| EVAL     | Evaluation tables                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |        |                                |       |                                 |       |                                 |        |                          |      |                   |

## MFCTA - Administration of Multifrequency Code Tables

### Parameter Description

|        |                            |
|--------|----------------------------|
| FIDENT | Group I signal on ID check |
| FORIA  | Group II signal after A5   |
| FORIB  | Group II signal after A3   |
| FSIG   | Group I signal on dialing  |

Possible Values for TYPE=TBLF (forward mode):

|         |                                        |
|---------|----------------------------------------|
| BIDENT  | Group A signal on ID check             |
| BSIGA   | Group A signal on dialing              |
| BSIGB   | Group B signal on transition to grp II |
| BSIGB1  | 2nd group B signal table               |
| BSIG2   | Back grp II sig on transition to B sig |
| DIALOUT | Evaluation of digits to send           |
| FIDENT  | Back. significance on ID check         |

Possible Values for TYPE=MFCVAR

|        |                                            |
|--------|--------------------------------------------|
| MFCVAR | miscellaneous data for a specified variant |
| SUPERV | supervision parameters for evaluation      |

ORIG      Originating party signal handling option

Type of Input      : Single value, single value, optional

Possible Values      : COEX      Class of externals  
                               EVAL      Evaluation of dialed number,  
                               NOPO      Not possible (error listing is output)  
                               SIG      apply the backward signal from group b

PABXID      PABX identification sequence

Type of Input      : Single value, optional

Possible Values      : 0 - 9, A - F, of max. 22 hexadecimal digits  
                               MFC signal sequence of 1 - 22 hexadecimal digits

Default Value      : blank signal sequence

PAR      Parameters (attributes) for MFC variant

Type of Input      : 1 to 17 single values, concatenated with &, optional

Possible Values      AMTC2      Electro mechanical exchange of type C2  
                               AMTC3      Electro mechanical exchange of type C3  
                               CATTOID      change category to identifier  
                               CHKIDDGT      check first digit at ident  
                               CHRGSIM      activate call charging simulateion  
                               EOFSEL      send dialing end to lw  
                               FRELBU      forward release if busy  
                               FRELSB      forward release if station busy

## MFCTA - Administration of Multifrequency Code Tables

### Parameter Description

|          |                                                                                                                                                                                       |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDBEFBS  | identify before b station                                                                                                                                                             |
| IDCAT    | Station/subscriber category number transfer.                                                                                                                                          |
| IDNOCAT  | identification without station/sub. category                                                                                                                                          |
| IGNI15   | ignore i-15 as first sign                                                                                                                                                             |
| KATTOA   | category is part of A number                                                                                                                                                          |
| MFCMO    | mfc monitoring message for test                                                                                                                                                       |
| MFRP3    | mfr-packet protocol 3                                                                                                                                                                 |
| MFRPE    | mfr-packet with echo blocking                                                                                                                                                         |
| MFRPRES  | reserved parameter 1 for MFRP                                                                                                                                                         |
| NOB11    | no B11-Signal at incoming long distance seizure                                                                                                                                       |
| NOMFCMO  | supress mfc monitoring message                                                                                                                                                        |
| NONE     | No attribute<br><br>NONE is used to delete resp. override values of the parameter PAR. If NONE is used in combination with other values, only the values after NONE will be accepted. |
| NOTNER   | Backward release on error without alerting tones or MFC register signals (e.g. as for Belgium).                                                                                       |
| PRIOSUB  | subscriber with override authorization                                                                                                                                                |
| RSV1     | Reserve attribute 1 for diverse country-specific adaptations.                                                                                                                         |
| RSV2     | Reserve attribute 2 for diverse country-specific adaptations.                                                                                                                         |
| RSV3     | Reserve attribute 3 for diverse country-specific adaptations.                                                                                                                         |
| RSV4     | Reserve attribute 4 for diverse country-specific adaptations.                                                                                                                         |
| RSV5     | Reserve attribute 5 for diverse xcountry-specific adaptations.                                                                                                                        |
| SOCEBWS  | extended backwardsignal (socotel)                                                                                                                                                     |
| SOCTEST  | exchange simulation ibercom,mfc-socotel (spain)                                                                                                                                       |
| SPCMA    | Programmable exchange of type SPC with A number                                                                                                                                       |
| SPCOA    | Programmable exchange of type SPC w/o A number                                                                                                                                        |
| TRANSWB  | without b-signal at transit if b-number available                                                                                                                                     |
| WBEOAAN  | wait between end of address and answer                                                                                                                                                |
| TSTSTATE | activate test states                                                                                                                                                                  |
| MLPP     | Multi-Level Precedence and Preemption Service                                                                                                                                         |

PCNT            Number of valid position in the PABX ID  
                   Type of Input            : Single value, optional  
                   Possible Values        : 0 - 22

## MFCTA - Administration of Multifrequency Code Tables

### Parameter Description

Default Value : Number of specified hexadecimal digits of the parameter PABXID  
If PCNT is less than the number of characters specified with PABXID, then only the value entered for PCNT is taken into account.  
If PCNT is greater than the number of characters specified with PABXID, then the value entered for ID is boosted by adding zeroes ('0') to the hexadecimal number.  
If PCNT=0, ID is deleted.

#### PHYSIG

Supervision physical forward signal  
Grp I forward signal on dialing (TYPE=TBLB, OPT=FSIG)  
Grp I forward signal, significance after A5 (TYPE=TBLB, OPT=FORIA)  
Grp I forward signal on ID check (TYPE=TBLB, OPT=FIDENT)  
Grp II forward signal, significance after A3 (TYPE=TBLB, OPT=FORIB)  
Type of Input : Single value, concatenated single values(max.16)  
optional (for TYPE=TBLF, OPT=BSIG2)  
mandatory (else)  
Possible Values : 0 - 15

#### POS1

Position for the insertion of various id sig. blocks, e.g. PABXID

#### POS2

Position for the insertion of various id sig. blocks, e.g. PABXID

#### POS3

Position for the insertion of various id sig. blocks, e.g. PABXID

#### POS4

Position for the insertion of various id sig. blocks, e.g. PABXID

Type of Input : Single value, optional  
Possible Values : 0 - 22  
Default Value : 0

#### RMVCTL

Supervision time for control frequency removal  
Only used for SOCOTEL (BACKTYPE/FORWTYPE=SOCFB/SOCEB/SOCFF/SOCEF)  
Type of Input : Single value, optional  
Possible Values : 0 - 999999 milliseconds  
0 = Deactivate supervision

#### RMVSIG

Supervision time for removal of forward signal  
Type of Input : Single value, optional  
Possible Values : 0 - 999999 milliseconds  
0 = Deactivate supervision

#### SIG

Logical significance of an MFC signal (on dialing)  
For SOCOTEL (BACKTYPE/FORWTYPE=SOCFB/SOCEB/SOCFF/SOCEF) only the values SIG = DGT0 - DGT15 may be allowed for the forward signal (not verified by the AMO)

## MFCTA - Administration of Multifrequency Code Tables

### Parameter Description

|                 |                                                                                   |
|-----------------|-----------------------------------------------------------------------------------|
| Type of Input   | : Single value, mandatory                                                         |
| Possible Values | : DGT0 - DGT15      Number of called station                                      |
|                 | REJ      Request rejected i.e information requested is not available              |
|                 | EOD      End of dialing / pulsing or end of identification                        |
|                 | NOPO      Not possible                                                            |
|                 | EVAL      Evaluation of dialed number pointer to evaluation table (parameter IDX) |
|                 | GR2      group II signal                                                          |
|                 | IDALLWD      ident allowed                                                        |

SIGLENF      Signal duration (length) in forward mode

Type of Input      : Single value, optional

Possible Values      : 0 - 999999 milliseconds

0 = Deactivate supervision

SIGN      Backward signal name

Type of Input      : Single value, mandatory

|                 |                                                |
|-----------------|------------------------------------------------|
| Possible Values | : INCO      Dialing incomplete                 |
|                 | MIN1      Repeat second last digit (N - 1)     |
|                 | MIN2      Repeat third last digit (N - 2)      |
|                 | MIN3      Repeat fourth last digit (N - 3)     |
|                 | RPTALL      Repeat all digits from beginning   |
|                 | BSIG      End signal exchange, change to B sig |
|                 | BUSY      Station busy                         |
|                 | BSYINT      Station busy on internal call      |
|                 | BSYCO      Station busy on CO call             |
|                 | BSYLCL      Station busy on local call         |
|                 | BSYTOLL      Station busy on toll call         |
|                 | CONG      Congestion / exchange busy           |
|                 | STNCL      Station/subscriber class            |
|                 | IDENT      Send station number of A station    |
|                 | TRACE      Start malicious call trace          |
|                 | NOTERM      No terminal connection             |
|                 | NEWNO      Number changed                      |
|                 | FRCHG      Station free, call charges          |
|                 | FRNCHG      Station free, no call charges      |
|                 | FAULT      Station or station port fault       |
|                 | OLDSTN      Previous station/subscriber        |

## MFCTA - Administration of Multifrequency Code Tables

### Parameter Description

|         |                             |

# 147 NAVAR - Administration of Static Night Switch Option Data

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

When night service is in effect, an attendant group (ATNDGR) is represented by a night option. All calls to the attendant group are signalled on an available device that is allocated to this night option. The allocation of the devices to the *night options* is carried out by means of this AMO.

The feature "Centralized Attendant Services" also offers the option of assigning an attendant group to a night option (instead of a specific device). This attendant group can then function as a night switch for the entire attendant traffic of the ATNDGR which needs to be represented. An attendant group which takes on the duties of another attendant group is a "centralized attendant services group" (CASGR). A CASGR can be an ATNDGR within the same PABX (CASINT) or even within the same integrated network (CASEXT).

Thus, this AMO provides a range of night options, which can be identified by their option number. Using AMO VFGR, it is then possible to allocate up to 8 of these night options to each ATNDGR. The night option that represents a given ATNDGR when the night service is active can be individually defined via screen menu at an attendant console (ATND) in that ATNDGR.

A night option can assume the following configurations:

- a) "None" Night Option (Dummy Option, Blank Option)  
Only one option can be defined as a dummy option. It can be allocated to an ATNDGR as a night option if the particular ATNDGR does not wish to have night service.
- b) General Answering from any Station Option/ Universal Night Answer/  
Night bell pick-up  
Options of this type consist of exactly one device created especially for "general answering from any station" by means of AMO SSC.
- c) Station Option  
Options of this type consist of up to 10 assigned local stations of the own node.  
Incoming calls are allocated cyclically.
- d) CASINT option  
Options of this type consist of an ATNDGR in the same PABX as the ATNDGR to be represented, which is identified by its

## NAVAR - Administration of Static Night Switch Option Data

### Restrictions

attendant group number (ATNDGR). An internal CASGR may only be assigned to one night option. However, an internal CASGR does not have to be assigned as such using the AMO VFGR, since its presence is not verified by this AMO.

e) CASEXT option

Options of this type consists of an ATNDGR within an integrated network, which is identified by its attendant group dialing code and the destination number of the PABX to which it belongs. An external CASGR may only be assigned to one night option. However, neither the attendant group dialing code (AMO VFGKZ) nor the destination number (AMO RICHT) must have been specifically assigned, since the presence is not verified by this AMO.

The parameter CD is need to enter a 22 digit number. For open numbering this number consits of the tie trunk access code and attendant code. For closed numbering the attendant code of the ATNDGR for the target switch is used. This identification number must exist in the digit translation as a digit analysis = NETWORK along with the corresponding target number.

## 147.1 Restrictions

This description is valid for HICOM 300E V2.0.

## 147.2 Interrelationships

- AMO ACSU : Attendant Console Configuration
- AMO SCSU/SBCSU : Subscriber Configuration of Switching Unit
- AMO VFGR : Attendant Console Groups
- AMO SSC : Special Subscriber Configuration

## 147.3 Functions of the AMO

- [ADD-NAVAR](#) : Create Night Option
- [CHANGE-NAVAR](#) : Change the Night Option Data
- [DELETE NAVAR](#) : Cancel the Night Options
- [DISPLAY-NAVAR](#) : Interrogate All Static Data of All Night Options

- **REGENERATE-NAVAR** : Regenerate the Current Status of the Night Option Data

### 147.3.1 ADD-NAVAR

A night option is identified by its option number.

A maximum of 128 night options in total are possible.

#### Procedure Overview

| Command Code | Parameter                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-NAVAR    | NOPTNO=<number><br>,TYPE=NONE<br><br>  ,TYPE=GENANS, GENANSNO=<number>;<br><br>  ,TYPE=STN, STNO=<number>;<br><br>  ,TYPE=CASINT, ATNDGR=<number>;<br><br>  ,TYPE=CASEXT, CD=<number>; |

### 147.3.2 CHANGE-NAVAR

By means of the function CHANGE NAVAR, it is possible to change a set of devices allocated to a night option.

A distinction must be made between two types of changes:

- **Change the Option Type**  
This corresponds to a complete redefinition of the night option and is therefore possible only by means of the DELETE and ADD functions.
- **Change the Set of Devices (for TYPE=STN only)**  
The parameter FUNCT is used to describe the type of change, i.e., it is possible to remove devices from the set (FUNCT=DEL) and to add devices to the existing set (FUNCT=ADD). In particular, by using FUNCT=DEL and by specifying several options for parameter NOPTNO, it is possible to search for a device within several options and to remove this device from all of them. This is necessary, for example, if the device concerned is to be cancelled.  
In order to preserve the clarity, however, only several night options or several devices can be specified. It is also impossible to simultaneously add/remove several devices to/from several

## NAVAR - Administration of Static Night Switch Option Data

### Functions of the AMO

options.

If the first device in a night option assigned to an attendant group is deleted (FUNCT=DEL), the number of the new first device will be displayed at the ATND.

#### Procedure Overview

| Command Code | Parameter                                                      |
|--------------|----------------------------------------------------------------|
| CHANGE-NAVAR | [NOPTNO=<number>], FUNCT=<param><br>, TYPE=STN, STNO=<number>; |

#### Example

Search all night options for station 3100 and remove it.

Input:

```
CHANGE-NAVAR:FUNCT=DEL, TYPE=STN, STNO=3100;
```

#### Note

In this case the NOPTNO is missing.

### 147.3.3 DELETE NAVAR

It must be noted that a night option to be cancelled must not be to allocated any ATNDGR (cancel by means of AMO VFGR, parameter NOPT1 - NOPT8).

#### Procedure Overview

| Command Code | Parameter        |
|--------------|------------------|
| DELETE-NAVAR | NOPTNO=<number>; |

### 147.3.4 DISPLAY-NAVAR

The function DISPLAY-NAVAR provides an overview of the devices allocated to the night options.

The attendant console group to which the option is allocated as a night option and group-specific night option number (NOPT) and name (NOPTNAME) under which it is listed there are also displayed.

The active night option of an ATND group is marked with an asterisk '\*' (behind the group-specific night option number NOPT).

SG provides the number of the subgroup via which the night option is implemented internally (for traffic measurement).

