## Procedure overview

| Command code | Parameters                                                                                                                                                                         |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-KNMAT | [NPI=<param>], LEVEL=<number><br>, {ONNO=<number>, ONNOL=<param>}<br>, {DNNO=<number>, DNNOL=<param>}<br>, {CONN=<param>, MODCON=<param><br>, NUMEXT=<key-num>, NUMRED=<key-num>}; |

### Examples

1. Single-level network (level 0 only). The station numbering plan UNKNOWN is to be changed by adding the extension 91 for connections from the home node to all other nodes in the network for all kind of traffic conditions.

Input:

```
CHANGE-KNMAT:UNKNOWN,0,,OWN,,ROW,,,91;
```

2. Two-level network (levels 0, 1). Connections from the originating node number 100 to destination nodes with the numbers 120 to 200 on level 0 are to be permitted, and the extension 722 is to be added to station numbers signaled in this context in the ISDN numbering plan. This extension should only apply to outgoing connections. The modification takes effect between the nodes xx-100 and xx-120 to xx-200 (xx being any level 1 region).

Input:

```
CHANGE-KNMAT:ISDN,0,100,,120&&200,,A,OUT,722;
```

If the extension 89 is to be added to outgoing connections from level 1 region number 15 to region number 16 in addition to the above example, the following command must be entered:

```
CHANGE-KNMAT ISDN,1,15,,16,,A,OUT,89;
```

Once both commands have been entered, a dual extension is applied between 15-100 and 16-120 to 16-200: 722 is added to begin with, and then 89, with the result that the station number 4711 is converted to 897224711. Between 15-100 and 15-120 the resultant modified station number would be 7224711; no modification would take place between 15-100 and 15-119.

3. On level 2, the international element of the station number (exit code, prefix and country code) are to be reduced in the ISDN numbering plan in incoming terminal traffic and transit traffic from Central Office (CO) region specified by fictitious level 2 region number 1 (e.g. by AMO TDCSU, parameter NNO=1-0-0).

Input:

```
CHANGE-KNMAT:ISDN,2,1,,,ROW,,IN&TRANSI,,00049;
```

## KNMAT - Administer node connection matrix

### Functions of the AMO

4. Connections from originating region 25 to destination region 92 on level 1 are to be denied.. Any station number modifications already entered in the PRIVATE numbering plan for these connections are to be deleted.

Input:

```
CHANGE-KNMAT:PRIVATE,1,25,,92,,D,,*****,*;;
```

5. Configuration of a replacement number between a local station with extension number suppression (SSTNO=ONLYEXT) defined in the own virtual node 17 and a Central Office specified by a fictitious node number 100:

```
CHANGE-SDAT:STNO=2100,TYP=DATA,SSTNO=ONLYEXT;
```

```
CHANGE-KNMAT:ISDN,0,17,,100,,,OUT&REPEXT,4989722*0;
```

The asterisk character (\*) in NUMEXT has a special meaning in combination with MODCON=REPEXT. It means that, if the calling station has the attribute ONLYEXT, the calling extension number is replaced by the part right of the asterisk. Afterwards, the resulting extension number is extended by the part left of the asterisk independent of the attribute ONLYEXT.

Please note that the format of NUMEXT corresponds to the format defined by AMO KNFOR for the destination node (here international format, i.e. no entry in AMO KNFOR or the entry INTERNAT for DNNO=100). The codes (49, 89, 722) can be read by means of the virtual node number of the local subscribers (17) from the Kndef table.

In the example above the calling number 3111 is converted into the new calling number 49897223111 (no ONLYEXT, i.e. normal number extension). The calling extension 2100 (ONLYEXT) is sent to the Central Office as 49897220 (that means the number was replaced and extended).

For a detailed description see service manual, chapter " Display Suppression".

## 125.4.2 DISPLAY-KNMAT

Displays the denied connections and the station number modifications.

Only entries, which are different from the initialization values, are displayed.

The parameter TYPE controls whether only entries with denied connections, only entries with station number modifications, or both types of entry are displayed. If (in accordance with the TYPE selection parameter) an entry in the node connection matrix is displayed, then

**all** information is displayed (e.g. including the denied/allowed connection information, even if the selection was based on TYPE=MOD).

Although restricted connections are independent of the numbering plan, they are always displayed for all numbering plans to provide the user with as much information as possible (i.e. to ensure that all modifications are also displayed).

The system issues a prompt for the LEVEL parameter if it has not been specified in a command which contains physical node entries (ONNO, DNNO). Logical nodes (ONNOL, DNNOL) apply for all levels, which means that, if the LEVEL parameter is omitted, the modifications on all levels are displayed for the corresponding ONNOL/DNNOL.

Group relationship between ONNO and ONNOL and/or DNNO and DNNOL:

If one of the parameters in the group is specified, the parameter that has not been specified will be interpreted by default as "no display". If neither of the parameters in the group is specified, both parameters will be interpreted by default as "all nodes".

### Procedure overview

| Command code  | Parameters                                                                                                                  |
|---------------|-----------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-KNMAT | [NPI=<param>], [LEVEL=<number>]<br>, {ONNO=<number>, ONNOL=<param>}<br>, {DNNO=<number>, DNNOL=<param>}<br>, [MODE=<param>] |

### Examples

1. Display the station number modifications in the UNKNOWN numbering plan for connections from the originating nodes OWN, 91 and 96 to the destination nodes 80 to 85, and to all logical nodes on level 0. The KNDEF-Table contains only 1 own virtual node (95). For ONNO 96, no modification is entered for any DNNO; the message H02 is therefore output.

Input:

```
DISPLAY-KNMAT:UNKNOWN,0,91&96,OWN,80&&85,OWN&ROW&CDR,MOD;
```

Output:

```
H08: ONNOL=OWN WAS CONVERTED ACCORDING TO KNDEF-TABLE INTO
ONNO=95.
```

```
-----
NODE MATRIX FOR  NPI = UNKNOWN, LEVEL = 0
-----
```

## KNMAT - Administer node connection matrix

### Functions of the AMO

| ONNO /<br>ONNOL | DNNO /<br>DNNOL | CONN | MODCON | NUMEXT | NUMRED |
|-----------------|-----------------|------|--------|--------|--------|
| 91              | 80              | A    | ALL    | 91     | -      |

| 10              | 11              | D    | -      | -      | -      |
| 15              | 10              | D    | -      | -      | -      |
| 15              | 99              | D    | -      | -      | -      |

H02: NOT ALL REQUESTED ONNO ARE DISPLAYED

### Note:

The parameter "MODE" does not affect the format of the display.

### 125.4.3 REGENERATE-KNMAT

Displays denied connections or connections with station number modifications in the form of change commands.

If no parameter is specified, all denied connections and all connections with station number modifications will be regenerated.

#### Procedure overview

| Command code     | Parameters                                                                                                                 |
|------------------|----------------------------------------------------------------------------------------------------------------------------|
| REGENERATE-KNMAT | [NPI=<param>], [LEVEL=<number><br>, {ONNO=<number>, ONNOL=<param>}<br>, {DNNO=<number>, DNNOL=<param>}<br>, [MODE=<param>] |

#### Example

List all change commands which affect originating nodes with the numbers 90 to 99 and destination nodes 60 to 85 on level 0.

Input:

```
REGENERATE-KNMAT:,0,90&&99,,60&&85;
```

Output:

```
CHA-KNMAT:ISDN,0,91,,84,,D,,,;
CHA-KNMAT:ISDN,0,99,,60,,D,ALL,722,;
CHA-KNMAT: PRIVATE,0,91,,84,,D,,,;

## KNMAT - Administer node connection matrix

### Parameter description

Node numbers have level specific ranges.

|                 |                                                                                                                                                            |                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| Type of input   | : single value, range or concatenated values, group member (at least 1) with DNNOL for CHANGE, group member (maximum 2) with DNNOL for DISPLAY, REGENERATE |                                                                      |
| Possible values | : 1 - 999                                                                                                                                                  | for LEVEL = 0                                                        |
|                 | 1 - 253                                                                                                                                                    | for LEVEL = 1                                                        |
|                 | 1 - 29                                                                                                                                                     | for LEVEL = 2                                                        |
| Default value   | : 1&&999                                                                                                                                                   | for DISPLAY and REGENERATE LEVEL= 0 if DNNOL is missing from command |
|                 | 1&&253                                                                                                                                                     | for DISPLAY and REGENERATE LEVEL=1 if DNNOL is missing from command  |
|                 | 1&&29                                                                                                                                                      | for DISPLAY and REGENERATE LEVEL=2 if DNNOL is missing from command  |
|                 | no node                                                                                                                                                    | for DISPLAY and REGENERATE if DNNOL exists in command                |

#### DNNOL

Logical destination node

Logical nodes have been introduced in order to simplify administration of modifications. For denying connections, logical nodes are not allowed. **OWN is only allowed for level 0 in numbering plan UNKNOWN and is extracted from KNCDEF-Table.** The other values (ROW, CDR) are mapped to special node numbers which are not visible at user interface.

#### LEVEL

Level of the node numbers for modifications or denied connections

Node numbers consist of up to 3 levels. Each level has its own value range. Higher levels than 0 are used for building up hierarchical networks.

#### ONNOL

Logical originating node

Logical nodes have been introduced in order to simplify administration of modifications. For denying connections, logical nodes are not allowed. **OWN is only allowed for level 0 in numbering plan UNKNOWN and is extracted from Kndef-Table.** The other values (ROW, CDR) are mapped to special node numbers which are not visible at user interface.

## **125.6 Error messages and advisories**

### **125.6.1 Error messages**

- F01: CONNECTIONS FROM <aaa> TO <bbb> IN LEVEL <c> CANNOT BE DENIED SINCE THE MEMORY AREA WHICH WAS ASSIGNED BY MEANS OF THE AMO DIMSU PARAMETER RSTCON HAS ALREADY BEEN USED UP.
- F02: STATION NUMBER MODIFICATIONS FROM NODE <dddd> TO NODE <eeee> IN LEVEL <c> CANNOT BE ENTERED SINCE THE MEMORY AREA WHICH WAS ASSIGNED BY MEANS OF THE AMO DIMSU (PARAMETER DSPMOD AND DPDSPMOD) HAS ALREADY BEEN USED UP.
- F03: MODCON = NOMOD MUST NOT BE CONCATENATED WITH OTHER VALUES.
- F04: FOR CHANGING A MODIFICATION VALUE (MODCON, NUMEXT, NUMRED), NPI IS MANDATORY.
- F05: LOGICAL NODES (PARAMETER ONNOL, DNNOL) ARE NOT ALLOWED FOR DENYING CONNECTIONS.
- F06: <ffff> = <ggg> IS OUT OF RANGE FOR LEVEL = <c>. POSSIBLE RANGE: 1 - <hhh>
- F08: <ffff> IS ONLY VALID FOR A SPECIFIC LEVEL.
- F09: TOO MANY ENTRIES FOR DENIED CONNECTIONS OR MODIFICATIONS: THE MAXIMUM RUNTIME WAS EXCEEDED. THE ENTRIES UNTIL NODE <dddd> OF LEVEL <c> HAVE BEEN EXECUTED.  
PLEASE ENTER COMMAND AGAIN FOR THE REMAINING NODES.
- F10: THE LOGICAL NODE 'OWN' IS ONLY ALLOWED FOR NPI=UNKNOWN AND LEVEL=0
- F11: THE SPECIAL VALUE ##### IN PARAMETER NUMEXT/NUMRED IS ONLY ALLOWED FOR THE LOGICAL NODE 'OWN'. EITHER ONNOL OR DNNOL MUST BE 'OWN'.
- F12: OWN NODE ID'S COULD NOT BE PICKED UP FROM KNDEF-TABLE BECAUSE NODE ID <ggg> IS NOT UNIQUE IN LEVEL 0 IN KNDEF-TABLE.
- F13: OWN NODE ID'S COULD NOT BE PICKED UP FROM KNDEF-TABLE BECAUSE THE KNDEF-TABLE FOR OWN NODES IS EMPTY.
- F14: OWN NODE CODES COULD NOT BE EXTRACTED FROM KNDEF-TABLE (NO ENTRY IN KNDEF FOR NODECD OR NODECDISK).
- F15: MODCON IS ONLY VALID IN COMBINATION WITH NUMBER EXTENSION OR REDUCTION. MODCON WAS IGNORED BECAUSE NO NUMBER EXTENSION OR REDUCTION WAS FOUND EITHER IN COMMAND OR IN MODIFICATION MATRIX.
- F16: ONNOL AND DNNOL MUST NOT BE BOTH 'OWN' IF NODE CODES ARE TO BE EXTRACTED FROM KNDEF-TABLE (NUMEXT/NUMRED=#####).

## 125.6.2 Advisories

H01: NO ENTRY WITH THE REQUIRED ATTRIBUTES AVAILABLE  
 H02: NOT ALL REQUESTED ONNO ARE DISPLAYED  
 H04: NPI IS NOT RELEVANT TO DENY / ALLOW CONNECTIONS.  
 THE PARAMETER WAS IGNORED FOR THIS FUNCTION.  
 H05: MODCON IS ONLY VALID IN COMBINATION WITH NUMBER EXTENSION OR REDUCTION.  
 MODCON WAS IGNORED WHERE NO NUMBER EXTENSION OR REDUCTION WAS FOUND  
 EITHER IN COMMAND OR IN MODIFICATION MATRIX.  
 H06: NPI IS NOT RELEVANT TO DENY CONNECTIONS. THE PARAMETER IS NOT IGNORED  
 FOR OUTPUT RESTRICTIONS.  
 H07: THE LOGICAL NODE CDR BECOMES ONLY EFFECTIVE AS DESTINATION NODE FOR  
 NPI=UNKNOWN.  
 H08: <iiii>=OWN WAS CONVERTED ACCORDING TO KNCDEF-TABLE INTO <ffff>=<ggg>.  
 H09: <iiii>=OWN WAS CONVERTED ACCORDING TO KNCDEF-TABLE INTO <ffff>=<ggg>.  
 EXTRACTED NUMBER: <zzzz>=<nnnnnn> (SKIP DIGITS HAVE BEEN CONSIDERED)  
 H10: PLEASE NOTE THAT ENTRIES, WHICH ARE EXTRACTED FROM KNCDEF-TABLE, ARE NOT  
 AUTOMATICALLY ADAPTED, IF KNCDEF-TABLE IS CHANGED.  
 H11: FOR EXTRACTING OF NUMEXT/NUMRED FROM KNCDEF-TABLE ONLY <iiii>=OWN WAS  
 CONSIDERED. OTHER <tttttttttttttttt> HAVE BEEN IGNORED.

### Output texts:

<fffff>: ONNO or DNNO  
 <ggg>: Node / region number  
 <iiii>: ONNOL or DNNOL  
 <zzzzzz>: NUMEXT or NUMRED  
 <nnnnnn>: Node access code from KNCDEF-Table  
 <tttttttttttttttt>: ORIGINATING NODES or DESTINATION NODES

## 126 KNPRES - Administer node prefix table

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

This AMO administers the node prefix table for the various dial plans. Currently ISDN-E and Private Numbering Plans (PNP) are handled by the call processing. The node prefix table contains the DPLN-dependent designations of the Numbering Plan Identifier (NPI), the Type of Number (TON), as well as the associated exit codes and the prefixes for the national/international code for the own node. These table entries are used by the call processing to convert implicit numbers to explicit ones, and vice versa.

### 126.1 Interrelationships

- AMO KNFOR : Administration of the Node Format Tables
- AMO KNMAT : Administration of the Node Matrix
- AMO LDAT : Administration of the LCR Route Elements
- AMO LODR : Administration of LCR Outdial Rules
- AMO TDCSU : Configuration of digital Trunk Circuits
- AMO WABE : Administration of the Digit Analysis

### 126.2 Functions of the AMO

- [ADD-KNPRES](#) : Create an entry in the node prefix table
- [CHANGE-KNPRES](#) : Change an entry in the node prefix table
- [DELETE-KNPRES](#) : Delete an entry from the node prefix table
- [DISPLAY-KNPRES](#) : Display the node prefix table
- [REGENERATE-KNPRES](#) : Regenerate the entries of the node prefix table

#### 126.2.1 ADD-KNPRES

This action creates an entry in the node prefix table.

KNPRE - Administer node prefix table

Functions of the AMO

The entry is DPLN-dependent and contains the Numbering Plan Identifier (NPI), the Type of Number (TON), as well as the associated exit codes and the prefixes for the national/international code. If an entry for the specified Numbering Plan Identifier (NPI) and the Type of Number (TON) already exists for the particular DPLN group, the new entry is rejected and an error message output.

Procedure overview

| Command code | Parameters                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-KNPRES   | [DPLN=<number>],<br>  NPI=ISDN,<br>  TON=INTERNAT,EXIT=<key-num>,[PREFIX=<key-num>];<br>  TON=NATIONAL,EXIT=<key-num>,[PREFIX=<key-num>];<br>  TON=SUBSCR,EXIT=<key-num>,[PREFIX=<key-num>];<br>  NPI=PRIVATE,<br>  TON=LEVEL2,EXIT=<key-num>,[PREFIXPREFIX=<key-num>];<br>  TON=LEVEL1,EXIT=<key-num>,[PREFIX=<key-num>];<br>  TON=LOCAL,EXIT=<key-num>,[PREFIX=<key-num>]; |

Example:

Create an entry in the node prefix table for DPLN group 1, the numbering plan "ISDN-E.164" and the type of number "International Number" with exit code 0 and 00 as prefix for the international code.

Input:

ADD-KNPRES:1,ISDN,INTERNAT,0,00;

Output:

ADD-KNPRES:1,ISDN,INTERNAT,0,00;  
AMO-KNPRES -... ADMINISTRATION OF PREFIX TABLE OF NODE  
ADD COMPLETED;

126.2.2 CHANGE-KNPRES

The CHANGE function allows to you modify data entered with ADD.

The table entry is addressed by the DPLN group, the Numbering Plan Identifier (NPI) and the Type of Number (TON); the exit code or the prefix for national/international can be changed. At least on entry to be changed must be specified. The change is indicated by an advisory.

If there is no table entry for the DPLN group, the Numbering Plan Identifier (NPI) and the Type of Number (TON), the change is rejected and an error message displayed.

### Procedure overview

| Command code  | Parameters                                                                                                                                    |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-KNPRES | [DPLN=<number>],<br>  NPI=ISDN,TON=<param>,{EXIT=<key-num>, PREFIX=<key-num>;<br>  NPI=PRIVATE,TON=<param>,{EXIT=<key-num>, PREFIX=<key-num>; |

### Example

Change the exit code for DPLN group 1, numbering plan "ISDN-E.164" and type of number "International number" from 0 to 0123.

Input:

```
CHANGE-KNPRES:1,ISDN,INTERNAT,0123;
```

Output:

```
CHANGE-KNPRES:1,ISDN,INTERNAT,0123;
H01: ENRTY FOR DPLN=1, NPI=ISDN, TON=INTERNAT CHANGED:
      EXIT: 0 TO 0123, PREFIX: 00 TO 00
AMO-KNPRES -... ADMINISTRATION OF PREFIX TABLE OF NODE
CHANGE COMPLETED;
```

## 126.2.3 DELETE-KNPRES

The DELETE function allows you to delete a table entry addressed by the DPLN group, the Numbering Plan Identifier (NPI) and the Type of Number (TON). An advisory is displayed to indicate that the deletion is completed.

If there is no corresponding table entry, the deletion is rejected and an error message displayed.

### Procedure overview

| Command code  | Parameters                                                                |
|---------------|---------------------------------------------------------------------------|
| DELETE-KNPRES | [DPLN=<number>],<br>  NPI=ISDN,TON=<param>;<br>  NPI=PRIVATE,TON=<param>; |

KNPRE - Administer node prefix table

Functions of the AMO

Example

Delete the table entry for DPLN group 1, the Numbering Plan Identifier (NPI) "ISDN-E.164" and the Type of Number (TON) "International Number".

Input:

DELETE-KNPRES:1,ISDN,INTERNAT;

Output:

DELETE-KNPRES:1,ISDN,INTERNAT;  
H02: ENRTY FOR DPLN=1, NPI=ISDN, TON=INTERNAT  
WITH EXIT=0123, PREFIX=00 DELETED  
AMO-KNPRES -... ADMINISTRATION OF PREFIX TABLE OF NODE  
DELETE COMPLETED;

126.2.4 DISPLAY-KNPRES

This action outputs the entries in the node prefix table.

Procedure overview

| Command code   | Parameters       |
|----------------|------------------|
| DISPLAY-KNPRES | [DPLN=<number>]; |

Example

Input:

DISPLAY-KNPRES:0&&1;

Output:

DISPLAY-KNPRES:0&&1;  
DPLN | NPI | TON | EXIT | PREFIX |  
=====|=====|=====|=====|=====|  
0 | PRIVATE | LEVEL2 | 99 | 000 |  
0 | PRIVATE | LEVEL1 | 99 | 011 |  
1 | ISDN | INTERNAT | 0 | 00 |  
1 | ISDN | NATIONAL | 0 | 1 |  
AMO-KNPRES -... ADMINISTRATION OF PREFIX TABLE OF NODE  
DISPLAY COMPLETED;

## 126.2.5 REGENERATE-KNPRES

### Procedure overview

| Command code      | Parameters       |
|-------------------|------------------|
| REGENERATE-KNPRES | [DPLN=<number>]; |

### Example

Input:

```
REG-KNPRES:1;
```

Output:

```
REG-KNPRES:1;
ADD-KNPRES:1,ISDN,INTERNAT,0,00;
ADD-KNPRES:1,ISDN,NATIONAL,0,1;
AMO-KNPRES-... ADMINISTRATION OF PREFIX TABLE OF NODE
REGENERATE COMPLETED;
```

## 126.3 Parameter description

|                 |                                                                              |

Error Messages and Advisories

## **127 KNTOP - Administrates Nodes Topology**

The description of this AMO is only available in html format!

## 128 LANC - LAN configuration

The AMO LANC can be used to administer the WAML board's board-specific configuration data that is required for LAN communication via the ISDN network or with the Atlantic LAN to the ADP. In addition to its administration function, the AMO LANC also serves to read out the WAML board's MAC addresses and initiate loading of the data to the board. In a system maximally 4 WAML boards can be configured.

The following tables are processed:

- Global parameter table  
This table contains all the characteristics and limiting values that are generally valid for each WAML board. The number of B-channels in the WAML circuit is administered by means of AMO TDCSU!
- Network interface table  
This table defines the 4 network interfaces on the WAML board. One entry is provided for each interface. The network mask defines the network connected to the interface. The interface is identified by means of its defined name (see NETNAME parameter).
- IP routing table  
This table contains routing information for the packet's destination IP address. The entry determines the next router to be required in the network. Entries can apply to an entire network or to individual hosts. The table is arranged by IP address and can hold up to 200 different entries.  
With the help of an entry with the "wild card address" 0.0.0.0 the WAML board can route all IP addresses not contained in its IP routing table to a default router. See [Section 128.2.1, "ADD-LANC", on page 1351](#).
- ISDN remote terminal table  
This table assigns possible station numbers and characteristics to the destination IP address of an ISDN remote terminal (WAML) in the network. The usage must be specified for a station number. Also note that the station number for which the 'OUT' value was specified in the INOUTCHx parameter is always used as the station number for callback. The table is arranged by IP address and can hold up to 200 different entries.
- Firewall IP address table  
This table contains the IP addresses of hosts connected to external servers and their network access rights. On the basis of the rights entered, a check is run for each packet to determine whether the source IP address and destination IP address are allowed to communicate. The table is arranged by IP address and can hold up to 305 different entries.

- Firewall MAC address table

This table contains the assignment of MAC addresses to IP addresses for hosts connected to external servers. It can be used to check the assignment of source IP addresses to MAC addresses only for packets received from the external LAN. The table is arranged by IP address and can hold up to 100 different entries. If routers are inserted between the WAML2 and the external server, as source MAC address the MAC address of the last router has to be added into the Firewall MAC Address Table.

The MAC address is an internationally unique hardware address of the Ethernet interface that is permanently encoded on every LAN board at the time of production. The verb DISPLAY can be used to determine the MAC addresses of any WAML.

When basic initialization is performed for the tables, the WAML board is not operational.

The criteria that determine whether data transmission is performed include a packet's source IP address and destination IP address and, in the case of ISDN access, the station number. The firewall function on the WAML board is a protective mechanism that prevents the transmission of packets from unauthorized stations. To do so, it uses the entries in the firewall IP address table, firewall MAC address table and ISDN remote terminal table. The firewall checks and WAML network interfaces are activated in the global parameter table.

Only one LAN interface on the external LAN can be operated at one time. The relevant LAN hardware interface is selected in the global parameter table.

The WAML supports 2 routing methods regarding the Atlantic LAN which can be set in the global parameter table. By default, the Atlantic LAN interface doesn't need to be configured. In case of access to ADP via external LAN, the ADP can be reached with the IP address of the external LAN interface; in case of access to ADP via ISDN, the ADP can be reached with the IP address of the ISDN interface.

The AMO LANC is not able to check whether tables that are added are consistent with the topology of an existing network (e.g. IP addresses).

If more than one WAML board is configured in a system, the following items must be considered:

- the Atlantic LAN interface can be added to only one WAML
- the IP addresses of the network interfaces EXTLAN1, ISDN1 und ISDN2 must be unique
- the WAML station number (parameter STNO) must be different for each WAML

In scope of feature IPDA (IP Distributed Architecture) the WAML boards can be configured in the Access Points which have the LTU range from 17 to 99 (added by AMO UCSU and BCSU). The Source Group Index (SRCGRP) assigned to the LTU is issued in the header mask at command DISP-LANC.

Further details and other WAML specific configuration examples see Feature Usage Example LAN Connectivity.

## 128.1 Interrelationships

- AMO DIMSU      Memory configuration in SWU
- AMO BCSU      Board configuration SWU

Order of generation: DIMSU -> BCSU -> LANC

## 128.2 Functions of the AMO

- [ADD-LANC](#) : Adds the WAML-specific configuration tables.
- [CHANGE-LANC](#) : Changes entries in the WAML-specific configuration tables.
- [DELETE-LANC](#) : Deletes entries from the WAML-specific configuration tables.
- [EXEC-LANC](#) : Initiates loading of the WAML-specific configuration tables to the board.
- [DISPLAY-LANC](#) : Displays entries from the WAML-specific configuration tables along with the MAC address entries.
- [REGENERATE-LANC](#) : Regenerates entries in the WAML-specific configuration tables.

### 128.2.1 ADD-LANC

No particular order is specified for configuring the tables. However, the following cross-references exist when the global parameter table is added:

- To the network interface table:  
Used to check whether the network interface(s) to be activated (ACTNETIF parameter) has/have been added. All network interfaces that have not been added are output with the message H08 and the command is executed as specified.  
The associated network interface must be added for all network access rights used in the firewall IP address table.

## LANC - LAN configuration

### Functions of the AMO

- To the firewall checks:  
Depending on the scope selected (FIREWALL parameter), the entries in the firewall IP address table, firewall MAC address table and ISDN remote terminal table are used. If the firewall checks are activated but the associated table contains no valid entries, no packets are transmitted.
- To the IP routing tables:  
At host IP addresses the net mask does not have to be entered because it does not take effect. Even if the net mask has been entered the default value 255.255.255.255 shall be written in the database and H10 is output. In case of network IP addresses the network mask 255.255.255.255 is not allowed and the command is rejected with the message F26.

The WAML board can route all IP addresses not contained in its IP routing table to a default router. The solution is to let a specific entry having the "wild card address" 0.0.0.0 be configured in the IP routing table where this entry must contain the IP address of the default router as a further parameter. If this entry is present, all IP addresses not configured in the IP routing table will be routed to the default router.

When adding the network interface to the Atlantic LAN (network interface table), note that the last position in this IP address is permanently assigned and must always be '4' (e.g. IPADDR=192.168.1.4). Each incorrect entry is rejected with the message F24!

In order to guarantee the uniqueness of IP addresses, each IP address must be entered no more than once in all tables arranged by IP address.

### Procedure overview

| Command code | Parameter                                                                                                                                                                                                                                                                                                                                                                                     |     |

### Examples

1. Configure the global parameter table.

Input:

```
ADD-LANC:1,2,25,GLOBAL,47211,WESTERN,EXTLAN1&ISDN,SRICIP&ISDN;
```

2. Add the network interface to the external LAN in the network interface table with IP address 140.1.0.1, with network mask 255.255.255.0 and a packet size of 1000 bytes.

Input:

```
ADD-LANC:1,2,25,NETWORK,EXTLAN1,140.1.0.1,255.255.255.0,1000;
```

3. Add an entry to the IP routing table for host IP address 198.1.108.3, with network mask 255.255.255.0 and IP address 140.1.0.2 as the next router.

Input:

```
ADD-  
LANC:1,2,25,IPROUTE,198.1.108.3,NET,255.255.255.0,140.1.0.2;
```

4. Add an entry to the IP routing table for host IP address 198.1.108.103 and IP address 140.1.0.3 as the next router.

Input:

```
ADD-LANC:1,2,25,IPROUTE,198.1.108.103,HOST,,140.1.0.3;
```

5. Add an entry to the ISDN remote terminal table for IP address 192.168.255.64 along with the possible ISDN station numbers for the WAML and their usage.

Input:

## LANC - LAN configuration

### Functions of the AMO

```
ADD-LANC:1,2,25,ISDNTERM,192.168.255.64,036147931,OUT;
```

6. Add an entry to the firewall IP address table for IP address 192.168.1.3 with access rights to all networks.

Input:

```
ADD-LANC:1,2,25,FIREIP,192.168.1.3,ALL;
```

7. Add an entry to the firewall MAC address table for IP address 192.168.5.1 and MAC address CC.00.A0.45.D0.7F.

Input:

```
ADD-LANC:1,2,25,FIREMAC,192.168.5.1,CC.00.A0.45.D0.7F;
```

## 128.2.2 CHANGE-LANC

The same cross-references exist as for the ADD action. Furthermore, only table entries that have been added can be changed.

Entering a network mask allows you to change the data uniformly for entire networks.

Specifying the IPADRNEW parameter allows you to change an IP address that is already configured (IPADDR parameter).

### Procedure overview

| Command code | Parameter                                                                                                                                                                                                                                                                                                                                                                                             |     |

| Command code | Parameter                                                                                                                                                                                                                                                                         |     |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
|              | <pre>, [STNO2=&lt;key-num&gt;], [INOUTCH2=&lt;param&gt;] , [STNO3=&lt;key-num&gt;], [INOUTCH3=&lt;param&gt;] , [STNO4=&lt;key-num&gt;], [INOUTCH4=&lt;param&gt;] , [HOLDTIME=&lt;number&gt;], [CHBUND=&lt;number&gt;] , [BITRATE=&lt;number&gt;], [CALLBACK=&lt;param&gt;];</pre> |     |
|              | <pre> , TABTYPE=FIREIP, IPADDR=&lt;string&gt;, [IPADRNEW=&lt;string&gt;] , [NETAR=&lt;param&gt;];</pre>                                                                                                                                                                           | (5) |
|              | <pre> , TABTYPE=FIREMAC, IPADDR=&lt;string&gt;, [IPADRNEW=&lt;string&gt;] , [MACADDR=&lt;string&gt;];</pre>                                                                                                                                                                       | (6) |

### Examples

1. Change WAML station numbers, active network interfaces and the number of dialing attempts in the global parameter table.

Input:

```
CHANGE-LANC: , 2, 25, GLOBAL, 004325829, , ALL, , 6;
```

2. Change IP address and packet size for the network interface to the external LAN.

Input:

```
CHANGE-LANC: , 2, 25, NETWORK, EXTLAN1, 140.1.0.2, , 300;
```

3. For the entry with IP address 198.1.108.3 in the IP routing table, change the IP address to 198.1.108.0.

Input:

```
CHANGE-LANC: , 2, 25, IPROUTE, 198.1.108.3, 198.1.108.0;
```

4. For the entry with IP address 192.168.255.64 in the ISDN remote terminal table, change the usage type for WAML station number 1 and add a second station number with a usage type.

Input:

```
CHANGE-
LANC: , 2, 25, ISDNTERM, 192.168.255.64, , , IN&OUT, 03742250868, IN;
```

5. For the entry with IP address 192.168.1.3 in the firewall IP address table, change the IP address itself and the network access rights.

Input:

```
CHANGE-
LANC: , 2, 25, FIREIP, 192.168.1.3, 140.1.0.9, ATLLAN&EXTLAN1;
```

6. For the entry with IP address 192.168.5.1 in the firewall MAC address table, change the IP address.

Input:

```
CHANGE-LANC: , 2, 25, FIREMAC, 192.168.5.1, 140.1.0.10;
```

128.2.3 DELETE-LANC

The WAML-specific tables may become inconsistent due to the cross-references between the global parameter table and the tables listed below. Before deleting entire tables, it is recommended that you deactivate the relevant function in the global parameter table.

- Network interface table:  
The AMO checks whether the network interface(s) to be deleted has/have been deactivated. All active network interfaces are output with the message H09 but the command is executed as desired.
- Firewall checks:  
These checks use the entries in the firewall IP address table, firewall MAC address table and ISDN remote terminal table. If firewall checks are activated but the associated table contains no valid entries, no packets can be transmitted! The AMO does not check for consistency.

You can delete both individual table elements and the contents of entire tables. Entire tables can be deleted only if entries have been configured previously.

In case of TABTYPE=ALL all tables are deleted without checking whether entries are available in the table or not.

Procedure overview

| Command code | Parameter                                                        |     |
|--------------|------------------------------------------------------------------|-----|
| DELETE-LANC  | [LTG=<number>], LTU=<number>, SLOT=<number><br>, TABTYPE=GLOBAL; | (1) |
|              | , TABTYPE=NETWORK, [NETNAME=<param>;                             | (2) |
|              | , TABTYPE=IPROUTE, [IPADDR=<string>;                             | (3) |
|              | , TABTYPE=ISDNTERM, [IPADDR=<string>;                            | (4) |
|              | , TABTYPE=FIREIP, [IPADDR=<string>;                              | (5) |
|              | , TABTYPE=FIREMAC, [IPADDR=<string>;                             | (6) |
|              | , TABTYPE=ALL;                                                   | (7) |

**Examples**

1. Delete the global parameter table.

Input:

```
DEL-LANC: , 2, 25, GLOBAL;
```

2. Delete the external LAN network interface from the network interface table.

Input:

```
DEL-LANC: 1, 2, 25, NETWORK, EXTLAN1;
```

3. Delete the entire IP routing table.

Input:

```
DEL-LANC: 1, 2, 25, IPROUTE;
```

4. Delete the table element with IP address 143.18.205.11 from the ISDN remote terminal table.

Input:

```
DEL-LANC: , 2, 25, ISDNTERM, 143.18.205.11;
```

5. Delete the entire firewall IP address table.

Input:

```
DEL-LANC: 1, 2, 25, FIREIP;
```

6. Delete the table element with IP address 93.181.25.47 from the firewall MAC address table.

Input:

```
DEL-LANC: 1, 2, 25, FIREMAC, 93.181.25.47;
```

7. Delete all WAML configuration tables.

Input:

```
DEL-LANC: , 2, 25, ALL;
```

**128.2.4 EXEC-LANC**

This command initiates the dynamic loading of all WAML configuration data during operation. The board is also loaded:

- When added by means of AMO BCSU,
- When inserted in the LTU shelf,
- When activated by means of AMO BSSU.

The WAML does not use the configured data until it has been successfully loaded.

## LANC - LAN configuration

### Functions of the AMO

The response message from PIT is timer supervised, a timer is set for this purpose.

If the board data can not be loaded or it doesn't succeed, an error message with possible remedy is output and the AMO stops. An unsuccessful loading can have the following reasons:

- board data have not been configured yet
- WAML board is not available
- no acknowledge has arrived from PIT within the 10 minutes response time
- the dynamic board identifier is not available
- board is not in state 'ready'.

### Procedure overview

| Command code | Parameter                                      |
|--------------|------------------------------------------------|
| EXEC-LANC    | [LTG=<number>] , LTU=<number> , SLOT=<number>; |

### Examples

1. Initiate loading of WAML configuration data.

Input:

```
EXEC-LANC: , 2, 25;
```

## 128.2.5 DISPLAY-LANC

Configured entries can be output for each table individually or for all tables as a whole. Moreover, entering the level of display makes it possible to limit the output range. If you specify the MOD value, only those entries are output that have been changed since the last load job. In the default configuration, all configured entries are output.

You can search for IP addresses in the IPROUTE, ISDNTERM, FIREIP and FIREMAC tables and output the matching entries; if you specify a network mask, the search can also be performed on a network-specific basis.

By specifying TABTYPE=ALL, the global parameter table and the network interface table are output, regardless of subsequent parameters.

The WAML board has 2 Ethernet interfaces, that's why 2 MAC addresses also exist and these can be output by means of the AMO LANC. This information (2 MAC addresses) is output even in the case when 'TABTYPE=ALL' is selected.

If a table is empty, the message H01 is output. If none of the existing table elements matches the criteria in the AMO command, the message H04 is displayed.

When the message H07 is output, it explicitly informs the user that WAML configuration data has been changed since the last load job and that the WAML must be dynamically loaded in order for these changes to become valid.

### Procedure overview

| Command code | Parameter                                                                          |     |
|--------------|------------------------------------------------------------------------------------|-----|
| DISPLAY-LANC | [LTG=<number>], LTU=<number>, SLOT=<number><br>, TABTYPE=GLOBAL, [DISPLV=<param>]; | (1) |
|              | , TABTYPE=NETWORK, [NETNAME=<param>], [DISPLV=<param>];                            | (2) |
|              | , TABTYPE=IPROUTE, [IPADDR=<string>], [IPNMASK=<string>]<br>, [DISPLV=<param>];    | (3) |
|              | , TABTYPE=ISDNTERM, [IPADDR=<string>]<br>, [IPNMASK=<string>], [DISPLV=<param>];   | (4) |
|              | , TABTYPE=FIREIP, [IPADDR=<string>], [IPNMASK=<string>]<br>, [DISPLV=<param>];     | (5) |
|              | , TABTYPE=FIREMAC, [IPADDR=<string>], [IPNMASK=<string>]<br>, [DISPLV=<param>];    | (6) |
|              | , TABTYPE=MACADDR;                                                                 | (7) |
|              | , TABTYPE=ALL, [IPADDR=<string>], [IPNMASK=<string>]<br>, [DISPLV=<param>];        | (8) |

### Examples

1. Output the global parameter table if the data has been changed since the last load job.

Input:

DISP-LANC:1,2,25,GLOBAL,MOD;

Output:

```

+-----+-----+-----+-----+
| WAML :  LTG = 1      LTU = 2      SLOT = 25      | SRCGRP: 1 |
+-----+-----+-----+-----+

'EXEC-LANC' REQUIRED.

### 2. Output network interfaces added to the network interface table.

Input:

DISP-LANC:,2,25,NETWORK;

Output:

```
+-----+
| WAML : LTG = 1      LTU = 2      SLOT = 25      | SRCGRP: 1 |
+-----+
```

```
+-----+
|                                     NETWORK INTERFACE TABLE                                     |
|=====|
| INTERFACE NAME | IP-ADDRESS | IP-NETMASK | MTU |
+-----+-----+-----+-----+
| EXTLAN1        | 140.001.000.002 | 255.255.000.000 | 300 |
| ISDN1          | 192.168.155.001 | 255.255.255.000 | 1000 |
+-----+
```

### 3. Output all entries added to the IP routing table.

Input:

DISP-LANC:1,2,25,IPROUTE;

Output:

```
+-----+
| WAML : LTG = 1      LTU = 2      SLOT = 25      | SRCGRP: 1 |
+-----+
```

```
+-----+
|                                     IP - ROUTING TABLE                                     |

7. Display the WAML MAC addresses.

Input:

DISP-LANC:1,2,25,MACADDR;

Output:

|                           |                      |                   |                                 |
|---------------------------|----------------------|-------------------|---------------------------------|
| +-----+-----+-----+-----+ |                      |                   |                                 |
|                           | WAML :               | LTG = 1           | LTU = 2                         |
|                           |                      | SLOT = 25         | SRCGRP: 1                       |
| +-----+-----+-----+-----+ |                      |                   |                                 |
|                           | WAML MAC - ADDRESSES |                   |                                 |
|                           | =====                |                   |                                 |
|                           |                      |                   |                                 |
|                           | ATLANTIC LAN:        | 08.00.06.0A.0E.98 | EXTERNAL LAN: 08.00.06.0A.0E.99 |
| +-----+-----+-----+-----+ |                      |                   |                                 |

8. Output all entries in the WAML configuration tables that have been changed since the last load job.

Input:

DISP-LANC:,2,25,ALL,,MOD;

Output:

The table contents are output in the following order:

|          |                                     |
|----------|-------------------------------------|
| GLOBAL   | - Global parameter table            |
| NETWORK  | - Network interface table           |
| IPROUTE  | - IP routing table                  |
| ISDNTERM | - ISDN remote terminal table        |
| FIREIP   | - Firewall IP address table         |
| FIREMAC  | - Firewall MAC address table        |
| MACADDR  | - Display MAC address of WAML board |

## 128.2.6 REGENERATE-LANC

Configured entries can be output for each table individually or for all tables as a whole. You can specify an IP address to search the IPROUTE, ISDNTERM, FIREIP and FIREMAC tables for individual entries; you can also enter an IP network mask to search for entire networks.

By specifying TABTYPE=ALL, you can always generate the ADD commands for the global parameter table and network interface table as well, regardless of subsequent parameters.

If more than one WAML board is configured in a system, the configuration data of all WAML boards can be regenerated with the command `REGEN-LANC;`. But if the parameter TABTYPE is given, the PEN (shelf position: LTG, LTU, SLOT) must be entered explicit as well.

### Procedure overview

| Command code    | Parameter                                                            |     |
|-----------------|----------------------------------------------------------------------|-----|
| REGENERATE-LANC | [LTG=<number>], [LTU=<number>], [SLOT=<number>]<br>, TABTYPE=GLOBAL; | (1) |
|                 | , TABTYPE=NETWORK, [NETNAME=<param>];                                | (2) |
|                 | , TABTYPE=IPROUTE, [IPADDR=<string>]<br>, [IPNMASK=<string>];        | (3) |
|                 | , TABTYPE=ISDNTERM, [IPADDR=<string>]<br>, [IPNMASK=<string>];       | (4) |
|                 | , TABTYPE=FIREIP, [IPADDR=<string>], [IPNMASK=<string>];             | (5) |
|                 | , TABTYPE=FIREMAC, [IPADDR=<string>]<br>, [IPNMASK=<string>];        | (6) |
|                 | , TABTYPE=ALL, [IPADDR=<string>], [IPNMASK=<string>];                | (7) |

### Examples

1. Generate an ADD command for a global parameter table.

Input:

```
REG-LANC:1,2,25,GLOBAL;
```

Output:

```
ADD-LANC:1,2,25,GLOBAL,47211,WESTERN,EXTLAN1&ISDN,  
SRCIP&ISDN,,,,,,,,,PROXY,PROXY;
```

## LANC - LAN configuration

### Functions of the AMO

2. Generate ADD commands for a network interface table.

Input:

```
REG-LANC:1,2,25,NETWORK;
```

Output:

```
ADD-LANC:1,2,25,NETWORK,EXTLAN1,140.1.0.2,255.255.0.0,300;  
ADD-  
LANC:1,2,25,NETWORK,ISDN1,192.168.255.1,255.255.255.0,1000;
```

3. Generate ADD commands for an IP routing table.

Input:

```
REG-LANC:1,2,25,IPROUTE;
```

Output:

```
ADD-LANC:1,2,25,IPROUTE,192.168.3.3,HOST,,140.1.0.3;  
ADD-LANC:1,2,25,IPROUTE,192.168.2.3,NET,255.255.255.0,  
140.1.0.2;
```

4. Generate an ADD command for IP address 192.168.255.64 in the IP routing table.

Input:

```
REG-LANC:1,2,25,ISDNTERM,192.168.255.64;
```

Output:

```
ADD-LANC:1,2,25,ISDNTERM,192.168.255.64,036147931,IN&OUT,  
03742250868,IN,,,,,,64,N;
```

5. Generate ADD commands for the network containing IP address 140.1.0.9 in the firewall IP address table.

Input:

```
REG-LANC:1,2,25,FIREIP,140.1.0.9,255.255.255.0;
```

Output:

```
ADD-LANC:1,2,25,FIREIP,140.1.0.9,ATLLAN&EXTLAN1;  
ADD-LANC:1,2,25,FIREIP,140.1.0.5,ALL;
```

6. Generate ADD commands for the firewall MAC address table.

Input:

```
REG-LANC:1,2,25,FIREMAC;
```

Output:

```
ADD-LANC:1,2,25,FIREMAC,140.1.0.10,CC.00.A0.45.D0.7F;
```

7. Generate ADD commands for the current WAML configuration data.

Input:

```
REG-LANC:1,2,25,ALL;
```

Output:

```

ADD-LANC:1,2,25,GLOBAL,47211,WESTERN,EXTLAN1&ISDN,
SRCIP&ISDN,,,,,,,,,PROXY,PROXY;
ADD-LANC:1,2,25,NETWORK,EXTLAN1,140.1.0.2,255.255.0.0,300;
ADD-
LANC:1,2,25,NETWORK,ISDN1,192.168.255.1,255.255.255.0,1000;
ADD-LANC:1,2,25,IROUTE,192.168.3.3,HOST,,140.1.0.3;
ADD-LANC:1,2,25,IROUTE,192.168.2.3,NET,255.255.255.0,
140.1.0.2;
ADD-LANC:1,2,25,ISDNTERM,192.168.255.64,036147931,IN&OUT,
03742250868,IN,,,
,,,,64,N;
ADD-LANC:1,2,25,FIREIP,140.1.0.9,ATLLAN&ISDN;
ADD-LANC:1,2,25,FIREIP,140.1.0.5,ALL;
ADD-LANC:1,2,25,FIREMAC,140.1.0.10,CC.00.A0.45.D0.7F;

```

## 128.3 Parameter Description

|                                                                                                              |                                        |                                                                                                                  |

## LANC - LAN configuration

### Parameter Description

|                 |                                                                                                |
|-----------------|------------------------------------------------------------------------------------------------|
| Type of input   | : Single value<br>mandatory (ADD, CHANGE, DELETE, EXEC, DISPLAY)<br>optional (REGENERATE)      |
| Possible values | : 1-121      A suitable module must be configured for the<br>slot addressed by PEN (AMO BCSU). |
| Default value   | : 1                                                                                            |

The possible Slot values depend on the systems architecture and can be found in the BCSU AMO description.

|         |                                                                                                                                                                                                                                                                                                                             |

## 128.4 Error messages and advisories

### 128.4.1 Error messages

- F01: A WAML BOARD WITH THIS PEN HAS NOT BEEN CONFIGURED  
No WAML board has been added for the specified address (LTG, LTU, EBT) or the address is incorrect or invalid. You must use the same address that was used for adding a WAML by means of AMO BCSU.
- F02: THERE ARE FORMAL ERRORS IN THE STATION NUMBER @@@@  
The specified station number contains invalid characters. Only digits in the 0 - 9 range may be used.
- F03: THE VALUE 'NONE' FOR PARAMETER 'FIREWALL' MUST BE ENTERED AS SINGLE VALUE  
The NONE parameter value must not be specified together with other values. This combination is meaningless!
- F04: TABLE '#####' IS FULL, NO ENTRY POSSIBLE  
All table elements in the table specified are already being used. In order to be able to add another entry, you must first delete an entry that is no longer needed.
- F05: THERE IS ANOTHER WAML BOARD WITH ACCESS RIGHTS TO THE ATLANTIC LAN  
In a system, only one WAML can access the ADP via the Atlantic LAN. This connection already exists and, therefore, cannot be configured here.
- F06: WHEN A NETMASK HAS BEEN ENTERED AN IP-ADDRESS IS REQUIRED  
ENTER PARAMETER '#####'  
For the DISPLAY and REGENERATE actions, you must specify an IP address if you wish to use a network mask.
- F07: THERE ARE FORMAL ERRORS IN THE IP-ADDRESS @@@.@@@.@@@.@@@  
The IP address specified is errored. Only digits in the 0 - 9 range may be used. Furthermore, the address must comprise 4 parts separated by dots; none of these values may exceed 255 and at least one part of the address must equal '0'.
- F08: DATA HAVE NOT BEEN LOADED  
The load job was rejected by the PIT with a negative load result (DB\_LC\_LR\_DATA NOT LOADED). This was caused by the fact that, for reasons that cannot be specified further, the PIT could not load data to the board (e.g. no connection to board). One solution might be to deactivate (DEACTIVATE-BSSU) and activate (ACTIVATE-BSSU) the board, since this also serves to load the board.
- F09: TO EACH STATION NUMBER ITS USAGE HAS TO BE ENTERED

## LANC - LAN configuration

### Error messages and advisories

When adding or changing station number(s), you must specify the usage type and the STNOx and INOUTCHx parameters must be specified together. This determines whether a station number can be used for incoming calls only or can also be used for the WAML's callback function.

F10: THE SPECIFIED IP-ADDRESS HAS NOT BEEN CONFIGURED

The IP address specified in the command is not contained in the table selected. The address must first be configured in the table by means of the ADD action.

F11: THE ENTERED NETWORK INTERFACE HAS NOT BEEN CONFIGURED

The network interface specified in the command is not contained in the table selected. The interface must first be configured in the table by means of the ADD action.

F12: THE ENTERED IP-ADDRESS HAS BEEN ALREADY CONFIGURED

The IP address specified in the command is contained in the table selected. You can reconfigure this address by means of the CHANGE action or delete it using the DELETE action.

F13: DATA HAVE BEEN ALREADY CONFIGURED

The data in the global parameter table is already configured. You can change this data by means of the CHANGE action or delete the entire table using the DELETE action.

F14: THE ENTERED NETWORK INTERFACE HAS BEEN ALREADY CONFIGURED

The network interface specified in the command is contained in the table. You can reconfigure this interface by means of the CHANGE action or delete it from the table using the DELETE action.

F15: NO DATA HAVE BEEN CONFIGURED

The relevant table contains no entries; it is empty. You can configure entries by means of the ADD action.

F16: NO ANSWER FROM @@@

Instead of an acknowledgment of the load job, a message was received from an invalid task. It may be possible to correct the problem by repeating the job.

F17: LTU NUMBER @@@ DOES NOT HAVE ADMISSIBLE VALUE

The LTU number specified is not within the limiting values permitted in the system.

F18: THERE ARE FORMAL ERRORS IN THE MAC-ADDRESS @.@@.@@.@@.@@.@@

The MAC address specified is errored. Only characters from 0 to 9 and from A to F may be used. Moreover, the address must comprise 6 parts separated by dots; none of these values may exceed 'FF' and at least one part of the address must equal '0'.

F19: NO PLAUSIBLE EVENT FROM @@@

The acknowledgment from the task specified contains an incorrect event code. It may be possible to correct the problem by repeating the command.

F20: THE IP-ADDRESS 255.255.255.255 IN PARAMETER @@@@ is NOT ALLOWED

The IP address specified cannot be used in the parameter named.

F21: THE DYNAMIC BOARD-ID FOR WAML IS NOT AVAILABLE

This error message could indicate an inconsistency in the board's ADD data. Using 'DISPLAY-BCSU:TBL,...', check whether the board has been properly added and is operating. If yes, repeat the command.

F22: LOW WATERMARK MUST BE LESS THAN HIGH WATERMARK

An invalid limiting value was specified for the low watermark or high watermark.

F23: DATA HAVE NOT BEEN LOADED BECAUSE THE BOARD IS NOT IN STATE 'READY'

The relevant load job could not be executed because the WAML is not operating.  
Using  
'DISPLAY-BCSU:TBL,..', check whether the board has been properly added and  
determine its current status.

F24: THIS IP-ADDRESS IST NOT ALLOWED FOR ATLANTIC-LAN. THE FOURTH PART  
OF THE IP-ADDRESS MUST HAVE EVER THE VALUE '4'.

The value of the fourth part of the IP address for the Atlantic LAN interface on  
each WAML is permanently defined as '4'. All other values are therefore invalid.

F25: IT WAS NOT POSSIBLE TO READ THE WAML MAC-ADDRESS, THE BOARD IS NOT IN STATE 'READY'  
Due to a dump problem on the WAML board, it was not possible to read a MAC address.  
Using 'DISPLAY-BCSU:TBL,..', check whether the board has been properly added and  
determine its current status.

F26: THE ENTERED NET MASK CAN NOT BE USED IF DESTINATION=NET

At network IP addresses the network mask 255.255.255.255 is not allowed to use.  
Type in a valid network mask.

F27: THE ENTERED STATION NUMBER IS ALREADY USED BY ANOTHER WAML BOARD AT PEN  
<ltg>.<ltu>.<slot>.

The WAML station number added only once. Each WAML board must have its own station  
number.

F28: THE ENTERED IP-ADDRESS IS ALREADY USED BY ANOTHER WAML BOARD AT PEN  
<ltg>.<ltu>.<slot> TO ACCESS THE NETWORK INTERFACE <param>.

Each IP address must be unique within a system. Take care of it, if you try to add  
more than one WAML board.

F29: THE PARAMETER VALUE 'OUT' MAY BE ENTERED ONLY FOR ONE STATION NUMBER.

The WAML uses the station number with specified OUT flag for its callback function.

## **128.4.2 Advisories**

H01: THERE ARE NO DATA CONFIGURED IN TABLE '@@@@@'

The relevant table contains no entries; it is empty. You can configure entries by  
means of the ADD action.

H02: THE IP-ADDRESS @@@.@@@.@@@.@@@ OF THE NEXT ROUTER DO NOT CORRESPOND  
TO A WAML INTERFACE.

The IP address specified does not match the IP address of a WAML network interface  
or the WAML's network interface(s) has/have not yet been added. NO data can  
currently be routed with this IP address. You can use the 'DISPLAY-  
LANC:TABTYPE=NETWORK;' command to view the configured network interfaces (IP  
addresses).

H03: BEFORE USING ACTION 'CHANGE, THE TABLE @@@@@@ MUST BE ADMINISTERED WITH THE VERB  
'ADD'

H04: TABLE '@@@@@' - NO DATA FOUND

The table specified contains no entries that match the command entered. The  
relevant entry was not found.

H05: USER ADVISORY: THIS ACTION POSSIBLY MAY RESULT IN AN INCONSISTENT  
CONFIGURATION OF THE LAN. FOR MORE INFORMATION READ THE AMO DESCRIPTION.

## LANC - LAN configuration

### Error messages and advisories

Changing these tables without taking into account the cross-references may result in an inconsistency in the LAN connectivity configuration. This could mean that when, for example, the IP routing table is deleted, no data packets can be assigned to a WAML interface by means of the WAML router function. Deleting a firewall table may mean that when a check is activated, the check result will be negative and a data connection will be rejected. Under such circumstances, it is the user's responsibility to determine the effect of his or her command; in such cases, the AMO LANC can provide no support.

H07: CHANGED CONFIGURATION DATA AVAILABLE - LOAD WAML BOARD WITH COMMAND 'EXEC-LANC' REQUIRED.

Changes were made to the WAML configuration data since the last load command. In order for these changes to become valid, they must be loaded to the board by means of the 'EXEC-LANC:...' command.

H08: THE NETWORK INTERFACE(S) @@@@@@@@ @@@@@@@@ @@@@ (PARAMETER 'ACTNETIF') IS/ARE NOT CONFIGURED IN THE NETWORK INTERFACE TABLE.

This message means that the network interfaces specified were activated in the global parameter table but have not yet been added to the network interface table. You can configure the specified network interfaces by means of the 'ADD-LANC::TABTYPE=NETWORK,...' command.

H09: THE NETWORK INTERFACE(S) @@@@@@@@ @@@@@@@@ @@@@ (PARAMETER 'ACTNETIF') IS/ARE STILL ACTIVE IN THE GLOBAL TABLE.

This message means that the network interface(s) specified has/have been deleted from the network interface table but is/are still activated in the global parameter table. You can deactivate the specified network interface(s) by means of the 'CHANGE-LANC:TABTYPE=GLOBAL, ACTNETIF=...' command. At least one active interface is required for operating the WAML.

H10: THE IP-ADDRESS IS CONFIGURED AS HOST, SO THE NET MASK (IPNMASK) IS NOT EFFECTIVE.

At host IP addresses the network mask is ignored and automatically the default value 255.255.255.255 shall be written in the database.

H11: THE IP-ADDRESS @@@.@@@.@@@.@@@ IS USED BY THE WAML AS DEFAULT ROUTER.

It is indicated that an entry in the IP routing table with the "wild card address" 0.0.0.0 has been added or changed.

## 129 LAUTH - Administration of Least Cost Routing Authorisation Codes

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO LAUTH administers the authorisation codes which are used to access alternate public carriers from a private network.

Up to 4 authorisation codes may be configured for each Internal Traffic Restriction (ITR) group.

The authorisation codes are used by the Least Cost Routing (LCR) feature and are referenced by the LCR outdial rules. See AMO LODR for the configuration of outdial rules.

The correct authorisation code must be configured to provide an ITR group with access to an alternate public carrier. No error is generated if a correct authorisation code is not configured.

The authorization codes are entered in human readable form and are stored in encrypted form on the system.

Due to data security there is no DISPLAY function. The configured codes will only be seen in encrypted form in REGEN. In DELETE and CHANGE the user has to enter the human readable form of the code as it was entered in ADD i.e. to be able to change or delete an entered code the human readable form has to be known by the user.

The encrypted form from REGEN can be used to regenerate the system. e.g. GENDB

### 129.1 Restrictions

This description is valid from SP300-V3.4

### 129.2 Interrelationships

- AMO LODR : Administration of LCR outdial rules
- GENERATION SEQUENCE : LAUTH --> LODR --> LDAT --> LDPLN

### 129.3 Functions of the AMO

- **ADD-LAUTH** : Add an authorisation code to an Internal Traffic Restriction (ITR) group.
- **CHANGE-LAUTH** : Change an existing authorisation code in an Internal Traffic Restriction (ITR) group.
- **DELETE-LAUTH** : Delete an existing authorisation code from an Internal Traffic Restriction (ITR) group.
- **REGENERATE-LAUTH** : Regenerate the authorisation codes configured for one or more Internal Traffic Restriction (ITR) groups in encrypted format.

#### 129.3.1 ADD-LAUTH

Add a new LCR authorisation code to an ITR group.

The authorisation code to be added is specified by the ITR and INDEX parameters.

The authorisation code may be entered in either human readable or encrypted form, specified by the FORMAT parameter. The encrypted format is used by the regenerate command.

The authorisation code is stored in encrypted form on the system, which can be observed by the regenerate command.

Remarks:

- An authorisation code can only be added if a code is not already configured for the given ITR and INDEX.
- Users should use NORMAL branch to create new entries.
- ENCRYPT branch is only for regeneration of the system using the REGEN output.

#### Procedure Overview

| Command Code | Parameter                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------|
| ADD-LAUTH    | ITR=<number>, INDEX=<number>, FORMAT=NORMAL/ENCRYPT;<br>  FORMAT=NORMAL, CODE=<string>;<br>  FORMAT=ENCRYPT, CRYP CODE=<string>; |

**Examples**

1. To add a normal authorisation code to ITR group number 4.

Input:

```
ADD-LAUTH:4,1,NORMAL,2788991;
```

2. To add an encrypted authorisation code to ITR group number 4.

Input:

```
ADD-LAUTH:4,1,ENCRYPT,72JQD2520J;
```

## 129.3.2 CHANGE-LAUTH

Change an existing LCR authorisation code.

The authorisation code to be changed is specified by the ITR and INDEX parameters.

Remark:

To change the existing code, the human readable form of the old code has to be known by the user. Both old code and new code should be entered in human readable form.

**Procedure Overview**

| Command Code | Parameter                                                      |
|--------------|----------------------------------------------------------------|
| CHANGE-LAUTH | ITR=<number>, INDEX=<number>, OLDCODE=<string>, CODE=<string>; |

**Example**

To change an authorisation code.

Input:

```
CHANGE-LAUTH:4,1,2788991,2788992;
```

## 129.3.3 DELETE-LAUTH

Delete an existing LCR authorisation code.

The authorisation code to be deleted is specified by the ITR and INDEX parameters.

Remark:

**LAUTH - Administration of Least Cost Routing Authorisation Codes**

Parameter Description

To delete an existing code, the original human readable form of the has to be known by the user. OLDCODE should be entered in human readable form.

**Procedure Overview**

| Command Code | Parameter                                       |
|--------------|-------------------------------------------------|
| DELETE-LAUTH | ITR=<number>, INDEX=<number>, OLDCODE=<string>; |

**Example**

To delete an authorisation code.

Input:

DELETE-LAUTH:4,1,2788992;

**129.3.4 REGENERATE-LAUTH**

Regenerate configured LCR authorisation codes.

The authorisation code table for the specified ITR group(s) is regenerated in encrypted form due to security reason. It therefore is not possible to see the configured codes in human readable form.

**Procedure Overview**

| Command Code | Parameter      |
|--------------|----------------|
| REGEN-LAUTH  | [ITR=<number>; |

**Example**

To regenerate the whole authorisation code table.

Input:

REGEN-LAUTH;

Output:

ADD-LAUTH:0,1,ENCRYPT,520HQVSTQP;  
ADD-LAUTH:4,1,ENCRYPT,LRC4;  
ADD-LAUTH:13,3,ENCRYPT,HSTTC4JOSEJTDL86I8KAHS;

**129.4 Parameter Description**

CODE                   AUTHORISATION CODE DIGIT STRING

Type of Input : Single value, required  
Possible Values : 1 to 22 numeric digits

**CRYP CODE ENCRYPTED AUTHORISATION CODE**

Type of Input : Single value,  
required when FORMAT=ENCRYPT (ADD)  
Possible Values : 1 to 22 alphanumeric characters

**FORMAT OF AUTHORISATION CODE TO BE ADDED**

Type of Input : Single value, required (ADD)  
Possible Values : NORMAL - Add normal authorisation code  
(Parameter CODE mandatory)  
ENCRYPT - Add encrypted authorisation code  
(Parameter CRYP CODE mandatory)

**INDEX OF AUTHORISATION CODE IN TRAFFIC RESTRICTION GROUP**

Type of Input : Single value, required (ADD, CHANGE, DELETE, DISPLAY)  
Possible Values : 1 to 4

**ITR INTERNAL TRAFFIC RESTRICTION GROUP**

Type of Input : Single value, required (ADD, CHANGE, DELETE, DISPLAY)  
Single value, chained single values or ranges, optional (REGEN)  
Possible Values : 0 to 15

**OLDCODE ALREADY CONFIGURED AUTHORISATION CODE DIGIT STRING**

Type of Input : Single value, required  
Possible Values : 1 to 22 numeric digits

## 129.5 Error Messages and Advisories

### 129.5.1 Error Messages

F01: THERE IS ALREADY AN AUTHORISATION CODE CONFIGURED FOR THIS ITR/INDEX  
F02: THERE IS NO AUTHORISATION CODE CONFIGURED FOR THIS ITR/INDEX  
F03: THE "OLDCODE" DOES NOT MATCH THE CONFIGURED CODE

F04: THE "CRYPCODE" CANNOT BE DECRYPTED  
--> PROMPT CRYPCODE

**129.5.2 Advisories**

H01: THERE IS NO AUTHORISATION CODE CONFIGURED FOR THIS ITR/INDEX  
H02: THERE ARE NO AUTHORISATION CODES CONFIGURED FOR THIS (THESE) ITR GROUP(S)

**129.5.3 Use of the Output Messages for Each Action**

|            |   |      |     |

| ADD        | : | F01, | F04 |
| CHANGE     | : | F02, | F03 |
| DELETE     | : | F02, | F03 |
| REGENERATE | : | H02  |     |

## 130 LCSM - Configure Line in the Server

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

AMO LCSM processes the data of lines between the line controller (LCX) of the servers and the terminal devices (Terminal, Fax, ...?).

No IBM link is possible with this AMO.

### 130.1 Restrictions

This description is valid from SP300-Rel6.3.

### 130.2 Interrelationships

- AMO UCSM : Configure Servers
- AMO BCSM : Configure Mounting Location of a Module in the Server

### 130.3 Functions of the AMO

- [ADD-LCSM](#) : Creation of Line Data in the Database
- [CHANGE-LCSM](#) : Changing the Line Data
- [DELETE-LCSM](#) : Deletion of Line Data
- [DISPLAY-LCSM](#) : Interrogating the Data of a (all) line(s)
- [REGENERATE-LCSM](#) : Regeneration

#### 130.3.1 ADD-LCSM

**Restriction:**

There don't exist ASYNCH - or V24 - Lines in a Hipath 4000 V2.0 .

## LCSM - Configure Line in the Server

### Functions of the AMO

#### Procedure Overview

| Command Code | Parameter                                     |
|--------------|-----------------------------------------------|
| ADD-LCSM     | [UNIT=<param>]                                |
|              | ,MLNTYPE=ASYNC,TYPENO=<number>,BAUD=<number>  |
|              | ,LEN=<number>,STOPLEN=<param>,TRNSCLK=<param> |
|              | ,RCLK=<param>;                                |
|              |                                               |
|              | ,MLNTYPE=V24,TYPENO=<number>,NORM=<param>     |
|              | ,OPTYPE=<param>,SPEED=<param>,CLK=<param>     |
|              | ,TIME=<number>,LNTYPE=<param>;                |

#### Example

Creation of line data for administration and data module 1 for an asynchronous line.

Input:

```
ADD-LCSM:A1,ASYNC,1,4800,7,SL1.5,INT,EXT;
```

#### Note

The module for the physical line must be present.

#### Note

If the length of stop has value SL1.5 the value SL1.5 is mapped internally to the value SL1.

## 130.3.2 CHANGE-LCSM

#### Restriction:

There don't exist ASYNCH - or V24 - Lines in a Hipath 4000 V2.0 .

#### Procedure Overview

| Command Code | Parameter                                     |
|--------------|-----------------------------------------------|
| CHANGE-LCSM  | [UNIT=<param>]                                |
|              | ,MLNTYPE=ASYNC,TYPENO=<param>,[BAUD=<number>] |
|              | ,[LEN=<number>],[STOPLEN=<param>]             |
|              | ,[TRNSCLK=<param>],[RCLK];                    |
|              |                                               |
|              | \,MLNTYPE=V24,TYPENO=<param>,[NORM=<param>]   |
|              | ,[OPTYPE=<param>],[SPEED=<param>]             |

| Command Code | Parameter                        |
|--------------|----------------------------------|
|              | , [CLK=<param>], [TIME=<number>] |
|              | , [LNTYPE=<param>];              |

**Example**

Creation of line data for the administration and data module 1 for an asynchronous line.

Input:

```
CHANGE-LCSM:A1,ASYNC,1,4800,5,SL1,INT,INT;
```

**Note**

If the length of stop has value SL1.5 the value SL1.5 is mapped internally to the value SL1.

**130.3.3 DELETE-LCSM****Procedure Overview**

| Command Code | Parameter                                            |
|--------------|------------------------------------------------------|
| DELETE-LCSM  | [UNIT=<param>], [MLNTYPE=<param>, [TYPENO=<number>]] |

**Example**

Deletion of the data of the logical line 2 of line type ASYNC in the Administration and Data Module 1.

Input:

```
DELETE-LCSM:A1,ASYNC,2;
```

**130.3.4 DISPLAY-LCSM****Procedure Overview**

| Command Code | Parameter                                            |
|--------------|------------------------------------------------------|
| DISPLAY-LCSM | [UNIT=<param>], [MLNTYPE=<param>, [TYPENO=<number>]] |

**Examples**

1. Interrogation of the data of the logical line 1 of type ASYNC on the administration and data module.

Input:

```
DISPLAY-LCSM:A1,ASYNC,1;
```

## LCSM - Configure Line in the Server

### Functions of the AMO

#### Output:

```
MLNTYPE : ASYNC
TYPENO  : <1>
BAUD    : <4800>
LEN     : <5>
STOPLEN : <SL1>
TRNSCLK : <INT>
RCLK    : <INT>
```

- Interrogation of the data of all logical lines of type ASYNC on the administration and data module.

#### Input:

```
DISPLAY-LCSM:A1,ASYNC;
```

#### Output:

```
LIST OF THE LOGICAL LINES ( LINE TYPE = ASYNC )
```

| TYPENO | BAUD | LEN | STOPLEN | TRNSCLK | RCLK |
|--------|------|-----|---------|---------|------|
| 1      | 4800 | 7   | SL1.5   | INT     | INT  |
| 3      | 4800 | 7   | SL1     | INT     | EXT  |

- Interrogation of the data of the logical line 3 of type V24 synchronous on the administration and Data module.

#### Input:

```
DISPLAY-LCSM:A1,V24,3;
```

#### Output:

```
MLNTYPE : V24
TYPENO  : <3>
NORM    : <V23>
OPTYPE  : <DTE>
SPEED   : <LOW>
CLK     : <INT>
TIME    : <100>
LNTYPE  : <DIALN>
```

- Interrogation of the data of all logical lines of type V24 synchronous on the administration and data module.

#### Input:

```
DISPLAY-LCSM:A1,V24;
```

#### Output:

```
LIST OF LOGICAL LINES ( LINE TYPE = V24 )
```

| TYPENO | NORM  | OPTYPE | SPEED | CLK | TIME | LNTYPE |
|--------|-------|--------|-------|-----|------|--------|
| 2      | V27   | DTE    | LOW   | EXT | 60   | HDX    |
| 4      | V27TO | DCE    | HIGH  | INT | 100  | FDX    |

## 130.3.5 REGENERATE-LCSM

### Procedure Overview

| Command Code    | Parameter       |
|-----------------|-----------------|
| REGENERATE-LCSM | [UNIT=<param>]; |

#### Example

Regeneration of the data of all lines of administration and data server 1.

Input:

```
REG-LCSM:UNIT=A1;
```

Output:

```
ADD-LCSM:A1,ASYNC,1,4800,7,SL1.5,INT,EXT;
:
.
```

## 130.4 Parameter Description

|      |                                             |                                                            |  |
|------|---------------------------------------------|------------------------------------------------------------|--|
| BAUD | Standardized transmission speed (baud rate) |                                                            |  |
|      | Type of Input                               | : Single value,<br>required (ADD)<br>optional (CHANGE)     |  |
|      | Possible Values                             | : 50, 100, 200, 300, 600, 1200,<br>2400, 4800, 9600, 19200 |  |
| CLK  | Clock signal                                |                                                            |  |
|      | Type of Input                               | : Single value,<br>required (ADD)<br>optional (CHANGE)     |  |
|      | Possible Values                             | : EXT =external<br>INT =internal                           |  |
| LEN  | Signal length (number of bits per signal)   |                                                            |  |
|      | Type of Input                               | : Single value,<br>required (ADD)<br>optional (CHANGE)     |  |
|      | Possible Values                             | : 5 - 7                                                    |  |

## LCSM - Configure Line in the Server

### Parameter Description

|         |                                                                                 |                                                                                                                                                                                                                                  |
|---------|---------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LNTYPE  | Line type                                                                       |                                                                                                                                                                                                                                  |
|         | Type of Input                                                                   | : Single value,<br>required (ADD)<br>optional (CHANGE)                                                                                                                                                                           |

## 130.5 Error Messages and Advisories

### 130.5.1 Error Messages

F01: THE LOGICAL LINE MLNTYPE <@@@> AND TYPENO <@> EXISTS ALREADY.  
PLEASE USE FUNCTION "CHANGE-LCSM" OR "DELETE-LCSM".

F02: free

F03: THE LOGICAL LINE MLNTYPE <@@@> AND TYPENO <@> DOES NOT EXIST

F04: THE VALUE OF PARAMETER <@@@@@@@@> IS INVALID.

F05: THE VALUE OF PARAMETER TRNSCLK AND (OR) RCLK IS INVALID.

F06: THE LOGICAL LINE MLNTYPE <@@@> AND TYPENO <@> IS STILL ASSIGNED TO A PHYSICAL LINE.

F07: THERE DON'T EXIST ASNYCH OR V24 LINES IN A CPCI SHELF

F08: free

### 130.5.2 Advisories

H01: THERE ARE NO LOGICAL LINES OF MLNTYPE <@@@>.

H02: free

H03: THE LENGTH OF STOP WAS CHANGED TO SL1.

H04: THIS CONFIGURATION ALREADY EXISTS

## 131 LDAT - Administration of LCR Routes

|----------------------|-------------------------------|
| Interrelationships   | Parameter Description         |
| Functions of the AMO | Error Messages and Advisories |

The AMO LDAT creates *LCR route elements* (LRTEL) for each LCR route (LROUTE). These LCR route elements specify in which sequence the trunk groups are to be seized.

Each *LCR route element* is prioritized within the LCR route and assigned a trunk group from this route, an outdial rule and a LCR authorization. An associated gateway element consists of up to 5 gateway and sector path number entries.

Adding the first LCR route element to an LROUTE also adds the route itself. The route can then be assigned to individual *LCR digit patterns* using the AMO LDPLN.

Deleting the last LCR route element from an LROUTE also deletes the route itself.

CHANGE the data of an LCR route element, ADD new LCR route elements and DELETE LCR route elements is also possible.

With the AMO LDAT, only those trunk groups can be used for an LCR route, which have previously been assigned to the route by means of the AMO RICHT.

### 131.1 Interrelationships

- AMO BUEND : Definition of trunk groups
- AMO TACSU : Allocation of analog circuits to trunk groups
- AMO TDCSU : Allocation of digital circuits to trunk groups
- AMO TSCSU : Allocation of X.21 circuits to trunk groups
- AMO RICHT : Grouping various trunk groups into routes
- AMO DIMSU : Administration of database layout
- AMO LODR : Administration of outdial rules
- AMO LDPLN : Administration of LCR digit patterns
- AMO LDSRT : Administration of LCR Digit String Restriction Tables
- AMO LPROF : Administration of LCR profiles

**Generation sequence:**

The LCR route type is derived from the AMO RICH branch (parameter TYPE) in which the LCR route was defined.

All LCR routes which were defined as TYPE=CD are assigned the TYPE NWLCR (networking LCR, standard alternative routing), routes from the branch LROUTENEW are assigned the TYPE LCR.

The branch LRTEEXP in the AMO RICH is used to assign new trunk groups and define additional services to existing LCR routes.

*NWLCR routes* are always expanded to include new trunk groups in the branch TYPE=CD in the AMO RICH.

The LCR routes that were set up using the AMO LDAT assigned to individual digit patterns by means of the AMO LDPLN.

AMO LDSRT is used to construct LCR digit string restriction tables. These tables are assigned to route elements by AMO LDAT afterwards.

Volume 2 of the Service Manual, 'AMO Usage Examples', Section 'Networking' describes various configurations and how they are set up.

**131.2 Functions of the AMO**

- [ADD-LDAT](#) : Add route elements
- [CHANGE-LDAT](#) : Change individual route elements
- [DELETE-LDAT](#) : Delete entire routes, individual route elements or gateway enries belonging to a route element
- [DISPLAY-LDAT](#) : Display LCR routes
- [REGEN-LDAT](#) : Regenerate parameters

**131.2.1 ADD-LDAT**

For the features

- (i) LCR and
- (ii) LCR with closed numbering (NWLCR),

the LCR routes that were predefined using the AMO RICHT are assigned data for the device search.

For the LCR with its *LCR digit patterns*, the trunk groups that were assigned to a specific LCR route for one or more services using the AMO RICHT must be arranged according to specific (i.e. usually economical) considerations for path selection purposes.

The LCR route to be processed is specified with the parameter LROUTE.

The Parameter LSVC specifies the services (VCE, DTE or ALL) for which the route is installed.

If the route is defined in AMO RICHT using LSVC=ALL, only one maingroup will be installed for both services (check: DISP-RICHT;). All subsequent operations on this route using AMO LDAT must specify LSVC=ALL. If the services of the route have been defined separately from each other (1. using TYPE=LRTNEW, 2. using TYPE=LRTEXT), 2 different maingroups will be installed for this route. As the 2 maingroups may content different trunk groups, all LDAT operations must handle the services separately (except for DEL-LDAT:TYPE=LRTG).

LSVC=ALL is used, if the parameter is not entered.

Each LCR route is made up of individual *LCR route elements*, each of which constitutes a *routing alternative*.

The number of possible route elements per LCR route is unlimited.

EXCEPTION:

The maximum number of route elements per system (*DIMSU parameter LRTEL*) has been reached.

The route elements within an LCR route are prioritized (to ensure, for instance, that the cheapest routing alternative, the satellite or optical-fiber link etc. is used first) by assigning an *LCR priority* to every route element (parameter LVAL / LVALNEW).

Priority 1 is given the cheapest route element(s) within the LCR route.

The route elements are sorted in ascending order according to their priority. The priorities must be numbered consecutively; gaps are not allowed and will be prevented by the AMO, i.e. two adjacent route elements will always have either the same priority or a priority that differs by a factor of 1.

If the parameter LVAL/LVALNEW has not been specified, the AMO will use the LCR priority of the last element (i.e. 1 if no route element has been specified as yet). If the parameter LVAL has been specified, the specified route element is inserted after the last route element with the same LCR priority.

## LDAT - Administration of LCR Routes

### Functions of the AMO

If, at a later stage, it becomes necessary to insert a route element with a "new" LCR priority, not the above-described parameter LVAL but the parameter LVALNEW should be used. In this case, the new route element will be inserted before the first route element with the same LCR priority; at the same time, the LCR priority of all subsequent route elements is incremented by 1.

Only one of the two parameters LVAL or LVALNEW must be used at any given time.

Each LCR route element (parameter LRTEL) is either assigned a trunk group (parameter TGRP) which has previously been defined for this LCR route using the AMO RICHT or gateway entries (up to 5) consisting of gateway number and sector path number.

#### EXCEPTION :

It is not allowed to create a route element which is assigned neither a trunkgroup nor a gateway element.

It is possible to assign the same trunk group to several LCR route elements so that it can be used more than once for a device search within the same (LCR) route.

Each LCR route element must be assigned an outdial rule previously defined by means of the AMO LODR parameter ODR. This *outdial rule* must be terminated with an END command.

To enable or disable a specific route element for a particular user, each route element must be assigned at least one LCR authorization (using the parameter LAUTH). It is possible to assign more than one authorization to a route element.

Only users whose active *LCR class of service* contains this LCR authorization will be able to seize this route element.

The 8 LCR schedules can be locked or marked as expensive for each LCR route element using parameter LSCHED. Each schedule may be marked as expensive or locked exclusively. If the parameter is missing, all schedules are unlocked and not marked as expensive.

Each LCR route may assigned a network carrier (parameter CARRIER) and a corresponding zone (parameter ZONE). Both parameters must be entered together. If the parameters are missing, CARRIER=1 and ZONE=EMPTY is used. If a value different from EMPTY has been specified for a zone, WCHREG (parameter LATTR) will automatically be set and the advisory H15 will be displayed.

Each LCR route may be assigned a Destination Node Number (parameter DNNO), which will override the DNNO set for the route in AMO RICHT for number modification purposes.

Each LCR route may be assigned a maximum number of compression/decompression cycles (parameter VCCYC). The value of VCCYC will be without effect, if the value VOICO of parameter LATTR is not set. The value VOICO of parameter LATTR can not be set if the service of the route is not only VOICE.

Each LCR route element may be assigned a country- or network-specific LCR attribute (parameter LATTR). If LATTR is missing, no LCR attribute is assigned to this route.

To each LCR route element a central byte manipulation attribute (parameter CBMATTR) may be assigned, which specifies echo cancellation and a-law/m-law conversion.

To each LCR route element a specialized common carrier identifier (parameter SCCID) may be assigned, which is required to designate the specialized common carrier that point to a PRI trunk group. When OUTWATS is assigned as a call-by-call voice calling service and the LCR route element points to a NI-2 PRI trunk, a non-null SCCID value (0000-9999) must be assigned.

To each LCR route element a facility number (parameter FACILITY) must be assigned when the call-by-call PRI calling service is FX (Foreign Exchange Access) or TTA (Tie Trunk Access) (parameters SVCVCE and SVCNVCE). FACILITY value can be associated with only one service, SVCVCE or SVCNVCE. If for SVCVCE and SVCNVCE the values other than FX or TTA are entered, the FACILITY parameter is ignored if it is specified. Otherwise, it is set to empty.

To each LCR route element a service voice capability (parameter SVCVCE) may be assigned to designate the call-by-call voice capable PRI calling service to be used when the call being routed is a voice (speech) or voice-band call. This parameter is applicable only for LCR route elements that point to a PRI or CorNet-NQ trunk group. If FX or TTA is assigned to SVCVCE then FACILITY parameter must also be set. Parameter SVCVCE can be set if LSVCE is VCE or ALL.

To each LCR route element a non-voice capability (parameter SVCNVCE) may be assigned to designate the call-by-call non-voice capable PRI calling service to be used when the call being routed is a digital data (UDI) call. This parameter is applicable only for LCR route elements that point to a PRI or CorNet-NQ trunk group. If FX or TTA is assigned then the FACILITY parameter must also be set. Parameter SVCNVCE can be set if LSVCE is DTE or ALL.

**LDAT - Administration of LCR Routes**

Functions of the AMO

One of the values OUTWATS, WB0..WB9, FX and TTA for SVCVCE and one of the values OUTWATS, FX and TTA for SVCNVCE can not be entered together.

LCR digit string restriction tables (parameter LDSRT) may be assigned to each LCR route element which contain the dial numbers to be restricted for the route element. These tables are administered via AMO LDSRT.

A Class of trunk index may be assigned to each LCR route element (parameter COTIDX).

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 131.2.2 CHANGE-LDAT

The LCR route element to be changed should be addressed by means of the LCR route (parameter LROUTE) and the *LCR route element number* (parameter LRTEL) which can be output with DISPLAY.

The LCR route element to be changed must already exist.

The element's position within the LCR route and its priority (parameter LVAL/LVALNEW in ADD command) can no longer be changed.

To be able to make a change, the respective element must first be deleted and then recreated (ADD) with another priority.

## **LDAT - Administration of LCR Routes**

### Functions of the AMO

The trunk group previously assigned to the LCR route element can be replaced by a new one (parameter TGRP). To be able to delete a trunk group (TGRP = 0), there must be at least one destination gateway entry configured in the selected LCR route element.

The outdial rule previously assigned to an LCR route element can be replaced by a new one (parameter ODR).

As far as the validity of outdial rules is concerned, the restriction for the ADD command applies, i.e. the outdial rule must be terminated with an END command.

The LCR authorization previously assigned to an LCR route element can be replaced by new authorization numbers (parameter LAUTH).

The LCR schedule previously assigned to an LCR route element can be replaced by a new one (parameter LSCHED).

The LCR carrier and corresponding zone previously assigned to an LCR route element can be replaced by a new one (parameter CARRIER and ZONE).

The DNNO previously assigned to an LCR route element can be replaced by a new one. In all pre-Unity versions when DNNO (in LDAT) was changed to 0, the DNNO was deleted and the DNNO from RICHT became active. According with the new features in Unity versions this behaviour is no longer possible. If the DNNO is not specified, the DNNO from AMO-RICHT gets active. DNNO 0-0-0 is also allowed as a normal DNNO.

The maximum number of voice compression cycles previously assigned to an LCR route element can be replaced by a new one (parameter VCCYC).

The LCR attribute previously assigned to an LCR route element can be deleted or replaced by a new one (parameter LATTR). In case the attribute WCHREG has been deleted, the zone (parameter ZONE) will automatically be set to EMPTY and the advisory H16 will be displayed.

The Central byte manipulation attribute can be replaced by a new one (parameter CBMATTR).

The specialized common carrier identification can be replaced by a new one (parameter SCCID). The rules specified in section 0.1.3.1 when adding a route element are also applied here.

The facility number can be replaced by a new one (parameter FACILITY).

Service voice capability can be replaced by a new one (parameter SVCVCE). The rules specified in section 0.1.3.1 when adding a route element are also applied here.

Service non-voice capability can be replaced by a new one (parameter SVCNVCE). The rules specified in section 0.1.3.1 when adding a route element are also applied here.

LCR digit string restriction tables can be replaced by new ones (parameter LDSRT).

Class of trunk index can be replaced by new one (parameter COTIDX).

Destination gateway entries can be replaced by new ones (Parameter GW1 .... GW5).

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-LDAT  | LROUTE=<number>, [LSVC =<param>], LRTEL=<number><br>, { (min 1)TGRP=<number>, ODR=<number><br>, LAUTH =<number>, LSCHED=<param><br>, CARRIER =<number>, ZONE = <param><br>, LATTR = <param>, DNNO=<number><br>, VCCYC=<number>, CBMATTR=<param><br>, SCCID=<key-num>, FACILITY=<key-num><br>, SVCVCE=<param>, SVCNVCE=<param><br>, LDSRT=<number>, COTIDX=<number><br>, GW1=<number>, GW2=<number>, GW3=<number><br>, GW4=<number>, GW5=<number>}; |

### Example

The result from the ADD example is changed.

Input:

```
CHANGE-LDAT:LROUTE=21,LRTEL=2,ODR=1;
CHANGE-LDAT:LROUTE=21,LRTEL=4,LAUTH=2;
CHANGE-LDAT:LROUTE=21,LRTEL=4,ODR=1,LSCHED=A&C&HE,LDSRT=2&5;
CHANGE-LDAT:LROUTE=21,LRTEL=5,LAUTH=2&5&8;
CHANGE-LDAT:LROUTE=21,LRTEL=1,TGRP=0,GW1=2-7;
```

and displayed again:

Input:

```
DISPLAY-LDAT:ALL,21;
```

Output:

```
+-----+
| LROUTE = 21                                NAME = AMT S2 NAT.                SERVICE = ALL |
```

### 131.2.3 DELETE-LDAT

It is possible to delete all LCR route elements and its associated data (trunk groups, LCR priority, outdial rule, LCR authorization) from an LCR route simply by specifying the LCR route (TYPE=LROUTE and parameter LROUTE).

An LCR route cannot be deleted fully (using TYPE=LROUTE) as long as it is still assigned to one or several *LCR digit patterns* or assigned by LPROF to one or several LCR Profile.

TYPE=LRTEL can be used to delete individual LCR route elements from a specific LCR route by specifying the LCR route (parameter LROUTE) and the LCR route element number (parameter LRTEL) output with the DISPLAY command.

The deletion of individual route elements leads to gaps in the LRTEL and LVAL values. The AMO eliminates these gaps through renumbering. The LVALs of each route begin with 1. Elements which previously had the same VALs are assigned the same VALs again.

TYPE=LRTEL can also be used to delete one or more destination gateway entries belonging to the specified routing element. In this case parameter GWIDX has to be entered. Parameter GWIDX specifies the destination gateway entry to be deleted. The deletion of individual gateway entries may result with gaps. In this case gaps are eliminated by compressing the destination gateway list. It is not allowed to delete all gateway elements of a routing element which doesn't have an assigned trunk group.

TYPE=LRTEL cannot be used to delete all elements from a route.

TYPE=LROUTE,LSVC=ALL; can be used to delete LCR routes which has been defined using LSVC=ALL.

TYPE=LDSRT is used when no LDSR table is required by a route element.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DELETE-LDAT  | KIND=LROUTE, LROUTE=<range> [, LSVC=<param>];<br> KIND=LRTEL, LROUTE=<number><br>[,LSVC=<param>], LRTEL=<range>,[GWIDX=<number>];<br> KIND=LDSRT,LROUTE=<number>, [LSVC=<param>],<br>LRTEL=<number>; |

### Example

After one of the batches from the ADD example has been executed, the command

Input:

```
DEL-LDAT:LRTEL,21,,1,1;
```

Output:

```
F36: GATEWAY DATA FOR LRTG =21 LRTGEL=1 CAN NOT BE DELETED.
```

```
DATA FOR BUNDLE AND GATEWAY MAY NOT BE EMPTY AT THE SAME  
TIME FOR IP-LCR.
```

Input:

**LDAT - Administration of LCR Routes**  
Functions of the AMO

CHANGE-LDAT:LROUTE=21,LRTTEL=1,TGRP=71;  
DEL-LDAT:LRTTEL,21,,1,1;

**Output:**

H22: GATEWAY INDEX 1 IS DELETED FROM SELECTED ROUTE ELEMENTS.

**Input:**

DEL-LDAT:LRTTEL,21,,2&3;

**Output:**

H09: LRTTEL 2 TO 3 DELETED FROM LROUTE 21 LSVC ALL  
- RESULTING LVAL GAPS ARE ELIMINATED THROUGH RENUMBERING

Since elements have to be deleted from back to front, delete messages will also be displayed back to front. This ensures that once one of the elements is deleted the remaining elements to be deleted need not be renumbered prior to deletion.

**Input:**

DISP-LDAT:,21;

**Output:**

|                                                                                 |      |      |     |                         |          |         |  |       |               |          |  |         |  |      |  |      |  |   |  |  |

-----+

The element parameters show clearly that the first and the third element were deleted and that the LVAL of the subsequent elements was decreased by 1. The deletion of the third element did not affect the LVAL numbering because no gap had been created.

## **131.2.4 DISPLAY-LDAT**

In general, LCR routes can be displayed either individually according to the purpose for which they are used, e.g.

- LCR routes for LCR (TYP=LCR)
- LCR routes for LCR with closed numbering (TYP=NWLCR)

or independently of it (TYPE=ALL includes TYPE=LCR and TYPE=NWLCR).

For all LCR/NWLCR routes, the data of all associated LCR route elements (LCR priority, trunk groups, outdial rule, LCR authorization) can be displayed (TYPE=LCR, NWLCR or ALL without specifying any further parameters).

For specific LCR/NWLCR routes, the data of all associated LCR route elements can be displayed (TYPE=LCR, NWLCR or ALL with parameter LROUTE).

However, it is also possible to display LCR/NWLCLR routes in which one or several LCR route elements are assigned

|                                    |                    |
|------------------------------------|--------------------|
| specific trunk groups              | (parameter TGRP)   |
| specific outdial rules             | (parameter ODR)    |
| specific LCR authorizations        | (parameter LAUTH)  |
| a specific Destination Node Number | (parameter DNNO)   |
| specific LCR attributes            | (parameter LATTR)  |
| specific LDSR tables               | (parameter LDSRT)_ |
| specific Gateway Element           | (parameter GW)     |

Lower levels of an DNNO may be zero, in this case routes to all nodes of that level will be displayed.

The range of LCR routes and the service to be searched through can be limited (parameter LROUTE, LSV). In this case, only those LCR routes will be output in which at least one element complies with the *search criteria*.

The values which result of the ADD and CHANGE commands will be displayed. The SCHEDULES will be displayed as an asteriks (\*) when unlocked, a dash (-) when locked and the letter E when marked as expensive.

## LDAT - Administration of LCR Routes

### Functions of the AMO

LCR routes which are already assigned to a LCR dialling plan (AMO LDPLN) are marked with LDPLN in the first line.

The field SERVICE INFO is written by AMOs COP,COT,COSSU,LODR,LWPAR,TAPRO and RICHT and is only displayed by AMO-LDAT.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                         |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-LDAT | TYPE= LCR   NWLCR   ALL<br>, [LROUTE=<number>], [LSVC=<param>], [TGRP=<number>]<br>, [ODR=<number>], [LAUTH=<number>]<br>, [DNNO=<number>], [LATTR=<param>]<br>, [LDSRT=<number>], [GW=<number>]; |

### Examples

1. Display all routes

Input:

```
DIS-LDAT:TYPE=ALL;
```

2. Display all LCR routes

Input:

```
DIS-LDAT:TYPE=LCR;
```

3. Display all networking LCR routes

Input:

```
DIS-LDAT:TYP=NWLCR;
```

4. Display all LCR routes in which at least one route element uses trunk group 91.

Input:

```
DIS-LDAT:TYP=LCR,TGRP=91;
```

5. Display all LCR routes in which at least one route element uses trunk group 72 with an outdial rule between 50 and 59.

Input:

```
DIS-LDAT:TYPE=LCR,TGRP=72,ODR=50&&59;
```

6. Display all LCR routes in which at least one route element uses trunk group 91 with outdial rule 31 and LCR authorization 1.

Input:

```
DIS-LDAT:TYPE=LCR,TGRP=91,ODR=31,LAUTH=1;
```

7. Display all LCR routes in which at least one route element uses LDSRT 5.

Input:

```
DIS-LDAT:TYPE=LCR,LDSRT=5;
```

8. Display all LCR routes in which at least one route element uses the destination gateway entry GW = 1-8, where gateway number=1 and sector path number = 8.

Input:

```
DIS-LDAT:TYPE=LCR,GW=1-8;
```

## 131.2.5 REGEN-LDAT

For all LCR routes, the data of all associated LCR route elements (LCR priority, trunk groups, outdial rule, LCR authorization) can be regenerated (without specifying a parameter).

For specific LCR routes, the data of all associated LCR route elements can be regenerated by specifying the parameter LROUTE.

Since the route elements do not contain any information about the *sequence* in which the elements were 'added', the REGENERATED commands may sometimes differ from the original ADD commands for a route.

### Procedure Overview

| Command Code    | Parameter          |
|-----------------|--------------------|
| REGENERATE-LDAT | [LROUTE=<range>] ; |

### Example

After one of the batches from the ADD example has been executed, the command

Input:

```
REGEN-LDAT:21;
```

Output:

results in the second form of the first case (ADD):