### Procedure Overview

| Command Code  | Parameter           |
|---------------|---------------------|
| DISPLAY-NAVAR | [NOPTNO=<number>] ; |

#### Example

Interrogate all existing night options

Input:

DISPLAY-NAVAR ;

Output:

| NOPT-<br>NO | TYPE   | DEVICES         | ATND<br>GR | NOPT | NOPTNAME       | SG |
|-------------|--------|-----------------|------------|------|----------------|----|
| 1           | STN    | 2104 3100 3110  | 0          | 1    | NIGHT OPTION 1 | 1  |
| 2           | GENANS | 0               | 0          | 2*   | NIGHT OPTION 2 | 2  |
| 3           | STN    | 2103 3110       | 1          | 1    | NIGHT OPTION 1 | 3  |
| 4           | STN    | 4302            | 1          | 7*   | NIGHT OPTION 7 | 4  |
| 6           | STN    | 4306 4307       | 2          | 1*   | NIGHT OPTION 1 | 5  |
| 7           | STN    | 2115            | 1          | 8    | NIGHT OPTION 8 | 6  |
| 8           | NONE   |                 |            |      |                | 7  |
| 9           | STN    | 4308            |            |      |                | 8  |
| 10          | CASINT | ATNDGR=1        | 2          | 2    | NIGHT OPTION 2 |    |
| 11          | CASEXT | CD=123456789090 |            |      |                |    |

## 147.3.5 REGENERATE-NAVAR

### Procedure Overview

| Command Code     | Parameter           |
|------------------|---------------------|
| REGENERATE-NAVAR | [NOPTNO=<number>] ; |

## 147.4 Parameter Description

|                 |                                                                                      |
|-----------------|--------------------------------------------------------------------------------------|
| ATNDGR          | ATND group number of internal centralized ATND service                               |
| Type of Input   | : single value, mandatory                                                            |
| Possible Values | : 0 - 15                                                                             |
|                 | AMO NAVAR does not verify, whether the ATNDGR has already been assigned by AMO VFGR. |
| CD              | Code for external centralized ATND service                                           |

## NAVAR - Administration of Static Night Switch Option Data

### Parameter Description

|          |                                                             |                                                                                                                                                                                                                               |
|----------|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | Type of Input                                               | : single value, mandatory                                                                                                                                                                                                     |
|          | Possible Values                                             | : 1 - 22 digits long<br>AMO NAVAR does not verify, whether the CD has already been assigned by AMO VFGKZ.                                                                                                                     |
| FUNCT    | Whether devices are to be added or removed                  |                                                                                                                                                                                                                               |

## 147.5 Error Messages and Advisories

### 147.5.1 Error Messages

- F01: NIGHT OPTION <nnn> ALREADY ASSIGNED
- F02: NIGHT OPTION <nnn> NOT ASSIGNED
- F03: NIGHT OPTION <nnn> CANNOT BE DELETED, AS IT IS STILL ASSIGNED TO  
ATND GROUP <gg>
- F04: DEVICE TYPE ENTERED DOES NOT MATCH NIGHT OPTION <nnn> SPECIFIED
- F05: DEVICE <xxxxxx> IS ALREADY INCORPORATED IN NIGHT OPTION <nnn>
- F06: NIGHT OPTION <nnn> CANNOT BE ASSIGNED, SINCE NO PROVISION HAS BEEN MADE  
FOR FURTHER NIGHT STATIONS (AMO DIMSU: PARAMETER NSTN)
- F07: NIGHT OPTION <nnn> CANNOT BE ASSIGNED, AS A "NONE" OPTION  
ALREADY EXISTS
- F09: NIGHT OPTION <nnn> CONTAINS TOO MANY DEVICES
- F10: DEVICE <xxxxxx> IS NOT OF THE DEVICE TYPE SPECIFIED  
(Note: It is not possible to assign SET600 devices (see AMO SBCSU) to a night  
option of TYPE=STN.)
- F11: THERE IS NO DEVICE <xxxxxx> IN NIGHT OPTION <nnn>
- F12: THE SPECIFIED RANGE(S) DO(ES) NOT CONTAIN A VALID NIGHT OPTION
- F13: STNO <xxxxxx> IS THE ANALOG SIDE OF A MODEM
- F14: THE SIMULTANEOUS SPECIFICATION OF A NUMBER OF NIGHT OPTIONS  
AND DEVICES IS INADMISSABLE
- F15: DEVICE <xxxxxx> NOT ASSIGNED FOR ANSWERING FROM ANY STATION (GENANS)
- F16: DELINKING THE FINAL DEVICE FROM NIGHT OPTION <nnn> IS INADMISSIBLE.  
USE DELETE FUNCTION!
- F17: THE SPECIFICATION OF SEVERAL NIGHT OPTIONS WHEN ADDING NIGHT ATND'S IS  
ILLOGICAL
- F18: NIGHT OPTION <nnn> IS THE ACTIVE OPTION OF ATND GROUP <gg>. NO DEVICE  
MAY BE REMOVED (AT FIRST THE NIGHT OPTION MUST BE DEACTIVATED)
- F19: NIGHT OPTION <nnn> CANNOT BE ASSIGNED SINCE INSUFFICIENT SUBGROUPS ARE  
AVAILABLE (AMO DIMSU: PARAMETER SG)
- F20: NIGHT OPTION <nnn> CANNOT BE ALLOCATED MEMORY
- F21: DEVICE <xxxxxx> HAS BEEN SPECIFIED A NUMBER OF TIMES
- F22: NIGHT OPTION <nnn> HAS BEEN SPECIFIED A NUMBER OF TIMES
- F23: DEVICE <xxxxxx> IS NOT PRESENT IN ANY NIGHT OPTION IN THE (ONE OF THE) RANGE(S)  
SPECIFIED
- F24: STNO <xxxxxx> INVALID (WITNESS FACILITY)
- F25: SPECIFIED CENTRALIZED ATND SERVICE ALREADY ASSIGNED IN NOPTNO <nnn>
- F26: STNO <xxxxxx> CANNOT BE ADDED TO A NIGHT OPTION, AS LONG ACKST=TE IS) SET IN  
THE AMO SCSU
- F27: STNO <xxxxxx> IS A SPECIAL <amo> SUBSCRIBER WHICH IS NOT ALLOWED IN A NIGHT  
OPTION.
- F28: ONS GROUP MEMBERS (STNO =<stno>) CAN NOT BE ASSIGNED AS NIGHSTATION
- F29: THERE IS ANOTHER NOPTNO WITH THE SAME CD.

147.5.2 Advisories

H01: NIGHT OPTION <nnn> NOT YET ASSIGNED  
H02: RANGE <nnn> TO <nnn> DOES NOT CONTAIN ANY ASSIGNED NIGHT OPTION  
H03: NIGHT SERVICE NEEDS TO BE ACTIVATED  
(ADD-ACTDA:TYPE=ATNDGR,ATNDGR=<gg>,ACT=ACT;)

Output Texts

<nnn> Night option number  
<gg> ATND group number (assigned by AMO VFGR)  
<xxxxxx> Code of devices  
<amo> SCSU, SBCSU, SSCSU

| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

Passwords and password classes regulate the user's access to the various AMO functions. The AMO PASSW is used to administrate the user passwords and to assign these passwords to password classes in accordance with the user's authorizations. A total of 15 passwords can be defined. Each password can consist of up to 8 uppercase letters, digits or special characters. The passwords are stored in encoded format.

The following table can be used as an aid for assigning user passwords to password classes:

| <b>User</b>            | <b>Password class</b> |
|------------------------|-----------------------|
| Password administrator | 5                     |
| Sales rep.             | 4                     |
| Product specialist     | 3                     |
| System administrator   | 2                     |
| Customer               | 1                     |

Each AMO function (verb-noun combination) is (only) assigned one password class. In addition to the above-mentioned password classes there is class 0 whose functions are accessible without specifying a password. Higher classes automatically include lower classes (i.e. class-5 users can access all AMO functions).

With the exception of REGENERATE, all functions of the AMO PASSW belong to password class 5.

The password HICOM is assigned password class 5 by default. This password should be changed immediately to protect the system against access from unauthorized users. The password should have a length of at least six characters. At least one of these characters should be either a digit or a special character. The passwords should be changed at regular intervals by the password administrator.

The password HICOM is assigned password class 5 by default. This password should be changed immediately to protect the system against access from unauthorized users. The password should have a length of at least six characters.

**PASSW - Password**  
Restrictions

The AMO PASSW is also used to administrate the terminal lock function. After a number of attempts for entering the correct user’s password, the terminal will be locked for a specific time. If the lock time equals zero, then the lock function is inactive.

**148.1 Restrictions**

This description is valid from SP300-V3.4

**148.2 Interrelationships**

None

**148.3 Functions of the AMO**

- [ADD-PASSW](#) : Creating a password
- [CHANGE-PASSW](#) : Changing a password
- [DISPLAY-PASSW](#) : Displaying the password table
- [DELETE-PASSW](#) : Canceling a password
- [REGENERATE-PASSW](#) : Regenerating the password table

**148.3.1 ADD-PASSW**

1. Adding a new password and assigning it to a password class.
2. Reloading the entire password table. The associated data is copied from a backup file which was previously generated by means of the function REGENERATE-PASSW.
3. Changing number of attempts and lock time.

**Procedure Overview**

| Command Code | Parameter                                  |
|--------------|--------------------------------------------|
| ADD-PASSW    | TYPE=PSWD, PWN=<string>, PWC=<number>; (1) |
|              | TYPE=TBL; (2)                              |

| Command Code | Parameter                                     |
|--------------|-----------------------------------------------|
|              | TYPE=LOCK, {COUNT=<number>,TIME=<number>; (3) |

### Examples

1. Assigning the password EXAMPLE to password class 1.

Input:

```
ADD-PASSW:PSWD,EXAMPLE,1;
```

2. Reloading the entire password table by means of the generated backup file.

Input:

```
ADD-PASSW:TBL;
```

3. Changing number of attempts to 7 and lock time to 1 hour

Input:

```
ADD-PASSW:LOCK,7,1;
```

## 148.3.2 CHANGE-PASSW

An old password is replaced by a new password with the same password class.

### Procedure Overview

| Command Code | Parameter                  |
|--------------|----------------------------|
| CHANGE-PASSW | PWO=<string>,PWN=<string>; |

### Example

The password EXAMPLE is to be replaced by the password SECRET.

Input:

```
CHANGE-PASSW:EXAMPLE,SECRET;
```

## 148.3.3 DISPLAY-PASSW

All user passwords and the associated password classes are displayed.

### Procedure Overview

| Command Code  | Parameter |
|---------------|-----------|
| DISPLAY-PASSW | ;         |

Example

Input:

DISPLAY-PASSW:;

Output:

| PASSWORD | CLASS |
|----------|-------|
| -----    | ----- |
| HICOM    | 5     |
| SECRET   | 1     |
| XYZZXY   | 3     |
| X1X7C2X0 | 2     |
| ELEKTRON | 1     |
| QUANTEN  | 1     |
| ASW3521  | 2     |
| ARTHUR   | 4     |
| WILLEMII | 5     |

1 HOURS TERMINAL LOCK AFTER 7 ATTEMPTS OF ENTERING CORRECT  
PASSWORD

148.3.4 DELETE-PASSW

This function cancels an existing user password. If the password to be canceled has been assigned to password class 5, it will only be canceled if there is at least one other password with password class 5. This ensures that at least one password with password class 5 exists.

Procedure Overview

| Command Code | Parameter     |
|--------------|---------------|
| DELETE-PASSW | PWO=<string>; |

Example

Canceling the password SECRET from the password table.

Input:

DELETE-PASSW:SECRET;

148.3.5 REGENERATE-PASSW

Regenerating the password table and lock information. Unlike other AMO functions, this function does not use the ADD command format for output but encodes the passwords and then transfers them to a backup file. The contents of the backup file can be reloaded by using the command ADD-PASSW:TBL;

## Procedure Overview

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-PASSW | ;         |

### Example

Regeneration of the password table.

Input:

```
REGENERATE-PASSW;
```

Output:

```
ADD-PASSW:TBL;
ADD-PASSW:LOCK,7,1;
```

## 148.4 Parameter Description

|            |                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COUNT      | Number of attempts for entering the correct password<br>Type of Input : Single value, optional<br>Possible Values : 1-99                                           |
| PWC        | Password class<br>Type of Input : Single value, mandatory<br>Possible Values : 1-5<br>Password class 5 is the highest password class without any restrictions.     |
| PWO<br>PWN | Old password,<br>New password<br>Type of Input : Single value, mandatory<br>Possible Values : max. 8 characters (upper case letters, digits or special characters) |
| TIME       | Lock time in hours<br>Type of Input : Single value, optional<br>Possible Values : 0 = lock function inactive<br>1-240                                              |
| TYPE       | Branching parameter<br>Type of Input : Single value, mandatory<br>Possible Values : PSWD = create new password                                                     |

## PASSW - Password

### Error Messages and Advisories

|      |                         |
|------|-------------------------|
| TBL  | = reload password table |
| LOCK | = change lock function  |

## 148.5 Error Messages and Advisories

### 148.5.1 Error Messages

F01: PASSWORD ALREADY EXISTS  
F02: PASSWORD DOES NOT EXIST  
F04: NEW PASSWORD ALREADY EXISTS  
F05: NO FURTHER PASSWORDS CAN BE ASSIGNED  
F06: FILE ACCESS ERROR; DMS ERROR CODE: @@@@  
F07: BACKUP FILE FOR PASSWORDS DOES NOT EXIST  
F08: THE LAST PASSWORD WITH PASSWORD CLASS 5 MAY NOT BE CANCELED

### 148.5.2 Advisories

None

### 148.5.3 Use of the Output Messages for Each Action

|            |                      |
|------------|----------------------|
| DISPLAY    | : None               |
| CHANGE     | : F02, F04           |
| ADD        | : F01, F05, F06, F07 |
| DELETE     | : F02, F08           |
| REGENERATE | : F06                |

## 149 PATCH - Administration and Activation

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

Using the AMO PATCH, patch files (PF) which are on the hard disk (HD) can be added into a patch catalog, thus making them known to administration. PFs and Patch Catalog are located in: PDS: area of HD.

In addition, with the AMO PATCH the operator can delete patch files and their catalog entry and output information on patches in protocol form.

The group-id can be changed from all catalogued patches.

The AMO PATCH is used to activate or deactivate a software patch cataloged in the patch catalog on the hard disk. Adding into the patch catalog may be carried out when activating or deactivating the patch.

Patches can be activated and deactivated as MegaPatch or SinglePatch. Activating of many Patches will be faster with MegaPatch.

Patching is possible for:

- Resident subsystems on central processors: (de)activation possible on the hard disk (in the PGLIB) as well as in the main memory.

There are three possibilities for activation:

- In the main memory only
- In the main memory and on the hard disk (in the PGLIB)
- On hard disk only (in the PGLIB)

An activation on hard disk only is also possible for unloaded subsystems.

Patch activation can be carried out with securing (TEST=YES) or without securing (TEST=NO), with the following checks being carried out depending on the TEST parameter entered

| Activation                 | Consistency check | Address check |
|----------------------------|-------------------|---------------|
| secured<br>(TEST = YES)    | Yes               | Yes           |
| not secured<br>(TEST = NO) | No                | Yes           |

Table 3 Patch Activation Tests

The functions of the different tests are as follows:

- **Consistency test:**  
In case of a valid subsystem header, APS-ID and subsystem are checked against the subsystem header. If the dummy correction version entry is valid, values of the subsystem correction version between the dummy and the source correction version are allowed.
- **Address check:**  
A check is made to determine whether all patch addresses given in the patch file are located in the corresponding subsystems. This check is only carried out when (de)activating a patch.

One significant feature of patch technology is the possibility to return a system to its original status (as it was before initiation of the patch functions) at any time. The deactivation function can be used for this purpose. The "old data" stored in the patch file can be re-imported into the system software using this function. This "old data" must therefore always be available in the patch file, i.e. it is either supplied with the patch or is automatically read from the system software and stored in the patch file as part of the patch activation.

|                |                             |                             |   |
|----------------|-----------------------------|-----------------------------|---|
| Old data       | not present                 | present                     |   |
| TEST parameter | Y/N                         | N                           | Y |
| Action         | Data securing in patch file | Data securing in patch file | - |

Table 4 Concept of Data Securing during Patch Activation

During (de)activation in the RAM of patches for resident subsystems on central processors, the checksum is always corrected in the JOTA. In addition, the activation status is entered in the patch catalog for every patch.

### Structure of a patch file in E-file format

```

/****SOH2*****/

                        */

/* NEW  DATA           = */

BYTE 0xxxx:0xxxx = 0xx,0xx,0xx,0xx,0xx,0xx,0xx,.....

```

#### Restrictions and Notes

- Only patches in E-file format are supported
- Patch only in central subsystems in OMF286
- No data cross-check
- Interrupted (de)activation sequences are not recorded

## 149.1 Interrelationships

no relations

## 149.2 Functions of the AMO

- [ADD-PATCH](#) : Add (catalog) patch files
- [DELETE-PATCH](#) : Delete patch files and associated catalog entries
- [DISPLAY-PATCH](#) : Display patch data
- [ACTIVATE-PATCH](#) : Activate (and catalog) patches
- [DEACTIVATE-PATCH](#) : Deactivate (and delete) patches
- [CHANGE-PATCH](#) : Change the group-id of catalogued patch files
- [REGENERATE-PATCH](#) : Only the activation of optional patches is regenerated

### 149.2.1 ADD-PATCH

The specified patch files which must be in the PATCHINPUT area on the hard disk (:PDS:PATCHINPUT/<patno>) are catalogued. If the command does not contain a patch number, it applies to all patch files in the specified area. The parameter TEST enables a "hard" activation without consistency check. Patches may be supplied with a group-identification.  
Optional patches can't be added.

#### Procedure Overview

| Command Code | Parameter                                            |
|--------------|------------------------------------------------------|
| ADD-PATCH    | [PATNO=<string>],[TEST=<param>]<br>,[GRPID=<string>; |

#### Example

Input:  
  
ADD-PATCH:D60001&D60002&D60005,,KV15TS07;  
ADD-PATCH:TESTPATCH,N;

### 149.2.2 DELETE-PATCH

Depending on the TYPE parameter, the following data is deleted

- All system patches (SYS)
- All patches of a APS (APS)
- All patches of a subsystem (SUSY)
- All patches of a group (GRP)

- Single patches (PATCH)

Optional patches can't be deleted explicit. They are deleted from the administration with the DEACT-Command. A copy of the deactivated patches remains in the :pds:opt directory.

### Procedure Overview

#### Command Code

DELETE-PATCH

#### Parameter

```
TYPE=SYS;
|TYPE=APS,APSSIGN=<param>;
|TYPE=SUSY,SUSYNAME=<string>;
|TYPE=GRP,[GRPID=<string>];
|TYPE=PATCH,PATNO=<string>;
```

Example:

Input:

```
DELETE-PATCH:SYS;
DELETE-PATCH:APS,S;
DELETE-PATCH:SUSY,ZMCLAY00;
DELETE-PATCH:PATCH,PA60001&PA60002;
DELETE-PATCH:GRP,KV15*;
```

Output:

```
DELETE ALL PATCHES WITH GROUP IDENTIFIER KV15TS06 ? (Y/N)
```

Input:

Y

#### Note

In DELETE-PATCH:GRP is at the end of the string for group identifier allowed an asterisk as wildcard symbol.

## 149.2.3 DISPLAY-PATCH

Depending on the TYPE parameter, the following data is displayed.

- All system patches (SYS)
- All patches of a APS (APS)
- All patches of a subsystem (SUSY)
- All patches of a group (GRP)
- Single patches (PATCH)
- All optional patches and all activation flags in the DB

PATCH - Administration and Activation

Functions of the AMO

Procedure Overview

| Command Code  | Parameter                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-PATCH | TYPE=SYS;<br>TYPE=APS,APSSIGN=<param>;<br>TYPE=SUSY,SUSYNAME=<string>;<br>TYPE=GRP,GRPID=<string>;<br>TYPE=PATCH,PATNO=<string>;<br>TYPE=OPT; |

Example:

Input:

DISPLAY-PATCH:SYS;

Output:

| SUBSYSTEM         | GROUP    | PATNO     | H   | RAM            | DATE          |
|-------------------|----------|-----------|-----|----------------|---------------|
|                   |          |           | D   | A VMS TCS BP G | HHMM   DDMMYY |
| ZMIPTCH0.D.10.031 |          | D60007    | X X | ---            | 1107   210892 |
| ZMIPTCH0.D.10.031 | KV15TS06 | D60001    | X X | ---            | 0944   280692 |
| ZMDAMCJA.D.10.035 | KV15TS07 | D60002    | X X | ---            | 1457   150792 |
| ZMDSIG00.D.10.033 | KV15TS07 | D60005    | X X | ---            | 1505   150792 |
| ZMIPTCH0.D.10.031 |          | DERPATCH  | X X | ---            | 1748   180692 |
| ZMDAMCJA.D.10.035 |          | *PATCHAMC | X X | ---            | 0821   010892 |

Note

The asterisk "\*" indicates a patch that has been added with TEST=N.

The plus "+" indicates a patch that has been activated by MegaPatch.

The activation status of a patch is shown in the columns HD and RAM. The column RAM is subdivided into ADS (for module A1), VMS (V1, V2 and V3), TFS (T1, T2 and T3) and in column BP (processors BPA and BPB). In the last column the GP(LTG) status is presented generally, i.e. the symbol X is displayed when the patch is activated in at least one GP.

The date shows the last relevant access on patch file, i.e. adding of the patch, (de)activation on HD. (De)activation only in RAM are not signed.

Input:

DISPLAY-PATCH:GRP,KV15TS07

Output:

## Functions of the AMO

### Note

In DISPLAY-PATCH:GRP is at the end of the string for group identifier allowed an asterisk as wildcard symbol.

Input:

```
DISPLAY-PATCH:PATCH,D60007;
```

Output:

[illegible]

### **149.2.4 ACTIVATE-PATCH**

#### **Activation of single patches (TYPE=PATCH)**

The specified patches are activated. If no patch numbers are specified, all patches found in :PDS:PATCHINPUT/ will be added and activated.

The parameter DEST specifies where the patch is activated:

- in the main memory only (DEST = RAM)
- in the main memory and on HD for resident subsystems (DEST = HD&RAM)
- on HD for resident subsystems only (DEST = HD).

If the parameter DEST is not specified, patch broadcasting is automatic. If a patch is only to be (de)activated in a specific system unit (processor), DEST must be specified.

The parameter TEST enables a "hard" activation without consistency check.

Activation on HD is carried out secured by means of a patch sequence (similar to ROLL\_OUT) using PBO calls. Patching is always in the non-current version of the subsystem. Following this, the current and non-current versions are exchanged by means of changing the TAB. When the patch sequence is closed, the TAB is written back and the patch is thus active. For subsystems without reserve versions (ABS\_ONLY), a "RES version" is automatically set up. When the patch sequence is closed, in this case the subsystem version which is no longer current is deleted. As a result, the TAB also has the status RES\_ONLY. If an error occurs during patch activation, the patch sequence is automatically deleted (TAB is not switched over). The consistency of the PGLIB is also retained in the event of an error in patch activation.

The parameter GRPID only takes effect when adding a patch.

#### **Activation of all patches of a group (TYPE=GRP)**

All patches with the specified group identifier are activated. The patches must be added with that group identifier previously. It's possible to activate patches by 16 different group IDs.

#### **Note**

The activation status of a patch is not significant. The activation is performed once more, if the patch is still active.

#### **Activate patches with MegaPatch**

The patches can be activated as single or all together (MegaPatch). The manner of activation depends on the activation sign ACTSG. The default value is MEGA. Activation by MegaPatch will be used for many

patches. The activation will be much faster, if their are only patches from one subsystem (or only some few subsystems). All the patches recording to the same subsystem will be picked up and activated all at once by using the MegaPatch option (subsystem is copied only once). After activating all patches of one subsystem the patches of the next subsystem will be activated. Therefore the process is much faster for activating many patches.

The single-patch-process activates one patch after the other.

### Activation of optional Patches

- Optional Patches are located in the directory ":PDS:OPT/". It isn't possible to use the command "ADD-PATCH" for optional Patches.
- The activation flag in the DB is set during the activation of optional patches. (Formerly done by AMO PSA resp. AMO PSS)
- Optional Patches are always activated on Harddisc and on all available target processors.
- The group ID's can't be chosen for free. The group ID is generated from the value of the field ACTIVATION in the patch header. (e.g.: group ID D0017 for the value 17 in the header field ACTIVATION of a ADP patch.)
- The parameter TEST isn't possible for optional patches. They are always activated secure and with all checks.

### Procedure Overview

#### Command Code

ACTIVATE-PATCH

#### Parameter

```
TYPE=PATCH, [PATNO=<string>], [DEST=<param>]
, [TEST=<param>], [GRPID=<string>], [ACTSG=<param>];

|TYPE=GRP, GRPID=<string>, [DEST=<param>]
, [TEST=<param>], [ACTSG=<param>];

|TYPE=OPT, APSSIGN=<param>, ACTFLAG=<number>;
```

### Example:

Input:

```
ACTIVATE-PATCH:PATCH,,,,,TS15KV07;
```

### Note

All patches found in :PDS:PATCHINPUT/ will be added to the catalog. The catalog entry will be supplied with the group name "TS15KV07". Patch broadcasting applies to this example (HD and all target processors valid for subsystem).

## PATCH - Administration and Activation

### Functions of the AMO

Input:

```
ACTIVATE-PATCH:PATCH,DERPATCH,A1,N;
```

The patch will be activated in processor A1 without consistency-check.

Input:

```
ACTIVATE-PATCH:PATCH,PS30001,HD&BPA;
```

Patch on HD and processor BPA applies to this example.

Input:

```
ACTIVATE-PATCH:PATCH,D60001,RAM;
```

Patch at all target processors valid for subsystem (not on HD).

Input:

```
ACTIVATE-PATCH:GRP,KV15TS07;
```

All patches with group identifier KV15TS07 will be activated.

```
ACTIVATE-PATCH:GRP,KV15TS06&KV15TS07;
```

All patches with group identifier KV15TS06 and KV15TS07 will be activated.

```
ACTIVATE-PATCH:PATCH,D60001&D60002&D60003,,,SINGLE;
```

Patch activated with Single Patch.

Input:

```
ACTIVATE-PATCH:OPT,D,12;
```

Activate all optional patches for ADP with activation flag 12.

```
ACTIVATE-PATCH:OPT,S,27&33&34;
```

Activate all optional patches for SWU with activation flags 27, 33, 34.

## 149.2.5 DEACTIVATE-PATCH

The specified patches are deactivated. This action is the opposite of the action ACTIVATE. Depending on the DEL parameter (DEL = Y), the patch(es) will be deleted after deactivation.

### Note

The activation status of a patch is not significant. The deactivation is performed too, if the patch is not active. Only the "old data" must be available in the patch file.

### Deactivate patches with MegaPatch

The patches can be deactivated as single or all together (MegaPatch). The manner of deactivation depends on the activation sign ACTSG. The default value is MEGA. Deactivation by MegaPatch will be used for many patches. The deactivation will be much faster, if their are only patches from one subsystem (or only some few subsystems). All the patches recording to the same subsystem will be picked up and deactivated all at once by using the MegaPatch option (subsystem is copied only once). After deactivating all patches of one subsystem the patches of the next subsystem will be deactivated. Therefore the process is much faster for deactivating many patches.

The single-patch-process deactivates one patch after the other.

#### Deactivate optional patches

- The activation flag in the DB is reset during the activation of optional patches. (Formerly done by AMO PSA resp. AMO PSS)
- Optional Patches are always deactivated on Harddisc and on all available target processors.
- Optional patches are always deactivated secure and with all checks.
- Optional patches are always removed from the administration. A copy of the patch remains in the directory ":PDS:OPT/"
- All patches with the same activation flag and APSSIGN are removed from the administration.

### Procedure Overview

#### Command Code

DEACTIVATE-PATCH

#### Parameter

```
TYPE=PATCH,PATNO=<string>,[DEST=<param>]
,[TEST=<param>],[DEL=<param>],[ACTSG=<param>];
|TYPE=GRP,GRPID=<string>,[DEST=<param>]
,[TEST=<param>],[DEL=<param>],[ACTSG=<param>];
|TYPE=OPT,APSSIGN=<param>,ACTFLAG=<number>;
```

### Example

Input:

```
DEACTIVATE-PATCH:PATCH,S30001,BPA;
```

Input:

```
DEACTIVATE-PATCH:PATCH,DERPATCH,,Y;
```

Input:

```
DEACTIVATE-PATCH:PATCH,S30001&S30002&S30003;
```

The patches will be deactivated with the Megapatch process.

Input:

```
DEACTIVATE-PATCH:PATCH,S30001&S30002&S30003,,,,SINGLE;
Patch deactivated with Single Patch.
```

Input:

```
DEACTIVATE-PATCH:OPT,D,12;
Deactivate all optional patches for ADP with activation flag 12.

DEACTIVATE-PATCH:OPT,S,27&33&34;
Deactivate all optional patches for SWU with activation flags 27, 33, 34.
```

149.2.6 CHANGE-PATCH

The group-id can be changed with the command change. The patch files must be catalogued to use this command on the patches. To change the group-id you must give the name of the patches and the new group-id as input. Optional patches can't be changed.

Note:

The patch files can have a different group-id and get now a new group-id.

Procedure Overview:

| Kommandocode | Parameter                                |
|--------------|------------------------------------------|
| CHANGE-PATCH | TYPE=PATCH,PATNO=<string>,GRPID=<string> |

Example

Input:

```
DISPLAY-PATCH:GRU,*;
PATCH V135
```

## **PATCH - Administration and Activation**

Error Messages and Advisories

## 150 PERSI - Personal Identification

The AMO PERSI is used to administer personal data. The cross-reference to the person is invariably established via the station number.

### Names

Each station number can be assigned either one or several (any number of) names; the name entered first will be displayed on DIGITE displays. All other names are used for ETD functions. The name can also be made up of 2 parts:

1. Surname, simple or composite, e.g. Hr. Meier, Fr. Dr. Huber
2. Name, and additional information, e.g. Anna, Dept. A3  
The characters of the "surname" are separated from those of the "name" by means of a "\*".

Display at Optiset/OptiPoint:

The DIGITE has a 24-character display. The type of display, e.g. station number plus name or name only is defined by means of AMO ZAND, TYPE=ALLDATA, DISPMODE-MODE1 to MODE5 (see [Examples](#)). There is no verification of the last name. The number of blanks between the station number and the name is exactly one.

When configuring or changing a network wide subscriber name ( parameter NAME, NEWNAME ), which doesn't correspond to a person but e.g. to the geographical location ( "ENTRANCE ADMIN.BLDG5" ) of a terminal the display of the subscriber name can be incorrect, if a blank occurs in the subscriber name, and DISPMODE=MODE5 ( see AMO ZAND ) is activated. The reason for this is, that blanks are used to separate family names and first names, and errors can occur due to the network protocol, when the subscriber name is transferred. This can be avoided, if blanks are replaced by special characters e.g. "-", ".", "," or "\_" in the geographical identification of the terminal.

### Examples

Input: Dr. v. Ritter\*Martin

Display

MODE1: 32857 DR. V. RITTER M.

MODE2: 32857

MODE3: DR. V. RITTER MARTIN

MODE4: DR. V. RITTER

MODE5: # DR. V. RITTER

Display at OpenStage:

The OpenStage devices have different display sizes. The type of the display is controlled internally in OpenStage devices. The ZAND parameter **DISPMODE** is not evaluated at OpenStage devices.

The data configured via AMO-PERSI are transferred to the OpenStage device without any modification. If the name display field is too short, the OpenStage device shortens the name itself (no specification by the system).

### Emails

For mapping between ONS/DESK number and Unify Video accounts, the email address of the users are used. Therefore, AMO PERSI is used to configure an email address for a station.

For each station, only one email address can be assigned and it must be unique in the system.

The PERSI rules for email address configuration are listed below:

- All characters must be convert to lower case.
- According to section 4.5.3 of RFC 5321, the maximum length of an email address is 320 byte (64 octets for the user name, 1 octet for the '@' and 255 octets for the domain). However, in order to align SIP URI and EMAIL concepts in RMX DB, the maximum length of an email address is **127 byte** (63 octets for the user name, 1 octet for the '@' and 63 octets for the domain).
- The following characters are allowed:  
! # \$ % & ' \* + - / = ? ^ \_ ` { | ?
- The domain name must start with a letter and end with letter or a digit. Inside the domain name, there can be letter, digits, hyphens and dot. For more information, see section 3.5 of RFC 1034.
- The NGTC solution allows only basic Latin characters (Aa Bb Cc Dd Ee Ff Gg Hh Ii Jj Kk Ll Mm Nn Oo Pp Qq Rr Ss Tt Uu Vv Ww Xx Yy Zz) inside the email addresses associated with users or administrators. Variations of the allowed characters set (e.g. ä) are not supported.

More precisely, email addresses should:

- Contain basic Latin characters, numbers and the following special characters for the local part of the address:  
\_ \* + - \$ ? ^ { ! # % & ' / = ` | } ~ .
- The local part cannot start or end with a period (.).
- There should be only one @ inside the email address.
- The server and domain parts can only consist of Latin characters, numbers or hyphens ( - ).

- The domain part (.com) should include at least 2 items. There can be more than one domain part.

Examples of unusual, but valid email addresses:

```
^local.2@server8.domain-1.domain-2
```

```
*_+-$?^{!#%&' / = ` | } . ~ @ e . co
```

```
a@a.co
```

### **Organizational unit**

Each name can be assigned an organizational unit (for ETD functions). If a station number has not been assigned a name, no org. unit can be assigned.

If station number has been assigned several names, but not everyone of these names has been assigned an organizational unit, the organizational unit which was assigned last is automatically assigned to the remaining names.

### **Personal identification number (PIN)**

The PIN is used for personal identification of a person to the system. Each station number can be assigned any number of PINs. The length of a particular PIN type is determined centrally. The PIN length may or may not be the same for the types of PINs described above. Each PIN (except COSXCD) must be unique throughout the system.

The same class of service changeover code (COSXCD) can be assigned to any number of stations. When a COSXCD that was previously assigned to a station is configured, the system outputs advisory message H38 to notify the user of this fact, and the command is still executed. If the user does not want the COSXCD to be assigned to multiple stations, he can delete the COSXCD for the station with DEL-PERSI:TYPE=PIN,PIN=number,STNO=number ;

In the case of PINC, it must also be determined at which position on the magnetic/chip card the PINC begins. (PIN pointer)

A 'Class of PIN' (COPIN) must be introduced for each type of PIN to be able to implement the PIN display feature and to be able to differentiate between the various types of PINs.