```
ADD-LDAT:21,ALL,1,,71,1,1,,1,EMPTY,NONE,,4,,,,,,,,,,,,;
```

```
ADD-LDAT:21,ALL,1,,71,1,2,A&C&HE,1,EMPTY,NONE,,4,,,,,2&5,,1-8,,,,;
```

```
ADD-LDAT:21,ALL,2,,71,1,2&5&8,,1,EMPTY,NONE,,4,,,,,,,,,,,,;
```

```
ADD-LDAT:21,ALL,2,,71,21,2,,1,EMPTY,NONE,,4,,,,,,,,,,,,;
```

## LDAT - Administration of LCR Routes

### Parameter Description

Once route 21 has been deleted, the commands must be entered exactly in the regenerated sequence to arrive at the same result as previously.

## 131.3 Parameter Description

|                 |                                                                                |
|-----------------|--------------------------------------------------------------------------------|
| CARRIER         | LCR carrier, always enter in combination with ZONE                             |
| Type of Input   | : Single value, optional                                                       |
| Possible Values | : 1 - 9                                                                        |
| Default Value   | 1                                                                              |
| CBMATTR         | Central Byte Manipulation Attributes                                           |
| Type of Input   | : single value, optional (ADD, CHANGE)                                         |
| Possible Values | : AMC                      a-law/m-law conversion                              |
|                 | EC128                      128 ms echo cancellation                            |
|                 | EC128AMC                  128 ms echo cancellation with a-law/m-law conversion |
|                 | EC64                      64 ms echo cancellation                              |
|                 | EC64AMC                  64 ms echo cancellation with a-law/m-law conversion   |
|                 | NOCBM                    No CBM attribute                                      |
| Default value   | NOCBM                                                                          |
| COTIDX          | Class of Trunk Index                                                           |
| Type of Input   | : Single value, optional                                                       |
| Possible Values | : 0 - 255                                                                      |
| Default Value   | 0                                                                              |
| DNNO            | Destination Node Number, overrides DNNO of the route                           |
| Type of Input   | : Up to 3 values, linked by -, optional                                        |
| Possible Values | : LEVEL2: 0 - 29                                                               |
|                 | LEVEL1: 0 - 253                                                                |
|                 | LEVEL0: 0 - 999                                                                |
| Default Value   | No Entry                                                                       |
| FACILITY        | Facility number for the call-by-call services FX and TTA                       |
| Type of Input   | : Single value, optional (ADD, CHANGE)                                         |

|       |                 |                                                                                                                                                                                              |                                                                            |
|-------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
|       | Possible Values | : 0-9, up to 5 characters                                                                                                                                                                    |                                                                            |
| KIND  | Deletion kind   |                                                                                                                                                                                              |                                                                            |
|       | Type of Input   | : Single value, mandatory (DEL)                                                                                                                                                              |                                                                            |
|       | Possible Values | : LROUTE - Delete all LCR route elements from an LROUTE (parameter LROUTE, mandatory)<br>LRTEL - Delete individual LCR route elements from an LROUTE (parameters LROUTE and LRTEL mandatory) |                                                                            |
| LATTR | LCR Attribute   |                                                                                                                                                                                              |                                                                            |
|       | Type of Input   | : Up to 8 values, optional (ADD, CHANGE, DISP)                                                                                                                                               |                                                                            |
|       | Possible Values | : NONE no LCR-attributes                                                                                                                                                                     |                                                                            |

## LDAT - Administration of LCR Routes

### Parameter Description

Possible Values : 1-254  
Default Value : 1 if LRTEL=1 else LVAL (LRTEL max)

LVALNEW LCR PRIORITY TO BE INSERTED

Type of Input : Single value, optional (ADD)  
Possible Values : 1-254

GW1 Destination Gateway 1, consists of gateway number-sector path number  
Type of Input : 2 concatenated values with "-", optional (ADD, CHANGE)  
  
Possible Values : 0-65535

GW2 Destination Gateway 2, consists of gateway number-sector path number  
Type of Input : 2 concatenated values with "-", optional (ADD, CHANGE)  
  
Possible Values : 0-65535

GW3 Destination Gateway 3, consists of gateway number-sector path number  
Type of Input : 2 concatenated values with "-", optional (ADD, CHANGE)  
  
Possible Values : 0-65535

GW4 Destination Gateway 4, consists of gateway number-sector path number  
Type of Input : 2 concatenated values with "-", optional (ADD, CHANGE)  
  
Possible Values : 0-65535

GW5 Destination Gateway 5, consists of gateway number-sector path number  
Type of Input : 2 concatenated values with "-", optional (ADD, CHANGE)  
  
Possible Values : 0-65535

GWIDX Gateway Index  
Type of Input : Single value, & optional (DELETE)  
Up to 3 concatenated values with &  
Possible Values : 1-5

GW Destination Gateway, consists of gateway number-sector path number

## LDAT - Administration of LCR Routes

### Parameter Description

|     |             |
|-----|-------------|
| WB1 | WATS Band 1 |
| WB2 | WATS Band 2 |
| WB3 | WATS Band 3 |
| WB4 | WATS Band 4 |
| WB5 | WATS Band 5 |
| WB6 | WATS Band 6 |
| WB7 | WATS Band 7 |
| WB8 | WATS Band 8 |
| WB9 | WATS Band 9 |

**TGRP** Trunk group number  
must be assigned to LROUTE using the AMO RICHT  
Type of Input : Single value, mandatory (ADD)  
Single value, optional (CHANGE)  
Single value &, &&, optional (DISPLAY)  
(up to 10 individual concatenations or 5 individual range inputs)  
Possible Values : 1-512

**TYPE** LCR route type  
Type of Input : Single value, mandatory (DISPLAY)  
Possible Values : LCR - only LROUTEs for LCR  
NWLCR - only LROUTEs for LCR  
with closed numbering (networking LCR)  
ALL - LROUTEs for LCR and NWLCR

**VCCYC** Maximum number of voice compression/decompressions cycles  
Type of Input : Single value, optional  
Possible Values : 1-15  
Default Value : 4

**ZONE** LCR zone, always enter in combination with CARRIER  
Type of Input : Single value, optional  
Possible Values : EMPTY no zone  
LOCAL local zone  
SHORT (NEAR) short distance zone 1 - 9  
INTERN01 - internal zone 1 - 9  
INTERN09 (INT)  
LONG01- long distance zone 1 - 50  
LONG50 (DIST)

|               |                   |                             |
|---------------|-------------------|-----------------------------|
|               | ABROAD01 -        | abroad distance zone 1 - 99 |
|               | ABROAD99<br>(ABR) |                             |
|               | TIE01 - TIE09     | tie zone 1 - 9              |
| Default Value | EMPTY             |                             |

## 131.4 Error Messages and Advisories

### 131.4.1 Error Messages

- F01: LROUTE <xxxx> HAS NOT BEEN DEFINED (AMO RICHT).
- F02: NO LROUT MEMORY LEFT (AMO DIMSU, PARAMETER LROUT)
- F03: ADDING A LRTEL MUST NOT CREATE A GAP NEXT POSSIBLE VALUE = <xxx>.
- F04: LRTEL CANNOT BE APPENDED, BECAUSE LVAL MAX. = <xxx> HAS ALREADY BEEN REACHED.
- F05: LRTEL CANNOT BE INSERTED,  
BECAUSE LVAL MAX. = <xxx> HAS ALREADY BEEN REACHED.
- F06: TRUNK GROUP <xxx> HAS NOT BEEN DEFINED FOR LROUTE <xxxx> AND THE ENTERED LSVC (AMO RICHT).
- F07: ODR <xxxx> HAS NOT BEEN DEFINED, OR COMMAND SEQUENCE WAS NOT TERMINATED WITH END (AMO LODR).
- F08: LRTEL <xxxx> HAS NOT BEEN SET UP.
- F09: TRUNK GROUP <xxx> HAS NOT BEEN SET UP (AMO BUEND).
- F10: NO LRTEL HAS BEEN SET UP FOR LROUTE <xxxx>.
- F11: KIND=LROUTE MUST BE USED TO DELETE ALL LRTEL FROM LROUTE <xxxx>.
- F12: ATTRIBUTES PRIMRTE AND REROUTE CAN NOT BE SET AT THE SAME TIME CHECK PARAMETER LATTR AGAIN
- F13: THE TRUNK GROUP IS NOT OF THE APPROPRIATE TYPE
- F14: THE CONCATENATED VALUES FOR PARAMETER LSCHED CONFLICT WITH EACH OTHER  
A TIMEBAND CAN NOT BE DISABLED AND EXPENSIVE AT THE SAME TIME
- F15: LSVC=<xxxx> MUST BE USED, AS THIS ROUTE IS NOT INSTALLED  
FOR ALL SERVICES
- F16: LSVC=VCE/DTE MUST BE USED, AS THIS ROUTE HAS NOT BEEN INSTALLED  
FOR ALL SERVICES USING LSVC=ALL
- F17: LSVC=ALL MUST USED, AS THIS ROUTE HAS BEEN INSTALLED  
FOR ALL SERVICES USING LSVC=ALL
- F18: LSVC=<xxxx> CAN NOT BE USED, AS THIS ROUTE HAS NOT BEEN INSTALLED  
FOR THIS SERVICES
- F19: PARAMETER CARRIER AND ZONE HAS TO BE ENTERED BOTH IN COMBINATION

## LDAT - Administration of LCR Routes

### Error Messages and Advisories

- F20: LEVEL<x> OF DNNO MAY NOT EXCEED <xxx>
- F22: LATTR=VOICO MUST NOT BE USED FOR ROUTES WITH LSVC=DTE
- F23: ATTRIBUTES ETEUNVO, ETEMIN0, ETEMIN1, ETEMIN2, ETEMIN3, ETEMINX AND ETENORSP CAN NOT BE SET AT THE SAME TIME  
CHECK PARAMETER LATTR AGAIN
- F24: LRTEL @@@@@@@@@@@@@@ LSVC @@@@ HAS NOT BEEN SET UP
- F26: YOU HAVE NOT ENTERED A PROPER SCCID VALUE. IT SHOULD RANGE BETWEEN [0000,9999) OR '\*'
- F27: BEFORE SETTING FX OR TTA TO SVCVCE OR SVCNVCE PARAMETER A NON-NULL VALUE FOR PARAMETER FACILITY MUST BE SET
- F28: DNNO LIKE X-0-Y (X AND Y ARE NOT 0) IS NOT ALLOWED
- F29: DNNO OF LRTEL MUST BE DIFFERENT FROM THE PHYSICAL NODE ID
- F30: FACILITY PARAMETER CAN RANGE BETWEEN 0 AND 99999
- F31: THE VALUE OF SERVICE PARAMETER (LSVC) AND USE OF SVCVCE AND SVCNVCE PARAMETERS SHOULD BE CONSISTENT. SVCVCE CAN BE SET WHEN LSVC IS ALL OR VCE. SVCNVCE CAN BE SET WHEN LSVC IS ALL OR DTE
- F32: THE TRUNKS (AMO-TDCSU) OF LRTEL HAVE OUTWATS AS DEDICATED SERVICE (PARAM DEDSVC) AND LRTEL POINTS TO A NI-2 PRI TRUNK (PARAM PROTVAR). IN THIS CASE YOU MUST ENTER A NON-NULL SCCID VALUE.
- F33: VALUES OUTWATS, WB0..WB9, FX AND TTA FOR SVCVCE (VOICE) AND VALUES OUTWATS, FX AND TTA FOR SVCNVCE (NON-VOICE) CAN NOT BE USED TOGETHER
- F34: THE COT INDEX DOES NOT EXIST. PLEASE CONFIGURE BY MEANS OF AMO-COT FIRST
- F35: FIRST PART (GATEWAY NO) OF PARAMETER ^param^ MUST BE BETWEEN 1 AND 9999
- F36: GATEWAY DATA FOR LRTG = ^lrtg^ LRTGEL = ^lrtgel^ CAN NOT BE DELETED. DATA FOR BUNDLE AND GATEWAY MAY NOT BE EMPTY AT THE SAME TIME FOR IP-LCR
- F37: BUNDLE AND GATEWAY DATA CAN BE EMPTY AT THE SAME TIME ONLY FOR LATTR VALUES WHICH CONTAIN RERTEINT.
- F38: THE GATEKEEPER IS NOT ACTIVATED IN THE SYSTEM. CONFIGURATION OF GATEWAY ENTRIES GW1..GW5 IS NOT PERMITTED. (CHA-ZANDE: TYPE=ALLDATA, GATEKPR=YES;)
- F39: NO LCR CAN BE DEFINED FOR THIS ROUTE SINCE IT HAS BEEN INSTALLED AS FAX FROM AMO RICHT WHICH IS NOT A VALID SERVICE FOR LCR.

## 131.4.2 Advisories

- H01: LRTEL WITH LVAL <xxxx> WAS INSERTED. THE NUMBERING OF ALL SUBSEQUENT ELEMENTS WAS CHANGED ACCORDINGLY.
- H02: LRTEL <xxxx> WAS SET UP FOR LROUTE <xxxx> WITH LVAL <xxx>.
- H03: LRTEL <xxxx> FOR LROUTE <xxxx> WAS CHANGED.
- H04: LROUTE <xxxx> <TO <xxxx>> HAS NOT BEEN SET UP (AMO RICHT).
- H05: NO ROUTE ELEMENTS HAVE BEEN CREATED FOR LROUTE <xxxx> <TO <xxxx>> AS YET.

H07: LROUTE <xxxx> <TO <xxxx>> WAS NOT DELETED BECAUSE IT IS STILL ASSIGNED TO AT LEAST ONE LCR DIAL PATTERN (AMO LDPLN).

H08: LROUTE <xxxx> <TO <xxxx>> WAS DELETED.

H09: LRTEL <xxxx> <TO <xxxx>> WAS DELETED FROM LROUTE <xxxx>  
- RESULTING LVAL GAPS ARE ELIMINATED THROUGH RENUMBERING.

H10: NO ENTRY FOR THE SPECIFIED SEARCH CRITERION.

H11: THE PARAMETER ZONE MUST BE CHECKED WITH AMO TTBL

H12: LRTE <xxx> MUST BE DELETED USING LSVC=ALL

H13: PARAMETER <xxxxx>: THE VALUE NONE IS WITHOUT ANY EFFECT, IF ENTERED IN COMBINATION WITH OTHER VALUES

H15: ATTRIBUTE:WCHREG(PARAMETER LATTR) IS SET IN LRTG @@@@ LRTGEL @@@@@ BECAUSE PARAMETER ZONE IS NOT EMPTY

H16: THE PARAMETER ZONE IS SET TO EMPTY IN LRTG @@@@ LRTGEL @@@@@ BECAUSE ATTRIBUTE:WCHREG(PARAMETER LATTR) NOT SET

H17: LDSRT PARAMETER WAS SET TO EMPTY IN LRTE @@@@ LRTEL @@@@@

H18: PARAMETER FACILITY WAS SET TO EMPTY SINCE A FACILITY NUMBER IS ONLY VALID FOR SVCVCE=FX OR TTA, OR SVCNVCE=FX OR TTA.

H19: PARAMETER FACILITY WAS IGNORED SINCE A FACILITY NUMBER CAN ONLY BE ENTERED TOGETHER WITH SVCVCE=FX OR TTA, OR SVCNVCE=FX OR TTA

H20: A DESTINATION GATEWAY ENTRY WITH ENTERED ROUTING DATA ALREADY EXISTS AND CAN NOT BE CONFIGURED AGAIN.

H21: PTHE DESTINATION GATEWAY TABLE WAS COMPRESSED, FREE ENRIES HAVE BEEN REMOVED.

H22: GATEWAY INDEX ^gw1^bis1^gw2^bis2^gw3^ ^amisare^ DELETED FROM SELECTED ROUTE ELEMENTS

H23: LROUTE ^lrtg1^bis^lrtg2^ WAS NOT DELETED BECAUSE IT IS STILL USED BY AMO LPROF.

H24: PARAMETER @@@@@@@@: THE VALUE @@@@@@@@ IS WITHOUT ANY EFFECT, IF ENTERED IN COMBINATION WITH OTHER MLPP VALUES

H25: NOT ALL TRUNKS ENTERED IN RICHT ARE CONFIGURED IN LDAT (LROUTE:@@@@) TOO THIS CAN LEAD TO PROBLEMS FOR TRUNK B-CHANNEL SEARCH, THIS IS ESPECIALLY IMPORTANT FOR IP-TRUNKING TO WORK !!CORRECTLY.ALL TRUNKS CONFIGURED IN RICHT SHOULD BE ENTERED IN LDAT!!

## 132 LDB - Load Data Base from Hard Disk

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO LDB enables the operator to reload the database of a hardware module (SWU, ADS) from hard disk. This is done by setting the database inconsistency bit in the boot communications area (BCA) of the controller concerned. The operator can then initiate a parametric load sequence by means of a hard restart, or with the aid of the AMO REST (Restart of a Functional System Unit).

---

**NOTE:** If the SWU is operating in duplex mode a hard restart activates the standby processor. The database can only be completely reloaded by calling the AMO LDB twice.

---

### 132.1 Restrictions

This description is valid from SP300-V3.1

### 132.2 Interrelationships

- AMO REST : Restart Hardware Modules
- AMO REGEN : Regenerate Customer Data from Data Base

### 132.3 Functions of the AMO

- [EXECUTE-LDB](#) : Execute or prepare a database load sequence

**132.3.1 EXECUTE-LDB**

Reload the database of a hardware module. The AMO must be loaded into the appropriate hardware module (parameter UNIT). The parameter LOAD determines whether a hard restart is to be initiated after setting the database inconsistency bit.

Please remember that a load sequence initiated by means of this AMO will necessarily terminate the action abnormally, since the host computer concerned immediately executes a hard restart.

For this reason, the end message

```
AMO-LDB - . . .   LOAD DATABASE
EXECUTE COMPLETED;
```

is not output.

**Procedure Overview**

| Command Code | Parameter                      |
|--------------|--------------------------------|
| EXECUTE-LDB  | UNIT=<param>, [LOAD=<param>] ; |

**Examples**

- 1. Load the database of the A1

Input:

```
EXECUTE-LDB:UNIT=A1;
```

Output:

```
H01: A HARD RESTART HAS BEEN INITIATED FOR MODULE A1
```

- 2. Prepare the database of the A1 for the load sequence

Input:

```
EXECUTE-LDB:UNIT=A1,LOAD=N;
```

Output:

```
H02: THE DATABASE FOR THE MODULE A1 HAS BEEN SET TO INCON-
SISTENT.
      INITIATE THE HARD RESTART MANUALLY.
```

**132.4 Parameter Description**

LOAD                      Flag for initializing load sequence

Type of Input : Single value, optional

Possible Values : Y, N

Default Value : Y

UNIT

Module to be reloaded

Type of Input : Single value, mandatory

Possible Values : BP = base processor

BPS = base processor standby

A1 = A1

## **132.5 Error Messages and Advisories**

### **132.5.1 Error Messages**

None

### **132.5.2 Advisories**

H01: A HARD RESTART HAS BEEN INITIATED FOR MODULE @@@@

H02: THE DATABASE FOR THE MODULE @@@@ HAS BEEN SET TO INCONSISTENT.  
INITIATE THE HARD RESTART MANUALLY.

Error Messages and Advisories

## 133 LDPLN - Administration of the LCR Dialing Plan

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The AMO LDPLN (LCR dialing plan) administers the LCR dialing plan.

The LCR digit patterns (LDP) are sorted and stored in the database. A configured LCR route and an LCR authorization are assigned to each LDP for each DPLN group. An LDP can also be disabled for specific DPLN groups.

### 133.1 Interrelationships

- AMO DIMSU : Dimensioning of FLEXAMA memory
- AMO WABE : Administration of the digit analysis tables
- AMO COSSU : COS administration
- AMO RICHT : Route administration
- AMO LODR : Outdial rules
- AMO LDAT : LCR data

Generation sequence:

DIMSU --> WABE --> COSSU --> RICHT --> LODR --> LDAT --> LDPLN

### 133.2 Functions of the AMO

- [ADD-LDPLN](#) : Add LCR digit patterns
- [CHANGE-LDPLN](#) : Change LCR digit patterns
- [DELETE-LDPLN](#) : Delete LCR digit patterns
- [OPTIMIZE-LDPLN](#) : Optimize LCR dialing plan
- [DISPLAY-LDPLN](#) : Display LCR digit patterns
- [REGENERATE-LDPLN](#) : Regenerate LCR digit patterns

### 133.2.1 ADD-LDPLN

The ADD function is used to administer dialplans and to create a new LCR digit pattern.

AMO LDPLN administers up to 2048 dialplans in the 8 pools by using the dialplan number (1-2047). The dial plan number corresponds to the number of dialing plans in all pools(8\*256-1). A dialplan number can be separately configured to each dialplan within a pool . A service information can be added to each dialplan number. Dialplan 0 can not be administered.

DIPLNUM >0 is only valid for configurations in relationship with HG3550 and AMO-GKREG. The DIPLNUM can only be assigned by means of AMO-GKREG and is only relevant for 'Admission Request' configurations of Remote Gateways (DIPLNUM range from 1 to 2047).

For all other (tradional) configurations, DIPLNUM must be zero.

DIPLNUM = 0: Means standard configuration if only TDM connections are used. The enhancement by additional dial plan numbers , means DIPLNUM = 1 - 2047 is only needed for IPDA configurations, respectively for IP connections.

LCR digit patterns are defined with parameter LDP.

So that individual digit patterns do not have to be created for all possible combinations within a certain digit range, there are special #wildcards#, to represent the digit ranges:

X - for any digit between 0 and 9, A and D or \*

T - for timeout or # (=end-of-dial character)

Z - for any digit sequence followed by timeout or # (=end-of-dial character)

W - for send out dial tone

Y - is used to indicated the beginning of the Carrier Identification Code (CIC)

The digit sequence of any LCR digit pattern can be divided into up to 10 fields separated by '-'. These fields can be accessed directly by the the assigned outdial rule during outpulsing (see AMO LODR).

For example, 997-XXXX stands for all numbers from 997-0000 to 997-9999.

The first two field must contain a valid *routing code* (see AMO WABE). Wildcards can therefore not be used in the first field of the digit pattern. In the second field the wildcards will be truncated, and the checks will be done without the evaluation of them. Every LCR digit pattern can be

assigned to a specific DPLN group (parameter DPLN). Routing codes can have a maximum of 6 digits. The other digits can be divided into fields as required. The LCR digit pattern may not exceed 22 digits in length.

If no DPLN group is specified, the LCR digit pattern defined in parameter LDP is assumed to be valid for all DPLN groups.

A valid LDP structure contains either the values of the parameter LROUTE or the values of the parameter PROFIDX. If a value from type LROUTE or PROFIDX or GWNO was assigned to one LDPLN-entry then it's not possible (or only the deletion and reconfiguration) to change that from one type to other.

To integrate an LCR digit pattern into the CP-specific device search procedure, a valid LCR route (parameter LROUTE) or an LCR profile index (parameter PROFIDX) must be assigned to one digit pattern per DPLN group. See AMO RICHT, AMO LDAT (in case of parameter LROUTE), AMO LPROF (parameter PROFIDX) for further information. The number of LCR routes specified in parameter LROUTE must be the same as the number of DPLN groups specified in parameter DPLN. However, if only one LROUTE/PROFIDX/GWNO is specified, it is then valid for all specified DPLN groups.

If an LCR digit pattern for a DPLN group has not been assigned an LCR route, the pattern is not defined for the DPLN group

If an LCR digit pattern for a DPLN group has been assigned the *LCR route 0*, the pattern is explicitly disabled for the DPLN group

An LCR route is valid if it has been defined with AMO RICHT for LCR and if it has been assigned at least one *route element* with AMO LDAT.

All *LCR authorizations levels* (specified in parameter LAUTH) are assigned to each DPLN group of a digit pattern when specified in parameter DPLN. If parameter DPLN is not specified an LCR authorization level is assigned to the whole DPLN group. Therefore LCR digit patterns can be enabled or disabled for specific users within the same DPLN group. This pattern can be dialed successfully only by the users in the DPLN group who have this LCR authorization in their active *LCR class of service* (AMO COSSU, parameter LCOS).

To a DPLN group is possible to enter 1 to 16 LCR authorizations specified in parameter LAUTH. However, if only one LAUTH is specified, it is then valid for all specified DPLN groups.

A *serial pulse counter* can also be assigned to the LCR digit pattern (parameter SPC). The serial pulse counter specifies how many characters in a pulse are evaluated if the end of the LCRT digit pattern is open (wildcard Z). The default value of parameter SPC is the same as the maximum number of digits, i.e. 22.

## LDPLN - Administration of the LCR Dialing Plan

### Functions of the AMO

The position of the First Digit String and Sub Digit String in a LDPLN-entry can be set up with the SDSFIELD and FDSFIELD parameters.

SDS field index must be greater than FDS field index. Value 0 means, that no index has been specified.

The authorization for a call is based on the dialed number. Two types of dialing patterns exist, one, which can be used directly, and the other, which needs a special authorization before use. Via parameter PINDP this check request can be set.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-LDPLN    | LCRCONF=LCRADM, DIPLNUM=<number>, LWMPOOL=<number>, [DIALPLN=<number>, INFO=<string>];                                                                                                                                    |
| ADD-LDPLN    | LCRCONF=LCRPATT, DIPLNUM=<number>, LDP=<string>, [DPLN=<range>], { (max1) LROUTE=<number>, PROFIDX=<number>, GWNO=<number>} , LAUTH=<number>, [SPC=<number>] , [FDSFIELD=<number>], [SDSFIELD=<number>], [PINDP=<param>]; |

#### Example 1

The dialplan number 5 is needed to be allocated to the dialplan 30 in pool 3 and service info is inserted to label the dialplan number.

Input:

```
ADD-LDPLN:LCRADM,5,3,30,"LCRDIALPLANNO5";
```

#### Example 2

The dialplan number 40 is needed to be allocated in pool 3 (no dialplan is specified) and service info is inserted to label the dialplan number. In this case starting from first dialplan in pool 3, an empty dialplan will be sought till last dialplan(255) in the last pool(8)

Input:

```
ADD-LDPLN:LCRADM,40,3,, "LCRDIALPLANNO40";
```

#### Example 3

A digit pattern which is valid for the characters 990000 through 999999 in DPLN groups 1&&5 is created. The routing code 99 must have a digit analysis result in the DPLN tables which is valid for LCR, e.g. CO. When users dial this code, their LCR authorization is checked (in this case 1) and LCR route 888, which has been created with AMO RICHT and AMO LDAT, is used as the route.

Input:

```
ADD-LDPLN:LCRPATT,0,99-XXXX,1&&5,888,,,1,;
```

**Example 4**

A digit pattern is created for all DPLN groups. LROUTE=1 and LAUTH=2 for all DPLN groups. The digit pattern represents all directory numbers with a maximum of 6 digits (SPC=6), which begin with routing code 98.

Input:

```
ADD-LDPLN:LCRPATT,2,98-Z,,1,,2,6;
```

**133.2.2 CHANGE-LDPLN**

The Change function is used to change the service info of a dialplan number.

The CHANGE function is used to change the data assigned to an existing LCR digit pattern (LCR routes and LCR authorizations per DPLN group, serial pulse counter).

The LCR digit pattern itself can no longer be corrected, nor can the *subdivision into fields* within the digit pattern be corrected any longer. This can be done only by using DELETE and ADD.

The desired LCR digit pattern may either be addressed via parameter LDP or the LCR digit pattern number (parameter LDPNO). If addressing via LDP is used, the digit pattern must be exactly identical.

The assignment of LCR digit pattern number to LCR digit pattern itself is static. When a LCR digit pattern is added, it is assigned some number. This LCR digit pattern number (LDPNO) can be found with DISPLAY.

The LCR route assigned to a DPLN group can be modified, i.e. it can be overwritten with a new valid LCR route, or explicitly disabled for the DPLN group by specifying LCR route 0.

The mandatory LCR authorization of an LCR digit pattern assigned to a DPLN group can be modified (parameter LAUTH).

**Procedure Overview**

At least one of the parameters DPLN, LROUTE, LAUTH and SPC must be specified.

| Command Code | Parameter                                                                                      |
|--------------|------------------------------------------------------------------------------------------------|
| CHANGE-LDPLN | LCRCONF=LCRADM, DIPLNUM=<number>, INFO=<string>;                                               |
| CHANGE-LDPLN | LCRCONF=LCRPATT, DIPLNUM=<number>, { (min1) LDPNO=<number>, LDP=<text string>}, [DPLN=<range>] |

## LDPLN - Administration of the LCR Dialing Plan

### Functions of the AMO

| Command Code | Parameter                                                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | , { (min1) LROUTE=<range>PROFIDX=<number>GWNO<number>,<br>LAUTH=<range>,<br>, SPC=<number>, FDSFIELD=<number>, SDSFIELD=<number><br>, PINDP=<param>; |

#### Example 1

The service info the dialplan 40 is needed to be changed to "lcrservice40"

Input:

```
CHANGE-LDPLN:LCRADM,40,"LCRSERVICE40";
```

#### Example 2

In DPLN group 2, the LCR route of the first digit pattern is to be set to 889 and its corresponding LCR authorization to 4:

Input:

```
CHANGE-LDPLN:LCRPATT,2,1,,2,889,,,4;
```

### 133.2.3 DELETE-LDPLN

The DELETE function is used to remove assignment of dialplan number to dial plan in a pool. Dialing plan numbers only without dialing patterns can be deleted.

The DELETE function is used to delete one or more LCR digit patterns from the LCR dialing plan.

The LCR digit patterns to be deleted are identified either via LCR digit pattern (parameter LDP) or their assigned numbers, which can be found with DISPLAY (parameter LDPNO).

#### Procedure Overview

| Command Code | Parameter                                                                       |
|--------------|---------------------------------------------------------------------------------|
| DELETE-LDPLN | LCRCONF=LCRADM, DIPLNUM=<number>;                                               |
| DELETE-LDPLN | LCRCONF=LCRPATT, DIPLNUM=<number>,<br>{ (min1) LDPNO=<range>, LDP=<textstring>; |

### 133.2.4 OPTIMIZE-LDPLN

Using action OPTIMIZE the LCR dialing plan can be optimized to decrease the access/search times of Call Processing in the LCR dialing plan. If OPTIMIZE is called, an internal cache tree is created or refined.

Parameter LIMIT defines the linear search length for Call Processing (CP) within the LCR dialing plan to be achieved. The smaller the value of LIMIT the shorter is the CP access time.

The internal cache tree will be refined until this LIMIT is reached if there is no more cache tree memory available (AMO DIMSU, Parameter LDPLNC1 to LDPLNC8).

The internal cache tree memory can be released with OPTIMIZE-LDPLN : DIPLNUM=@@@@, ACTION=DELETE; .

After a generation of some LCR dialing patterns the optimize function should be called.

## Procedure overview

| Command Code   | Parameter                                                               |
|----------------|-------------------------------------------------------------------------|
| OPTIMIZE-LDPLN | DIPLNUM=<number>, ACTION=REBUILD, [LIMIT=<number>];<br>  ACTION=DELETE; |

## 133.2.5 DISPLAY-LDPLN

### Branch TYPE=LDP:

All LCR digit patterns can be displayed with their associated data (Dial Plan Number, LCR routes and LCR authorizations per DPLN group, serial pulse counter) (no parameters specified).

Specific LCR digit patterns can be displayed with their associated data (parameter DIPLNUM parameter LDPNO or parameter LDP).

All or specific LCR digit patterns can be displayed with their associated data for specific DPLN groups (parameters DIPLNUM, LDPNO and DPLN).

LCR digit patterns which have been assigned one of the following can also be displayed:

specific LCR routes (parameter LROUTE)

specific LCR authorizations (parameter LAUTH)

specific serial pulse counters (parameter SPC)

In these cases, the range of the LCR digit patterns to be searched can also be limited (parameters LDPNO and DPLN).

Branch TYPE=CD:

All LCR digit patterns are displayed which would be "accessed" when the in parameter CD specified access code is entered. The corresponding Dial Plan Number (DIPLNU) LCR digit pattern (LDP) and LCR digit pattern numbers (LDPNO) are displayed.

Branch TYPE=STAT:

The actual linear search length in the LCR dialing plan will be calculated and displayed.

Branch TYPE=LCRADM:

All Dial Plan Numbers(except for dial plan number 0) and their attributes (pool number (LWMPOOL, Dial Plan(DIALPLN) and info(INFO) ) can be displayed.

Procedure Overview

| Command Code  | Parameter                                                                                                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-LDPLN | TYPE=LDP, DIPLNUM=<number>, { (max1) LDPNO=<range>, LDP=<string><br>, { (max1) LROUTE=<range>, PROFIDX=<number>, GWN0=<number>},<br>[DPLN=<range>]<br>, [LAUTH=<range>], [SPC=<range>];<br>  TYPE=CD, [CD=<keynum>];<br>  TYPE=STAT;<br>  TYPE=LCRADM, DIPLNUM=<number>; |

Example 1

All digit patterns which use an LROUTE between 800 and 900 in DPLN groups 2 through 4 are to be displayed:

Input:

DISPLAY-LDPLN:TYPE=LDP,DPLN=2&&4,LROUTE=800&&900;

Output:

|                                                   |          |   |  |                                                   |         |        |  |   |
|---------------------------------------------------|----------|---|--|---------------------------------------------------|---------|--------|--|---|
| +-----+-----+-----+-----+-----+-----+-----+-----+ |          |   |  |                                                   |         |        |  |   |
|                                                   | DIPLNUM: | 0 |  |                                                   |         |        |  |   |
|                                                   | LDPNO :  | 1 |  | LDP :                                             | 99-XXXX |        |  |   |
|                                                   |          |   |  | SPC :                                             | 22      |        |  |   |
| +-----+-----+-----+-----+-----+-----+-----+-----+ |          |   |  |                                                   |         |        |  |   |
|                                                   |          |   |  | DPLN                                              |         | LROUTE |  |   |
|                                                   |          |   |  | +-----+-----+-----+-----+-----+-----+-----+-----+ |         |        |  |   |
|                                                   |          |   |  | 2                                                 |         | 889    |  | 4 |
|                                                   |          |   |  | 3                                                 |         | 888    |  | 1 |
| +-----+-----+-----+-----+-----+-----+-----+-----+ |          |   |  |                                                   |         |        |  |   |

**LDPLN - Administration of the LCR Dialing Plan**

Functions of the AMO

| DPLN | PROFIDX | LAUTH |
|------|---------|-------|
| 0    | 1       | 1     |
| 1    | 1       | 1     |

| 51   | 1       | 1     |
| 52   | 1       | 1     |
| 53   | 1       | 1     |
| 54   | 1       | 1     |
| 55   | 1       | 1     |
| 56   | 1       | 1     |
| 57   | 1       | 1     |
| 58   | 1       | 1     |
| 59   | 1       | 1     |
| 60   | 1       | 1     |

|                                                         |    |  |  |   |  |   |  |  |
|---------------------------------------------------------|----|--|--|---|--|---|--|--|
|                                                         | 61 |  |  | 1 |  | 1 |  |  |
|                                                         | 62 |  |  | 1 |  | 1 |  |  |
|                                                         | 63 |  |  | 1 |  | 1 |  |  |
| +-----+-----+-----+-----+-----+-----+-----+-----+-----+ |    |  |  |   |  |   |  |  |

### 133.2.6 REGENERATE-LDPLN

All dialplan numbers(except for 0) can be generated with their associated data (LWMPool , Dialplan, Service Info).

All LCR digit patterns can be regenerated with their associated data (LCR routes and LCR authorizations per DPLN group, serial pulse counter) (without specifying a parameter).

However, it is also possible to regenerate specific LCR digit patterns with their associated data (parameter LDPNO, parameter LDP).

#### Procedure Overview

| Command Code     | Parameter                                                   |
|------------------|-------------------------------------------------------------|
| REGENERATE-LDPLN | DIPLNUM=<number>, { (max1) LDPNO=<range>, LDP=<textstring>; |

#### Example1:

All dialplan numbers with their attributes are to be generated:

Input:

```
REGENERATE-LDPLN:1&&2047;
```

Output:

```
ADD-LDPLN:LCRADM,1,1,1;
ADD-LDPLN:LCRADM,2,1,2;
ADD-LDPLN:LCRADM,5,3,40,"LCRSERV5";
ADD-LDPLN:LCRADM,50,8,200,"LCRSERV50";
ADD-LDPLN:LCRADM,2000,6,200,"LCRSERV2000";
```

#### Example2:

The first five digit patterns are to be regenerated:

Input:

```
REGENERATE-LDPLN:,1&5;
```

Output:

```
ADD-LDPLN:LCRPATT,0,98-Z,,1,,2,6;
ADD-LDPLN:LCRPATT,3,99-XXXX,1&2&3&4&5,888,,1,;
```

Due to syntactical correctness a LAUTH value 1 will be regeneratet for disabled routes (LRTG=0).

#### Example 3:

LDPLN - Administration of the LCR Dialing Plan

Parameter Description

Additional CHANGE-LDPLN commands are generated.

Input:

REG-LDPLN:LDP="\*\*05"-12";

Output:

ADD-LDPLN:LCRPATT,0,\*\*05-12,  
0&1&2&3&4&5&6&7&8&9&10&11&12&13&14&15,

**133.4 Error Messages and Advisories**

**133.4.1 Error Messages**

- F01: DPLN <DPLN> IS ENTERED MORE THAN ONCE  
Cause:  
Parameter value for parameter DPLN entered twice.  
Action:  
Check parameter DPLN.
- F02: NUMBER OF VALUES FOR DPLN AND <PARAM> DIFFERENT  
<PARAM> cannot have the values LROUTE and LAUTH.  
Cause:  
A number of PARAM>=LROUTE or LAUTH values which was neither 1 nor the number of specified DPLN groups was specified.  
Action:  
Check the number of values for DPLN, LROUTE and LAUTH.
- F03: IF PARAMETER LROUTE OR LAUTH ENTERED, PARAMETER DPLN IS REQUIRED
- F04: IF PARAMETER DPLN IS NOT ENTERED PARAMETER <PARAM> MAY ONLY GET ONE VALUE.  
<PARAM> can have the values LROUTE and LAUTH.  
Cause:  
Parameter DPLN was not specified, because an addition was to be made for all DPLN groups, or it was forgotten. In any case, more than one value was specified for LROUTE or LAUTH.  
Action:  
Check number of values of DPLN, LROUTE and LAUTH.

F05: THE FIRST FIELD OF A LDP MAY NOT CONTAIN A WILDCARD (X,T,Z) AND MORE THAN 6 DIGITS

Cause:

The first field of an LDP is the routing code of this LCR digit pattern.

Action:

It may therefore contain only digits 0-9 and \*.

F06: THE LEADING DIGITS OF LDP ARE NOT DEFINED AS ROUTING CODE.

[FOR DPLN <DPLN1>[,<DPLN2>[...]]]

[WITH CPS <CPS1>[,<CPS2>[...]]].

Cause:

The first field of the current LCR digit pattern does not find a digit analysis result in the digit analysis tables administered by AMO WABE (in any DPLN and CPS values displayed).

Action:

Before an addition can be made to the LCR dialing plan, a digit analysis result relevant for LCR must be created for the routing code in the digit analysis tables, using AMO WABE.

F07: THE LEADING DIGITS OF LDP LEAD

TO NONE OF THE DIGIT ANALYSIS RESULTS RELEVANT FOR LCR

[FOR DPLN <DPLN1>[,<DPLN2>[...]]]

[WITH CPS <CPS1>[,<CPS2>[...]]].

(AMO-WABE, DAR)

Cause:

The first field of the current LCR digit pattern finds digit analysis results in the digit analysis tables, but they are not relevant for LCR.

Action:

If this routing number is to be assigned to LCR, the 'incorrect' digit analysis results must be changed into digit analysis results relevant for LCR, using AMO-DPLN (as specified in the error message).

F08: THE DIAL PATTERN LDP MAY NOT BE LONGER THAN 22 CHARACTERS

F09: THE LEADING DIGITS OF LDP ARE

ALREADY USED BY AMO RICHT AS ROUTING CODE

[FOR DPLN <DPLN1>[,<DPLN2>[...]]]

[WITH CPS <CPS1>[,<CPS2>[...]]].

Cause:

The first field of the current LCR digit pattern shows digit analysis results in the digit analysis tables, but they have already been used by AMO RICHT.

Action:

Specify another routing code or stop use by AMO RICHT.

F10: A CORRESPONDING VALUE FOR PARAMETER LAUTH MUST BE ENTERED BECAUSE THE LDP WAS RESTRICTED OR NOT YET EXISTING IN DPLN <DPLN>.

Cause:

The digit pattern LDPNO was restricted or does not yet exist for the specified DPLN. No LAUTH has therefore been assigned to the LROUTE. An LAUTH must be specified.

Action:

Specify the LAUTH assigned to the LROUTE.

F11: LDPNO <LDPNO> NOT YET EXISTING.

Cause:

The value of parameter LDPNO is outside the range created.

## LDPLN - Administration of the LCR Dialing Plan

### Error Messages and Advisories

Action:

Give LDPNO the relevant value; it can be found with DISPLAY for the valid range or all LDPs.

F12: LDP EXISTS ALREADY WITH LDPNO <LDPNO>.

Cause:

A same digit pattern has already been created with the LDPNO specified. Note: two digit patterns are the same if the shorter of the two has the same digit pattern as the longer over its entire length (e.g. 91-XX is the same as 91-XX-Z).

Action:

Correct LDP; there may be errors in the digit pattern design.

F13: LDP CANNOT BE INSERTED - THERE IS NO FREE FICTIVE LINE.

F14: LDP CANNOT BE ADDED - THERE IS NO FREE <PARAM>-MEMORY (AMO-DIMSU, PARAMETER <PARAM><PARAM>)

Occurs with: ADD, CHANGE

Cause:

There is no free FLEXAMA memory of the specified type <PARAM><PARAM>.

Action:

AMO DIMSU can be used to change the distribution of the FLEXAMA memory. Memory of the type specified in the error message must be made available.

F15: LDP CANNOT BE ADDED/CHANGED - THERE IS NO MORE LDP-MEMORY (AMO-DIMSU, PARAMETER LDP)

F16: THE LAST CHARACTER OF LDP MAY NOT BE W.

F17: LROUTE <LROUTE> IS NOT DEFINED (AMO-RICHT).

Cause:

The LCR route specified in parameter LROUTE has not yet been created with AMO RICHT.

Action:

Correct parameter LROUTE or create with AMO RICHT before trying again.

F18: LROUTE <LROUTE> IS NOT DEFINED FOR LCR.

Cause:

The route specified in parameter LROUTE has been created with AMO RICHT, but has not been defined for LCR.

Action:

Correct parameter LROUTE or change the route with AMO RICHT.

F19: LROUTE <LROUTE> IS ILLEGAL: NO ROUTE ELEMENTS DEFINED (AMO LDAT)

Cause:

No route element has been defined with AMO LDAT for the LCR route specified in parameter LROUTE.

Action:

Correct parameter LROUTE or use LDAT to create route elements for the LCR route.

F20: SPC <<SPC> ILLEGAL: LESS THAN LENGTH OF LDP

Cause:

An SPC value which is less than the length of the LDP was specified. The wildcards T and Z are not counted as being part of the length of a dial pattern.

Action:

Correct SPC value.

- F21: ILLEGAL CHARACTER IN DIALING PATTERN LDP:  
LDP MAY ONLY CONTAIN THE CHARACTERS 0 TO 9, A TO D, \*, #  
AND THE WILDCARDS X,T,Z.  
Cause:  
Illegal character in digit pattern.  
Action:  
Correct digit pattern.
- F22: THERE IS NO LDP.
- F23: CHANGE OF LAUTH IN DPLN <DPLN> NOT POSSIBLE, BECAUSE THE LDP IS RESTRICTED OR NOT YET EXISTING IN THIS DPLN.  
Cause:  
Only a LAUTH to which a valid LROUTE has been assigned can be changed.  
Action:  
Specify valid LROUTE.
- F24: W MAY ONLY BE IN A FIELD ALONE.
- F25: EITHER PARAMETER LDP OR PARAMETER LDPNO MAY BE ENTERED
- F26: THE SPECIFIED DIALING PATTERN WAS NOT FOUND.
- F27: THERE IS NO MORE LCR DIALPLAN CACHE MEMORY AVAILABLE.  
PLEASE TRY TO INCREASE THIS MEMORY USING AMO DIMSU, PARAMETER LDPLNC@  
OR TRY REORGANIZE THE CACHE BY MEANS OF DELETE AND REBUILD.
- F28: Either LROUTE or PROFIDX or GWNO MAY BE ENTERED. BOTH TOGETHER ARE NOT ALLOWED.
- F29: PROFIDX @@@@ IS NOT DEFINED (AMO-LPROF).
- F30: THE PARAMETER PPPPPP HAS BEEN ASSIGNED TO THE ENTERED LDPNO/LDP.  
Help: DISP-LDPLN:TYPE=LDP,DIPLNUM=@@@@,{(max 1) LDPNO=, LDP=},PPPPPP=<value>;
- F31: THE MARKER Y MAY NOT BE IN A FIELD ALONE.
- F32: THE MARKER Y MUST BE THE FIRST CHARACTER IN A FIELD.
- F33: THE MARKER Y CAN APPEAR ONLY ONCE IN AN LDP.
- F34: THE DIPLNUM @@@@ DOES NOT EXIST.
- F35: DIPLNUM @@@@ CAN NOT BE DELETED , BECAUSE IT IS STILL ASSIGNED TO AT LEAST ONE LCR DIAL PATTERN
- F36: NO VALID DIALING PATTERN FOR DIPLNUM @@@@ AVAILABLE
- F37: DIPLNUM @@@@ IS RESERVED FOR @@@ NUMBERING PLAN. NO LCR PATTERN MAY BE ADDED FOR DIPLNUM @@@@.
- F38: DIPLNUM @@@@ IS RESERVED FOR @@@ NUMBERING PLAN. CONFIGURE IT WITH: ADD-LDPLN:LCRADM,@@@@,8,@@@@,'@@@ NUMBERING PLAN';
- F39: DIPLNUM @@@@ IS ALREADY ASSIGNED
- F40: ENTRY COULD NOT BE DELETED COMPLETELY SUCCESFUL. IT MAY CAUSE INCONSISTANCY IN DATABASE.
- F41: The entered parameter @@@@@@@@@@ contains more values than allowed.

## 133.4.2 Advisories

- H01: THE LEADING DIGITS OF LDP ARE NOT DEFINED  
[FOR DPLN <DPLN1>[,<DPLN2>[...]]]  
[WITH CPS <CPS1>[,<CPS2>[...]]].  
Cause:  
The first field of the current LCR digit pattern does not find a digit analysis result in the digit analysis tables administered by AMO WABE (in any DPLN and CPS values displayed).
- H02: PARAMETER LAUTH IN DPLN <DPLN> WILL BE IGNORED BECAUSE THE LDP WILL BE RESTRICTED FOR THIS DPLN (LROUTE=0)  
Cause:  
An LROUTE is to be restricted. An LAUTH was assigned to this LROUTE, but will be ignored.
- H03: THE LEADING ROUTING DIGITS OF LDP LEAD  
TO NONE OF THE DIGIT ANALYSIS RESULTS RELEVANT FOR LCR  
[FOR DPLN <DPLN1>[,<DPLN2>[...]]]  
[WITH CPS <CPS1>[,<CPS2>[...]]].  
(AMO-WABE, DAR)  
Cause:  
The first field of the current digit pattern finds digit analysis results in the digit analysis tables, but they are not relevant for LCR.
- H04: NO MATCHING LCR DIALING PATTERN FOUND.
- H05: THE LEADING DIGITS OF LDP ARE ALREADY USED BY AMO RICHT AS ROUTING CODE FOR SERVICE=VOICE  
[FOR DPLN <DPLN1>[,<DPLN2>[...]]]  
[WITH CPS <CPS1>[,<CPS2>[...]]].  
Cause:  
The first field of the current digit pattern shows digit analysis results in the digit analysis tables, but they have already been used by AMO RICHT.
- H07: LDP HAS BEEN ADDED  
[FOR DPLN <DPLN1>[,<DPLN2>[...]]]  
[WITH CPS <CPS1>[,<CPS2>[...]]].
- H08: FOR CHANGE OF THE SPC THE PARAMETER DPLN IS NOT NECESSARY AND WILL BE IGNORED  
Cause:  
Parameters DPLN and SPC were specified. DPLN will be ignored because parameter SPC is independent of the digit analysis group number.
- H09: LDPNO <LDPNO> HAS BEEN CHANGED  
[FOR DPLN <DPLN1>[,<DPLN2>[...]]]  
[WITH CPS <CPS1>[,<CPS2>[...]]].
- H10: THERE IS NO LDP.
- H11: LDPNOS <LDPNOMIN>[ THROUGH <LDPNOMAX>] DO NOT EXIST.  
Cause:  
The value of parameter LDPNO is outside the range created.

H12: LDPNO <LDPNO> HAS BEEN DELETED.

H13: THE ACTUAL MAXIMAL LINEAR SEARCH LENGTH IS <LEN>.

H14: THE LCR DIALPLAN CACHE HAS BEEN DELETED.

H15: DIPLNUM @@@@ IS ALREADY ASSIGNED.

H16: DIALPLAN IS ALREADY USED

H17: STARTING FROM LWMPOOL @ AND DIALPLAN @@@,NO EMPTY DIAL PLAN IS FOUND FOR DIPLNUM @@@@.START SEARCHING FROM LWMPOOL 1 AND DIALPLAN 1.

H18: DIPLNUM @@@@ IS NOT ASSIGNED

H19: THE DIALING PLAN NUMBER @@@@ WAS ALLOCATED TO DIALING PLAN @@@ IN LCR-POOL @ .

H20: DIPLNUM @@@@ IS ALLOCATED TO @@@ NUMBERING PLAN.

## **LDPLN - Administration of the LCR Dialing Plan**

### Error Messages and Advisories

## 134 LDSRT - Administration of LCR Digit String Restriction Tables

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

By means of AMO LDSRT it is possible to block calls to certain dial numbers. The LCR restriction tables are assigned to LCR route elements by the help of AMO LDAT. When an LDSR table is assigned to an LCR route element all dial numbers included in LDSR table are not allowed for that route element.

More than one LDSR tables can be assigned to one route element. There are 16 LDSR tables and up to 5120 dial numbers, which constitute from two parts, can be stored. The first part is called First Digit String (FDS) with 1-5 digits while the second part is called Second Digit String (SDS) with 1-8 digits. The limit of the amount of SDSs is administrated by AMO DIMSU.

All dial numbers with the FDS are combined to a dial number group and stored in a LDSRT. In one LDSRT it is possible to store 16 FDS groups. AMO LDSRT handles one FDS and 20 SDS input values at once. The SDS values will be split into packages of up to 20 if they are more than 20 for one FDS.

It is possible to enter SDS ranges in the user interface, however, SDS numbers will be stored in the database as single values. In order to decrease the memory requirements the ranges will be stored as compressed values. For example, the user has entered 089 for FDS and 6000&7110 for SDS. The range of SDS will be compressed and the resulted numbers will be stored in the database as follows:

| Split Values: |                                                                       |
|---------------|-----------------------------------------------------------------------|
| FDS           | SDS Sub Range/Single Value                                            |
| 089           | 6000-6999 => 6<br>7000-7099 => 70<br>7100-7109 => 710<br>7110 => 7110 |

### 134.1 Interrelationships

- AMO DIMSU: Administration of data layout.

The memory is allocated by means of this AMO. To increase memory enter

```
ADD-DIMSU:LCRDSR=<memory size>.
```

- AMO LDAT: Administration of LCR routes

LDSR tables are used by AMO LDAT to restrict dial numbers for routes.

134.2 Functions of the AMO

- ADD-LDSRT : Add FDS and SDS numbers to the tables.
- DELETE-LDSRT : Delete tables or table entries.
- DISPLAY-LDSRT : Display LDSR tables.
- REGEN-LDSRT : Regenerate ADD commands.

134.2.1 ADD-LDSRT

The following cases are valid:

1. Adding one FDS to one LDSRT.  
Adding one FDS means that all dial numbers beginning with this FDS and ending with any possible SDS number are restricted. It is not possible to reduce this dial number area by adding an SDS number. If this is required, first the FDS must be deleted and then the SDS must be added.
2. Adding one or more SDSs to one FDS of one LDSRT.  
Adding one or more SDS depends on whether the corresponding FDS exists or not. If it exists, the list of existing SDSs will be expanded by the new SDSs. If the FDS does not exist, the FDS will be created and the SDSs will be added. The SDSs are added in blocks of 20 elements.

Procedure Overview

| Command Code | Parameter                                    |
|--------------|----------------------------------------------|
| ADD-LDSRT    | LDSRT=<number>,FDS=<number>, [SDS=<number>]; |

Examples

At the beginning there is no memory allocated for the LDSRT.

### Input:

```
ADD-LDSRT:LDSRT=1,FDS=089,SDS=6000&&7110;
```

### Output:

```
ADD-LDSRT:LDSRT=1,FDS=089,SDS=6000&&7110;
H500: AMO LDSRT STARTED
F01: FDS AND/OR SDS NUMBERS COULD NOT BE ADDED BECAUSE THERE IS
NO ENOUGH MEMORY
      INCREASE MEMORY VIA ADD-DIMSU:LCRDSR=<?>;
AMO-LDSRT-26          LCR DIGIT STRING RESTRICTION TABLE
ADD NOT COMPLETED;>
```

We have to increment memory by means of AMO DIMSU:

### Input:

```
ADD-DIMSU:LCRDSR=100;
```

### Output:

```
ADD-DIMSU:LCRDSR=100;
H500: AMO DIMSU STARTED
H00: +-----+
      | LCRDSR.ACTUAL   : 100      |
      |               .PREVIOUS: 0      |
      +-----+
AMO-DIMSU-26          DIMENSIONING OF FEATURES, SWITCHING UNIT
ADD COMPLETED;
<
```

Now it is possible to add.

#### 1. Case 1

```
ADD-LDSRT:2,18678;
```

### Input:

```
DISPLAY-LDSRT:2;
```

### Output:

```
+-----+
|                                             |
| LCR DIGIT STRING RESTRICTION TABLE (LDSRT) : 2      |
|                                             |
+-----+-----+
| FDS |                               SDS |
+-----+-----+
| 18678 | ALL |
+-----+-----+
```

#### 2. Case 2

##### Example 1

### Input:

```
ADD-LDSRT:LDSRT=1,FDS=089,SDS=6000&&7110;
```

### Input:

DISPLAY-LDSRT;

Output:

|                                                |     |    |     |      |  |
|------------------------------------------------|-----|----|-----|------|--|
| LCR DIGIT STRING RESTRICTION TABLE (LDSRT) : 1 |     |    |     |      |  |
| FDS                                            | SDS |    |     |      |  |
| 089                                            | 6   | 70 | 710 | 7110 |  |

Example 2

Input:

ADD-LDSRT:1,200,6985&&7205;

Input:

DISP-LDSRT;

Output:

|                                                |      |      |      |      |      |
|------------------------------------------------|------|------|------|------|------|
| LCR DIGIT STRING RESTRICTION TABLE (LDSRT) : 1 |      |      |      |      |      |
| FDS                                            | SDS  |      |      |      |      |
| 089                                            | 6    | 70   | 710  | 7110 |      |
| 200                                            | 6985 | 6986 | 6987 | 6988 | 6989 |
|                                                | 699  | 70   | 71   | 7200 | 7201 |
|                                                | 7202 | 7203 | 7204 | 7205 |      |

134.2.2 DELETE-LDSRT

The following cases are valid:

- 1. Deleting all data. All LDSR tables will be cleared.
- 2. Deleting one or several LDSRTs. One or more LDSR tables can be cleared. That is, all FDS and SDS entered in specified LDSRT(s) will be deleted inclusively. If the LDSRT to be deleted is used by a route element, an advisory message (delete this table also from the route element) will be displayed.

3. Deleting one FDS and all corresponding SDSs of an LDSRT. The FDS entry and the corresponding SDSs will be deleted from the specified LDSRT. In order to delete the FDS, LDSRT must be entered before FDS.
4. Deleting one or more SDSs of an FDS of an LDSRT. The specified SDSs of FDS will be deleted from the LDSRT. If the last SDS of the FDS is deleted from the table, the FDS will also be deleted. To delete SDS numbers, LDSRT and FDS must be entered before SDS.

## Procedure Overview

| Command Code | Parameter                                         |
|--------------|---------------------------------------------------|
| DELETE-LDSRT | [LDSRT=<number>], [FDS=<number>], [SDS=<number>]; |

### Example

#### 1. Case1

Input:

```
DELETE-LDSRT;
```

Output:

```
DELETE-LDSRT;
H500: AMO LDSRT STARTED
H01: LDSRT 1 WAS DELETED
H01: LDSRT 2 WAS DELETED
H05: NO ENTRY WAS FOUND IN LDSRT 3
H05: NO ENTRY WAS FOUND IN LDSRT 4
H05: NO ENTRY WAS FOUND IN LDSRT 5
H05: NO ENTRY WAS FOUND IN LDSRT 6
H05: NO ENTRY WAS FOUND IN LDSRT 7
H05: NO ENTRY WAS FOUND IN LDSRT 8
H05: NO ENTRY WAS FOUND IN LDSRT 9
H05: NO ENTRY WAS FOUND IN LDSRT 10
H05: NO ENTRY WAS FOUND IN LDSRT 11
H05: NO ENTRY WAS FOUND IN LDSRT 12
H05: NO ENTRY WAS FOUND IN LDSRT 13
H05: NO ENTRY WAS FOUND IN LDSRT 14
H05: NO ENTRY WAS FOUND IN LDSRT 15
H05: NO ENTRY WAS FOUND IN LDSRT 16
AMO-LDSRT-199      LCR DIGIT STRING RESTRICTION TABLE
DELETE COMPLETED;
>
```

#### 2. Case 2

Input:

```
DEL-LDSRT:1&&2;
```

Output:

```
DEL-LDSRT:1&&2;
H500: AMO LDSRT STARTED
H01: LDSRT 1 WAS DELETED
H01: LDSRT 2 WAS DELETED
```

LDSRT - Administration of LCR Digit String Restriction Tables

Functions of the AMO

```
AMO-LDSRT-143      LCR DIGIT STRING RESTRICTION TABLE
DELETE COMPLETED;
<
```

3. Case 3

The content of LDSR Table 1 before Delete is executed:

Input:

```
DISPLAY-LDSRT:1;
```

Output:

|                     |                                                |         |
|---------------------|------------------------------------------------|---------|
| +-----+-----+-----+ |                                                |         |
|                     | LCR DIGIT STRING RESTRICTION TABLE (LDSRT) : 1 |         |
|                     |                                                |         |
| +-----+-----+-----+ |                                                |         |
|                     | FDS                                            | SDS     |
| +-----+-----+-----+ |                                                |         |
|                     | 068                                            | 32      |
| +-----+-----+-----+ |                                                |         |
|                     | 312                                            | 4595690 |
| +-----+-----+-----+ |                                                |         |

Input:

```
DEL-LDSRT:1,068;
```

Output:

```
DEL-LDSRT:1,068;
H500:  AMO LDSRT STARTED
H04:  FDS 068 FROM LDSRT 1 WAS DELETED
AMO-LDSRT-143      LCR DIGIT STRING RESTRICTION TABLE
DELETE COMPLETED;
<
```

Control with DISPLAY:

Input:

```
DISP-LDSRT:1;
```

Output:

|                     |                                                |         |
|---------------------|------------------------------------------------|---------|
| +-----+-----+-----+ |                                                |         |
|                     | LCR DIGIT STRING RESTRICTION TABLE (LDSRT) : 1 |         |
|                     |                                                |         |
| +-----+-----+-----+ |                                                |         |
|                     | FDS                                            | SDS     |
| +-----+-----+-----+ |                                                |         |
|                     | 312                                            | 4595690 |
| +-----+-----+-----+ |                                                |         |

4. Case 4

The content of LDSR Table 6 before Delete is executed:

## LDSRT - Administration of LCR Digit String Restriction Tables

Functions of the AMO

Input:

DISPLAY-LDSRT:6;

Output:

|                                                |  |     |    |    |    |    |
|------------------------------------------------|--|-----|----|----|----|----|
| +-----+                                        |  |     |    |    |    |    |
|                                                |  |     |    |    |    |    |
| LCR DIGIT STRING RESTRICTION TABLE (LDSRT) : 6 |  |     |    |    |    |    |
|                                                |  |     |    |    |    |    |
| +-----+                                        |  |     |    |    |    |    |
| FDS                                            |  | SDS |    |    |    |    |
| +-----+                                        |  |     |    |    |    |    |
| 300                                            |  | 21  | 22 | 23 | 24 | 25 |
| +-----+                                        |  |     |    |    |    |    |
|                                                |  | 26  | 27 | 28 | 29 | 30 |
| +-----+                                        |  |     |    |    |    |    |
|                                                |  | 31  | 32 | 33 | 34 | 35 |
| +-----+                                        |  |     |    |    |    |    |
|                                                |  | 36  | 37 | 38 | 39 | 40 |
| +-----+                                        |  |     |    |    |    |    |

134.2.3 DISPLAY-LDSRT

The following cases are valid:

- 1. Displaying all data. All LDSR tables (1-16) are displayed.
- 2. Displaying all SDSs of all FDSs of one or more LDSRTs. A single value or a range for LDSRT is entered and these LDSRTs are displayed.
- 3. Displaying all SDSs of one or more FDSs of one LDSRT. An LDSRT and a single value or a range for FDS is entered and the SDSs of specified FDS and LDSRT are displayed. In order to display the FDS and associated SDSs, LDSRT must be entered before FDS.
- 4. Displaying one or more SDSs of one FDS of one LDSRT. An LDSRT, an FDS and a single value or range for SDS are entered. The specified SDSs are displayed for the FDS and LDSRT entered. To display SDS numbers, LDSRT and FDS must be entered before SDS.

If all SDSs are restricted for an FDS then ALL will appear instead of SDS values.

Procedure Overview

| Command Code | Parameter                                           |
|--------------|-----------------------------------------------------|
| DISPLAY-LDAT | [LDSRT=<number>] , [FDS=<number>] , [SDS=<number>]; |

Examples:

- 1. Case 1

Input:

DISPLAY-LDSRT;

Output:

| +-----+-----+-----+-----+-----+-----+-----+ |                                                |  |  |  |  |  |

LDSRT - Administration of LCR Digit String Restriction Tables

Functions of the AMO

| FDS | SDS |    |    |    |    |  |
|-----|-----|----|----|----|----|--|
| 300 | 21  | 22 | 23 | 24 | 25 |  |
|     | 26  | 27 | 28 | 29 | 30 |  |
|     | 31  | 32 | 33 | 34 | 35 |  |
|     | 36  | 37 | 38 | 39 | 40 |  |
| 300 | 41  | 42 | 43 | 44 | 45 |  |
|     | 46  | 47 | 48 | 49 |    |  |

H05: NO ENTRY WAS FOUND IN LDSRT 7

3. Case 3

Input:

DISPLAY-LDSRT:1,312;

Output:

| FDS | SDS     |  |  |  |  |  |
|-----|---------|--|--|--|--|--|
| 312 | 4595690 |  |  |  |  |  |

4. Case 4

Input:

DISPLAY-LDSRT:6,2,23&&34;

Output:

| FDS | SDS |    |    |    |    |  |
|-----|-----|----|----|----|----|--|
| 6   | 23  | 24 | 25 | 26 | 27 |  |
|     | 28  | 29 | 30 | 31 | 32 |  |
|     | 33  | 34 |    |    |    |  |

134.2.4 REGEN-LDSRT

The following cases are valid:

1. Regenerating all data.ADD commands for all LDSR tables (1-16) are regenerated.
2. Regenerating all SDSs of all FDSs of one or more LDSRTs. A single value or a range for LDSRT is entered and add commands for these LDSRTs are regenerated.
3. Regenerating all SDSs of one or more FDSs of one LDSRT. An LDSRT and a single value or a range for FDS is entered and the add commands of specified FDS and LDSRT are regenerated. In order to regenerate the FDS and associated SDSs, LDSRT must be entered before FDS.
4. Regenerating one or more SDSs of one FDS of one LDSRT. An LDSRT, an FDS and a single value or range for SDS are entered. Add commands for the specified SDSs are regenerated. To regenerate SDS numbers, LDSRT and FDS must be entered before SDS.

### Procedure Overview

| Command Code    | Parameter                                         |
|-----------------|---------------------------------------------------|
| REGENERATE-LDAT | [LDSRT=<number>], [FDS=<number>], [SDS=<number>]; |

### Examples

#### 1. Case 1

Input:

REGEN-LDSRT;

Output:

ADD-LDSRT:1,068,6&70&710&7110;

ADD-LDSRT:1,312,4595690;

ADD-LDSRT:2,18678,;

ADD-

LDSRT:6,300,21&22&23&24&25&26&27&28&29&30&31&32&33&34&35&36&37&38&39&40;

ADD-LDSRT:6,300,41&42&43&44&45&46&47&48&49;

#### 2. Case 2

Input:

REGEN-LDSRT:1&&4;

Output:

ADD-LDSRT:1,068,6&70&710&7110;

ADD-LDSRT:1,312,4595690;

ADD-LDSRT:2,18678,;

#### 3. Case 3

**LDSRT - Administration of LCR Digit String Restriction Tables**

Parameter Description

Input:

REGEN-LDSRT:1,068&312;

Output:

ADD-LDSRT:1,068,6&70&710&7110;

ADD-LDSRT:1,312,4595690;

4. Case 4

Input:

REGEN-LDSRT:6,300,26&&39;

Output:

ADD-LDSRT:6,300,26&27&28&29&30&31&32&33&34&35&36&37&38&39;

**134.3 Parameter Description**

|                 |                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| FDS             | First Digit String number                                                                                                                               |
| Type of Input   | : 1 to 16 single values, concatenated with & or &&, optional (DISPLAY / REGENERATE)<br>single value, mandatory (ADD)<br>single value, optional (DELETE) |
| Possible Values | : 0 - 9, up to 5 characters                                                                                                                             |
| LDSRT           | Number of LCR Digit String Restriction Table                                                                                                            |
| Type of Input   | : 1 to 16 single values, concatenated with & or &&, optional (DELETE / DISPLAY / REGENERATE)<br>single value, mandatory (ADD)                           |
| Possible Values | : numeric, 1-16                                                                                                                                         |
| SDS             | Sub Digit String number                                                                                                                                 |
| Type of Input   | : 1 to 20 single values, concatenated with & or &&, optional                                                                                            |
| Possible Values | : 0 - 9, up to 8 characters                                                                                                                             |

## 134.4 Error Messages and Advisories

### 134.4.1 Error Messages

F01: FDS AND/OR SDS NUMBERS COULD NOT BE ADDED BECAUSE THERE IS NO ENOUGH MEMORY INCREASE MEMORY VIA ADD-DIMSU:LCRDSR=<?>;.

F02: THE FOLLOWING SDS NUMBERS FOR FDS ^fds^ WERE NOT ADDED TO LDSRT <XX> BECAUSE IT ALREADY EXISTS, OR AN SDS EXISTS THAT COVERS IT, OR AN SDS EXISTS WHICH IS PART OF IT.

F03: THE FDS <XXXXX> WAS NOT FOUND IN LDSRT <XX>

F04: THE FOLLOWING SDS NUMBERS FOR FDS <XXXXX> WERE NOT DELETED FROM LDSRT <XX> BECAUSE IT DOES NOT EXIST, OR AN SDS EXISTS THAT COVERS IT, OR AN SDS EXISTS WHICH IS PART OF IT.

F05: YOU HAVE NOT ENTERED A PROPER VALUE FOR FDS AND/OR SDS,OR THE VALUE RANGE WAS NOT GIVEN IN ASCENDING ORDER. FDS MUST BE IN RANGE [0,99999], MAXIMUM 5 DIGITS AND SDS MUST BE IN RANGE [0,99999999], MAXIMUM 8 DIGITS.

F06: YOU HAVE NOT ENTERED THE REQUIRED PARAMETERS. BEFORE ENTERING FDS IT IS NEEDED TO SPECIFY LDSRT. BEFORE ENTERING SDS IT IS NEEDED TO SPECIFY LDSRT AND FDS.

F07: THE FDS <XXXXX> WAS NOT ADDED SINCE IT ALREADY EXISTS IN LDSRT <XX>

F08: FDS CAN NOT BE ADDED SINCE LDSR TABLE @@ IS FULL (MAX. 16 FDS ENTRIES FOR ONE TABLE )

### 134.4.2 Advisories

H01: LDSRT <XX> WAS DELETED.

H02: LDSRT <XX> IS USED BY LRTGEL <XXXXX> OF LRTG <XXXX>. ALSO DELETE LDSRT NUMBER FROM LRTGEL BY USING AMO-LDAT.

H03: NO (SPECIFIED) SDS FOUND FOR FDS <XXXXX> IN LDSRT <XX>.

H04: FDS <XXXXX> FROM LDSRT <XX> WAS DELETED.

H05: NO ENTRY WAS FOUND IN LDSRT <XX>.

H06: NO SPECIFIED FDS WAS FOUND IN LDSRT <XX>

H07: NO ENTRY WAS FOUND IN ANY OF THE LDSR TABLES.

#### 137.3.1 START-LIST

##### Procedure Overview

| Command Code | Parameter                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| START-LIST   | FILENAME=<string>, [ADR=<number>], [LEN=<number>]<br>, FORMAT=<param>, [SEL=<param>], [ANS=<param>]<br>, [DIALOG=<param>], [UNIT=<param>; |

##### Example

The first 20 bytes of the code file from AMO file :PDS/APSN/S/DATE@ are to be output in hexadecimal format. Output text format.

Input:

**LIST - List Files**  
Parameter Description

START-LIST:":PDS:APSN/S/DATE@/",",,20,H,Y;

**Output:**

```
LIST ?
<:PDS:APSN/S/DATE@/C> ?
ANS = y

<:PDS:APSN/S/DATE@/D> ?
ANS = n

DEV NAME : PDS
FILE NAME: :PDS:APSN/S/DATE@/C
TYPE      : RMX
ADDRESS   : H'00000000'

0000 :6E 25 00 08 4E 44 41 54 40 43 30 03 0A 00 00
0010 :00 00 00 00

LIST TERMINATED
STATUS  = H'0000
```

**137.4 Parameter Description**

|        |                                                                                 |                                             |                      |
|--------|---------------------------------------------------------------------------------|---------------------------------------------|----------------------|
| ADR    | Start address                                                                   |                                             |                      |
|        | Relative starting address of the data area to be output.                        |                                             |                      |

## 138 LODR - Administration of LCR Outdial Rules

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

LODR is used to create complete LCR outdial rules (ODR) consisting of several outdial rule commands. The commands are identified by a number allocated to each *ODR* and assigned to the LCR route elements with AMO *LDAT*.

### Possible values of ODR:

- DTMF - Set output mode to DTMF
- SENDCIC - Send Carrier Identification Code
- ECHO - Output all the digits of a specified field

Using the LCR digit pattern detected as being associated (and defined with AMO LDPLN); The field number must be specified in parameter FIELD.

- ECHOALL - Output all the digits of all remaining fields

Using the LCR digit pattern detected as being associated (and defined with AMO LDPLN).

- NPI - Network plan identifier

Subscribers willing to communicate located in different networks using different dialing plans need a conversion of their subscriber number to get in contact. It can not be expected that dialing plans can be exchanged during a connection via public or private networks.

To avoid network looping and to ensure proper routing within least cost routing the current 3 digit node number has to be enhanced by a Domain and Sub-domain number. A conversion of the PNP address to the international E.164 address is also necessary on interfaces from Hicom 300 networks to other networks.

Signalling from foreign networks also requires a subsequent conversion.

The outdial rule element NPI is always to be used in connection with the element TON. Both parameters are set together. An ODR with only TON or only NPI does not make sense. Notice that NPI and TON may be set in an ODR only one time.

The following NPI/TON combinations are allowed:

| <b>NPI = ISDN</b>     | <b>NPI = PRIVATE</b>      | <b>NPI = UNKNOWN</b><br><b>NPI = LANDMOB</b><br><b>NPI = DATA</b><br><b>NPI = MARITMOB</b><br><b>NPI = NATIONAL</b><br><b>NPI = TELEX</b> |
|-----------------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| • TON = INTERNATIONAL | • TON = LEVEL2 (regional) | • TON = UNKNOWN                                                                                                                           |
| • TON = NATIONAL      | • TON = LEVEL1 (regional) | •                                                                                                                                         |
| • TON = SUBSCR        | • TON = LOCAL             | •                                                                                                                                         |
| • TON = UNKNOWN       | • TON = UNKNOWN           | •                                                                                                                                         |

Table 2

Table 1: ETSI: allowed NPI/TON - combinations

- OUTCODE - Outpulse the authorization code (AMO LAUTH)

Outpulse the authorization code for network access stored with AMO LAUTH;  
the network operator's number must be specified in parameter INDEX.

OUTCODE is only available, if feature package 'LCR COMFORT' or 'NETWORKING COMFORT' is included.

- OUTCOEX - Outpulse the class of external

The class-of-external's number must be specified in parameter COEX.

- OUTCSN - Outpulse the call serial number

The network operator's number must be specified in parameter INDEX.

OUTCODE is only available, if feature package 'LCR COMFORT' or 'NETWORKING COMFORT' is included

- OUTPULSE - Outpulse specific digits

The digits must be specified in parameter DGTS.

- CPNLIN - order to send an up to a 22-digit CPN or LIN via DTMF tones on an analog E&M tie trunk. The digits must be specified in parameter DGTS.

- NWOP - The network operator command, when assigned to an outdial rule, requires further configuration of the parameter OPTYPE to indicate the type of operator to be requested. The following values may be assigned to this parameter:
  - PRINOP = request principal operator (e.g., when the user dials 0, 0+ or 01+)
  - ALTOP = request alternate operator (e.g., when the user dials 00 or 00+)

- PAUSE - Start a pause timer for a specified duration

The timer value must be specified in parameter TIME.

- SENDCOMP - Sending complete

Send info element sending complete

- SENDNOW - Send second digit block now

It interrupts the execution of an out dial rule: The Setup message to DIUS7 contains the digits of the current dialling plan which have been processed prior to the interruption. On reception of the Setup\_Ack message from DIUS7 LCR checks if further out dial rule commands have to be processed. If so the out dial rule is continued and the remaining digits are sent to DIUS7 in an info message. The new command SENDNOW is allowed only once in an out dial rule, because an out dial rule can be continued on reception of a Setup\_Ack only.

- TON - Type of number

(according to NPI - Network plan identifier, see Table 1) As a single value TON cannot be added into the ODR.

- WAITANS - Wait for dialing tone

The timer value must be specified in parameter TIME.

- END - The end of the ODR command sequence

## 138.1 Restrictions

This description is valid from HiPath 4000 V1.0.

## 138.2 Interrelationships

- AMO DIMSU : Defining the max. number of LCR outdial rules  
(ADD-DIMSU:TYPE=CC,LODR=0..4096;)
  - AMO COSSU : Administration of class of externals for *COEX*
  - AMO CTIME : Definition of the LCR end-of-dial timer value  
(ADD-CTIME:TYPE=CP,LCREOD=3..30 sec, default=10 sek)
  - AMO LDAT : Administration of LCR route elements  
(ADD-LDAT:ODR=1..4096)
  - AMO LAUTH : Administration of the authorization code for privatenetworks
- GENERATION SEQUENCE : DIMSU --> COSSU --> CTIME --> LODR --> RICHT --> LDAT  
--> LAUTH

## 138.3 Functions of the AMO

- [ADD-LODR](#) : Add the outdial rules with their associated outdial rule commands
- [DELETE-LODR](#) : Delete the outdial rules with their associated outdial rule commands
- [DISPLAY-LODR](#) : Display the outdial rules with their associated outdial rule commands
- [REGENERATE-LODR](#) : Regenerate the outdial rules with their associated outdial rule commands

### 138.3.1 ADD-LODR

Create outdial rule commands (CMD).

An outdial rule consists of several different outdial rule commands (e.g. Wait for Dialing Tone, Outpulse Specific Digits, etc.).

The ADD command is used to enter an outdial rule command in an outdial rule.

The new outdial rule command can

- be added to the outdial rule (without parameter *CMDPOS*, without parameter *REPLACE*)
- be inserted in the outdial rule (with parameter *CMDPOS*, without parameter *REPLACE*)
- replace an existing outdial rule command (with parameter *CMDPOS*, with parameter *REPLACE*)

**Bild Bild** Parameter *CMDPOS* may not be specified if the command is being appended. The AMO determines the current end of the outdial rule and appends the new CMD there.

The *CMDPOS* parameter, which must be specified when inserting and replacing, determines the position at which the new outdial rule command is to be inserted (parameter *REPLACE=NO*) or the old outdial rule command is to be replaced (parameter *REPLACE=YES*).

The AMO cannot add new outdial rule commands after an *END* command. If the outdial rule has an *END* command, new commands can only be inserted or existing commands overwritten.

If the outdial rule command to be inserted is an *END* command, all commands after its insertion point are automatically deleted.

When an already existing outdial rule command is to be modified, it must be overwritten in its entirety, i.e. it is not possible to correct only the parameter value (e.g. timer value, digit string) assigned to a command (e.g. Wait for Dialing Tone, Outpulse Specific Digits).

If the new outdial rule command is an *END* command, all commands after its insertion point are automatically deleted.

An outdial rule is completed with an

*END* command.

The AMO LDAT ensures that only outdial rules with *END* commands are assigned to an LCR route element.

For this reason, *END* commands may not be overwritten in outdial rules that have already been assigned.

With the parameter *INFO* you can add a max. 50 character long text string for service interests for each ODR. If the first character of the *INFO* string is ' ' (space) then the *INFO* string is deleted.

## Procedure Overview

| Command Code | Parameter                                                                |
|--------------|--------------------------------------------------------------------------|
| ADD-LODR     | ODR=<number>, [CMDPOS=<number>],<br>[REPLACE =<ident>], [INFO=<string>], |

## LODR - Administration of LCR Outdial Rules

### Functions of the AMO

| Command Code | Parameter                        |
|--------------|----------------------------------|
|              | CMD=CPNLIN,DGTS=<string>;        |
|              | CMD=DTMF;                        |
|              | CMD=ECHO, FIELD=<number>;        |
|              | CMD=ECHOALL;                     |
|              | CMD=NPI,NPI=<ident>,TON=<ident>; |
|              | CMD=NWOP,OPTYPE=<ident>;         |
|              | CMD=OUTCODE, INDEX=<number>;     |
|              | CMD=OUTCOEX, COEX=<number>;      |
|              | CMD=OUTCSN, INDEX=<number>;      |
|              | CMD=OUTPULSE,DGTS=<string>;      |
|              | CMD=PAUSE, TIME=<number>;        |
|              | CMD=SENDICIC;                    |
|              | CMD=SENDCOMP;                    |
|              | CMD=SENDNOW;                     |
|              | CMD=WAITANS, TIME=<number>;      |
|              | CMD=END;                         |

### Example

1. In a *PABX* , outdial rules 1 through 4 must be created as follows:

```
ADD-LODR:ODR=1,CMD=ECHOALL;
ADD-LODR:ODR=1,CMD=END;

ADD-LODR:ODR=2,CMD=ECHO, FIELD=1;
ADD-LODR:ODR=2,CMD=ECHO, FIELD=2;
ADD-LODR:ODR=2,CMD=END;

ADD-LODR:ODR=3,CMD=OUTPULSE,DGTS=131;
ADD-LODR:ODR=3,CMD=PAUSE, TIME=3;
ADD-LODR:ODR=3,CMD=TOGGLE;
ADD-LODR:ODR=3,CMD=OUTCODE, INDEX=1;
ADD-LODR:ODR=3,CMD=OUTCSN, INDEX=1;
ADD-LODR:ODR=3,CMD=OUTPULSE,DGTS=060212155;
```

```
ADD-LODR:ODR=3,CMD=ECHO,FIELD=2;
ADD-LODR:ODR=3,CMD=END;

ADD-LODR:ODR=4,CMD=OUTPUTSE,DGTS=060255;
ADD-LODR:ODR=4,CMD=ECHO,FIELD=2;
ADD-LODR:ODR=4,CMD=END;

ADD-LODR:ODR=5,INFO=TEST;
ADD-LODR:ODR=5,INFO= ;
```

## 138.3.2 DELETE-LODR

Delete outdial rules (ODR) or outdial rule commands ( *CMD* ).

One or more specified outdial rules can be deleted in their entirety (i.e. with all associated outdial rule commands) (TYPE=ODR and parameter ODR).

One or more specified outdial rule commands (e.g. Wait for Dialing Tone, Output Specific Digits, etc.) can be deleted from an outdial rule (TYPE=CMD and parameter ODR). The outdial rule command to be deleted is specified according to its position, which can be found with DISPLAY (parameter CMDPOS). It is to be considered, that if NPI (TON) is going to be deleted in the ODR, then TON (NPI) will be deleted as well.

An outdial rule may be completely deleted only if it is no longer assigned to an LCR route element (via AMO LDAT), so that consistency is retained with the AMO LDAT.

For the same reason, individual outdial rule commands may only be deleted from an outdial rule which has already been assigned providing the rule remains complete, i.e. an END command may not be deleted in this case.

### Note:

To delete the INFO string of an ODR you should use the following command:

```
ADD-LODR:ODR=<x>,INFO=' ';
```

### Procedure Overview

| Command Code | Parameter                                                           |
|--------------|---------------------------------------------------------------------|
| DELETE-LODR  | TYPE=ODR, ODR=<range>;<br>  TYPE=CMD, ODR=<number>, CMDPOS=<range>; |

#### Examples

1. Deleting outdial rules 1 through 3 :

```
DELETE-LODR:TYPE=ODR,ODR=1&&3;
```

2. Deleting outdial rule 4, commands 2 through 5 :

```
DELETE-LODR:TYPE=CMD,ODR=4,CMDPOS=2&&5;
```

### 138.3.3 DISPLAY-LODR

Display the following outdial rule commands.

All created outdial rules can be displayed with their associated outdial rule commands (DISPLAY-LODR without parameters).

Specific outdial rules can be displayed with their associated outdial rule commands (parameter ODR).

The following outdial rule commands exist:

CPNLIN  
DTMF  
ECHO  
ECHOALL  
NPI  
NWOP  
OUTCODE  
OUTCOEX  
OUTCSN  
OUTPULSE  
PAUSE  
SENDIC  
SENDCOMP  
SENDNOW  
TON  
WAITANS  
END

The saved INFO strings can be displayed. Depending on the parameter FORMAT the INFO string can be displayed in long or short format. In short format only the ODR-number and the INFO string is output if available. It is possible to search for any text pattern using the parameter INFOPAT. In this case only those ODRs are displayed in appropriate output format which contain the given text pattern.

### Note

Advance provision is made with '\*' for every outdial rule which has not been assigned to a route element.

### Procedure Overview

| Command Code | Parameter                                            |
|--------------|------------------------------------------------------|
| DISPLAY-LODR | [ODR=<range>], [INFOPAT=<string>], [FORMAT=<ident>]; |

### Examples

Display outdial rules 1 through 3 with their outdial rule commands.

Input:

DISPLAY-LODR:ODR=1&&3;

Output:

| ODR | CMDPOS                        | CMD      | PARAMETER              |
|-----|-------------------------------|----------|------------------------|
| 1   | 1                             | WAITANS  | 5 SEC                  |
|     | 2                             | OUTPULSE | 1234567890123456789012 |
|     | 3                             | PAUSE    | 3 SEC                  |
|     | 4                             | OUTPULSE | 131                    |
|     | 5                             | ECHO     | 2                      |
|     | 6                             | DTMF     |                        |
|     | 7                             | END      |                        |
| ODR | CMDPOS                        | CMD      | PARAMETER              |

|     | 2                             | OUTPULSE | 131                    |

DISPLAY-LODR:5,,S;

|            |
|------------|
| ODR : INFO |
| 5 :TEST    |

138.3.4 REGENERATE-LODR

Regenerate outdial rules

All existing outdial rules can be regenerated with their associated outdial rule commands (REGEN-LODR without parameters).

Specific outdial rules can be regenerated with their associated outdial rule commands (parameter ODR).

Procedure Overview

| Command Code | Parameter      |
|--------------|----------------|
| REGEN-LODR   | [ODR=<range>]; |

EXAMPLE

Regenerate outdial rules 1 through 3 with their outdial rule commands.

Input:

REGEN-LODR:ODR=1&&3;

Output:

ADD-LODR:1,,,WAITANS,5;  
ADD-LODR:1,,,OUTPULSE,1234567890123456789012;  
ADD-LODR:1,,,PAUSE,3;  
ADD-LODR:1,,,OUTPULSE,131;  
ADD-LODR:1,,,ECHO,2;  
ADD-LODR:1,,,DTMF;  
ADD-LODR:1,,,END;  
ADD-LODR:2,,,WAITANS,5;  
ADD-LODR:2,,,OUTPULSE,131;  
ADD-LODR:2,,,OUTCODE,1;  
ADD-LODR:2,,,OUTCSN,1;  
ADD-LODR:2,,,ECHOALL;  
ADD-LODR:2,,,END;  
ADD-LODR:3,,,WAITANS,5;  
ADD-LODR:3,,,OUTPULSE,131;

138.4 Parameter Description

|                 |                                                         |
|-----------------|---------------------------------------------------------|
| CMD             | OUTDIAL RULE COMMAND                                    |
| Type of Input   | : single value, mandatory (ADD)                         |
| Possible Values | : DTMF Set outpulse mode to DTMF                        |
|                 | CPNLIN Send an up to 22 digit CPN or LIN                |
|                 | ECHO Outpulse all the digits of a specified field       |
|                 | ECHOALL Outpulse all the digits of all remaining fields |

|        |                                                                                                                    |                                                                                                                                                |                            |
|--------|--------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
|        | END                                                                                                                | The end of the ODR command sequence                                                                                                            |                            |
|        | NPI                                                                                                                | Network plan identifier                                                                                                                        |                            |
|        | NWOP                                                                                                               | Network operator                                                                                                                               |                            |
|        | OUTCODE                                                                                                            | Outpulse the authorization code (AMO LAUTH)                                                                                                    |                            |

## 138.5 Error Messages and Advisories

### 138.5.1 Error Messages

F01: ODR NUMBERS LARGER THAN <@@@> (*lwrmax*) CANNOT BE PROCESSED  
(*AMO DIMSU, PARAMETER ODR*)  
--> *PROMPT ODR*

F02: ODR <@@@@> (*lwr*) ONLY HAS <@@@@@> (*maxstel*) COMMANDS  
--> *PROMPT CMDPOS*

F03: THE PARAMETER CMDPOS MUST BE SPECIFIED WHEN REPLACE=YES  
--> *PROMPT CMDPOS*

F04: ODR <@@@@> (*lwr*) CAN NOT BE CHANGED BECAUSE IT IS STILL  
REFERENCED TO BY AT LEAST ONE LCR ROUTE ELEMENT  
(*AMO LDAT*)  
--> *NO PROMPT \* END AMO*

F05: COEX <@@@@> (*coex*) DOES NOT YET EXIST (*AMO COSSU*)  
--> *PROMPT COEX*

F06: ODR <@@@@> (*lwr*) CAN NOT BE EXTENDED.  
REASON: THERE IS NO MORE FREE MEMORY (*AMO DIMSU*)  
--> *NO PROMPT \* END AMO*

F07: ODR <@@@@> (*lwr*) DOES NOT EXIST OR HAS NOT BEEN ADDED  
--> *PROMPT ODR*

F08: ODR <@@@@> (*lwr*) CAN NOT BE DELETED BECAUSE IT IS STILL  
REFERENCED TO BY AT LEAST ONE LCR ROUTE ELEMENT  
(*AMO LDAT*)  
--> *NO PROMPT \* END AMO*

F09: IN ORDER THAT THE ODR <@@@@> (*lwr*) CAN BE TOTALLY DELETED,  
THE PARAMETER CMDPOS MUST NOT BE INCLUDED  
--> *NO PROMPT \* END AMO*

F10: CMD=END CAN NOT BE DELETED IN ODR <@@@> (lwr) BECAUSE IT IS STILL REFERENCED TO BY AT LEAST ONE LCR ROUTE ELEMENT (AMO LDAT)  
--> NO PROMPT \* END AMO

F12: ODR <@@@@> (lwr) HAS ALREADY BEEN ENDED WITH CMD=END AND CAN ONLY BE EXTENDED USING INSERT  
--> NO PROMPT \* END AMO

F13: THE COMMAND CMD=END CAN NOT BE INSERTED INTO AN OUTDIAL RULE  
--> NO PROMPT \* END AMO

F14: THE COMMAND CMD=SENDNOW MAY ONLY APPEAR ONCE IN AN ODR  
--> NO PROMPT \* END AMO

F15: THE COMMAND CMD=NPI CAN NOT BE INSERTED INTO AN OUTDIAL RULE  
--> NO PROMPT \* END AMO

F17: AN ODR MUST CONTAIN BOTH NPI AND TON BEFORE THE COMMAND CMD=END  
--> NO PROMPT \* END AMO

F18: THE COMMAND NPI CAN NOT BE CHANGED TO SOMETHING ELSE WHEN THE ODR IS COMPLETE (CMD=END AT END OF ODR)  
--> NO PROMPT \* END AMO

F19: THE COMMAND TON CAN NOT BE CHANGED TO SOMETHING ELSE WHEN THE ODR IS COMPLETE (CMD=END AT END OF ODR)  
--> NO PROMPT \* END AMO

F20: OUTCSN/OUTCODE CANNOT BE USED BECAUSE THE FEATURE PACKAGE 'TRUNK/NETWORKING COMFORT' WERE NOT CONTRACTED. PLEASE USE DISP-CODEW FOR DISPLAY OF THE CONTRACTED FEATURE PACKAGES. PLEASE CONTACT YOUR SERVICE CENTER IF YOU WISH TO USE THIS FEATURE.

F21: not used

F22: not used

F23: THE COMMAND NPI CAN NOT OCCURE MORE THAN ONCE IN A ODR

F25: MAXIMUM NUMBER OF INFO FIELDS ARE USED, NUMBER HAS TO BE INCREASED BY MEANS OF ADD-DIMSU:INFO=<?>;

F26: NOT ENOUGH MEMORY FOR INFO FIELD IN DATAPOOL TO WRITE THE INFO. INCREASE BY MEANS OF ADD-DIMSU:DPINFO=<?>;

F27: INFO INDEX OUT OF RANGE

F28: THE SERVICE INFORMATION (PARAM INFO) HAS NOT BEEN ENTERED DUE TO LACK OF LWR:@@@@.

F29: The maximal amount of CMD's in an ODR is 100. For further modification set REPLACE to YES.

## 138.5.2 Advisories

H01: ODR <@@@@> (lwr1) <@@@@> (bis) <@@@@> (lwr2) NOT YET ADDED  
--> NO PROMPT \* END AMO

H02: THERE ARE NO OUTDIAL RULES CONFIGURED  
--> NO PROMPT \* END AMO

H03: THE NEXT FREE ODR IS <@@@@> (lwr)  
--> NO PROMPT \* END AMO

H04: ODR <@@@@> (lwr) HAS BEEN DELETED  
--> NO PROMPT \* END AMO

H05: AN ODR MUST CONTAIN BOTH NPI AND TON BEFORE THE COMMAND CMD=END  
--> NO PROMPT \* END AMO

H06: HODR ^lwrell^ IS BEING DELETED AS WELL

H07: NO MATCHING PATTERN FOUND IN INFO FIELDS

## 139 LOGBK - Logbook

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

The AMO LOGBK can be used to display logbook data and perform searches of same. To enable reconstruction of the administration operations in the system, each individual AMO usage is recorded in the logbook on the hard disk.

### 139.1 Interrelationships

None.

### 139.2 Functions of the AMO

- [DISPLAY-LOGBK](#) : Output logbook data (last entry first)
- [START-LOGBK](#) : Output logbook data (oldest entry first)

#### 139.2.1 DISPLAY-LOGBK

The Display action displays the recorded logbook data.

##### Procedure Overview

| Command Code  | Parameters                                                                                                                                                      |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-LOGBK | [STIME=<string>], [ETIME=<string>], [NOUN=<string>],<br>[DEV=<param>] , [TSN=<number>] , [UID=<number>] ,<br>[TYPE=<param>] , [TEXT=<string>] , [ANS=<param>] ; |

If no parameters are specified, the entire logbook is displayed. The AMO LOGBK can also be used to perform queries in which the logbook can be searched for specific criteria. The search criteria is defined by parameter entries.

Searching for a text string (parameter TEXT) must be limited by further parameters, otherwise the entire logbook must be searched which slows the operation.

During a search according to STIME and/or ETIME, only the data records whose time stamps lie between STIME and ETIME are displayed. Gaps may occur in the output, if data records have an invalid time stamp or if the system clock was reset.

The direction of output can also be controlled with the STIME and ETIME parameters. If ETIME is specified greater than STIME, the direction of output is forward (oldest entries first). If ETIME is specified smaller than STIME, the direction of output is backward (newest entries first).

AMO execution is halted at some locations and the user asked whether (s)he wants to continue the program. This dialog can be deactivated (either at the beginning or during operation) by entering the value C for the ANS parameter.

### **Example**

Search logbook for AMO BUEND and display matches

Input:

```
DISPLAY-LOGBK:NOUN=BUEND,ANS=C;
```

Output:

```
P4714 DEV:CON1 TSN:1234 UID=1 NOUN:BUEND TYPE:END TIME:96-07-10 11:57:03
ADD PERFORMED;
```

```

### **Note**

Each individual log unit is output with a preceding header line. Each header line contains information about each MML input and MML output. This includes the logging number (P-Number), the calling device, the session number, the user ID, the AMO noun, the MML type (START, CONTINUE, OUTPUT or END) and the time stamp.

## 139.2.2 START-LOGBK

Same as [DISPLAY-LOGBK](#) action, except forward search direction (oldest entry first).

## 139.3 Parameter Description

**ANS** Answer to question CONTINUE (Y/N/C)

Type of Input : Single value, optional

Possible Values : Y = Continue  
N = Don't continue  
C = Continue without further questions

Default Value : Y

Dialog mode can be deactivated from the very beginning by entering the value C for the ANS parameter.

**DEV** Administrative device

The output set is limited to data records of the given device.

Type of Input : Single value, optional

Possible Values : CON1 = Console 1  
CON2 = Console 2  
CON3 = Console 3  
CON4 = Console 4  
CON5 = Console 5  
CON6 = Console 6  
FAS = Remote operation  
USER = Internal user

Default Value : No limitation

**ETIME** End time as "YY-MM-DD/hh:mm:ss"

The output set is limited to data records with time stamp not older than the given end time.

Type of Input : Single value, optional

Possible Values : YY : Last 2 digits of year - 00 to 99  
MM : Month of year - 01 to 12  
DD : Day of month - 01 to 31  
hh : Hour - 00 to 23  
mm : Minute - 00 to 59

**LOGBK - Logbook**  
 Parameter Description

ss

: Second - 00 to 59

Default Value

: No limitation

Data with an invalid time stamp (there was no valid time set-up in the system) will only be given whenever parameter ETIME was not entered.

NOUN

AMO noun

The output set is limited to data records of the given AMO.

Type of Input

: Single value, optional

Possible Values

: Any text string up to 5 chars.

Default Value

: No limitation

STIME

Start time as "YY-MM-DD/hh:mm:ss"

The output set is limited to data records with time stamp not younger as the given start time.

Type of Input

: Single value, optional

Possible Values

YY

: Last 2 digits of year - 00 to 99

MM

: Month of year - 01 to 12

DD

: Day of month - 01 to 31

hh

: Hour - 00 to 23

mm

: Minute - 00 to 59

ss

: Second - 00 to 59

Default Value

: No limitation

TEXT

Text pattern

The output set is limited to data records which match the given text pattern.

Type of Input

: Single value, optional

Possible Values

: Any text string up to 20 chars.

Default Value

: No limitation

The search takes a long time and therefore should be limited by further criteria to increase the speed of the operation.

TSN

Task sequence number

The output set is limited to data records of the given session.

Type of Input

: Single value, optional

Possible Values

: 0 to 9999

Default Value

: No limitation

TYPE

Type of MML

The output set is limited to data records which match the given type of MML.

|                 |                          |                                  |
|-----------------|--------------------------|----------------------------------|
| Type of Input   | : Single value, optional |                                  |
| Possible Values | : START                  | = MML input (AMO start commands) |
|                 | CONTINUE                 | = MML input after AMO prompting  |
|                 | OUTPUT                   | = MML outputs                    |
|                 | END                      | = MML end messages               |
| Default Value   | : No limitation          |                                  |

This query is recommended in combination with text-based searches.

|                 |                                                                 |
|-----------------|-----------------------------------------------------------------|
| UID             | User ID                                                         |
|                 | The output set is limited to data records of the given user ID. |
| Type of Input   | : single value, optional                                        |
| Possible Values | : 1 to 40                                                       |
| Default Value   | : No limitation                                                 |

# 141 LRNGZ - List of Central Speed Dialing Numbers

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The central speed dialing facility (SPDC) is used to simplify dialing. Long call numbers (destination numbers) - usually external numbers - can be transmitted by means of a speed dialing number.

The allocation of speed dialing numbers to destination numbers is stored in the central speed dialing lists.

Up to 16 of these lists (0 to 15) can be set up, each with a maximum of 1000 speed dialing numbers.

Each user can access up to 2 of these lists, which are allocated to him with parameters SPDC1 (List 1) and SPDC2 (LIST 2) of a subscriber AMO (e.g. AMO SCSU or SBCSU).

The AMO LRNGZ is used to set up the lists and to allocate speed dialing numbers to each of them. The allocation of destination numbers is carried out using AMO ZRNGZ.

The SPDC feature is accessed by dialing a code following the speed dialing number.

There are two versions of access.

- a) Access of both lists via only one dialing code (digit analysis result SPDC1 in AMO WABE).

In this case the speed dialing numbers of the lists, allocated to the user (parameter SPDC1 and SPDC2 of the subscriber AMO) must be different, since it is the speed dialing number which determines whether the 1st or 2nd list is dialed. The administrator of the switch has to take care of the so called „unambiguousness“ of the speed dialing number ranges. Because of the various combinations of speed dialing lists, allocated to the users (any two lists out of the available lists 0 to 15 can be allocated to any user), AMO LRNGZ is not able to check the unambiguousness.

In the case of 3 digit speed dialing numbers a user can access a maximum speed dialing number range of 000 to 999, divided over the two allocated lists. Therefore with this version of access a user has access to maximum 1000 speed dialing numbers.

## LRNGZ - List of Central Speed Dialing Numbers

### Restrictions

- b) Access of both lists via 2 dialing codes (digit analysis results SPDC1 and SPDC2 in AMO WABE). Via dialing code of digit analysis result SPDC1, the user has access to the 1st list, allocated to the user (parameter SPDC1 of the subscriber AMO) and via dialing code of SPDC2 to the 2nd list (parameter SPDC2 of the subscriber AMO)

In this case the speed dialing numbers of the lists, allocated to the user can be the same, i.e. the speed dialing number ranges can overlap, since the Lists are accessed via the dialing code (digit analysis results SPDC1 and SPDC2 in AMO WABE) and not via the speed dialing number.

In the case of 3 digit speed dialing numbers a user can access a maximum speed dialing number range range of 000 to 999 per list. Therefore with this version of access a user has access to maximum 2000 speed dialing numbers.

The AMO DIMSU is used to establish how many lists (parameter SPDCL) and destinations (parameter SPDCLD) can be set up in the system.

## 141.1 Restrictions

This description is valid from SP300-V3.4

## 141.2 Interrelationships

- AMO DIMSU : Define the number of lists and speed dialing numbers permitted
- AMO SCSU/SBCSU : Configure subscriber in the SWU
- AMO ZRNGZ : Central speed dialing destinations

## 141.3 Functions of the AMO

- [ADD-LRNGZ](#) : Create lists
- [CHANGE-LRNGZ](#) : Change the speed dialing number range and extend a list
- [DELETE-LRNGZ](#) : Cancel and reduce a list
- [DISPLAY-LRNGZ](#) : Interrogate the speed dialing numbers of a list
- [REGENERATE-LRNGZ](#) : Aligned output of the speed dialing number allocations

### 141.3.1 ADD-LRNGZ

The speed dialing numbers are allocated in ascending, consecutive order.

List lengths are determined by the lowest and the highest speed dialing number.

#### Procedure Overview

| Command Code | Parameter                                       |
|--------------|-------------------------------------------------|
| ADD-LRNGZ    | LST=<number>, SPDMIN=<number>, SPDMAX=<number>; |

### 141.3.2 CHANGE-LRNGZ

Change the range of speed dialing numbers in a list of central speed dialing numbers.

1. Change the range of speed dialing numbers in a list.
2. Change the number of speed dialing numbers in a list (extension)

#### Procedure Overview

| Command Code | Parameter                                         |
|--------------|---------------------------------------------------|
| CHANGE-LRNGZ | LST=<number><br>, TYPE=SPDNO, SPDNO=<number>; (1) |
|              | , TYPE=CNT, NO=<number>; (2)                      |

### 141.3.3 DELETE-LRNGZ

Cancel a list of central speed dialing numbers or a range of central speed dialing numbers in a list.

1. Cancel a list.
2. Change the number of speed dialing numbers in a list (shortening)

#### Procedure Overview

| Command Code | Parameter                                     |
|--------------|-----------------------------------------------|
| DELETE-LRNGZ | TYPE=LST, LST=<number>, DEL=<param>; (1)      |
|              | TYPE=SPDNO, LST=<number>, SPDNO=<number>; (2) |

**Examples**

- 1. Cancel list 00. It is to be canceled only if no more station users in the system can access it.

Input:

```
DELETE-LRNGZ:TYPE=LST,LST=00,DEL=N;
```

Output:

```
F08: USERS CAN STILL ACCESS THE LIST.  
AMO-LRNGZ -...      SPEED CALL DIALING CENTRAL,LISTS  
DELETE NOT COMPLETED;
```

- 2. Cancel speed dialing numbers 170-199 in list 2.

Input:

```
DELETE-LRNGZ:TYPE=SPDNO,LST=2,SPDNO=170;
```

**141.3.4 DISPLAY-LRNGZ**

Interrogate the range of speed dialing numbers of one or of all lists of the central speed dialing register with output in list format.

- 1. All lists in the system.
- 2. A specific list.

Only the created lists are displayed, i.e. lists that are not created do not result in a negative output.

**Procedure Overview**

| Command Code  | Parameter                  |
|---------------|----------------------------|
| DISPLAY-LRNGZ | TYPE=SYS; (1)              |
|               | TYPE=LST,LST=<number>; (2) |

**Example**

Interrogating the speed dialing number ranges of all lists in the system.

Input:

```
DISPLAY-SPDC:TYPE=SYS;
```

Output:

```
LST : 00   SPDNO RANGE:  00 TO  99  
LST : 01   SPDNO RANGE:  00 TO  99  
LST : 02   SPDNO RANGE:  00 TO  99  
LST : 03   SPDNO RANGE:  00 TO  99  
LST : 04   SPDNO RANGE:  00 TO  99  
LST : 05   SPDNO RANGE:  00 TO  49
```

```
LST : 06   SPDNO RANGE: 00 TO 49
LST : 07   SPDNO RANGE: 00 TO 49
LST : 08   SPDNO RANGE: 00 TO 49
LST : 09   SPDNO RANGE: 00 TO 49
LST : 10   SPDNO RANGE: 00 TO 49
LST : 11   SPDNO RANGE: 00 TO 49
LST : 12   SPDNO RANGE: 00 TO 49
LST : 13   SPDNO RANGE: 00 TO 49
LST : 14   SPDNO RANGE: 00 TO 24
LST : 15   SPDNO RANGE: 00 TO 24
```

## 141.3.5 REGENERATE-LRNGZ

1. All lists in the system.
2. Only one specific list.

### Procedure Overview

| Command Code     | Parameter                   |
|------------------|-----------------------------|
| REGENERATE-LRNGZ | TYPE=SYS; (1)               |
|                  | TYPE=LST, LST=<number>; (2) |

### Example

Interrogating the speed dialing number ranges of all lists in the system for regeneration.

Input:

```
REGENERATE-LRNGZ:TYPE=SYS;
```

Output:

```
ADD-LRNGZ:00, 00, 99;
ADD-LRNGZ:02, 00, 45;
ADD-LRNGZ:03, 00, 99;
ADD-LRNGZ:05, 00, 24;
ADD-LRNGZ:06, 00, 99;
ADD-LRNGZ:15, 00, 99;
```

## 141.4 Parameter Description

**DEL** Is the list to be canceled if it can still be used by subscribers?

Type of Input : single value, optional

Possible Values : N -> List should not be canceled  
Y -> List should be canceled

## LRNGZ - List of Central Speed Dialing Numbers

### Error Messages and Advisories

## 142 LSCHD - LCR Schedules

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The Least Cost Routing feature has a set of Schedules that are used when configuring route elements with AMO LDAT. Using the AMO LSCHD up to 8 schedules, identified by the letters A to H, can be defined. These will typically cover the week in bands corresponding to call charging rates. When configuring an LCR route an entry may be made against each schedule to indicate whether or not the route maybe used during the times encompassed by that Schedule, and if so whether or not a special tone must be applied to indicate that the route is an expensive one. The following table shows an example configuration. There is an entry for each day / hour combination which shows the Schedule and the minute past the hour at which changeover to that Schedule will occur. Should the Schedule remain unchanged from the previous hour then no changeover will occur and the minute field will have no relevance.

| HOURL | SUN    | MON    | TUE    | WED    | THU    | FRI    | SAT    |

Each Internal Traffic Restriction group has its own LCR Schedule table.  
The table is implemented as a static FIXAMA table.

142.1 Restrictions

This description is valid from SP300-V3.4

142.2 Interrelationships

- AMO LDAT : LCR Route Definitions
- GENERATION: : LAUTH --> LSCHD-->LODR-->LDAT-->LDPLN  
SEQUENCE

142.3 Functions of the AMO

- [CHANGE-LSCHD](#) : Enables the existing configuration to be altered.
- [DISPLAY-LSCHD](#) : Display the current table configuration
- [REGENERATE-LSCHD](#) : Produce the series of CHANGE-LSCHD commands necessary required to produce the current configuration.

142.3.1 CHANGE-LSCHD

Change Schedule.  
Procedure Overview

| Command Code | Parameter                                                                       |
|--------------|---------------------------------------------------------------------------------|
| CHANGE-LSCHD | ITR=<number>, DAY=<param>, HOUR=<number>,<br>{SCHED=<letter>, MINUTE=<number>}; |

**Examples**

1. For ITR group 1, configure all of Saturday and Sunday as schedule C.

Input:

CHANGE-LSCHD: ITR=1, DAY=SAT&SUN, HOUR=0&&23, SCHED=C, MINUTE=0;

- For ITR groups 1 to 3, put the hours 7am until 4:59pm, Monday to Friday into schedule A.

Input:

```
CHANGE-
LSCHD: ITR=1&&3, DAY=MON&TUE&WED&THUR&FRI, HOUR=7&&16, SCHED=A
MINUTE=0;;
```

- Change the above so that schedule A does not begin until 9:30.

Input:

```
CHANGE-LSCHD: ITR=1&&3, DAY=MON&TUE&WED&THUR&FRI, HOUR=9, MINUTE=30;
```

## 142.3.2 DISPLAY-LSCHD

Display the schedule table for one or more ITR groups.

### Procedure Overview

| Command Code  | Parameter          |
|---------------|--------------------|
| DISPLAY-LSCHD | [ ITR=<number> ] ; |

### Example

Display the schedule table for ITR group 10.

Input:

```
DISPLAY-LSCHD: ITR=10;
```

Output:

| LCR SCHEDULE FOR ITR GROUP 10 |      |      |      |      |      |      |      |      |
|-------------------------------|------|------|------|------|------|------|------|------|
| HOURL                         | SUN  | MON  | TUE  | WED  | THU  | FRI  | SAT  |      |
| 00                            | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C |
| 01                            | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C |
| 02                            | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C |
| 03                            | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C |
| 04                            | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C |
| 05                            | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C |
| 06                            | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C |
| 07                            | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C | 00 C |
| 08                            | 00 C | 00 A | 00 A | 00 A | 00 A | 00 A | 00 A | 00 C |
| 09                            | 00 C | 00 A | 00 A | 00 A | 00 A | 00 A | 00 A | 00 C |
| 10                            | 00 C | 00 A | 00 A | 00 A | 00 A | 00 A | 00 A | 00 C |
| 11                            | 00 C | 00 A | 00 A | 00 A | 00 A | 00 A | 00 A | 00 C |
| 12                            | 00 C | 00 A | 00 A | 00 A | 00 A | 00 A | 00 A | 00 C |
| 13                            | 00 C | 00 A | 00 A | 00 A | 00 A | 00 A | 00 A | 00 C |

## 142.3.3 REGENERATE-LSCHD

Generate the list of CHANGE commands required to configure the LCR Schedule table for one or more ITR groups. In order to reduce the output REGENERATE will produce commands using an hour range where possible. The actual number of lines output will depend upon the amount of variation in the table.

### Procedure Overview

| Command Code     | Parameter          |
|------------------|--------------------|
| REGENERATE-LSCHD | [ ITR=<number> ] ; |

### Example

Regenerate LCR Schedules for ITR group 10.