The COPIN defines the characteristics and functions of individual PIN applications such as the type of PIN (PINM, PINC, COSXCD, PCODE etc.), PIN length, PIN texts and various flags used to disable or enable specific functions.

The "class of PIN" (COPIN) is used for each PIN type in order to implement the PIN display feature and in order to distinguish between the different PIN types.

## PERSI - Personal Identification

The characteristics of the COPINs (1 through 15) are summarized in the so-called COPIN table in which the following default values are assigned to the type of PIN:

| PINTYPE<br>(=COPIN) |   | PIN    | COTYPE   | PIN Meaning of a type of PIN                                                                                                                                            |
|---------------------|---|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1                   | = | PIN1   | MOBILE   | Manual identification                                                                                                                                                   |
| 2                   | = | PIN2   | BUSLONG  | Identification of business calls (remains active until manual deletion or timeout).                                                                                     |
| 3                   | = | PIN3   | BUSSHRT  | Identification of business calls                                                                                                                                        |
| 4                   | = | PIN4   | PRIVSHRT | Identification of private calls                                                                                                                                         |
| 5                   | = | PIN5   | PCODE    | Identification of a project for a call (project code = PCODE).                                                                                                          |
| 6                   | = | PINC   | PINCARD  | Identification by means of a magnetic/chip card which is inserted into the card reader of the terminal.                                                                 |
| 7                   | = | COSXCD | COSXCD   | Identification of users which are authorized to activate COS changeover from the terminal.                                                                              |
| 8                   | = | SI     | SI       | Pin for service id                                                                                                                                                      |
| 9                   | = | CDRAC  | PCODE    | CDR account code                                                                                                                                                        |
| 10                  | = | PIN10  | PCODE    | PIN for dialing pattern check                                                                                                                                           |
| 11                  | = | PIN11  | MOBILE   | Manual identification                                                                                                                                                   |
| 12                  | = | PIN12  | MOBILE   | Manual identification                                                                                                                                                   |
| 13                  | = | PIN13  | MOBILE   | Manual identification                                                                                                                                                   |
| 14                  | = | PIN14  | MOBILE   | Manual identification                                                                                                                                                   |
| 15                  | = | PIN15  | MOBILE   | Manual identification<br>COPIN 15 is used for ONS groups. Therefore this COPIN is treated in a special way in CDR: The PIN number is not showing up in the CDR records. |

The COPIN table allows the administration of all entries except the timer administration (AMO CTIME) using the AMO PERSI. Please note that the type of PIN can only be changed for COPINs 1-5,10-15 and that for the PIN card only COPIN 6 is used, COS changeover only COPIN 7 is used whereas for service id only COPIN 8 and CDR account code only COPIN 9 is used.

Each PIN has at least one COPIN for identification of the PIN type. However, a PIN may also be valid for several PIN types. Such a PIN is assigned more than one COPIN.

For data protection reasons, manually keyed-in PINs are not displayed, instead a wildcard '\*' is displayed for each character.

To allow the user to check whether he has entered the PIN or PCODE correctly, he can use the parameter PINDISP or parameter DISPPIN (TYPE=COPIN) which allows each type of PIN to be administered separately.

The parameter COSXCOS2 is used for COS changeover to COS2 with or without a COSXCD.

a) Company code (COCO)

If several companies share a system, a 1- to 4-digit COCO on the magnetic/chip card indicates the card owner's company code. As a result of this, several companies can be assigned the same PIN.

The company code pointer (CPOINT) marks the position at which the COCO begins on the ID card. This position may coincide with that of the PINC.

The COCO is assigned for each ITR group since the STNs are categorized into ITR groups if several companies share the same system.

b) STNO-Code calling number conversion for code calling system, multiple (CCMS).

Some CCMSs have a repertory of code calling numbers which differs from the system's station number plan. Since individual persons are paged via their station numbers, it is necessary to convert the STNOs into CCMS code calling numbers. During conversion, several station numbers may be assigned the same code calling number, but not vice-versa.

A maximum of 2 CCMSs can be connected to the system. This is why, during STNO-Code calling number conversion the relevant CCMS is identified by its code (or else by the DPLN group it belongs to).

The size of the memories to be used for PERSI data (NAME, ORG, PIN) is defined by means of AMO DIMSU. For each 'STNO-Code calling number' conversion one table is available for each CCMS (1000 entries).

This AMO is non-resident and is only called down by the AM.

c) project code (PCODE)

The PCODE is used to assign call charges to specific projects. For this reason, it is not assigned to any of the users.

The PCODE is activated with the same code as the PIN.

The PCODE remains active only for the duration of a call.

The PCODE can also be entered while a PIN is active (mobile STN). In this case, the data and the classes of service of the PIN's home station are valid.

d) service id (SI)

The service id is used to sign off resp. sign on a station.

The service id is activated with the sign off resp. sign on code.

e) CDR account code (CDRAC)

The CDR account code is used as account code for incoming and outgoing call, which are listed in the call charge data output.

f) modulo check algorithm

The validity check on a PIN or project code cannot only be performed by comparing the entry in the PIN/Project code table created by the PERSI AMO but also using a module check algorithm. It is possible to define 3 modulo check algorithms in the system (action CHANGE TYPE=MODULO), see also FUE "Verifying the PIN/PCODE".

With which of the 3 algorithms the check is to be carried out can be specified individually for each type of PIN.

## 150.1 Interrelationships

- AMO SCSU/SBCSU : SWU Station Configuration
- AMO DIMSU : Feature Set
- AMO RICHT : Routes
- AMO WABE : Digit analysis

## 150.2 Functions of the AMO

- [ADD-PERSI](#) : Create general and individual user data for personal identification
- [CHANGE-PERSI](#) : Change personal identification data
- [DELETE-PERSI](#) : Cancel personal identification data
- [DISPLAY-PERSI](#) : Interrogate data for personal identification
- [REGENERATE-PERSI](#) : Regenerate personal identifications

### 150.2.1 ADD-PERSI

1. Definition of general PIN data

Create length of pins for each PIN type.

Create pin-display for each PIN type.

Create class of service changeover to COS2 with COSXCD.

Create number of failed attempts to enter the pin

---

**NOTE:** Attempts only works when TRACE=YES in COPIN. **Should the number of attempts be exceeded the interface is not locked, but a F2754 message logged to HISTA.**

---

2. Assigning a company code to an ITR group
3. Assigning the name and PIN to the STNO; assigning org. unit to name.
4. STNO-Code calling number conversion for CCMS.  
If a range of station numbers is to be specified, the parameter ALLOC can be used to determine whether the specified code calling number is to be assigned to all station numbers (ALLOC=SAME) or whether, starting with the specified code calling number, each station number is to be assigned a new code calling number in ascending order (ALLOC=ASCEND).
5. Create project code (PCODE)
6. Create service id (SI)
7. Create account code (CDRAC)

### Procedure Overview

| Command Code | Parameter                                            |
|--------------|------------------------------------------------------|
| ADD-PERSI    | TYPE=SYS, { PINCLN=<number>, PINPOINT=<number> (1)   |
|              | , COSLEN=<number>, PIN1LEN=<number>                  |
|              | , PIN2LEN=<number>, PIN3LEN=<number>                 |
|              | , PIN4LEN=<number>, PIN5LEN=<number>, SILEN=<number> |
|              | , CDRACLEN=<number>, PIN10LEN=<number>               |
|              | , PIN11LEN=<number>, PIN12LEN=<number>               |
|              | , PIN13LEN=<number>, PIN14LEN=<number>               |
|              | , PIN15LEN=<number>                                  |
|              | , PINDISP=<number>, COSXCOS2=<string>                |
|              | , ATTEMPTS=<number>;                                 |
|              |                                                      |
|              | TYPE=COCO, ITR=<number>, COCO=<string> (2)           |
|              | , CPOINT=<number>;                                   |
|              |                                                      |
|              | TYPE=STN, STNO=<number> (3)                          |
|              | , { NAME=<string>, ORG=<string>                      |
|              | , PINC=<string>, COSXCD=<string>                     |
|              | , PIN1=<string>, PIN2=<string>                       |
|              | , PIN3=<string>, PIN4=<string>                       |
|              | , PIN5=<string>, PIN10=<string>                      |
|              | , PIN11=<string>, PIN12=<string>                     |

## PERSI - Personal Identification

### Functions of the AMO

| Command Code | Parameter                                           |
|--------------|-----------------------------------------------------|
|              | , PIN13=<string>, PIN14=<string>                    |
|              | , PIN15=<string>                                    |
|              | , [PININDIV=<param>], [CHARCON=<param>];            |
|              |                                                     |
|              | TYPE=CCMS, CCMSCD=<key-num>, [DPLN=<number>] (4)    |
|              | , STNO=<number>, CCNO=<key-num>                     |
|              | , [ALLOC=<param>];                                  |
|              |                                                     |
|              | TYPE=PCODE, PCODE=<string>, [PINTYPE=<number>]; (5) |
|              |                                                     |
|              | TYPE=SI, SI=<string>; (6)                           |
|              |                                                     |
|              | TYPE=CDRAC, CDRAC=<number>; (7)                     |

### Examples

1. Create the length of the personal ID number (card) (=8) and the pointer to the personal ID number (card) (=7) (the manual personal ID numbers and the codes for class of service changeover remain blocked).

Input:

```
ADD-PERSI:TYPE=SYS,PINCLEN=8,PINPOINT=7;
```

2. Create the personal ID number (card) for directory number.3123  
Name=Schmidt MEIER\*JUERGEN  
PINC- No. 6000006, organizational unit=PN KD3

Input:

```
ADD-PERSI:TYPE=STN,STNO=3123,NAME=SCHMIDT MEIER*JUERGEN,  
PINC=60000006,,,ORG=PN KD3;
```

3. Create a STNO-Code calling number allocation for CCMS with code \*7, with station number range 2500-2520, with code calling number 300 to be allocated in ascending order.

Input:

```
ADD-  
PERSI:TYPE=CCMS,CCMSCD=*7,STNO=2500&&2520,CCNO=300,ALLOC=ASCE  
ND;
```

4. Create the pin display for pin type 1 and 3

Input:

```
ADD-PERSI:TYPE=SYS,PINDISP=1&3;
```

5. Create a project code

Input:

```
ADD-PERSI:TYPE=PCODE,PCODE=600600;
```

6. Create the same pin for pinc and pin1 (length of pinc, pin1 and pin4=8 )

Input:

```
ADD-  
PERSI:TYPE=STN,STNO=2100,PINC=21000000,PIN1=21000000,PININDIV  
=YES;
```

## **150.2.2 CHANGE-PERSI**

1. Change the length entries for each pin type. Any type of PIN can be deactivated by specifying "0" as PIN length.  
(this is only possible if the relevant PINs have not been created already)
2. Change the pointer indicating the card personal ID number
3. Change the company code or the pointer indicating the company code
4. Change one of the assigned names
5. Change one of the assigned ORG entries. This entry will be automatically changed for all names to which it is assigned.
6. Change one of the assigned ORG entries for all names assigned to the specified station number(s).
7. Change one of the assigned ORG entries for a specific name.
8. Change specific codes  
(OLDPCODE and NEWPCODE must be of equal length)  
If the same COSXCD is assigned to several different station numbers, the code can be changed only for the station concerned by specifying the station number. If the station number is omitted, the code will be changed for all station numbers.
9. Change the code-calling number associated with a registered station number for a particular CCMS.
10. Change the COPIN in the COPIN table.
11. Change the modulo check algorithm.
12. Change the email address.

## PERSI - Personal Identification

### Functions of the AMO

#### Procedure Overview

| Command Code | Parameter                                          |
|--------------|----------------------------------------------------|
| CHANGE-PERSI | TYPE=SYS, { PINLEN=<number>, COSLEN=<number> (1)   |
|              | , PIN1LEN=<number>, PIN2LEN=<number>               |
|              | , PIN3LEN=<number>, PIN4LEN=<number>               |
|              | , PIN5LEN=<number>, SILEN=<number>                 |
|              | , CDRACLEN=<number>, PIN10LEN=<number>             |
|              | , PIN11LEN=<number>, PIN12LEN=<number>             |
|              | , PIN13LEN=<number>, PIN14LEN=<number>             |
|              | , PIN15LEN=<number>                                |
|              | , COSXCOS2=<string>, ATTEMPTS=<number>;            |
|              | TYPE=PINPOINT, PINPOINT=<number>; (2)              |
|              | TYPE=COCO, ITR=<number>, { COCO=<string> (3)       |
|              | , CPOINT=<number>;                                 |

|              | , IDHOME=<param>, DISPID=<param>                       |
|              | , TRACE=<param>, PINEXT=<param>                        |
|              | , DISPPIN=<param>, PINNKEY=<param>                     |
|              | , DEACKEY=<param>, POSCHKN=<number>                    |
|              | , COSHOME=<param>, PINLCOS2=<param>, DPTEST=<param>    |
|              | , DISPTRKC=<param>, PARARNGM=<param>, PRIMDEV=<param>; |
|              |                                                        |
|              | TYPE=MODULO, MODULO=<number> (11)                      |
|              | , {VALENCE=<number>, TYPESUM=<param>                   |
|              | , MODULUS=<number>, CHKNLEN=<param>                    |
|              | , TYPECKN=<param>;                                     |
|              |                                                        |
|              | TYPE=EMAIL, STNO=<number>, EMAIL=<string>; (12)        |

### Notes:

CHANGE-PERSI:TYPE=ORGSYS or TYPE=ORGSTNO:

If several OLDORGs are to be changed to a NEWORG (new organizational unit), the NEWORG must be specified only once. All remaining OLDORGs will then be assigned this NEWORG.

CHANGE-PERSI:TYPE=ORNAME:

If a NEWORG is to be allocated for several names (change existing ORG to another), then the NEWORG need be entered only once. All remaining names are then allocated the new organizational unit.

CHANGE-PERSI:TYPE=NAME:

If the first name (i.e. the name which is displayed on the screen) is to be changed, the parameter OLDNAME can be omitted and the name which used to be the first name is overwritten with the first NEWNAME.

CHANGE-PERSI:TYPE=PIN:

If the same COSXCD is assigned to several different stations, the STNO parameter needs to be specified only when changing the COSXCD.

## PERSI - Personal Identification

### Functions of the AMO

#### Examples

Assignment of station number.3109 designated 'FLIERL\*GABI' to a new organizational unit designated 'PN V8332'.

Input:

```
CHANGE-PERSI:TYPE=ORGNAME,STNO=3109,NAME=FLIERL*GABI,NEWORG=PN  
V8332;
```

Change email address for station 12100

Input:

```
CHANGE-PERSI:TYPE=EMAIL,STNO=12100,EMAIL=anonymous@unify.com;
```

### 150.2.3 DELETE-PERSI

1. All assigned company codes are deleted for the specified traffic relation groups.
2. Delete all name entries (NAME and ORG) of a station DN
3. Delete Name(s) and ORG allocated to a station DN
4. Delete the specified ORG for all assigned names.
5. Delete all ORG units which are assigned to all names of a station number.
6. Delete the ORG unit which is assigned to a specific name of a station number.
7. Delete all codes indicated  
Only for the PIN types specified under PINTYPE, or for all PIN types if the parameter is not specified.  
If the same COSXCD is assigned to several different station numbers, the code can be deleted only for the station concerned by specifying the station number. If the station number is omitted, the code will be deleted for all station numbers.
8. Delete the codes assigned to the station numbers specified  
Only for the PIN types specified under PINTYPE, or for all PIN types if the parameter is not specified.
9. Delete station(s) from STNO/CCNO table for a particular CCMS.
10. Delete the email address of a station.

## Procedure Overview

| Command Code | Parameter                                        |
|--------------|--------------------------------------------------|
| DELETE-PERSI | TYPE=COCO, ITR=<number>; (1)                     |
|              |                                                  |
|              | TYPE=ALLNAME, STNO=<number>; (2)                 |
|              |                                                  |
|              | TYPE=NAME, STNO=<number>, NAME=<string>; (3)     |
|              |                                                  |
|              | TYPE=ORGSYS, ORG=<string>; (4)                   |
|              |                                                  |
|              | TYPE=ORGSTNO, STNO=<number>; (5)                 |
|              |                                                  |
|              | TYPE=ORGNAME, STNO=<number>, NAME=<string>; (6)  |
|              |                                                  |
|              | TYPE=PIN, PIN=<number>, [PINTYPE=<number>] (7)   |
|              | , [STNO=<number>];                               |
|              |                                                  |
|              | TYPE=STN, STNO=<number>, [PINTYPE=<string>]; (8) |
|              |                                                  |
|              | TYPE=CCMS, CCMSCD=<key-num>, [DPLN=<number>] (9) |
|              | , STNO=<number>;                                 |
|              |                                                  |
|              | TYPE=EMAIL, [STNO=<number>]; (10)                |

### Note

When NAMES or an organizational units which have been assigned to NAMES are deleted, the surname and the name (but not any additional information) are compared with the station number entry.

The NAME may be abbreviated. Care should, however, be taken to specify as many letters as necessary to ensure that a specific station number entry is unique (see example of input).

If several entries of the same name exist for the same station number, the first of these entries will be deleted.

### Examples

1. Delete name 'RICCATO\*' from directory no.3100

Input:

```
DELETE-PERSI:TYPE=NAME,STNO=3100,NAME=RICCATO*;
```

## PERSI - Personal Identification

### Functions of the AMO

#### Output:

```
H01: NAME TO BE DELETED RICCATO IS ONLY NAME FOR  
    ORG : ORG IS DELETED
```

2. Delete pin 12345678

#### Input:

```
DELETE-PERSI:TYPE=pin,pin=12345678;
```

3. The personal ID numbers (card) assigned to station number 7580 are to be deleted

```
DELETE-PERSI:TYPE=STN,STNO=7580,PINTYPE=6;
```

4. Delete the PINs, names and ORG assigned to station 2100.

#### Input:

```
DELETE-PERSI:TYPE=ALLNAME,STNO=2100;  
DELETE-PERSI:TYPE=TLN,STNO=2100;
```

5. Delete email address for station 12100.

#### Input:

```
DELETE-PERSI:TYPE=EMAIL,STNO=12100;
```

## 150.2.4 DISPLAY-PERSI

1. Interrogation of general personal ID data  
(PIN length and pointer, COCO and pointer)  
(Pin display for each pin type and class of service changeover)
2. Display the names and the assigned ORG for the specified/all station numbers.
3. Display PIN for all station numbers or for the the specified station number(s).
4. Interrogation of STNO/CCNO entries for a particular CCMS.
5. Display the specied/all PINs for the specied/all pin typs.
6. Display the specied/all COPINs of the COPIN table.
7. Display all modulo check algorithms.
8. Display email address.

### Procedure Overview

| Command Code  | Parameter     |
|---------------|---------------|
| DISPLAY-PERSI | TYPE=SYS; (1) |
|               |               |

| Command Code | Parameter                                         |
|--------------|---------------------------------------------------|
|              | TYPE=NAME, [STNO=<number>]; (2)                   |
|              |                                                   |
|              | TYPE=PIN, [PIN=<string>], [PINTYPE=<number>]; (3) |

### Examples

#### 1. Interrogating the general PERSI data.

Input:

DISPLAY-PERSI:TYPE=SYS;

Output:

```

+-----+
| COPIN                                     |
| 1     PIN1LEN    10                      |
| 2     PIN2LEN    8                       |
| 3     PIN3LEN    6                       |
| 4     PIN4LEN    10                      |
| 5     PIN5LEN    6                       |
| 6     PINCLN     8     PINPOINT  10      |
| 7     COSLEN     4     COSXCOS2  N       |
| 8     SILEN      10                      |
| 9     CDRACLEN   5     COSXCOS2  N       |
| 10    PIN10LEN   4                       |
| 11    PIN11LEN   2                       |
| 12    PIN12LEN   2                       |
| 13    PIN13LEN   2                       |
| 14    PIN14LEN   2                       |
| 15    PIN15LEN   2                       |
|
|     ATTEMPTS    5     (NUMBER OF FAILED ATTEMPTS) |
|
| ITR     COCO     CPOINT                   |
| 04      SIE      4                       |
| 06      SIE      4                       |
| 07      AGFA     8                       |
|
+-----+

```

## PERSI - Personal Identification

### Functions of the AMO

```
| 08          BMW          6          |
+-----+-----+-----+-----+
```

#### 2. Interrogation of personal ID of station nos. 3100 to 3104

Input:

```
DISPLAY-PERSI:TYPE=NAME,STNO=3100&&3104;
```

Output:

```
+-----+-----+-----+-----+
| STNO | CHRISTIAN AND SURNAME | ORGANIZATIONAL UNIT |
+-----+-----+-----+-----+
| 3100 | RICCATO*              |                      |
| 3101 | BINDER*               | PNEA 41              |
| 3102 | DUMONT*               |                      |
| 3103 | BULLE*                |                      |
| 3104 | TEAM ASSISTANT*        |                      |
+-----+-----+-----+-----+
```

#### 3. Interrogation of directory numbers of card personal ID numbers 12345678, 23456789 and 20007777

Input:

```
DISPLAY-PERSI:TYPE=PIN,PIN=12345678&23456789&20007777
```

Output:

```
+-----+-----+-----+-----+
| PIN   | STNO | PINTYPE |
|       |      | 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15|
+-----+-----+-----+-----+
| 12345678 | 7580 | X . . . . X . . . . . |
| 23456789 | 4500 | X . . . . X . . . . . |
| 20007777 | 7580 | X . . . . X . . . . . |
+-----+-----+-----+-----+
```

#### 4. Interrogation of card personal ID numbers to station numbers 4700 and 5600

Input:

```
DISPLAY-PERSI:TYPE=STN,STNO=4700&5600,PINTYPE=6;
```

Output:

```
+-----+-----+-----+-----+
| STNO | PIN   | PINTYPE |
|      |      | 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15|
+-----+-----+-----+-----+
| 4700 | 10000009 | . . . . . X . . . . . |
| 5600 | 12345678 | X . . . . X . . . . . |
| 5600 | 23456789 | X . . . . X . . . . . |
+-----+-----+-----+-----+
```

#### 5. Interrogation of STNO/CCNO conversion table for CCMSCD=922 (CCMS) and STNO=2100&&2110

Input:

DISPLAY-PERSI:TYPE=CCMS,CCMSCD=922,STNO=2100&&2115;

Output:

| STNO | CCNO |
|------|------|
| 2100 | 2105 |
| 2101 | 2108 |

## 6. Interrogation of specified pin typs.

Input:

DISPLAY-PERSI:TYPE=PIN,PINTYPE=1&3&5;

Output:

| PIN   | STNO | PINTYPE                             |
|-------|------|-------------------------------------|
|       |      | 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 |
| 1111  | 4711 | X . X . . . . . . . . . .           |
| 1234  | 4712 | X X X . . . . . . . . . .           |
| 12345 | ---- | . . . . X . . . . . . . . .         |

## 7. Interrogation of the pin 4444444.

Input:

DISPLAY-PERSI:TYPE=PIN,PIN=4444444;

Output:

| PIN     | STNO | PINTYPE                             |
|---------|------|-------------------------------------|
|         |      | 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 |
| 4444444 | 4712 | . . . . . X . . . . . . . .         |

## 8. Interrogation of all pins with the assigned station number 4711

Input:

DISPLAY-PERSI:TYPE=STN,STNO=4711;

Output:

| STNO | PIN   | PINTYPE                             |
|------|-------|-------------------------------------|
|      |       | 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 |
| 4711 | 1111  | X . X . . . . . . . . . .           |
|      | 22222 | . . . X . . . . . . . . . .         |

## Functions of the AMO

The example shows the initialisation of the COPIN table.

```
DISPLAY-PERSI:TYPE=COPIN;
```

| COPIN | COPIN-PARAMETER                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

AMO-PERSI-111 PERSONAL IDENTIFICATION DATA

DISPLAY COMPLETED;

&lt;

## 150.2.5 REGENERATE-PERSI

1. Regeneration of the general or of all general and individual user data for personal identification, of the CCMS data, project codes and service ids.
2. Regeneration of the individual user data for personal identification.
3. Regeneration of project codes
4. Regeneration of service ids
5. Regeneration of CDR account codes
6. Regeneration of COPINs
7. Regeneration of modulo check algorithm
8. Regeneration of email addresses

If no parameter is specified, all general and individual user data as well as all CCMS data is regenerated for personal identification.

If parameter STNO is omitted, all names, organizational units, and PINs in the system are regenerated.

### Procedure Overview

| Command Code     | Parameter                                         |
|------------------|---------------------------------------------------|
| REGENERATE-PERSI | [TYPE=SYS]; (1)                                   |
|                  |                                                   |
|                  | TYPE=STN, [STNO=<number>], [DEVTYPE=<param>]; (2) |
|                  |                                                   |
|                  | TYPE=PCODE; (3)                                   |
|                  |                                                   |
|                  | TYPE=SI; (4)                                      |

### Parameter Description

|         |                              |                                                 |                                      |
|---------|------------------------------|-------------------------------------------------|--------------------------------------|
|         | Possible Values              | : 1- to 12-character                            |                                      |
| PINCLEN | Length of pin - card         |                                                 |                                      |
|         | Type of Input                | single value, 1. parameter of a min-1-group     |                                      |
|         | Possible Values              | numeric, 0-12 (CHANGE,TYPE=SYS-common data)     | system                               |
|         |                              | numeric, 1-12 (ADD,TYPE=SYS-common system data) |                                      |
| PIN1LEN | Length of pin for pin type 1 |                                                 |                                      |
|         | Type of Input                | single value, 3. parameter of a min-1-group     | (CHANGE,TYPE=SYS-common system data) |
|         |                              | single value, 4. parameter of a min-1-group     | (ADD,TYPE=SYS-common system data)    |
|         | Possible Values              | numeric, 0-12 (CHANGE,TYPE=SYS-common data)     | system                               |
|         |                              | numeric, 1-12 (ADD,TYPE=SYS-common system data) |                                      |
| PIN2LEN | Length of pin for pin type 2 |                                                 |                                      |
|         | Type of Input                | single value, 4. parameter of a min-1-group     | (CHANGE,TYPE=SYS-common system data) |
|         |                              | single value, 5. parameter of a min-1-group     | (ADD,TYPE=SYS-common system data)    |
|         | Possible Values              | numeric, 0-12 (CHANGE,TYPE=SYS-common data)     | system                               |
|         |                              | numeric, 1-12 (ADD,TYPE=SYS-common system data) |                                      |
| PIN3LEN | Length of pin for pin type 3 |                                                 |                                      |
|         | Type of Input                | single value, 5. parameter of a min-1-group     | (CHANGE,TYPE=SYS-common system data) |
|         |                              | single value, 6. parameter of a min-1-group     | (ADD,TYPE=SYS-common system data)    |
|         | Possible Values              | numeric, 0-12 (CHANGE,TYPE=SYS-common data)     | system                               |
|         |                              | numeric, 1-12 (ADD,TYPE=SYS-common system data) |                                      |
| PIN4LEN | Length of pin for pin type 4 |                                                 |                                      |
|         | Type of Input                | single value, 6. parameter of a min-1-group     | (CHANGE,TYPE=SYS-common system data) |
|         |                              | single value, 7. parameter of a min-1-group     | (ADD,TYPE=SYS-common system data)    |

|          |                               |                               |                                              |        |
|----------|-------------------------------|-------------------------------|----------------------------------------------|--------|
| PIN5LEN  | Possible Values               | numeric, 0-12                 | (CHANGE,TYPE=SYS-common data)                | system |
|          |                               | numeric, 1-12                 | (ADD,TYPE=SYS-common data)                   | system |
|          | Length of pin for pin type 5  |                               |                                              |        |
|          | Type of Input                 | single value, 7. min-1-group  | (CHANGE,TYPE=SYS-common parameter of a data) | system |
| PIN10LEN |                               | single value, 8. min-1-group  | (ADD,TYPE=SYS-common parameter of a data)    | system |
|          | Possible Values               | numeric, 0-12                 | (CHANGE,TYPE=SYS-common data)                | system |
|          |                               | numeric, 1-12                 | (ADD,TYPE=SYS-common data)                   | system |
|          | Length of pin for pin type 10 |                               |                                              |        |
| PIN11LEN | Type of Input                 | single value, 10. min-1-group | (CHANGE,TYPE=SYS-common parameter of a data) | system |
|          |                               | single value, 11. min-1-group | (ADD,TYPE=SYS-common parameter of a data)    | system |
|          | Possible Values               | numeric, 0-12                 | (CHANGE,TYPE=SYS-common data)                | system |
|          |                               | numeric, 1-12                 | (ADD,TYPE=SYS-common data)                   | system |
| PIN12LEN | Length of pin for pin type 11 |                               |                                              |        |
|          | Type of Input                 | single value, 11. min-1-group | (CHANGE,TYPE=SYS-common parameter of a data) | system |
|          |                               | single value, 12. min-1-group | (ADD,TYPE=SYS-common parameter of a data)    | system |
|          | Possible Values               | numeric, 0-12                 | (CHANGE,TYPE=SYS-common data)                | system |
| PIN13LEN |                               | numeric, 1-12                 | (ADD,TYPE=SYS-common data)                   | system |
|          | Length of pin for pin type 12 |                               |                                              |        |
|          | Type of Input                 | single value, 12. min-1-group | (CHANGE,TYPE=SYS-common parameter of a data) | system |
|          |                               | single value, 13. min-1-group | (ADD,TYPE=SYS-common parameter of a data)    | system |
| PIN13LEN | Possible Values               | numeric, 0-12                 | (CHANGE,TYPE=SYS-common data)                | system |
|          |                               | numeric, 1-12                 | (ADD,TYPE=SYS-common data)                   | system |
| PIN13LEN | Length of pin for pin type 13 |                               |                                              |        |

## PERSI - Personal Identification

### Parameter Description

|          |                                                                                  |                                                                                                                                                                                                                                         |  |
|----------|----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|

| PINEXT   |                 | PIN of the forwarding station is retained                                                                                                                                                                                                                                                                                                                                                            |
|          | Type of Input   | : single value, 14. parameter of a min-1-group                                                                                                                                                                                                                                                                                                                                                       |
|          | Possible Values | : YES, NO                                                                                                                                                                                                                                                                                                                                                                                            |
| PININDIV |                 | Command allows pin entries to be evaluated one by one<br><br>PIN entries will be evaluated one by one for this command, i.e. each specified PIN will only be assigned to the specified PINTYPE even though other PINTYPES might have the same length. If this parameter is omitted, every specified PIN will be assigned both to the specified PINTYPE and to all other PINTYPES of the same length. |
|          | Type of Input   | : single value, optional                                                                                                                                                                                                                                                                                                                                                                             |

|                 | see AMO usage example Personal Identification Number, Algorithmic "MODULO-N" Verification                          |
| Type of Input   | : 12 linked single values, concatenated with -, 1. parameter of a min-1-group                                      |
| Possible Values | : numeric, 1-9                                                                                                     |

## **150.4 Error Messages and Advisories**

### **150.4.1 Error Messages**

F01: STNO <xxxxxx> IS NOT A STATION NUMBER

F02: STATION <xxxxxx> HAS NOT BEEN ADDED

F03: THE MAXIMUM NUMBER OF <xxxxxx> NAMES CAN NOT BE PASSED OVER.  
(EXTENSION WITH AMO DIMSU, PARAMETER NAME)

F04: THE MAXIMUM NUMBER OF <xxxxxx> ORGS CAN NOT BE PASSED OVER.  
(EXTENSION WITH AMO DIMSU, PARAMETER ORG)

F05: <c-----c> <x-----x> DOES NOT CORRESPOND TO THE PRESENT LENGTH,  
<l-----l> = <ll>

F06: <c-----c> <x-----x> ALREADY ASSIGNED TO A <t-----t>

F07: THE MAXIMUM NUMBER OF <xxxxxx> PINS CAN NOT BE PASSED OVER.  
(EXTENSION WITH AMO DIMSU, PARAMETER ID)

F08: NAME <n-----n> IS NOT ENTERED UNDER STNO <xxxxxx>

F09: OLDORG <o-----o> WAS NOT FOUND IN THE SYSTEM

F10: OLDORG <o-----o> WAS NOT FOUND UNDER STNO <xxxxxx>

F11: <x-----x> WAS NOT FOUND <a-----a>

F12: <x-----x> HAS ALREADY BEEN ENTERED IN THE SYSTEM

F14: <x-----x> HAS INVALID LENGTH

F15: RANGE LIMITS HAVE DIFFERENT LENGTHS

F16: <x-----x> AND <x-----x> HAVE DIFFERENT LENGTHS

F17: LENGTH ENTRY CANNOT BE CHANGED -  
ALL PINS OF PIN TYPE <c-----c> MUST FIRST BE DELETED

F18: BLOCKING NOT POSSIBLE - ALL PINS OF PIN TYPE <c-----c> MUST FIRST BE DELETED

F19: <l-----l> IS ALREADY ADDED

F20: FOR ITR <xx> COCO AND FPOINT ARE NOT ADDED

F23: <c-----c> IS BLOCKED

F24: NAMES MUST NOT BEGIN WITH \*

F25: NAMES MUST NOT CONTAIN ONLY BLANKS

F26: CODE <kkkkkk> DOES NOT LEAD TO DAR CCMS

F27: CODE <kkkkkk> LEADS TO DPLN GROUP BRANCH

F28: STATION NUMBER <xxxxxx> HAS NOT BEEN ASSIGNED WITHIN THE SYSTEM

F29: NO ROUTE TO TMOM ASSIGNED

F30: RANGE OF STATION NUMBERS MUST NOT EXCEED 100

[illegible]