Input:

```
REGENERATE-LSCHD: ITR=10;
```

Output:

```
CHANGE-LSCHD:10,SUN,0&&16,C,0;
CHANGE-LSCHD:10,SUN,17&&22,B,0;
CHANGE-LSCHD:10,SUN,23,C,0;
CHANGE-LSCHD:10,MON,0&&7,C,0;
CHANGE-LSCHD:10,MON,8&&16,A,0;
CHANGE-LSCHD:10,MON,17&&22,B,0;
CHANGE-LSCHD:10,MON,23,C,0;
CHANGE-LSCHD:10,TUE,0&&7,C,0;
CHANGE-LSCHD:10,TUE,8&&16,A,0;
CHANGE-LSCHD:10,TUE,17&&22,B,0;
CHANGE-LSCHD:10,TUE,23,C,0;
CHANGE-LSCHD:10,WED,0&&7,C,0;
CHANGE-LSCHD:10,WED,8&&16,A,0;
CHANGE-LSCHD:10,WED,17&&22,B,0;
CHANGE-LSCHD:10,WED,23,C,0;
CHANGE-LSCHD:10,THU,0&&7,C,0;
CHANGE-LSCHD:10,THU,8&&16,A,0;
CHANGE-LSCHD:10,THU,17&&22,B,0;
CHANGE-LSCHD:10,THU,23,C,0;
```

```
CHANGE-LSCHD:10,FRI,0&&7,C,0;
CHANGE-LSCHD:10,FRI,8&&16,A,0;
CHANGE-LSCHD:10,FRI,17&&22,B,0;
CHANGE-LSCHD:10,FRI,23,C,0;
CHANGE-LSCHD:10,SAT,0&&23,C,0;
```

## 142.4 Parameter Description

|                 |                                                                                 |
|-----------------|---------------------------------------------------------------------------------|
| ITR             | Internal Traffic Restriction group                                              |
| Type of Input   | : single value, chained single values, ranges<br>optional (DISPLAY, REGENERATE) |
| Possible Values | : 0 - 15                                                                        |
| DAY             | Day(s) that change is to affect                                                 |
| Type of Input   | : single value, chained single values                                           |
| Possible Values | SUN, MON, TUE, WED, THU, FRI, SAT                                               |
| HOURL           | Hour(s) which change is to affect                                               |
| Type of Input   | : single value, range                                                           |
| Possible Values | : 00 - 23                                                                       |
| SCHED           | LCR Schedule                                                                    |
| Type of Input   | : single value, group parameter with MINUTE                                     |
| Possible Values | : A, B, C, D, E, F, G, H                                                        |
| MINUTE          | Minute at which schedule switchover is to occur                                 |
| Type of Input   | : single value, group parameter with SCHED                                      |
| Possible Values | : 00 - 59                                                                       |

## 143 LSSM - Switch Circuit or Line in the Server

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The AMO LSSM (Line Switch of Service Modules) is used to place into service or remove from service the specified line or specified channel of a line. This requires that the hardware already be allocated and that a channel already be created.

According to the module type the physical line termination units can be assigned as following:

LCU/LBU

The first 2 line-numbers (out of 8) are valid for the 2 line termination units.

PSIO

The PSIO will not be marketed any longer.

LCR/LCS0

The following shows the sequence of the physical lines on a modul:

1. Delta-channel

no valid channel

1. B-channel of the 1. Delta-channel

2. B-channel of the 1. Delta-channel

2. Delta-channel

no valid channel

1. B-channel of the 2. Delta-channel

2. B-channel of the 2. Delta-channel

LAN

TCP - Line 1 up to TCP - Line 6 can be switched.

### Messages

The messages of dependability, which are the results of a test, are not output via AMO LSSM. These messages are displayed directly on the output device of dependability.

## 143.1 Restrictions

This description is valid from HiPath 4000 V2.0.

## 143.2 Interrelationships

- AMO UCSM : Configure server
- AMO BCSM : Configure slot for module in the server
- AMO LCSM : Configure circuit/line in the server

## 143.3 Functions of the AMO

- [ACTIVATE-LSSM](#) : Activate a line or channel either with or without a prior test
- [DEACTIVATE-LSSM](#) : Deactivate a line or channel either with o without prior blocking
- [TEST-LSSM](#) : Testing of lines or channels (these must already be deactivated)
- [DISPLAY-LSSM](#) : Displaying state of lines/channels

### 143.3.1 ACTIVATE-LSSM

#### Procedure Overview

| Command Code  | Parameter                                    |
|---------------|----------------------------------------------|
| ACTIVATE-LSSM | [UNIT=<param>], LN=<number>, [TYPE=<param>]; |

#### Examples

1. Activation of Line 9 Without Test.

Input:

```
ACTIVATE-LSSM:A1, 9, ANT;
```

**Remark:** Line 8 - Line 63 ( no TCP - Lines ) only can be switched.

2. Activation of TCP-Line 5.

Input:

```
ACTIVATE-LSSM:A1, 5, LAN;
```

**Remark:** In a cPCI - Shelf LAN lines only ( TCP - Line 1 till TCP - Line6 ) can be switched.

## 143.3.2 DEACTIVATE-LSSM

### Procedure Overview

| Command Code    | Parameter                                    |
|-----------------|----------------------------------------------|
| DEACTIVATE-LSSM | [UNIT=<param>], LN=<number>, [TYPE=<param>]; |

### Examples

1. Deactivation of Line 24.

Input:

```
DEACTIVATE-LSSM:A1, 24;
```

Remark: Line 8 - Line 63 ( no TCP - Lines ) only can be switched.

2. Deactivation of TCP-Line 5.

Input:

```
ACTIVATE-LSSM:A1, 5, LAN;
```

Remark: In a cPCI - Shelf LAN lines only ( TCP - Line 1 till TCP - Line6 ) can be switched.

## 143.3.3 TEST-LSSM

### Procedure Overview

| Command Code | Parameter                    |
|--------------|------------------------------|
| TEST-LSSM    | [UNIT=<param>], LN=<number>; |

### Example

Testing of line 10.

Input:

```
TEST-LSSM:A1, 10;
```

Remark:

In a cPCI - Shelf LAN only ( TCP - Line 1 till TCP - Line6 ) can be tested.  
Otherwise only Line 8 - Line 63 ( no TCP - Lines ) can be tested.

## 143.3.4 DISPLAY-LSSM

### Procedure Overview

| Command Code | Parameter                       |
|--------------|---------------------------------|
| DISPLAY-LSSM | [UNIT=<param>], [TYPE=<param>]; |

## 143.4 Parameter Description

|                 |                                                                                   |
|-----------------|-----------------------------------------------------------------------------------|
| LN              | Physical line number                                                              |
| Type of Input   | : Single value, required                                                          |
| Possible Values | : 1 - 6 ..... TCP - Lines in a cPCI - Shelf<br>8 - 63 .....other kind of channels |
| TYPE            | Spec. of the type of activation or deactivation job                               |
| Type of Input   | : Single value, optional                                                          |
| Possible Values | : AT,ANT,LAN                                                                      |
|                 | AT = Activation with test                                                         |
|                 | ANT = Activation without test                                                     |
|                 | LAN = Activation of a TCP-Line ( LAN )                                            |
| Default Value   | : ANT (ACTIVATE)                                                                  |
| UNIT            | Processor name of the service module to be activated                              |
| Type of Input   | : Single value, optional                                                          |
| Possible Values | : A1 = Adminis. & Data Server (ADS)                                               |

# 144 LWCMD - Loadware Diagnosis Command

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
|                                    | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

For purpose of diagnosis AMO-LWCMD sends executable commands in ASCII format to the module which should be diagnosed. The AMO receives also ASCII formatted strings from the board and displays them on the User Terminal without further manipulation.

The commands which can be sent to the board are board specific.

The AMO-LWCMD should only be used by trained system technicians. Therefore the AMO is protected by the use of password class 3 (product specialist).

## 144.1 Interrelationships

Direct communications partner for the AMO is PP. PP exchanges the messages with the CDG loadware in both (send and receive) directions.

## 144.2 Functions of the AMO

- [EXEC-LWCMD](#) : Send Loadware command directly to the board.

### 144.2.1 EXEC-LWCMD

The action EXEC sends a command to a configured board, addressed by the right LTU-number, mounting SLOT of module and board TYPE. The AMO communicates with the board over PP which collects the dump data from the board and sends them back to the AMO.

The AMO displays the received ASCII formatted dump data (max. 192kbyte in 8kbyte segments) without manipulation, except the case, that no CR/LF information has been detected within 80 characters (one COMTES line). In this case the AMO continues the dump in a new line.

## LWCMD - Loadware Diagnosis Command

### Functions of the AMO

The input parameter TIMER can be chosen between 1..100sec. If PP does not answer within the defined time the AMO terminates with an error message. A timer default value is set to 20sec. While collecting data from the CDG V4.0 board PP has also got a timer running. There are different error messages implemented for each case of timeout.

#### Note

The loadware command for the CDG V4.0 board (see examples) can contain double-quote characters. The HICOM User Terminal interface does not allow special characters such as the double-quote in TEXTSTRING parameters. Therefore the user has to enter two single-quote characters instead. The AMO transforms the single-quotes back into a double-quote and sends the corrected command to the CDG V4.0 board (via PP).

#### Example:

- The double-quote is not allowed to be entered:

```
EXEC-LWCMD:1,79,CDG,"execute 4 1 2 1 1 "PRA 1 test-link"
```

- The user has to enter two single-quotes instead:

```
EXEC-LWCMD:1,79,CDG,"execute 4 1 2 1 1 ''PRA 1 test-link''"
```

### Procedure Overview

| Command Code | Parameter                                                                           |
|--------------|-------------------------------------------------------------------------------------|
| EXEC-LWCMD   | LTU=<param>,<br>SLOT=<param>,<br>  TYPE=<CDG>,<br>CMD=<string>,<br>[TIMER=<param>]; |

#### Examples

Here is an example of the format that would be sent to the board. (Further required commands would be supplied by development for specific cases).

The following example shows the dump of a board which is configured at LTU=2, SLOT=43. The board shall dump all verbs of commands which are available (command 'help'). The Ustimer shall be set to 30 seconds.

#### Input:

```
exec-lwcmd:2,43,cdg,"help",30;
```

#### Output:

144.3 Parameter Description

|      |                         |                               |
|------|-------------------------|-------------------------------|
| CMD  | Board command           |                               |
|      | Type of Input           | : single value<br>: mandatory |
|      | Possible Values         | textstring max. 240 char.     |
| LTU  | Line Trunk Unit         |                               |
|      | Type of Input           | : single value<br>mandatory   |
|      | Possible Values         | : 1..15 and 17..99            |
| SLOT | Mounting slot of module |                               |
|      | Type of Input           | : single value<br>mandatory   |
|      | Possible Values         | : 1..121                      |

A suitable module must be configured for the slot addressed by PEN (AMO BCSU).  
The possible Slot values depend on the systems architecture and can be found in the BCSU AMO description.

|      |                 |                           |                        |                          |

|      | Type of Input   | single value<br>mandatory |                        |                          |
|      | Possible Values | CDG                       |                        | CDG V4.0 board           |
|      |                 | CMIV30                    |                        | CMI V3.0                 |

**144.4 Error Messages and Advisories**

**144.4.1 Error Messages**

- F01: AMO HAS BEEN STARTED TWICE  
AMO EXECUTABLE IF RUNNING TASK HAS PERFORMED  
OR  
AMO WAS ABORTED (USE ANOTHER SWU AMO TO ATTEMPT PROCESS RESET)
- F02: BOARD NOT ACESSIBLE
- F03: AT THIS SLOT THERE IS NO, A WRONG OR A NOT  
EXECUTABLE MARKED MODULE
- F04: INVALID COMMAND FOR MODULE
- F05: MAXIMUM DISPLAYABLE DUMP DATA (192K) EXCEEDED
- F06: DISPLAY STOPPED BY USER BREAK
- F07: MODULE DOES NOT RESPOND WITHIN THE DEFINED TIME
- F08: DATATRANSFER STOPED AFTER DISPLAY OF <DUMPLEN> BYTE
- F09: AMO EXCEPTION ERROR: COULD NOT SEND MESSAGE TO PP
- F10: AMO EXCEPTION ERROR: ERROR WHILE RECEIVING PP MESSAGE
- F11: RECEIVED DATA FROM BOARD INVALID
- F12: PP-TIMER EXPIRED
- F13: TIMER IN PP EXPIRED
- F14: LTU <ltu> HAS NOT BEEN ASSIGNED
- F15: No SLC24 board assigned to slot <ltu>-<slot>

Error message F07 is also displayed if a timeout occures at PP while waiting for response to the initial message ('START' condition) to the board. The PP internal timer is in default settings half as big (10s) as the AMO-LWCMD message timer.

Error message F11 contains of three possible additional error reasons: Z1, Z2 and Z3. They shall give a deeper view of the reason why the AMO stops displaying the dump data if the reveived dump header is inconsistant for AMO-LWCMD to the system technician.

### **144.4.2 Advisories**

## **LWCMD - Loadware Diagnosis Command**

Error Messages and Advisories

# 145 LWPAR - Loadware Parameters for Networking Modules

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO LWPAR is used to parameterize the loadware for analog and digital networking (NW) circuits of the following modules:

## Analog Circuits

- TMBS = Trunk Module Bothway Satellite = Satellite PABX traffic with loop signaling, bothway
- TMIPI = Trunk Module Inter PABX Incoming = Incoming inter-PABX traffic
- TMIPO = Trunk Module Inter PABX Outgoing = Outgoing inter-PABX traffic
- TMBCT = Trunk Module Bothway Alternating Current Tone Frequency = Satellite PABX traffic with AC voice frequency signaling system no. 1 (WTK1), bothway
- TMEM = Trunk Module E&M (ear & mouth) - signaling = Satellite PABX traffic with AC voice frequency signaling system no. 1 (WTK1) via E&M interface, bothway

The tables for the loadware parameters are part of the standard data base.

For the analog networking circuits, the blocks in question must be assigned the appropriate circuit type and, if required, adapted by the AMO LWPAR.

Assignment to circuit types is completely unrestricted.

A maximum of 80 different parameter blocks can be assigned. (0 - 79) Parameter blocks are assigned to the analog circuits with AMO TACSU, parameter LWPAR.

## Digital Circuits

The branch TYPE=DIUS2 is valid for the following modules: DIUS2, DIUS7, SLMN and VCM.

The branch TYPE=CDG is valid for the module CDG.

The branch TYPE=TMD is valid for the module TMD (BOS or MOS mode).

The parameter blocks are assigned to the digital circuits (e.g. DIU-S2, CDG or TMD) with the AMO TDCSU, parameter LWPAR.

## **LWPAR - Loadware Parameters for Networking Modules**

### **Restrictions**

#### **Circuits of the DIUC module**

- DIUC = Digital Interface Unit Channel-associated signaling = the digital module for the PCM30 interface.

Parameter blocks are assigned to the DIUC circuits with AMO BCSU, parameter LWPAR1 and LWPAR2.

The parameter blocks are permanently assigned for digital circuits (0-25 for DIUS2, 0-49 for CDG, 200 blocks for TMD-MOS and 200 for TMD-BOS) and DIUC circuits (1-6), and for this reason the AMO LWPAR function ADD is not provided for the digital circuits and DIUC circuits. Any required alterations of the parameter blocks are carried out with the function CHANGE.

The AMO LWPAR must be called before the AMO TACSU or TDCSU. In order for parameterizing to take effect, the parameter blocks must be loaded to the respective module. This applies for both initial assignment of a parameter block and for subsequent alterations of parameters. Loading of the parameter blocks is carried out automatically at the time of initial startup of the circuit; for subsequent alterations it is carried out by deactivating and then reactivating the circuit involved using AMO DSSU. What circuits definitely have been changed will be told by advisory H04.

What circuits of the CDG board have been changed - if there is any - will be told by advisories H06 resp. H07.

#### **Copying digital parameter blocks**

There are predefined standard parameter blocks on the HD for digital circuits DIUS2, CDG and TMD which can be copied from HD to DB by the help of command COPY-LWPAR. The parameter SOURCE may be used to specify whether the parameter block is to be copied within the DB (from source to target position) or from the HD to DB. The target block (parameter BLNONEW) will be overwritten in the copy process without precaution.

Morover there are country specific combinations (called variants) of these standard parameter blocks on the HD which can be copied at once by using the command

"COPY-LWPAR:TYPE=DIUS2/CDGVAR, VARN0=x;"

## **145.1 Restrictions**

This description is valid from HiPath 4000 V1.0.

## 145.2 Interrelationships

- AMO DSSU : Device switch of switching unit
- AMO TACSU : Configuration of analog trunk circuits in the SWU
- AMO TDCSU : Configuration of digital trunk circuits in the SWU
- AMO REFTA : Reference Clock Table
- AMO BCSU : Board Configuration in the SWU

## 145.3 Functions of the AMO

- [ADD-LWPAR](#) : Assign a parameter block for an analog circuit type
- [CHANGE-LWPAR](#) : Change the data of an assigned parameter block for a circuit type
- [DELETE-LWPAR](#) : Cancel the assignment of a parameter block for an analog circuit type and the standard data base of the block
- [DISPLAY-LWPAR](#) : Interrogate the contents of parameter blocks
- [COPY-LWPAR](#) : Copying parameter blocks
- [REGENERATE-LWPAR](#) : Regenerate parameter blocks

### 145.3.1 ADD-LWPAR

ADD the assignment of a parameter block to an analog circuit type and in some cases overwrite parameters, the standard settings of which do not match.

It is possible to define a maximal 50 character long help text called „service information“ for each parameter block (par. INFO). The service information can be deleted by typing a blank as first character of parameter INFO.

#### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-LWPAR    | TYPE=NWWTK, BLNO=<number><br>, [EDP=<number>], [CTYPE=<param>]<br>, [DGTPRMSI=<key-num>], [DGTPRMS=<key-num>]<br>, [DGTPRMST=<key-num>], [COS=<param>]<br>, [SPDC1=<number>], [SPD1=<number>] |

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <div>, [SPD2=&lt;number&gt;], [SPD3=&lt;number&gt;]</div> <div>, [SPD4=&lt;number&gt;], [SPD5=&lt;number&gt;]</div> <div>, [SPD6=&lt;number&gt;], [COS1=&lt;param&gt;], [COS2=&lt;param&gt;]</div> <div>, [COS3=&lt;param&gt;], [COS4=&lt;param&gt;], [COS5=&lt;param&gt;]</div> <div>, [PUTM=&lt;number&gt;], [PATM=&lt;number&gt;]</div> <div>, [SPDCDSS=&lt;param&gt;], [DGTPR=&lt;key-num&gt;]</div> <div>, [DGTPRC=&lt;key-num&gt;], [DEV=&lt;param&gt;], [INFO=&lt;string&gt;];</div> |

145.3.2 CHANGE-LWPAR

CHANGE assigned parameter blocks.

If a parameter block assigned for a certain analog circuit type is to be changed to another analog circuit type, a DELETE and new ADD of the block is required.

The parameter blocks are permanently assigned for digital circuits (0-9 for DIUS2, 0-49 for CDG, 200 for TMD-BOS and 200 for TMD-BOS) and DIUC circuits (1-6), and for this reason the AMO LWPAR function ADD is not provided for the digital circuits and DIUC circuits. Any required alterations of the parameter blocks are carried out with the function CHANGE.

**Note**

For parameters for which linked single values can be entered, all values which can be entered must be specified, since values which are not specified are automatically set to default values when CHANGE is carried out.

After a CHANGE of the circuit parameters for a certain block, the circuits assigned to this block must be manually deactivated and then reactivated in order to load the altered block (AMO DSSU).

Mapping tables of the digital CDG parameter blocks

The input branch TYPE=CDG,CDGTYPE=MAPPING allows the specification of four mapping tables, one for each CDG parameter block. These mapping tables may be activated or deactivated by the help of argument LCOSMAP (value=Y,N) in branch TYPE=CDG,CDGTYPE=CONF.

- TBL=LCOSVRRG: Conversion of HICOM specific LCOS (LCR Class Of Service, *Voice*) to the RRG values (Route Restriction Group) specific for the Realitis DX system and vice versa. The table has 32 entries and is initialized as follows:

| LCOS | RRG |
|------|-----|
| 1    | 0   |
| 2    | 1   |

| LCOS | RRG |
|------|-----|
| 3    | 2   |
| ...  | ... |
| 31   | 30  |
| 32   | 31  |

One can (simultaneously) change several entries describing the LCOS - RRG correspondence by concatenating (at most 8) values of the input in a single AMO command. Repetition of the LCOS input values is not allowed.

Uniqueness is required for RRG values in order to ensure a correct mapping function. However it is possible to add RRG values which have multiple occurrences in the table. In this case the user is noticed by the advisory message H19 and by displaying the table entries with multiple occurrences.

Before downloading the table any multiplicities of these values have to be eliminated.

- TBL=LCOSDRRG: Conversion of HICOM specific LCOSD (LCR Class Of Service, *Data*) to the RRG values (Route Restriction Group) specific for the Realitis DX system and vice versa. See previous paragraph for further details.
- TBL=TRGCBG: Conversion of HICOM specific TRG (Traffic Restriction Group) to the CBG values (Call Barring Group) specific for the Realitis DX system. The table has 16 entries and is initialized as follows:

| TRG | CBG |
|-----|-----|
| 0   | 0   |
| 1   | 1   |
| 2   | 2   |
| ... | ... |
| 14  | 14  |
| 15  | 15  |

One can (simultaneously) change several entries describing the TRG - RRG correspondence by concatenating (at most 8) values of the input in a single AMO command. Repetition of the TRG input values is not allowed.

Uniqueness is required for CBG values in order to ensure a correct mapping function. However it is possible to add CBG values which have multiple occurrences in the table. In this case the user is noticed by the advisory message H19 and by displaying the table entries with multiple occurrences.

Before downloading the table any multiplicities of these values have to be eliminated.

## LWPAR - Loadware Parameters for Networking Modules

### Functions of the AMO

- TBL=DXTGITR: Conversion of trunk groups specific for the Realitis DX system to the HICOM specific Internal Traffic Restriction (ITR) and vice versa. The table has 32 entries and is initialized as follows:

| DXTGPOS | DXTG | ITR | Primary |
|---------|------|-----|---------|
| 0       | 255  | 0   |         |
| 1       | 255  | 0   |         |
| 2       | 255  | 0   |         |
| ...     | 255  | 0   |         |
| 30      | 255  | 0   |         |
| 31      | 255  | 0   |         |

To a given ITR one can assign several DXTG entries at once by concatenating several (at most 8) DXTGPOS - DXTG pairs in the input of a single AMO command. Uniqueness is required in the resulting DXTG fields.

One of the DXTG entries belonging to the same ITR should be marked as PRIMARY. This can be selected by explicitly specifying parameter PRIMDXTG in the AMO input. The default in its absence is the entry with the lowest DXTGPOS.

Either all or none of the parameters DXTGPOS, DXTG and ITR must be specified. If none of DXTGPOS, DXTG, ITR and PRIMDXTG is given the whole mapping table will be deleted, i.e. reset to its default initialization.

### CDG Version 6:

The most parameters of CDG Version 6 are in branch TYPE=CONF2, and the timer AROB (TAROB) is stored in the TIMER branch. Depending on the value of parameter PROT either the value of parameter DASSOPN or the value of VMSYSTAD is stored in the CDG structure. The actions DISPLAY and REGENERATE show the actual parameter name and value of these fields from DB. If the value of PROT is DASS then parameter DASSOPN is displayed, if PROT is equal DPNSSN then VMSYSTAD is displayed.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                    |

### Example

See function DISPLAY in [Section 145.3.4, "DISPLAY-LWPAR"](#).

## 145.3.3 DELETE-LWPAR

DELETE the assignment of a parameter block to a certain analog circuit type and initialize the block. DELETE is not necessary for the parameter blocks of digital modules.

### Note

Before deleting a parameter block, the assignments for the circuits assigned for this block must be deleted or changed to a different block (use the AMO TACSU or TDCSU, parameter LWPAR).

The service information can be deleted by typing a blank as first character of parameter INFO

ADD-LWPAR:TYPE=<LWPAR-TYPE>,BLNO=<x>,INFO=' '; in case of analog blocks

CHANGE-LWPAR:TYPE=<LWPAR-TYPE>,BLNO=<x>,INFO=' '; in case of digital blocks

The deletion of a CDG or a TMD block results in resetting the block parameters to their default value.  
The mapping tables of the CDG blocks can be deleted one by one using the function CHANGE.

### Procedure Overview

| Command Code | Parameter                     |
|--------------|-------------------------------|
| DELETE-LWPAR | TYPE=ANALOG,BLNO=<number>;    |
|              | TYPE=CDG,BLNO=<number>;       |
|              | TYPE=TMD,                     |
|              | TMDTYPE=TMDMOS,BLNO=<number>; |
|              | TMDTYPE=TMDBOS,BLNO=<number>; |

## 145.3.4 DISPLAY-LWPAR

Display the contents of the parameter blocks for digital circuits (e.g. DIUS2, CDG or TMD) and for analog NW circuits.

### Procedure Overview

| Command Code  | Parameter                                          |
|---------------|----------------------------------------------------|
| DISPLAY-LWPAR | [INFOPAT=<string>],[FORMAT=<param>],[DEV=<param>], |
|               | [TYPE=DIUS2],[BLNO=<number>],[SOURCE=<param>;      |
|               | [TYP=DIUC],[BLNO=<number>;                         |
|               | [TYPE=NWWTK],[BLNO=<number>;                       |
|               | [TYPE=CDG],[BLNO=<number>],[LWPARREF=<param>],     |
|               | [SOURCE=<param>;                                   |
|               | [TYPE=TMD],                                        |
|               | TMDTYPE=TMDMOS,[BLNO=<number>;                     |
|               | TMDTYPE=TMDBOS,[BLNO=<number>;                     |

## LWPAR - Loadware Parameters for Networking Modules

### Functions of the AMO

| Command Code | Parameter                          |
|--------------|------------------------------------|
|              | [TYPE=DIUS2VAR], [VARNO=<number>]; |
|              | [TYPE=CDGVAR], [VARNO=<number>];   |

#### Note

The saved INFO strings (service information) can be displayed. Depending on the parameter FORMAT the INFO string can be displayed in long or short format. In short format only the block number and the INFO string is output if available. It is possible to search for any text pattern using the parameter INFOPAT. In this case only those blocks are displayed in appropriate output format which contain the given text pattern.

For selecting one or more parameter blocks one has the parameters INFOPAT, DEV, TYPE and BLNO. The selection criteria may be combined, thus only parameter blocks satisfying all specified conditions will be displayed.

In case of parameter blocks of type DIUS2 and CDG the set of search conditions can be complemented by the parameter SOURCE (search on HD or in DB).

Important: while searching for parameter blocks on the HD only the selection parameter DEV is taken into consideration.

The structure of the TMD block doesn't contain the fields for DEVICE and INFO. If between the search criterias one of them is present, the AMO sends the message H21, and these values are ignored.

The **mapping tables** of the CDG parameter blocks are displayed only if at least one table entry deviates from the default setting.

- In the tables LCOSVRRG, LCOSDRRG und TRGCBG all entries are marked with "<" which have multiple occurancies.  
Attention: before downloading these tables any multiplicities in the tables have to be eliminated.
- In the table DXTGITR the so called PRIMARY entries are marked with a "\*".

#### Example

1. Add a new CDG parameter block with BLNO=15.

Input:

```
CHANGE-LWPAR:TYPE=CDG,BLNO=15,CDGTYPE=CONF,INFO=TEST BLNO 15  
CDG;
```

Output:

```
DISPL-LWPAR:TYPE=CDG,BLNO=15;
```

### 145.3.5 COPY-LWPAR

Only the standard parameter blocks of type DIUS2, CDG and TMD resp. their country specific combinations (called variants) can be copied. Analog parameter blocks can not be copied.

For copying single blocks (TYPE=DIUS2/CDG/TMD) it must be specified by the help of parameter SOURCE whether

- an existing block within the DB (from source to target position)
- or a standard parameter block from HD to DB is to be copied.

The target block (parameter BLNONEW) will be overwritten in the copy process without precaution. As default value SOURCE=DB is assumed.

The country specific variants (TYPE=DIUS2VAR/CDGVAR) contain assignments which blocks have to be copied at once from HD to DB.

The standard parameter blocks on the HD to be copied are stored in the following data subsystems:

- ":PDS:APSU/DSLWTM0", ":PDS:APSU/DSLWT20" and ":PDS:APSU/DSLWCD0" for standard parameter blocks
- ":PDS:APSU/DSLWT2V" and ":PDS:APSU/DSLWCDV" for country specific variants.

The contents of these data subsystems can not be modified by AMO LWPAR.

### Procedure Overview

| Command Code | Parameter                                            |
|--------------|------------------------------------------------------|
| COPY-LWPAR   | TYPE=DIUS2,BLNOOLD=<number>, [BLNONEW=<number>],     |
|              | [SOURCE=<param>];                                    |
|              |                                                      |
|              | TYPE=CDG,BLNOOLD=<number>, [BLNONEW=<number>],       |
|              | [SOURCE=<param>];                                    |
|              |                                                      |
|              | TYPE=TMD,                                            |
|              | TMDTYPE=TMDMOS,BLNOOLD=<number>, [BLNONEW=<number>], |
|              | [SOURCE=<param>];                                    |
|              | TMDTYPE=TMDBOS,BLNOOLD=<number>, [BLNONEW=<number>], |
|              | [SOURCE=<param>];                                    |
|              |                                                      |
|              | TYPE=DIUS2VAR,VARNO=<number>;                        |
|              |                                                      |
|              | TYPE=CDGVAR,VARNO=<number>;                          |

**Note:** the COPY command are not regenerated.  
Only the actual DB state after executing the COPY function can be regenerated.

## 145.3.6 REGENERATE-LWPAR

REGENERATE parameter blocks of a certain circuit type or all circuit types.

All 10 data blocks (0 to 9) are regenerated for TYPE=DIUS2.

All 6 data blocks (1 to 6) are regenerated for TYPE=DIUC.

For TYPE=CDG all data blocks are regenerated which deviate from the standard data base.

For analog circuit types, only those data blocks are regenerated which

LWPAR - Loadware Parameters for Networking Modules

Parameter Description

have been assigned to a circuit type, and of these only those block parameters are regenerated which deviate from the standard data base.

Procedure Overview

| Command Code     | Parameter       |
|------------------|-----------------|
| REGENERATE-LWPAR | [TYPE=<param>]; |

Example

Regenerate the parameter block 15.

Input:

REGEN-LWPAR:CDG;

Output:

CHANGE-LWPAR:CDG,15,CONF,213,,,,,,,,,,,,,,,,,,,,,"TEST BLNO  
15 CDG",,;  
CHANGE-LWPAR:CDG,15,TIMER,5,,,,,,,,,,,,,,,,,,,,;  
CHANGE-LWPAR:CDG,15,MAPPING,LCOSVRRG,1&2&3&4,51&51&53&54;  
CHANGE-LWPAR:CDG,15,MAPPING,TRGCBG,1&2&3&4,22&22&23&24;  
CHANGE-LWPAR:CDG,15,MAPPING,DXTGITR,1&2&3&4,21&22&23&24,1,21;

145.4 Parameter Description

ACKTIM Acknowledgement timer: timer specifies the period between transmission of a command frame and the expected receipt of the response or acknowledgement. Value is specified in tenth of seconds.

Type of Input single value, 7. parameter of a min-1-group  
Possible Values 10-50  
Default Value 10

APCPN Analogue pstn call priority number

Type of Input single value, 3. parameter of a min-1-group  
Possible Values numeric, 0-16  
Default Value 14

AROB Automatic redirection on busy

Type of Input single value, 5. parameter of a min-1-group  
Possible Values N  
Y

### Default Value

|                 |                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATCPN           | Analogue trunk call priority number                                                                                                                                                                                                                                                                                                                                       |
| Type of Input   | single value, 1. parameter of a min-1-group                                                                                                                                                                                                                                                                                                                               |

| DCHAN2  | <p>ATTENTION: This function has <u>not</u> been implemented!</p> <p>Definition of timeslot for a second data channel If DCHAN2&gt;0, DCHAN1 may not be 0. Furthermore, DCHAN1 and DCHAN2 must have different values, except when both parameters have the value 0. The specified DCHAN2 number may not be configured as a device. A second D-channel is useful, for example, if a system user leases from the post office 10 B-channels of an S2-path as nailed connections via local exchanges to a certain remote system and, due to extensive signaling, defines one of these 10 B-channels as a 'private channel'. In both systems, the additional D-channel must be made known using loadware parameters and COT.</p> <p>Type of Input : Single value, optional</p> <p>Possible Values : 0 (0= no second data channel)</p> <p>Default Value : 0</p> <p>Note : DCHAN2 may not be 0 if the parameter block is allocated to a circuit which has been assigned a class of trunk (AMO TDCSU, parameter COTNO) in which the circuit parameter PRDC (private D channel; AMO COT, parameter PAR) is specified.</p> <p>The speed dialing codes to be pre-set (DGTPR and DGTPRC) are only evaluated if the correct value for parameter SPDCDSS (SPD for DGTPR, SPDC for DGTPRC) has been specified.</p> |
| DEFID   | <p>ROP, default call identity length used in CorNet-NQ</p> <p>Type of Input: single value, optional</p> <p>Possible Values B001 1 digit</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## LWPAR - Loadware Parameters for Networking Modules

### Parameter Description

|               |        |          |
|---------------|--------|----------|
|               | B010   | 2 digits |
|               | B011   | 3 digits |
|               | B100   | 4 digits |
| Default Value | : B010 |          |

|                 |                                     |  |
|-----------------|-------------------------------------|--|
| DEFPASSW        | Default password for DPNSS protocol |  |
| Type of Input   | single value, optional              |  |
| Possible Values | numeric, up to 6 characters         |  |

|                                                                                                                                                                                 |                                                      |  |

| This parameter indicates for what kind of device the LWPARG block is suitable. All values are accepted, no check is performed. The user is asked to use the right device types. |                                                      |  |

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DGTPR           | <p>Speed dialing code to be pre-set for seizure from satellite PABX (valid for SPD 1-15)</p> <p>If only one speed dialing code has been assigned in the system, and if both speed dialing codes (DGTPR,DGTPRC) are to be evaluated in accordance with parameter SPDCDSS, DGTPR must be equal to DGTPRC and lead to DAR 'SPDC1' in the DPLN. If two speed dialing codes have been assigned, DGTPR must lead to DAR 'SPDC2' in the DPLN.</p> |
| Type of Input   | : Single value (up to 6 digits), optional                                                                                                                                                                                                                                                                                                                                                                                                  |
| Possible Values | : 0 - 9, *, #                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Default Value   | : none                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                 |                                                                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DGTPRC          | Speed dialing code (central) to be pre-set for seizure from satellite PABX                                                                                                                              |
|                 | If only one speed dialing code has been assigned in the system, and if both speed dialing codes (DGTPR,DGTPRC) are to be evaluated in accordance with parameter SPDCDSS, DGTPRC must be equal to DGTPR. |
|                 | DGTPRC must lead to DAR 'SPDC1' in the DPLN.                                                                                                                                                            |
| Type of Input   | : Single value (up to 6 digits), optional                                                                                                                                                               |
| Possible Values | : 0 - 9, *, #                                                                                                                                                                                           |
| Default Value   | : none                                                                                                                                                                                                  |

The following digit pre-setting parameters DGTPRMS, DGTPRMSI and DGTPRMST are evaluated only if the corresponding parameter value (CO, HOME, TOLL) of the parameter CTYPE is set. The entry '\*' signifies that no digit pre-setting should be assigned. Pre-set digits are set according to line signal processing of the recorded dial information and handled by call processing as dialed digits.

|          |                                                                            |
|----------|----------------------------------------------------------------------------|
| DGTPRMS  | Digit pre-setting after incoming seizure for connection type CO            |
| DGTPRMSI | Digit pre-setting after incoming seizure for connection type HOME or RF_CO |
| DGTPRMST | Digit pre-setting digit after incoming seizure for connection type TOLL    |

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| FCBAB   | <p>Parameterization of frame code and answering byte</p> <p>Type of Input : Single value, optional</p> <p>Possible Values : two-digit, hexadecimal</p> <p>Default Value : DFH</p> <p>The hex value to be entered is based on the following context:</p> <p>In the byte to be parameterized, the answer byte is parameterized in bits 1 and 4 through 8 by counting down from the bit with the highest value. Bit 2, which is free, is used to store information on the frame code. This bit position evaluates the loadware in regard to "bit 1" for the frame code.</p> <p>The hex value to be entered is thus derived from the bit pattern for the parameterization of the answer byte (AB) and the frame code(FC).</p> |

LWPAR - Loadware Parameters for Networking Modules

Parameter Description

Byte to be parameterized:

(bit with lowest value on the right!)

bits 1 and 4 through 8 of the AB are entered.  
Bit 2 : here bit 1 of the FC is entered.  
Bit 3 is free.