## **150.4.2 Advisories**

H01: NAME <n----n> TO BE DELETED IS ONLY NAME FOR ORG <o----o>: ORG IS DELETED

H02: ORG <o----o> AND ALL ASSOCIATIONS TO THE NAMES ARE DELETED

H03: NO VALUES FOR <c----c> ENTERED IN SYSTEM

H04: NO NAMES OR ORGANIZATIONAL UNITS IN SYSTEM

H05: NO NAMES OR ORGANIZATIONAL UNITS FOR THE STATION NUMBERS SPECIFIED

H06: NONE OF THE SPECIFIED OR NO <c----c> AT ALL HAS BEEN ENTERED  
IN THE SYSTEM

H07: STATION NUMBERS SPECIFIED ARE NOT ASSIGNED OR DO NOT HAVE A STATION DAR

H13: NO <c----c> FOR STATION NUMBERS SPECIFIED

H15: SAME ASSIGNMENT - <c----c>/STATION NUMBER

H16: IN ITR <xx>: COMPANY CODE <ffff> WAS ENTERED

H17: @@@@ IS ALREADY BLOCKED

H18: NO <c----c> ASSIGNED

H20: NO ENTRY IN STNO/CCNO TABLE

H21: PIN TYPE <aa> CORRESPONDS TO PINC (WHICH IS NOT DISPLAYED)

H22: PIN TYPE <aa> CORRESPONDS TO PCODE (WHICH IS PERMANENTLY DISPLAYED)

H23: PIN DISPLAY IS ACTIVATED FOR PIN TYPE <aa>

H24: PIN DISPLAY WAS DELETED FOR PIN TYPE <aa>

H25: PIN DISPLAY WAS NOT ACTIVATED FOR ANY PIN TYPE EXCEPT PCODE

H26: FOR PIN <x----x> PIN TYPE <aa> HAS NOT BEEN ASSIGNED

H27: FOR STNO <xxxxxx> NO PIN HAS BEEN ASSIGNED PIN TYPE <aa>

H29: NO PIN HAS BEEN ASSIGNED FOR STNO <xxxxxx>

H30: <c----c> LEADS TO PIN TYPE PCODE. ASSIGNMENT TO STATION NUMBER IS NOT PERMISSIBLE  
AND WILL BE IGNORED

H31: ONLY ONE ORG. UNIT CAN BE ASSIGNED TO A NAME.  
SUPERNUMERARY ORG. UNITS BE IGNORED.

H32: THE FIRST NAME FOR STATION NUMBER <xxxxxx> HAS BEEN CHANGED

H33: THE SAME NAME WAS ENTERED AGAIN AND HAS BEEN DELETED

H34: NAMES IN EXCESS OF THE NUMBER OF NEW NAMES EXPECTED HAVE BEEN IGNORED

H35: NO NAMES WAS ASSIGNED FOR STATION NUMBER <xxxxxx>,  
ALL NEW NAMES HAVE BEEN ENTERED

H36: <d----d> <x----x> WAS ASSIGNED TO ALL <b----b> OF THE SAME LENGTH.

H38: COSXCD <x----x> ALREADY ASSIGNED TO A STATION NUMBER,  
COMMAND WILL BE EXECUTED.

H39: THE PCODE CAN NOT BE CHECKED AGAINST THE TABLE FOR  
PIN NETWORKWIDE, COMMAND WILL BE EXECUTED.

H40: FOR COTYPE=SI ONLY PINNKEY CAN BE CHANGED,  
ALL OTHER PARAMETERS WILL BE IGNORED.

H41: ALTHOUGH IN USE AT A FOREIGN STATION, PIN CODE IS DELETED.

H42: ISPPIN IGNORED FOR COPIN=6.  
FOR LOWER COPIN VALUES, CHANGES OF DISPPIN ARE ACCEPTED.

H43: NO EMAIL FOUND FOR THE SPECIFIED STATION NUMBERS

# 151 PETRA - Tracer Control via AMO

|                    |                               |
|--------------------|-------------------------------|
| Interrelationships | Parameter Description         |
| AMO Functions      | Error Messages and Advisories |

The AMO PETRA can be used to create, interrogate and stop trace procedures in circuits on peripheral modules of the SWU. Furthermore, memory contents can be displayed on these modules.

All received data can be displayed on the service terminal in its entirety or in part.

The periphery (PP) of an LTG collects these data, divided according to TRACE and DUMP values, in one memory segment each. Upon request by the AMO, PP forwards this data to the AMO.

The TRACE data can then be displayed entirely or in part as often as required using AMO PETRA. The DUMP data, on the other hand, are passed on directly to the terminal by the AMO.

Most peripheral modules can be operated with AMO PETRA.

If an attempt is made to activate the loadware TRACER in an untraceable module, the input is acknowledged by the AMO with the error message "F05: BOARD HAS NO PERIPHERAL TRACER". (Using the addressing specified, the module type is determined and compared with the value in the UBGDAT)

The same applies for the DUMP also.

## 151.1 Interrelationships

None

## 151.2 AMO Functions

- [ADD-PETRA](#) : Creating the TRACER in one circuit
- [DISPLAY-PETRA](#) : Retrieving TRACE memory  
Retrieval and output of DUMP memory
- [OUTPUT TRACE-DATA](#) : Output TRACE memory
- [DEACTIVATE-PETRA](#) : Deactivating a created TRACER
- [STOP-PETRA](#) : Stopping the TRACE memory allocation

## 151.2.1 ADD-PETRA

### 151.2.1.1 Creation of TRACE processes on standard modules (STD)

The create command is used to activate the trace procedure in a circuit. This causes one, several, or all processes (0...15) of the circuit to send the TRACE data to the periphery (PP).

Several TRACE procedures can be activated in sequence. These are executed in parallel. All results are marked for each LTG by the PP according to the sender and are collected in a common TRACE buffer. If the buffer overflows, this buffer is written again starting at the beginning (cyclic memory).

Each peripheral circuit requires its own job to activate the TRACER. The initiation of a circuit that has already been activated does not cause a fault; this permits activation of other processes of the same circuit.

#### Note:

In each case, only those processes which were specified in the last command are activated; previously activated processes, that were not specified in the last command, are deactivated.

#### Procedure Overview

| Kommandocode | Parameter                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------|
| ADD-PETRA    | TYPE=STD, [LTG=<number>], LTU=<number><br>, SLOT=<number>, [CCT=<number>], PROC1=<number><br>, [PROC2=<number>]; |

#### Example

The processes 1, 3, 5 to 9 and 11 are to be traced from the LTG=1, LTU=2, SLOT=19, and circuit number=5.

Input:

```
ADD-PETRA:STD,1,2,19,5,1&3&5&&9&B;
```

### 151.2.1.2 Trace processes on special modules (HEX)

On some modules (e.g. CMI) the trace process is activated with longer commands. This is possible with the branch HEX. 64 Byte in one command are possible.

The parameter LENGTH shows the number of HEX-Values. The parameter CCT is not estimated by all modules (you must not use this parameter in relation with the module CMI).

### Procedure Overview

| Kommandocode | Parameter                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-PETRA    | TYPE=HEX, [LTG=<number>], LTU=<number>, SLOT=<number><br>, [CCT=<number>], LENGTH=<number>, [HEX01=<number>]<br>, [HEX02=<number>] ... [HEX64=<number>]; |

### Example

The module is waiting for the command A157BD300F.

Input:

ADD-PETRA:HEX,,2,43,,5,A1,57,BD,30,0F;

### 151.2.1.3 Installation of TRACE processes on LTUR modules

In the ROLM modules of an LTUR shelf, trace processes are not set up by specifying the processes; rather, the trace process is activated using a trace control code 2 bytes long. These are specified as 2 concatenated single values, input as parameter PROC: PROC= <byte 1> & <byte 2>.

The composition of the 2 byte trace control code is as follows (taken from "LTUR trace Function - Component spec, ROLM Systems, author: Esther Poon"):

- Byte I:

|             |                            |
|-------------|----------------------------|
| T on<br>off | TRACE Class / Trigger code |
|-------------|----------------------------|

Figure 18 Structure of the Trace Control Code

a) T-on/off = 1: Activation of trace functions

|   |           |            |             |             |             |   |   |
|---|-----------|------------|-------------|-------------|-------------|---|---|
| 1 | on<br>off | all<br>ckt | snd<br>only | rcv<br>only | int<br>task |   |   |
| 7 | 6         | 5          | 4           | 3           | 2           | 1 | 0 |

Figure 19 Trace Functions

ON/OFF BIT: when set, the indicated trace state is to be reset (if it was on).

SEND ONLY BIT: when set, only messages sent are to be traced.

RECEIVE ONLY BIT: when set, only messages received are to be traced.

ALL CIRCUIT BIT: when set, the trace state is to be indicated for all circuits on the indicated trace object. If this bit is set the circuit number from the message is ignored.

INTERNAL TASK BIT: when set, internal functions (other than the mailbox messages) of the indicated trace object are to be reported.

b) T-on/off = 0: Stop conditions for trace functions

Figure 20 Trace-Classes and Trigger Code

There are 4 trace classes (bit 6 - 4) for setting the conditions which deactivate the trace functions and these trace classes have their specific trace trigger code (bit 3 - 0).

| Class Code | Trace Class Definition | Trace Trigger Code     |
|------------|------------------------|------------------------|
| 000        | OV2                    | N/A                    |
| 001        | ERR CODE               | specified error code   |
| 010        | STATE CODE             | specified state number |
| others     | not defined            |                        |

OV2: when set, the trace is to be reset when the overload threshold 2 is encountered.

ERR CODE: when set, the trace is to be reset when the specified error code (bit 3 - 0) of the given task/module occurs.

STATE CODE: when set, the trace is to be reset when the specified state (bit 3 - 0) of the given task/module occurs.

• Byte II:

Figure 21 Task/Module ID

MM (MAIN MICRO) BIT: when set, the trace state is to be set for the indicated components in the main micro.

IMF (IMF/DFE Server) BIT: when set, the trace state is to be set for the indicated components in the IMF/DFE Server.

TASK/MODULE ID (bit 5 - 0): when either MM BIT or IMF BIT is set, the Task/Module ID defines the various task or modules which should be activated/deactivated for tracing.

The following is an overview of the possibilities for byte II.

| Byte | II | mm | imf | Task/Module ID | Meaning of Task/Module ID             |
|------|----|----|-----|----------------|---------------------------------------|
| 00   |    | 0  | 0   | 0              | No task in neither MM nor IMF         |
| 40   |    | 0  | 1   | 0              | No task/module in IMF/DFE Server      |
| 41   |    | 0  | 1   | 1              | I_CONFIG                              |
| 42   |    | 0  | 1   | 2              | I_Restart                             |
| 43   |    | 0  | 1   | 3              | I_IPRC sender                         |
| 44   |    | 0  | 1   | 4              | I_IPRC receiver                       |
| 45   |    | 0  | 1   | 5              | IMF/DFE engine interface              |
| 4A   |    | 0  | 1   | 10             | RLI/DFE                               |
| 4B   |    | 0  | 1   | 11             | State messaging circuit state machine |
| 4D   |    | 0  | 1   | 13             | I_Card state machine                  |
| 4E   |    | 0  | 1   | 14             | TTI_BS state machine                  |

## Procedure Overview

### Kommandocode

ADD-PETRA

### Parameter

TYPE=LTUR, [LTG=<number>], LTU=<number>  
, [SLOT=<number>], CCT=<number>, BYTE1=<hex>  
, BYTE2=<hex>;

### Example

The processes 1, 3, 5 to 9 and 11 are to be traced from the LTG=1, LTU=2, SLOT=19, and circuit number=5.

Input:

ADD-PETRA:STD,1,2,19,5,1&3&5&&9&B;

An LTUR module in LTG=1, LTU=4, SLOT=133, circuit number=3, should be set up with the trace control code A8 and 7F for tracing.

Input:

ADD-PETRA:LTUR,1,4,133,3,A8,7F;

151.2.2 DISPLAY-PETRA

- 1. Retrieving the TRACE data.
- 2. Retrieval and output of the DUMP data.

The command with 'TRACE' parameter is used to transfer the data that has been compiled in a trace segment of the peripheral processing system (PP) by the 'ADD' command.

A message causes the PP to transfer the data segment with the collected TRACE data to the AMO.

The received segment is available only once. With the next interrogation job, the AMO receives a completely new segment with completely new data from the PP.

The trace data received by the PP can be output on the screen with the command "OUTPUT-PETRA" (see also the following section).

By specifying the 'DUMP' parameter, the memory contents of a module are displayed on the console.

A message via the PP causes the modules to send their dump data to the periphery (PP) as of a specific address, and in a specific length, where the data are collected in one segment. After the last data has arrived there, they are all sent to this AMO and displayed on the terminal.

The maximum length for the data area of a DUMP job is 2048 bytes since no separate data segment is created in the periphery for a DUMP. Newer modules with an extended DUMP-Area (e.g. STHC, SLTX) can work with DUMP jobs until 8154 Byte.

Currently, only one DUMP job at a time can be executed. Additional jobs are accepted without an error message, however, they are not executed by the periphery.

On modules with Motorola-Processor, the address is splitted to the parameter SEG and ADR. The input for the address 86754890 for example is SEG=8675 and ADR=4890 (DISP-PETRA:DUMP,1,3,37,86,8675,4890,2048)

Procedure Overview

| Command Code  | Parameter                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-PETRA | TYPE=TRACE, [LTG=<number>];<br><br>  TYPE=DUMP, [LTG=<number>], LTU=<number>, SLOT=<number><br>, CPU=51, SEG1=<param>, ADR=<hex><br>, [NO=<number>]; |

```
| TYPE=DUMP, [LTG=<number>], LTU=<number>, SLOT=<number>
| , CPU=<param>, SEG=<hex>, ADR=<hex>
| , [NO=<number>];
```

### Examples

1. The TRACE memory is to be retrieved from the LTG=1.

Input:

```
DISP-PETRA:TRACE,1;
```

2. A memory dump is to be requested and output from the module with slot 37 and LTU number 3 in the LTG 1.

Input:

```
DISP-PETRA:DUMP,1,3,37,86,1234,5678,217;
```

Output:

```
DUMP FUER    LTG  1    LTU   3    EBT   37
1234:5670                44 69 65 73 20 69 73 74 .....Dies ist

```

## 151.2.3 OUTPUT TRACE-DATA

After executing the command DISPLAY-PETRA the message H3 and the prompt "\*" is displayed asking the user to insert the parameter NO and CONT.

Instead of restarting the AMO, it is based on the DISPLAY action. This makes it possible to examine the data which were retrieved once, any number of times.

The rest of the AMO run is controlled with the second parameter CONT. As long as the parameter value is 'Y', further DISPLAY commands can be input. After 'N' the AMO is terminated and the internal PETRA data segment released.

Each individual data record of a module is 16x8 bit long, the first byte contains the LTU No., the second the PBC No., followed by 14 bytes of TRACE data. For TROSS51 modules these consist of individual 3 byte trace entries (1 empty bit, 2 bit flags, 5 bit circuit code and a 16 bit address); in the case of L3X and Rolm modules, on the other hand, the 14 bytes constitute one trace entry.

Procedure Overview

Command Code

Parameter

[NO=<number>], [CONT=<param>];

Examples

- 1. The previously retrieved TRACE data are to be displayed and the AMO is subsequently to be ended.

Input:

,N;

- 2. The last 100 of the data retrieved using the DISPLAY command are to be displayed.

Input:

100;

Output:

```
TRACE DATA FROM LTG 1
LTU  SLOT  CCT  DATA
  1    1    0  9234 A345 D678 ABCD 88EF 99FA
  1    1    5  9234 D678 ABCD 88EF E7E7
LTU  PBC  CIRCUIT  STATE  PROC    BOARD HEADER  L3X HEADER  DATA
  4   11    0        3     4      8020 075      85 1 1    9A5A5A5
  4   11    0        1     4      8620 0 3      4320A5  A5A5A5A5
LTU  SLOT  CCT  TR-TAG  DATA
  3   79    0      0    010203040506 07080910111213
LTU  SLOT  CCT  DATA
  2   13    1  D432 A345 BADE AFFE 8080 8085 8086
  2   37    0  FEDE BAFF E969 DAEF 9111 8194 C711 A921 B368 8926 B764
```

## 151.2.4 DEACTIVATE-PETRA

This command is used to deactivate the TRACE procedures again on the circuits.

For each circuit, a separate command must be given which is used to deactivate the TRACER for all processes on this circuit.

### Procedure Overview

#### Command Code

DEACTIVATE-PETRA

#### Parameter

[LTG=<number>], LTU=<number>, SLOT=<number>, CCT=<number>;

#### Example

The TRACER is to be deactivated on module LTG=1, LTU=2, SLOT=19, circuit number=5.

Input:

DEACT-PETRA:1,2,19,5;

## 151.2.5 STOP-PETRA

Stopping the TRACE memory allocation:

This command is used to force the release of the buffer segment in the periphery.

If the PP subsequently receives a TRACE data record from a module, the PP sends the command "deactivate tracer" to the module, thus stopping further tracing.

This command should be input at the end of all TRACE procedures in order to make the memory area of the trace data segment in the PP available again and prevent the modules continuously sending trace data and overloading the dynamics.

### Procedure Overview

#### Command Code

STOP-PETRA

#### Parameter

[LTG=<number>];

#### Example

The TRACE memory allocation and the trace function in LTG=1 is to be stopped.

Input:

## PETRA - Tracer Control via AMO

### Parameter Description

STOP-PETRA:1;

## 151.3 Parameter Description

|       |                                               |
|-------|-----------------------------------------------|
| ADR   | Address of DUMP                               |
|       | Type of Input : Single value, mandatory       |
|       | Possible Values : 0 to FFFF                   |
| BYTE1 |                                               |
|       | Type of Input : Single value, mandatory       |
|       | Possible Values : 0 to FF                     |
| BYTE2 |                                               |
|       | Type of Input : Single value, mandatory       |
|       | Possible Values : 0 to FF                     |
| CCT   | Circuit number of a module                    |
|       | Type of Input : Single value, mandatory       |
|       | Possible Values : 0 to 63                     |
| CONT  | Switch for ending the AMO                     |
|       | Type of Input : Single value, optional        |
|       | Possible Values : Y the AMO will not be ended |
|       | : N the AMO will be ended                     |
|       | Default Value : Y                             |
| CPU   | CPU type                                      |
|       | Type of Input : Single value, mandatory       |
|       | Possible Values : 86 for 8086                 |
|       | 51 for 8051                                   |
|       | MM for MAIN MICRO on a LTUR module            |
|       | IMF for IMF/DFE on a LTUR module              |
|       | HDLC for HDLC processor on a LTUR module      |
| HEX01 | 1. Byte of trace job                          |
|       | Type of input: Single Value, mandatory        |
|       | Possible Values 0 bis FF                      |
|       | Default Value 0                               |
| HEX02 | 2. Byte of trace job                          |
|       | Type of input: Single Value, mandatory        |
|       | Possible Values 0 bis FF                      |
|       | Default Value 0                               |
| HEX64 | 64. Byte of trace job                         |

|        |                 |                                                                                                                  |
|--------|-----------------|------------------------------------------------------------------------------------------------------------------|
|        | Type of input:  | Single Value, mandatory                                                                                          |
|        | Possible Values | 0 bis FF                                                                                                         |
|        | Default Value   | 0                                                                                                                |
| LENGTH |                 | Number of Trace jobs                                                                                             |
|        | Type of Input   | : Single Value, mandatory                                                                                        |
|        | Possible Values | : 1 to 64                                                                                                        |
| LTG    |                 | Number of the line trunk group                                                                                   |
|        | Type of Input   | : Single value, optional                                                                                         |
|        | Possible Values | : 1 to 32                                                                                                        |
|        | Default Value   | : 1 (for Hicom 370)                                                                                              |
| LTU    |                 | Number of the line trunk unit                                                                                    |
|        | Type of Input   | : Single value, mandatory                                                                                        |
|        | Possible Values | : 1-15 and 17-99                                                                                                 |
| NO     |                 | Length in bytes of the DUMP area to be output for DISPLAY or<br>number of the TRACE data to be output for OUTPUT |
|        | Type of Input   | : Single value, optional                                                                                         |
|        | Possible Values | : 0 to 8154 in DISPLAY<br>0 to 1024 in OUTPUT                                                                    |
|        | Default Value   | : 8154 in DISPLAY<br>1024 in OUTPUT                                                                              |
| PROC1  |                 | Receive processes to be logged unless on                                                                         |
|        | Input Type      | : Single value, linked single value or range of values,<br>mandatory                                             |
|        | Possible Values | : 0 to F                                                                                                         |
| PROC2  |                 | Send processes to be logged unless on                                                                            |
|        | Input Type      | : Single value, linked single value or range of values,<br>mandatory                                             |
|        | Possible Values | : 0 to F                                                                                                         |
|        | Default Values  | : no process                                                                                                     |
| SEG    |                 | Hexadecimal segment value for dump address on 8086 and ROLM<br>modules (for MM, IMF or HDLC)                     |
|        | Type of Input   | : Single Value, mandatory                                                                                        |
|        | Possible Values | : 0 to FFFF                                                                                                      |
| SEG1   |                 | Symbolic segment specification for 8051                                                                          |
|        | Type of Input   | : Single value, mandatory                                                                                        |
|        | Possible Values | : CSEG code segment<br>DSEG data segment<br>XSEG extra segment                                                   |
| SLOT   |                 | Specification of the slot in the LTU                                                                             |

## PETRA - Tracer Control via AMO

### Error Messages and Advisories

Type of Input : Single value, mandatory

Possible Values : 1 to 121

A suitable module must be configured for the slot addressed by PEN (AMO BCSU).

The possible Slot values depend on the systems architecture and can be found in the BCSU AMO description.

TYPE Type of display, Type of module

Type of Input : Single Value, mandatory in ADD, optional in DISPLAY

Possible Values in the branch DISPLAY:

TRACE retrieveTRACE-Memory (Default value)

DUMP retrieve and output DUMP memory

Possible Values in the branch ADD:

STD (Standard module)

HEX (Trace job in HEX format)

LTUR (LTUR-module)

## 151.4 Error Messages and Advisories

### 151.4.1 Error Messages

F01: CIRCUIT NOT PRESENT

The addressed circuit is not available, not active or larger than the maximum permissible value for this module.

F02: BOARD NOT PRESENT

The addressed module is not available or not active.

F03: LTU NOT PRESENT

The line trunk unit is not available, not active or larger than the maximum permissible value for this type of system.

F04: LTG NOT PRESENT

The line trunk group is not available, not active or larger than the maximum permissible value for this type of system.

F05: BOARD HAS NO PERIPHERAL TRACER

The module type determined for the specified address appears in the internal AMO table of untraceable modules. This also means that no message appears for new untraceable modules not yet included in the table (please notify PETRA developer).

F06: UNEXPECTED TRACE TYPE: <xxxxxxxxxxxxxxxx> <xxxxxxxxxxxxxxxx>

Trace type is invalid; the trace item data are output for diagnostic purposes (please notify PETRA developer).

F07: MOUNTING POSITION @@@T IN LTU-TYPE @@T CANNOT BE OCCUPIED

The entered mounting position (SLOT) is not valid for the current shelf type (LTU).

F08: INVALID PROCESS-VALUE, PERMITTED RANGE: 0H TO FH

Only a maximum value of 15 processes is permitted to be entered for not ROLM modules.

F09: INVALID TRACE-DATA FOR LTUR; PLEASE ENTER 2 CHAINED VALUES

Only two chained single values (0 - FF) are permitted to be entered as trace data for ROLM modules (e.g. LTUR).

F10: PROCESSOR-IDENTIFICATION NOT ALLOWED FOR MODULE

The entered processor type is not valid for the selected module.

F11: BOARD HAS NO DUMP FUNCTION

F12: SPECIFIED LENGTH SMALLER THAN NUMBER OF INPUT HEX-VALUES

## **151.4.2 Advisories**

H01: BUFFER EMPTY (DESIRED TRACE DATA NOT PRESENT)

If this message does not appear until 20 seconds after sending the output job, this means that a trace buffer segment is not yet assigned in the PP.

If this message occurs immediately after input, however, then a trace buffer segment has been assigned in the PP but is still empty.

H02: BUFFER EMPTY (DESIRED DUMP DATA NOT PRESENT)

H03: OUTPUT TRACE DATA WITH: NUMBER, CONTINUATION

Here, the user is prompted to display the data delivered by PP as often as he wishes.

H04: TRACE BUFFER CONTAINS <xxxxx> TRACE ITEMS

This is the information about the number of trace items that have been received and can be output.

H05: RAM ADDRESS AREA H'4000 - H'7000 NOT ACCESSIBLE FOR IMF/DFE PROCESSOR

This is the information about a not accessible storage area for an IMF/DFE processor on a LTUR module.

H99: THE PARAMETER 'TRACEID' AND 'TRCIDTYP' HAVE TO BE INPUT BOTH

## 152 PRODE - Protocol Descriptor for Networking

The AMO PRODE can be used to copy, change, display and regenerate tables for the protocol handler.

Use of this AMO requires well-founded specialized knowledge with respect to protocol conversion. The protocol handler uses these tables to convert system-specific messages to external signaling messages in accordance with the D-channel protocol (ISO layer 3, OSI transport layer) and vice versa. Further details see in example of use ISDN Protocol Variants.

In the system database, the tables consist of general entries, which are used by all protocols, and protocol-specific entries.

The protocols defined are linked to protocol variants.

When assigning a trunk circuit with the AMO TDCSU, the circuit is allocated one of these protocol variants.

In addition to the protocol tables (general PRODE entries) the variant also determines the implementation of the protocol (coding, error handling and interworking).

From SP300-V3.3 onward, the basic initialization of the PD tables is relocated from the database to the HD itself. The following command is sufficient to initialize the memories for the PD tables:

```
COPY-PRODE:PVCD,1;
```

The above command thus describes the database with the basic initialization data for the PD tables, initializes the general entries and loads all associated PDs.

The protocol descriptor tables consist of a general section and the PD tables. This applies both to the database (DB) and the hard disk (HD).

The general part is designated as a table of variants (VARTAB). The relationship between the protocol descriptors (PD) and the protocol variants is defined in it.

The hard disk contains up to 40 versions of these tables of variants, each of which is assigned to a country. On the HD the tables of variants are designated protocol variant combination descriptors (PVCD).

The PVCDs and PDs on the hard disk can be interrogated by way of the following commands:

```
DISPLAY-PRODE:HD,PVCDSHRT;
```

```
DISPLAY-PRODE:HD,PDSHORT;
```

## PRODE - Protocol Descriptor for Networking

The PVCDs or PDs are numbered for HD access and are addressed by the PVCDNO or PDNO.

To inquire the relationship between protocol variant and PD,

```
DISPLAY-PRODE:HD,PVCDLONG,<pvcdno>;
```

is used.

**Note:** the regenerated PRODE commands of a certain system version may not be transferred to other (newer) versions due to incompatibility.

References to protocols stored on the hard disk:

## 152.1 Interrelationships

- AMO TDCSU Configuration of digital trunk circuits in SWU  
If a protocol descriptor which is not part of the standard database has been assigned by AMO TDCSU, it must first be added and activated by means of AMO PRODE.

## 152.2 Functions of the AMO

- [COPY-PRODE](#) : Copy a protocol descriptor
- [CHANGE-PRODE](#) : Change a protocol descriptor
- [DISPLAY-PRODE](#) : Interrogate the protocol descriptor contents
- [REGENERATE-PRODE](#) : Regenerate the memory contents of PDs which differ from the standard database (corresponds to using the option COPY initialized tables and CHANGE changed tables).

### 152.2.1 COPY-PRODE

With the COPY function a complete protocol variant combination description (PVCD) or an individual protocol description (PD) can be loaded from the hard disk. The list of PVCDs and PDs on the hard disk can be displayed with the aid of the DISPLAY function.

When a PVCD is copied, the table of variants (VARTAB) in the database is initialized and all the PDs required for the PVCD are loaded. A maximum of 14 PDs can be used in a PVCD. The loaded PDs are activated automatically.

When individual PDs are copied, either an already loaded PD can be overwritten or free space can be searched or assigned for the PD. When an individual PD is loaded, it is deactivated.

This function makes it easier to set up a new protocol, assuming that only a relatively small amount of data has to be changed with respect to an existing PD.

If, during copying of an individual PD, a destination (parameter PDNAME) is specified, and if this is used or activated, a corresponding advisory is issued.

### Note

After an individual PD has been copied, the CHANGE command for activation of the PD must be entered in order to set the active bit and to make the protocol available to CP. The command for activating the PD is: 'CHANGE-PRODE:PD,<pdname>,ORG,,Y;' .

### Procedure Overview

| Command Code | Parameter                                                                  |
|--------------|----------------------------------------------------------------------------|
| COPY-PRODE   | TYPE=PVCD, PVCDNO=<number>;<br>  TYPE=PD, PDNO=<number>, [PDNAME=<param>]; |

#### Example 1:

Copy PVCD 1 (basic initialization for Germany)

Input:

COPY-PRODE:PVCD,1;

#### Example 2:

Copy PD 2 to pos. PD13

Input

COPY-PRODE:PD,2,PD13;

## 152.2.2 CHANGE-PRODE

The function CHANGE is used to alter the PD memory contents both in the general part (VARTAB) and in the individual protocol descriptions (PD). A PD can also be activated or deactivated.

**PRODE - Protocol Descriptor for Networking**

Functions of the AMO

Following selection of the table (using the parameters SEC and the sequential parameter PDBLK), addressing to the bytes to be changed is carried out with the aid of parameters NO and Bxx, SETNO and Bxx (SEC=WELMAND) or CS, NO and Bxx (SEC=WELNAME). A more detailed description of the addressing arithmetic is provided in the examples below.

Only a PD loaded by means of COPY can be changed.

To prevent the call processing CP reading out inconsistent data when a PD (protocol file) is changed, the PD is deactivated automatically with the first CHANGE command. Via circuits using a deactivated PD no connections can be established or released. The existing connections are not interrupted.  
The PD must be explicitly reactivated with the final CHANGE command (param. ACTIVE) (see example).

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-PRODE | <div>KIND=VARTAB,PROTVAR=&lt;string&gt;,{PDNORM=&lt;param&gt;,<br/>PDA1=&lt;param&gt;,PDA2=&lt;param&gt;};<br/> KIND=PD,PDNAME=&lt;param&gt;,<br/>SEC=ORG,{IDENT=&lt;hex&gt;,ACTIVE=&lt;param&gt;,<br/>PDSTRING=&lt;string&gt;};<br/> SEC=WELMAND,SETNO=&lt;number&gt;,{B00=&lt;hex&gt; to<br/>B59=&lt;hex&gt;};<br/> SEC=WELNAME,CS=&lt;number&gt;,[NO=&lt;number&gt;],<br/>{B00=&lt;hex&gt; to B59=&lt;hex&gt;};<br/> SEC=TIMER,TIMERID=&lt;param&gt;,TIMESEC=&lt;number&gt;,<br/>TIMEMS=&lt;number&gt;;<br/> SEC=RESTP,PDBLK=&lt;param&gt;,[NO=&lt;number&gt;],<br/>{B00=&lt;hex&gt; to B59=&lt;hex&gt;};</div> |

### Examples:

1. Change PD memory contents (BCLLCTC) for PD PD03. With the normal procedure, a maximum of 500 (NO parameters) + 60 (Bxx parameters) = 560 bytes are addressable.

Figure 23 Diagram of memory addressing for the BCLLCTC table

The AMO checks whether the memory area addressed with parameter PDBLK is exceeded by sequential parameters NO and Bxx (error message F6).