**FIXEDTEI**      Option to specify a value other than 0 for "FIXED TEI" for point-to-point connections  
Type of Input        : Single value, optional  
Possible Values      : 0 - 63  
Default Value        : 0

**FORMAT**        Format of output  
Type of Input:        single value, optional  
Possible Values      L    long output format  
                         S    short output format  
Default Value        : L

**ICPN**            Internal call priority number  
Type of Input        : Single value, 2. parameter of a min-1-group, optional  
Possible Values      : numeric, 0-16  
Default Value        : 11

**INFO**            Service Informations  
Type of Input:        single value, optional  
PossibleValues       : text, up to 50 characters

**INFOPAT**        Service info text pattern  
Type of Input:        single value, optional  
Possible Values       : text, up to 50 characters

**IPLDS**           The default intrude level assumed by CDG for DPNSS party  
Type of Input        single value, 21. parameter of a min-1-group, optional  
Possible Values      A                    intrusion allowed  
                         NA                  intrusion not allowed

**ITR**             HICOM internal traffic restrictions number  
Type of Input        single value, optional  
Possible Values       numeric, 0-15

## LWPAR - Loadware Parameters for Networking Modules

### Parameter Description

|      |                 |                          |
|------|-----------------|--------------------------|
| T303 | Timer T303      |                          |
|      | Type of Input   | : single value, optional |
|      | Possible Values | : 0-255                  |
|      | Default Value   | 4 sec                    |
| T304 | Timer T304      |                          |
|      | Type of Input   | : single value, optional |
|      | Possible Values | : 0-255                  |
|      | Default Value   | 15 sec                   |
| T305 | Timer T305      |                          |
|      | Type of Input   | : single value, optional |
|      | Possible Values | : 0-255                  |
|      | Default Value   | 30 sec                   |
| T308 | Timer T308      |                          |
|      | Type of Input   | : single value, optional |
|      | Possible Values | : 0-255                  |
|      | Default Value   | 4 sec                    |
| T309 | Timer T309      |                          |
|      | Type of Input   | : single value, optional |
|      | Possible Values | : 0-255                  |
|      | Default Value   | 90 sec                   |
| T310 | Timer T310      |                          |
|      | Type of Input   | : single value, optional |
|      | Possible Values | : 0 - 255                |
|      | Default Value   | 10 sec                   |
| T313 | Timer T313      |                          |
|      | Type of Input   | : single value, optional |
|      | Possible Values | : 0 - 255                |
|      | Default Value   | 4 sec                    |
| T314 | Timer T314      |                          |
|      | Type of Input   | : single value, optional |
|      | Possible Values | : 0 - 255                |
|      | Default Value   | 4 sec                    |

|                 |                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| T316            | Timer T316                                                                                                                                   |
| Type of Input   | : single value, optional                                                                                                                     |
| Possible Values | : 0 - 255                                                                                                                                    |
| Default Value   | 120 sec                                                                                                                                      |
| T322            | Timer T322                                                                                                                                   |
| Type of Input   | : single value, optional                                                                                                                     |
| Possible Values | : 0 - 255                                                                                                                                    |
| Default Value   | 4 sec                                                                                                                                        |
| TAMOST          | Timer AMO Supervision Timeout                                                                                                                |
| Type of Input   | : single value, optional                                                                                                                     |
| Possible Values | : 0-255                                                                                                                                      |
| Default Value   | 60 sec                                                                                                                                       |
| TAROB           | Timer for automatic redirection on busy                                                                                                      |
| Type of Input   | : single value, 22. parameter of a min-1-group                                                                                               |
| Possible Values | : numeric, 1-63                                                                                                                              |
| Default Value   | 10                                                                                                                                           |
| TBID            | timer callback interdigit                                                                                                                    |
| Type of Input   | : single value, optional                                                                                                                     |
| Possible Values | : :numeric, 1-20                                                                                                                             |
| Default Value   | : 5 SEC :<br>:                                                                                                                               |

## LWPAR - Loadware Parameters for Networking Modules

### Parameter Description

|         |                                                           |                                                     |                |
|---------|-----------------------------------------------------------|-----------------------------------------------------|----------------|
|         | Type of Input                                             | : Single value, optional                            |                |
|         | Possible Values                                           | : Y, N                                              |                |
|         | Default Value                                             | : N                                                 |                |
| TEMPSIG | Temporary Signaling Connection                            |                                                     |                |
|         | Type of Input                                             | : single value, optional                            |                |
|         | Possible Values                                           | : Y                                                 | YES            |
|         |                                                           | N                                                   | NO             |
|         | Default Value                                             | : Y                                                 |                |
| TIDOP   | DPNSS trunk identity (TID) option                         |                                                     |                |
|         | Type of Input                                             | : single value, optional                            |                |
|         | Possible Values                                           | : Y                                                 | YES            |
|         |                                                           | N                                                   | NO             |
|         | Default Value                                             | : N                                                 |                |
| TIPL    | Timer to delay the sending of IPL Req after call is conn. |                                                     |                |
|         | Type of Input                                             | : single value, 20. parameter of a min-1-group      |                |
|         | Possible Values                                           | : numeric, 0-60, 63                                 |                |
| TMDTYPE | TMD board type                                            |                                                     |                |
|         | Type of Input                                             | : single value, mandatory                           |                |
|         | Possible Values                                           | TMDMOS                                              | Board type MOS |
|         |                                                           | TMDBOS                                              | Board type BOS |
| TRG     | Traffic restrictions group (Hicom)                        |                                                     |                |
|         | Type of Input                                             | 1 to 8 single values, concatenated with &, optional |                |
|         | Possible Values                                           | numeric, 0-15                                       |                |
| TROPTBR | Timer ROPT Release - both end released                    |                                                     |                |
|         | Type of Input                                             | : single value, optional                            |                |
|         | Possible Values                                           | : numeric, 1-100                                    |                |
|         | Default Value                                             | 10                                                  |                |
| TROPTNR | Timer ROPT Release - neither end released                 |                                                     |                |
|         | Type of Input                                             | : single value, optional                            |                |
|         | Possible Values                                           | : numeric, 0-100                                    |                |
|         | Default Value                                             | 0                                                   |                |

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 145.5 Error Messages and Advisories

### 145.5.1 Error Messages

F01: IF DCHAN2 IS ENTERED > 0, DCHAN1 MUST BE GREATER THAN 0  
F02: DCHAN1 AND DCHAN2 MUST HAVE DIFFERENT VALUES  
F03: BLOCK <blockno> IS OF CIRCUIT TYPE <circtype>  
F04: PARAMETER LNCD: SET THE VALUES "DLPT" AND "DLCD" ALTERNATIVELY ONLY  
F05: BLOCK <blockno> IS NOT ALLOCATED  
F06: BLOCK <blockno> IS ALREADY ALLOCATED  
F07: BLOCK <blockno> IS ALLOCATED TO THE CIRCUIT WITH PEN <gg-u-sss-cc>  
F08: PARAMETER COS: "CDRAC", "CDRS", "CDRC" CANNOT BE CHAINED WITH "NCDR"  
F09: PLEASE USE THE VALUES "RTA1" TO "RTA6", "TA" AND "RTA" ALTERNATIVELY ONLY  
F10: PARAMETER PARTCD: USE THE VALUES "400E" AND "EMD" ALTERNATIVELY ONLY  
F11: PARAMETER PARTCD: USE THE VALUES "ASAT" AND "CSAT" ALTERNATIVELY ONLY  
F12: PARAMETER COS: USE THE VALUES "EXTEND" AND "PU" ALTERNATIVELY ONLY  
F13: PARAMETER COS: USE THE VALUES "OVR" AND "KN" ALTERNATIVELY ONLY

- F14: INADMISSIBLE INPUT VALUE FOR THE PRE-SET DIGIT
- F15: LPARAMEter CTYPE: "HOME", "CO", "TOLL" CANNOT BE CHAINED WITH "N"
- F16: DEVICE TYPE "S2COD" (AMO TDCSU) IS NOT PERMITTED FOR ANY OF THE ALLOCATED CIRCUITS IF PARAMETER SMD IS CHANGED FROM "N" TO "Y"
- F17: IF PARAMETER SMD IS SET TO "Y", ALL ALLOCATED CIRCUITS MUST THEN HAVE THE PRIORITY VALUE "0" (AMO REFTA)
- F18: PARAMETER TONES: "DTN1", "DTN2", "DTNT", "DTE" CANNOT BE CHAINED WITH "NULL"
- F19: PARAMETER SPDCDSS: "SPD", "SPDC" CANNOT BE CHAINED WITH "N"
- F20: IF THE VALUE <SPD/SPDC> HAS BEEN SPECIFIED FOR SPDCDSS, THEN THE PARAMETER <DGTPR/DGTPRC> MUST CONTAIN A VALID CODE
- F21: IF THE VALUE SPDC IS SPECIFIED IN PARAMETER SPDCDSS, SPDC1 MUST THEN BE SET TO 0 (ZERO)
- F22: IF ONLY A SINGLE SPEED DIALING CODE HAS BEEN ASSIGNED, THEN THE VALUES OF DGTPR AND DGTPRC MUST BE IDENTICAL
- F23: <DGTPR/DGTPRC> DOES NOT LEAD TO DAR <SPDC1/SPDC2> IN THE DPLN
- F24: PARAMETER LNTYPE: USE THE VALUES "COPPER" AND "OWG" ALTERNATIVELY ONLY
- F25: PARAMETER LNTYPE: AERIAL IN ITSELF IS NOT ALLOWED AS A SINGLE VALUE
- F26: PARAMETERS SMD AND MASTER MUST BOTH BE SET TO „Y“ OR „N“
- F27: NOT ENOUGH MEMORY FOR INFO FIELD IN DATAPOOL TO WRITE THE INFO, INCREASE AT LEAST BY @@ WITH THE HELP OF COMMAND  
ADD-DIMSU:DPINFO=<>;
- F28: MAXIMUM NUMBER OF INFO FIELDS ARE USED, NUMBER HAS TO BE INCREASED AT LEAST BY @@ WITH THE HELP OF COMMAND  
ADD-DIMSU:INFO=<>;
- F29: INDEX OUT OF RANGE
- F30: BLNO=@@ IS STILL ASSIGNED TO AT LEAST ONE CIRCUIT OF A CDG BOARD AND HENCE CANNOT BE DELETED. DISPLAY SETTINGS WITH  
DISPLAY-LWPAR:TYPE=CDG,BLNO=@@,LWPARREF=YES;
- F31: COULD NOT LOAD DATA SUBSYSTEM @@@@ FROM HARD DISK.
- F32: @@@@ NOT FOUND ON HARD DISK!
- F33: @@@@ OF TYPE @@@@ NOT IN THE RANGE FROM @ TO @@@.
- F34: AN ERROR OCCURED WHILE COPYING THE @@@@ @@@.
- F35: FOLLOWING VALUES CAN NOT BE CONFIGURED BECAUSE  
THEY ALREADY EXIST IN THE MAPPING TABLE:  
@@@ @@@ @@@ @@@ @@@ @@@ @@@ @@@
- F36: THE INPUT VALUES FOR PARAMETER @@@@@@ MUST BE DIFFERENT.
- F37: THE SPECIFIED VALUE FOR PARAMETER PRIMDXTG HAS NOT BEEN CONFIGURED, BECAUSE DXTG = @@@ IS NOT CONFIGURED IN THE MAPPING TABLE.
- F38: EITHER ALL OR NONE OF THE PARAMETERS DXTGPOS, DXTG AND ITR MUST BE SPECIFIED. PLEASE CHECK INPUT BECAUSE THE ERROR COULD HAVE RESULTED FROM WRONG DXTGPOS OR DXTG FIELD VALUES.
- F39: THE GIVEN BLNO IS BIGGER THAN WITH AMO DIMSU,PARAMETER TBLMAX RESERVED MEMORY.
- F41: THE TMD BLOCK TYPE HAS NO DEV AND INFO FIELD, AND THE SEARCH CRITERIAS BY INFOPAT, DEV AND FORMAT ARE IGNORED.

## 145.5.2 Advisories

- H01: NO BLOCK IS ALLOCATED FOR THE SPECIFIED PARAMETERS
- H02: NO ANALOG BLOCK IS ASSIGNED
- H03: BLOCK <blockno> IS OF CIRCUIT TYPE <circtype>

## LWPAR - Loadware Parameters for Networking Modules

### Error Messages and Advisories

H04: SWITCH PEN <gg-u-sss-cc> OFF AND ON TO LOAD CIRCUIT PARAMETERS

H05: PARAMETERS SMD AND MASTER MUST BOTH BE SET TO "Y" OR "N"

H06: THE CHANGES WILL BECOME EFFECTIVE ONLY AFTER SWITCHING OFF AND SWITCHING ON THE FOLLOWING CDG CIRCUITS. (RESTART-DSSU)

H07: THE CHANGES WILL BECOME EFFECTIVE ONLY AFTER SWITCHING OFF AND SWITCHING ON THE FOLLOWING CDG BOARDS. (DEACTIVATE/ACTIVATE-BSSU)

H08: NO MATCHING SERVICE INFO FIELDS WERE FOUND FOR THE PATTERN GIVEN

H09: IF THE PARAMETER INFOPAT OR FORMAT IS PRESENT IN THE COMMAND LINE, THEN THE VALUE FOR PARAMETER LWPARREF IS IGNORED

H10: THE PARAMETERS OF BLNO @@ HAVE BEEN RESET TO THEIR DEFAULT VALUE.

H11: @@@@=0 --> NO CHANNEL CONFIGURED. FURTHER PARAMETER VALUES ARE IGNORED.

H12: THE FOLLOWING BLNO ARE OVERWRITTEN IN THE DATA BASE WHILE COPYING THE VARIANT @@@:

H13: NO ENTRY FOUND.

H14: BLNNEW @@@ OF TYPE @@@@@ HAS BEEN OWERWRITTEN.

H15: THE PARAMETER @@@@@ AND @@@@@ DO NOT HAVE THE SAME NUMBER OF VALUES. THE REST OF THE LONGER PARAMETER WILL BE IGNORED.

H16: FOR THE SPECIFIED DXTG=255 THE ITR MUST BE ZERO. THE AMO IGNORES THE INPUT AND CONTINUES WITH ITR=0 FOR THIS DXTG.

H17: CAUSED BY THE RECONFIGURATION THE PRIMARY DXTG HAS BEEN CHANGED FOR ITR = @@@. THE NEW VALUE FOR PARAMETER PRIMDXTG IS @@@.

H18: PARAMETER PRIMDXTG IS IGNORED BECAUSE THE ITR BELONGING TO THIS DXTG AND THE ENTERED ITR ARE DIFFERENT.

H19: SINCE UNIQUENESS OF THE <RRG/CBG> VALUES IS REQUIRED YOU HAVE TO ELIMINATE ANY MULTIPLICITIES BEFORE DOWNLOADING THE <LCOSVRRG/LCOSDRRG/TRGCBG> TABLE. THE FOLLOWING VALUES HAVE MULTIPLE OCCURRENCES:  
@@@ @@@ @@@ @@@ @@@ @@@ @@@ @@@

H20: BDETON IS ONLY POSSIBLE, IF BISUB8ON IS SET TOO. BISUB8ON WAS NOT SET AND HAS NOW BEEN SET AUTOMATICALLY BY AMO.

H21: IF THE PARAMETER TYPE IS SET TO TMD THEN THE VALUES FOR THE PARAMETERS INFOPAT, FORMAT AND DEV ARE IGNORED.

H22: IF THE PARAMETER LNTYPE IS NOT COPPER  
THEN THE VALUE FOR THE PARAMETER COPTYPE IS IGNORED.

# 146 MFCTA - Administration of Multifrequency Code Tables

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO MFCTA allows the user to CHANGE, DISPLAY, REGENERATE and COPY the MFC variant tables and MFC signal conversion tables.

These are allocated when creating (adding) an MFC circuit, with the aid of the parameter MFCVAR of the AMO TACSU.

The tables exist in the CC and in the LTG(s), and are initialized with the aid of COPY the invariable basic initialized tables from the hard disc.

The existing initialization tables on harddisc can be displayed with the command

DISPLAY-MFCTA: ,HD;. The number of MFC tables in database are configured using AMO DIMSU, parameter MFCVAR.

For this reason, the AMO does not contain an ADD branch.

The contents of the CC tables are transferred to the corresponding DH (device handler) tables by means of an LTG 1:1 update.

The MFC tables (MFCVAR = 1 - up to 10 (AMO DIMSU, parameter MFCVAR)) are subdivided in:

1. MFC Variant Table
2. MFC Signal Conversion Table for Backward Mode
3. MFC Signal Conversion Table for Forward Mode

Figure 14      Memory Layout of the MFC Tables

Figure 15 MFC Variant tables

Figure 16 MFC Signal conversion table on forward mode

Figure 17 MFC Signal conversion tables on backward mode

## 146.1 Restrictions

This description is valid from HiPath 4000 V1.0.

146.2 Interrelationships

- AMO TACSU : Configuration of analog trunk circuits in the SWU
- AMO DIMSU : Memory configuration

146.3 Functions of the AMO

- [CHANGE-MFCTA](#) : Change MFC tables
- [DISPLAY-MFCTA](#) : Interrogate MFC tables
- [REGENERATE-MFCTA](#) : Regenerate MFC tables
- [COPY-MFCTA](#) : Copy MFC basic initialized tables

146.3.1 CHANGE-MFCTA

The action CHANGE allows the user to update data contained in existing, initialized MFC tables.

Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### 146.3.2 DISPLAY-MFCTA

This function allows the user easy access to the contents of the MFC tables according to different criteria.

The parameter MFCVAR specifies the MFC tables to be displayed. The parameter TYPE restricts the information output from the variant tables, backward and forward signal tables to the type desired. The parameter OPT enables the user to restrict the display output to specified table types (MISC to FIDENT).

Using TYPE=HD the list of MFC initialization tables on harddisc can be displayed.

Procedure Overview

| Command Code  | Parameter                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-MFCTA | [MFCVAR=<number>],<br>[TYPE=MFCVAR], [OPT=MISC   SUPERV];<br>  [TYPE=TLBL], [OPT=FSIG   FORIB   FORIA   FIDENT   BSIGA<br>  BSIGB   BSIGB1   BIDENT   EVAL];<br>  [TYPE=TLBF], [OPT=BSIGA   BSIGB   BSIGB1   BIDENT<br>  BSIG2   FIDENT];<br>  [TYPE=ALL];<br>  [TYPE=HD]; |

Note:

Default value is TYPE=ALL.

Examples:

1. Display diverse data

Input:

DISPLAY-MFCTA:MFCVAR=2&3, TYPE=MFCVAR, OPT=MISC;

2. Display the supervision time of the evaluation

Input:

DISPLAY-MFCTA:MFCVAR=1, TYPE=MFCVAR, OPT=SUPERV;

3. Display the table 'Group I signal on dialing'  
(MFC signal conversion table for BACKWARD mode)

Input:

DISPLAY-MFCTA:MFCVAR=3, TYPE=TLBL, OPT=FSIG;

4. Display the table 'Group II signal after A3'  
(MFC signal conversion table for BACKWARD mode)

Input:

DISPLAY-MFCTA:MFCVAR=1, TYPE=TLBL, OPT=FORIB;

Descriptions for the output of the table with OPT = FORIB

|   |        |                                                                                           |
|---|--------|-------------------------------------------------------------------------------------------|
| N | = NOPO | Not possible; an error will be output.                                                    |
| S | = SIG  | Apply the backward signal from group B assigned to the dialing result in the BSIGB table. |
| E | = EVAL | Refer to the appropriate EVAL table (0..3).                                               |
| C | = COEX | Class of externals                                                                        |

5. Display the table 'Group II signal after A5'  
(MFC signal conversion table for BACKWARD mode)

Input:

```
DISPLAY-MFCTA:MFCVAR=1,TYPE=TBLB,OPT=FORIA;
```

6. Display the table 'Group I signal on ID check'  
(MFC signal conversion table for BACKWARD mode)

Input:

```
DISPLAY-MFCTA:MFCVAR=1,TYPE=TBLB,OPT=FIDENT;
```

7. Display the table 'Group A signal on dialing'  
(MFC signal conversion table for BACKWARD mode, OPT=BSIGA)

The output tables for OPT=BSIGB/BSIGB1/BIDENT have the same output format as for OPT=BSIGA.

Input:

```
DISPLAY-MFCTA:MFCVAR=1,TYPE=TBLB,OPT=BSIGA;
```

8. Display the table 'Evaluation table'  
(MFC signal conversion table for BACKWARD mode)

Input:

```
DISPLAY-MFCTA:MFCVAR=1,TYPE=TBLB,OPT=EVAL;
```

9. Display the table 'Group A signal on dialing'  
(MFC signal conversion table for FORWARD mode, OPT=BSIGA)

The output tables for OPT=BSIGB/BSIGB1/BIDENT have the same output format as for OPT=BSIGA.

Input:

```
DISPLAY-MFCTA:MFCVAR=2,TYPE=TBLF,OPT=BSIGA;
```

10. Display the table 'Back. group II signal on transition to B signal'  
(MFC signal conversion table for FORWARD mode)

Input:

```
DISPLAY-MFCTA:MFCVAR=1,TYPE=TBLF,OPT=BSIG2;
```

11. Display the table 'Significance on ID check'  
(MFC signal conversion table for FORWARD mode)

Input:

```
DISPLAY-MFCTA:MFCVAR=1,TYPE=TBLF,OPT=FIDENT;
```

The REGENERATE action compares the contents of the MFC tables with those of the basic initialization tables on the hard disk, and outputs any discrepancies in the form of position-oriented commands for regenerating.

The parameter MFCVAR specifies the MFC tables to be displayed. The parameter TYPE restricts the information output from the variant tables, backward and forward signal tables to the type desired. The parameter OPT enables the user to restrict the display output to specified table types (MISC to FIDENT).

| Command Code     | Parameter                                                                                                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REGENERATE-MFCTA | <pre>[MFCVAR=&lt;number&gt;] ,   TYPE=MFCVAR, [OPT=MISC   SUPERV] ;    TYPE=TLBLB, [OPT=FSIG   FORIB   FORIA   FIDENT   BSIGA     ,   BSIGB   BSIGB1   BIDENT   EVAL] ;    TYPE=TLBLF, [OPT=BSIGA   BSIGB   BSIGB1   BIDENT     BSIG2   FIDENT] ;    [TYPE=ALL] ;</pre> |

Default value is TYPE=ALL.

### Regenerate miscellaneous data (MFC variant table)

```
REGENERATE-MFCTA:MFCVAR=2,TYPE=MFCVAR,OPT=MISC;
```

COPY-MFCTA: 1,2;  
CHANGE-  
MFCTA:2,MFCVAR,MISC,SOCFB,SOCFF,10,RSV1&RSV2&RSV3,N,,N,,N,,Y,2AB  
D0:

### 146.3.4 COPY-MFCTA

With the aid of the COPY action, the user can overwrite the MFC tables with the contents of the basic initialization tables on the hard disk.

Only complete MFC table sections can be copied, i.e. both the MFC variant tables and the MFC signal conversion tables are copied for forward and backward signaling.

By specifying MFCVARI=0, the user can delete the contents of a specified file. This is done by overwriting the MFC table with zeroes (empty fields). The MFC table 0 is initialized with zeroes on the hard disk.

The parameter MFCVAR is optional. If MFCVAR is not declared, the AMO searches for a free table element (i.e. not initialized). If the search is successful, the advisory message H1 is output; if unsuccessful, the advisory message H2 is output.

If the user specifies MFCVARI=0, then he must also declare MFCVAR, otherwise the input will be requested by output of the error message F3.

The COPY commands for all table elements with MFCVARI > 0 are output in the REGENERATE action.

#### Procedure Overview

| Command Code | Parameter                            |
|--------------|--------------------------------------|
| COPY-MFCTA   | MFCVARI=<number>, [MFCVAR=<number>]; |

### 146.4 Parameter Description

|                 |                                                                                                                                                                                            |

| Type of Input   | : Single value, optional                                                                                                                                                                   |
| Possible Values | : 0 - 99                                                                                                                                                                                   |
|                 | 1 - 16 for STNCAT=INFO                                                                                                                                                                     |
| Default Value   | 0                                                                                                                                                                                          |
| ADREQ           | Address request/retransmit signal(s)                                                                                                                                                       |
|                 | Number of request signals and request signals for SOCOTEL                                                                                                                                  |
|                 | The CCITT-R2 standard allows the dialed number to be repeated with this code once the MFC signal exchange has begun (request last or penultimate signal from the central office/exchange). |

## MFCTA - Administration of Multifrequency Code Tables

### Parameter Description

Type of Input : Single value, optional  
Possible Values : 0 - 9, A - F, \*, #, of max. 6 digits  
For SOCOTEL (MFCTYPB/MFCTYPF=SOCFB/SOCEB/SOCFF/SOCEF),  
at least 1 request signal must be set.

#### ANBEG

Begin position of A number in CPB  
Type of Input : Single value, optional  
Possible Values : 0 - 44  
Default Value : 0  
Type of Input : Single value, optional

#### ANEND

End position of A number in CPB  
Position for insertion of A number  
Type of Input : Single value, optional  
Possible Values : 0 - 44  
Default Value : 0

#### ANICAT

Ani category  
Type of input : single value, optional  
Possible values:

|       |               |    |              |
|-------|---------------|----|--------------|
| ANI1  | ani kategorie | 1  | DB_MFC_ANI1  |
| ANI10 | ani kategorie | 10 | DB_MFC_ANI10 |
| ANI2  | ani kategorie | 2  | DB_MFC_ANI2  |
| ANI3  | ani kategorie | 3  | DB_MFC_ANI3  |
| ANI4  | ani kategorie | 4  | DB_MFC_ANI4  |
| ANI5  | ani kategorie | 5  | DB_MFC_ANI5  |
| ANI6  | ani kategorie | 6  | DB_MFC_ANI6  |
| ANI7  | ani kategorie | 7  | DB_MFC_ANI7  |
| ANI8  | ani kategorie | 8  | DB_MFC_ANI8  |
| ANI9  | ani kategorie | 9  | DB_MFC_ANI9  |
| NULL  | no evaluation |    | DB_MFC_NULL  |

#### APOS

Position for insertion of A number  
Type of Input : Single value, 11. parameter of a min-1-group  
Possible Values : 0 - 44  
Default Value : 0

#### BACKTYPE

MFC conversion tables, backward signals  
Type of Input : Single value, optional  
Possible Values : ANIBACKW ani backward  
ANIFORW ani forward

## MFCTA - Administration of Multifrequency Code Tables

### Parameter Description

|          |                                                                                                                                                       |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| MFPBACKW | mfp backw co -> system                                                                                                                                |
| MFPFORW  | MFP mode forward system -> co                                                                                                                         |
| MFRPB    | multi frequency packed backward                                                                                                                       |
| MFRPF    | multi frequency packed forward                                                                                                                        |

## MFCTA - Administration of Multifrequency Code Tables

### Parameter Description

Transmitter: MFC signals

Receiver : Control freq. (2 out of 6)

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| DINFO    | <p>Dialing Information</p> <p>Type of Input : Single value, optional</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## MFCTA - Administration of Multifrequency Code Tables

### Parameter Description

|                   |        |                                     |
|-------------------|--------|-------------------------------------|
| Possible Values : | ADINFO | Additional information (reserved)   |
|                   | ANO    | Transfer to A-party number          |
|                   | DGT    | Transfer dialed digits              |
|                   | IDEND  | End of A-party number transfer      |
|                   | IDREF  | Send A-party number request refused |
|                   | IDSEND | Send A-party number                 |
|                   | INCO   | Dialing incomplete                  |
|                   | NOPO   | Not possible                        |
|                   | NULL   | No evaluation                       |
|                   | TRACE  | Malicious call trace                |

EODTYPE      End-of-dial signal type (digit analysis result)

Type of Input      1 to 20 single values, concatenated with &, mandatory

|                 |          |                                                   |
|-----------------|----------|---------------------------------------------------|
| Possible Values | ADVICE   | station returning advisory / recorded info        |
|                 | BSYCO    | Device busy on CO call                            |
|                 | BSYTIE   | Device busy on tie/house call                     |
|                 | BUSY     | Device busy                                       |
|                 | CONG     | Congestion / exchange busy                        |
|                 | DIDDND   | station has do not disturb for indial             |
|                 | DND      | Do not disturb is active                          |
|                 | STNCL    | station/subscriber class                          |
|                 | ETEMIN1  | End to End, repeat second last digit (n-1)        |
|                 | ETEMIN2  | End to End, repeat second last digit (n-2)        |
|                 | ETEMIN3  | End to End, repeat second last digit (n-3)        |
|                 | ETEMINX  | End to End, repeat all digits                     |
|                 | ETENORSP | End to End, no backward signal                    |
|                 | FRCHG    | Device free, call charges                         |
|                 | FRNCHG   | Device free, no call charges                      |
|                 | IDENT    | Changeover to identity check state                |
|                 | INCO     | Dialing incomplete                                |
|                 | MCIDFC   | subscriber call tracing and free of charge        |
|                 | NASS     | Call fwd. LODEN / station no. LODEN not assigned) |
|                 | NAUTH    | Connection does not have required authorization   |
|                 | NAVA     | Not available (finding or hunt restrictions)      |
|                 | NOPO     | Not possible                                      |
|                 | NVAL     | Not valid                                         |
|                 | OVR      | override busy station                             |
|                 | TEST     | Connection to test circuit                        |
|                 | TRACE    | Malicious call trace                              |

## MFCTA - Administration of Multifrequency Code Tables

### Parameter Description

|          |                                                                                    |                                                           |
|----------|------------------------------------------------------------------------------------|-----------------------------------------------------------|
|          | TRANS                                                                              | Through-connection (transit) to ATND console              |
| EVTBL    | Pointer to MFC evaluation tables                                                   |                                                           |
|          | Type of Input                                                                      | : Single value, mandatory                                 |
|          | Possible Values                                                                    | : 0 - 3                                                   |
| EXACFI   | Exchange access code for identification                                            |                                                           |
|          | Type of Input                                                                      | : Single value, optional                                  |
|          | Possible Values                                                                    | : 0 - 9, A - D, *, #, of max. 6 digits                    |
| FILLCHAR | fill character at minimal digit position                                           |                                                           |

## MFCTA - Administration of Multifrequency Code Tables

### Parameter Description

|          |                                   |
|----------|-----------------------------------|
| PRISTN   | Priority station or CO subscriber |
| SATCONN  | satellite connection              |
| STN      | Station                           |
| STNCAT1  | Reserved                          |
| STNCAT2  | Reserved                          |
| STNCAT3  | Reserved                          |
| STNNTLL  | station no toll                   |
| STNPRONT | station with priority, no toll    |
| STPRIO1  | Station/subscriber with prio 1    |
| TEST     | Connection to test circuit        |
| TOLLC    | Toll-Call                         |
| TOLLOP   | Toll operator                     |
| ROUTINE  | MLPP routine call                 |
| PRTY     | MLPP priority call                |
| IMMED    | MLPP immediate call               |
| FLASH    | MLPP flash call                   |
| FLASHOV  | MLPP flash override call          |
| PROT     | MLPP protected call               |

**ID** Identification signal sequence

Type of Input : Single value, optional

Possible Values : 0 - 9, A - F, of max. 22 hexadecimal digits  
MFC signal sequence of 1 - 22 hexadecimal digits

Default Value : blank signal sequence

**IDX** iIndex to evaluation table

Type of Input : Single value, optional

Possible Values : 0 - 3 Evaluation table 0 to 3  
4 Toll call  
5 Local call  
6 - 99 Preliminaries

Default Value : 0

**IMP** Revert to impulsing on error (MFC R2)

If BACKTYPE/FORWTYPE=SOCFB/SOCEB this parameter is of no significance

Type of Input : Single value, optional

Possible Values : 0 - 15

**IMP2** Error with call forwarding to attendant

## MFCTA - Administration of Multifrequency Code Tables

### Parameter Description

|         |                                                                                     |                                                                                  |
|---------|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