#### Input:

```
CHANGE-
PRODE:KIND=PD, PDNAME=PD03, SEC=RESTP, PDBLK=BCLLCTC, NO=3, B00=02,
      B01=04, B02=02, B11=03;
```

2. Addressing the WELHEX table results in the memory area being exceeded.

#### Input:

```
CHANGE-
PRODE:KIND=PD, PDNAME=PD03, SEC=RESTP, SEC=WELHEX, NO=120, B00=53, B01=54,
      B02=45, B03=56, B04=45;
```

#### Output:

```
F06: AREA EXCEEDED FOR WELHEX; MAX(NO + B..?) = ...
```

3. Activating protocol PD08.

Input:  
  
CHANGE-PRODE:PD,PD08,ORG,,Y;

**152.2.3 DISPLAY-PRODE**

The contents of the database (SRC=DB) and the hard disk (SRC=HD) can be interrogated.  
An overview of the PVCDs contained on the HD can be output from the HD (KIND=PVCDSHRT).  
The contents of a PVCD can also be output in detail from the HD (KIND= PVCDLONG). For the DB this output corresponds to the output of the table of variants (KIND=VARTAB)  
Both for the HD and the DB an overview of the existing or the loaded PDs can be displayed by means of KIND=PDSHORT.  
The contents of a PD can also be output in detail for both HD and DB (KIND=PDLONG). In this case the wanted table is specified by means of parameter PDBLK.  
Processing is block by block, with specification of the start address (parameter NO) and the wanted number of blocks to be output (parameter BNO). The blocks correspond to the parameter values for CHANGE.  
It is possible to selectively output a block or to output everything by omitting parameters NO and BNO.  
If a non-defined PD is displayed, it is rejected with advisory H7.

**Procedure Overview**

| Command Code  | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 152.2.4 REGENERATE-PRODE

The regenerate function relates back to COPYing a PVCD and possibly CHANGE commands. This means that in REG-PRODE only differences compared with the initialization files are output from the HD.

### Procedure Overview

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-PRODE | ;         |

### Examples

Input:

```
REGEN-PRODE;
```

Output:

```
COPY-PRODE:PVCD,1;
CHANGE-PRODE:PD,PD02,ORG,,OWN PD 2;
COPY-PRODE:PD,1,PD05;
COPY-PRODE:PD,1,PD10;
CHANGE-PRODE:PD,PD10,TIMER,T30X2,11111,111;
CHANGE-PRODE:PD,PD10,ORG,,Y,OWN PD 1;
```

## 152.3 Parameter Description

|        |                                                   |                                                                         |
|--------|---------------------------------------------------|-------------------------------------------------------------------------|
| ACTIVE | Release or blocking of the protocol for the CP    |                                                                         |
|        | Type of Input                                     | : Single value, optional                                                |
|        | Possible Values                                   | : YES, NO                                                               |
| KIND   | Branch parameter for selecting wanted output data |                                                                         |
|        | Type of Input                                     | : Single value, mandatory (DISPLAY, CHANGE)                             |
|        | Possible Values                                   | : 1st function DISPLAY                                                  |
|        | PVCDSHRT                                          | Brief interrogation of protocol variant combination description         |
|        | PVCDLONG                                          | Interrogation of a protocol variant combination description (complete). |
|        | PDSHORT                                           | Brief interrogation of the protocol descriptions                        |
|        | PDLONG                                            | Detailed interrogation of a protocol description                        |
|        | VARTAB                                            | Interrogation of the protocol variant descriptions                      |
|        |                                                   | 2nd function CHANGE                                                     |

## PRODE - Protocol Descriptor for Networking

### Parameter Description

|       |                                                                                                        |                                                                                                                            |
|-------|--------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
|       | VARTAB                                                                                                 | Changing the protocol variant description                                                                                  |
|       | PD                                                                                                     | Changing the protocol description                                                                                          |
| BNO   | Number of blocks (with max. of 60 bytes) to be output<br>(see function <a href="#">DISPLAY-PRODE</a> ) |                                                                                                                            |
|       | Type of Input                                                                                          | : Single value, optional                                                                                                   |
|       | Possible Values                                                                                        | : 1 to 8                                                                                                                   |
|       | Default Value                                                                                          | : 8                                                                                                                        |
| Bxx   | Contents of the xxth byte (B00 to B59)                                                                 |                                                                                                                            |
|       | Type of Input                                                                                          | : Single value, optional                                                                                                   |
|       | Possible Values                                                                                        | : Two-digit hexadecimal                                                                                                    |
|       | Group Condition                                                                                        | : At least one byte must be specified                                                                                      |
| CS    | Code set, used for further classification of the WELNAME table                                         |                                                                                                                            |

- F11 Table welname can only be changed via the inverse table welhex for cs 1 to 4.

## **152.4.2 Advisories**

H02: PD @@@@ has been overwritten by copying.  
H03: PD @@ has been stored to location @@@@.  
H04: IMPORTANT! PD @@@@ is now deactivated. The PD has to be activated with the following command:  
CHANGE-PRODE:PD,@@@@,ORG,,Y;  
H05: Upper limit @@@ of memory has been exceeded.  
H06: There are none of the wanted PVCDs on HD.  
H07: There are none of the wanted PDs on HD.  
H08: There is no PVCD loaded.  
H09: There is no PD stored in @@@@.  
H10: Important! ACTIVE=YES in the command line is ignored. The PD has to be activated with the following command:  
CHANGE-PRODE:PD,@@@@,ORG,,Y;

## 153 PSTAT - Peripheral Statistics

|                                                 |                                      |                                               |
|-------------------------------------------------|--------------------------------------|-----------------------------------------------|
| <a href="#">General information about PSTAT</a> | <a href="#">Interrelationships</a>   | <a href="#">Parameter description</a>         |
| <a href="#">Restrictions</a>                    | <a href="#">Functions of the AMO</a> | <a href="#">Fault Messages and Advisories</a> |

### 153.1 General information about PSTAT

1. The AMO PSTAT is used to display and reset the counters of the peripheral statistics.
2. The control tables of the peripheral statistics can also be displayed and changed.

When the peripheral statistics are called, the fault analysis (FA-LTG) reacts to error messages, to eradicate the causes of faults that could adversely affect the system and jeopardize normal operation. Such faults can be hardware faults or software errors which frequently occur and place an unnecessary load on the system, e.g. recurrence of line alarms. Units at which these faults originate are eliminated after a statistical overload by means of a force remove.

The statistical evaluation of faults also prevents message data overflow producing an unnecessarily high system loading.

The statistics counters are not cross-signaled to other processors or stored on hard disk. For all restarts, except for a simple soft restart, the contents of the statistics counter are lost.

The peripheral statistics are designed for use within the system as a whole, but they are implemented to respond only to signals from the peripherals. The statistics are implemented as a separate program package inside the FA-LTG subsystem and are called from this subsystem (TOOL of the FA-LTG).

In the peripheral statistics for fault analysis, each peripheral element (module, circuit, terminal) has up to 4 fault counters.

The task of the peripheral statistics is to record the statistics (increment counter), inform the caller (FA-LTG) if the counter limit is exceeded and to monitor the statistics counters. The dependability reaction on overload is covered solely by the fault analysis (FA-LTG). At present, the statistics counters of levels BOARD and CIR are used as follows:

- COUNT1    so-called pairs of module restore and module remove messages  
COUNT2    Messages which could cause message data overflow

## PSTAT - Peripheral Statistics

### General information about PSTAT

- COUNT3 These counters can be byte- or word-counters:
- COUNT4 used as byte-counter, they also display messages which could cause message data overflow; used as word-counter (at DIUS2, DIUS7, STMA, DIUC, DIUC64, and STMD2) they serve as reference clock counters

Both types of faults are counted individually for module, circuit and terminal in separate counters. If the thresholds are exceeded, the corresponding modules, circuits or terminals are removed from service by FA-LTG. Removal is signaled with STAT-OVERFLOW.

The statistics counters are then decremented again at set intervals.

The threshold values have been set to a level high enough to block out only those elements which would excessively load the system.

### 153.1.1 Quality counter DIUCAS

A second module level (BOARD1) has been introduced for the DIUC module to count the line alarms for all circuits of the single physical line of a DIUC module. These counters do not result in an automatic removal of the module, they merely serve as a quality counter for line evaluation.

A further level, BOARD2, relates to fault counters of the second physical line of a DIUC-64 module (circuits 32 to 63).

The statistics counters of the BOARD1 and BOARD2 levels are currently used for the following fault types:

- COUNT1 local alarms
- COUNT2 remote alarms
- COUNT3 AIS (Alarm Indication Signal)
- COUNT4 automatic removal

The AMO PSTAT is used to display and reset the counters of the peripheral statistics. Resetting is permissible only for counters on the levels BOARD1 and BOARD2.

### 153.1.2 Control tables

The control tables of the peripheral statistics can also be displayed and changed.

Since both the various boards and the terminals must be processed in the same way by the peripheral statistics, they are divided into different classes. These control tables contain the following information for each level, class and counter:

|          |                                                                                                                                                        |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| COUNTLOC | Position of the logical counter inside the counter structure<br>(FA-LTG uses byte and word counters.)<br>This value cannot be changed using AMO PSTAT. |
| MAXCOUNT | Threshold of the peripheral statistics<br>The value 0 means that the counter is inactive.                                                              |
| COUNTACT | Value by which the counter is reduced until the threshold is reached                                                                                   |
| TIME     | Time interval after which the time components become active                                                                                            |
| DECREM   | Value by which the counter is decremented after the time interval                                                                                      |

With the AMO PSTAT, also significant values of the veco-statistics can be displayed or changed.

### 153.1.3 Veco-statistics

The Veco-statistics serve to prevent multiple messages, caused by systematic errors or errors in frequently used program parts of the call-processing. It is the objective, to avoid these multiple signalings for the same object outside the dependability complex.

With the statistics switched on, a message will be issued on the first occurrence of an error, and thereafter, when the error-frequency surpasses the adjusted threshold, or a multiple thereof, within the statistic period. When the statistic period is reached, the counter is reset.

With the veco statistics switched on, the message display can be controlled by the parameter MODE:

- MODE = MSGON: error messages will periodically be displayed, according to the given parameters;
- MODE = MSGOFF: there is no periodic display, the statistics, however, are active and can be displayed.

The following significant values of the veco statistics can be displayed and changed by this AMO:

- switch off the veco statistics or switch it on (with or without message display);
- display or change the thresholds of the statistics counters;
- statistics period
- device-related suppression of message-display;
- the counter values can be displayed.

### **153.1.4 Lock- and Stabilisation Times**

If any equipment (board, circuit, device or LTUC) becomes defect, several trials are made to reactivate this equipment, before it is finally locked. After every deactivation, this equipment is locked for an adjustable time ("locktime"). When the equipment has been reactivated, it must stay stable for an adjustable observation time ("stabilisation time"), before it is finally put back in service. If the equipment becomes defect within the stabilisation time, a further trial is made to reactivate the equipment after the next lock time. In total, a maximum of 8 reactivation trials is possible. The lock times should be in ascending order. A lock time = 0 means, that no further reactivation trials are made. The lock- and stabilisation times can be processed by AMO PSTAT.

## **153.2 Restrictions**

This description is valid as from HiPath 4000 V2.0

## **153.3 Interrelationships**

None

## **153.4 Functions of the AMO**

- **CHANGE-PSTAT** : Reset a statistics counter  
Change a control table  
Change the veco parameters  
Change the lock times  
Change the stabilisation times
- **DISPLAY-PSTAT** : Display a statistics counter  
Display a control table  
Display the veco statistics table  
Display the lock times  
Display the stabilisation times
- **REGENERATE-PSTAT** : Regenerate a control table  
Regenerate the veco parameters  
Regenerate the lock times  
Regenerate the stabilisation times

## 153.4.1 CHANGE-PSTAT

1. Reset a counter:  
The statistics counter of levels BOARD1 and BOARD2 (quality counter for DIUC) can be reset.
2. Change the control table data:  
The entries in the control tables for the first two counters of levels BOARD and CIR can be changed.
3. Switch on or switch off the veco statistics:  
When switching on, the display of error messages can be activated or suppressed, and the statistics period (the time interval, after which the counters are reset) can be changed.
4. Change the message display thresholds:  
These thresholds can be changed for each error class individually.
5. Change the switch condition of the veco statistics:  
For every CP- or DH-device type, the display of error messages can be activated or suppressed individually.
6. Change the lock times for the automatic reactivation.  
Up to 8 lock times can be changed for the automatic reactivation of boards / circuits / terminal devices / LTUCs.
7. Change the stabilisation times for the automatic reactivation.  
One stabilisation time is possible for the equipment classes board / circuit / terminal device / LTUC.

### Note

When changing the control table, the statistics counters on all levels are reset for all modules in the overall system. In doing so, the call processing system is deactivated for several seconds. For this reason, the change should not be made during the busy hour. On the levels BOARD and CIR, the boards are divided into classes (see result of example 4 "display of control tables"). If for the values of the control tables are changed displayed for one board, the alteration, or display-output relates to all boards of the same class.

### Procedure overview

| Command Code | Parameter                                    |     |
|--------------|----------------------------------------------|-----|
| CHANGE-PSTAT | TYPE=RESET,                                  |     |
|              | LEVEL=BOARD1, PEN=<number>, [FAULT=<param>]; |     |
|              | LEVEL=BOARD2, PEN=<number>, [FAULT=<param>]; | (1) |
|              | TYPE=CTRLTAB,                                |     |

## PSTAT - Peripheral Statistics

### Functions of the AMO

| Command Code | Parameter                                                                          |     |
|--------------|------------------------------------------------------------------------------------|-----|
|              | LEVEL=BOARD, BOARD=<param>, [FAULT=<param>],                                       |     |
|              | [MAXCOUNT=<number>], [COUNTACT=<number>],                                          |     |
|              | [TIME=<number>] , [DECREM=<number>;                                                |     |
|              | LEVEL=CIR, LINE=<param>, [FAULT=<param>],                                          |     |
|              | [MAXCOUNT=<number>], [COUNTACT=<number>],                                          |     |
|              | [TIME=<number>] , [DECREM=<number>;                                                | (2) |
|              | TYPE=VECOGEN, [PERIOD=<number>], [MODE=<param>;                                    | (3) |
|              | TYPE=VECOLEVL, [ERROR=<param>], MAXCOUNT=<number>;                                 | (4) |
|              | TYPE=VECOSWCH, [ERROR=<param>], [CPTYPE=<hex>],<br>[DHTYPE=<hex>], SWITCH=<param>; | (5) |
|              | TYPE=LOCKTIM, LEVEL=<param>, { (min 1) TIM1=<number>,                              |     |
|              | TIM2=<number>, TIM3=<number>, TIM4=<number>,                                       |     |
|              | TIM5=<number>, TIM6=<number>, TIM7=<number>,                                       |     |
|              | TIM8=<number>;                                                                     | (6) |
|              | TYPE=STABTIM, LEVEL=<param>, STIM=<number>;                                        | (7) |

### Examples

1. Reset of all BOARD1-level counters for module DIUC at PEN 1-6-1.

Input:

```
CHANGE-PSTAT:TYPE=RESET,LEVEL=BOARD1,PEN=1-6-1;
```

Output:

```
H01: DIU-CAS 1-6-1 BOARD1 COUNTER RESET.
```

2. Reset of counter COUNT2 of BOARD1 level for module DIUC at PEN 1-6-1.

Input:

```
CHANGE-PSTAT:TYPE=RESET,LEVEL=BOARD2,PEN=1-6-1,FAULT=COUNT2;
```

Output:

```
H01: DIU-CAS 1-6-1 BOARD2 COUNTER COUNT2 RESET.
```

3. The fault counter COUNT1 of level BOARD for DIUC64 is deactivated by setting the threshold to 0 (valid as from Hicom 300 V3.2).

Input:

```
CHANGE-PSTAT:TYPE=CTRLTAB,LEVEL=BOARD,BOARD=DIUC64,FAULT=COUNT1,MAXCOUNT=0;
```

Output:

```
H02: THE CONTROL TABLE APPLIES FOR THE MODULE(S): DIUC  
DIUC64
```

Since the same control tables are used for DIUC and DIUC64 on the BOARD level, the change affects both types of module.

4. The threshold for COUNT2 of the CIR level for DIUC is set to 201. If the threshold is reached, the fault counter must be reduced by 100.

Input:

```
CHANGE-
PSTAT:TYPE=CTRLTAB, LEVEL=CIR, LINE=DIUC, FAULT=COUNT2, MAXCOUNT=
201, COUNTACT=100;
```

Output:

```
H02: THE CONTROL TABLE APPLIES FOR THE MODULE(S):  DIUC
DIUC64    DIUS2
```

5. The lock times 3 and 4 for terminal devices are changed, a maximum of 4 reactivation trials shall take place.

Input:

```
CHANGE-PSTAT:TYPE=LOCKTIM, LEVEL=DEV, TIM3=5, TIM4=10, TIM5=0;
```

## 153.4.2 DISPLAY-PSTAT

1. Display counters. In SP300-V3.1, only levels BOARD and BOARD1 of the statistics counter of DIUC modules can be displayed.
2. Display of control table.
3. Display the veco statistics.
4. Display the lock times.
5. Display the stabilisation times

### Procedure overview

| Command Code  | Parameter                     |     |
|---------------|-------------------------------|-----|
| DISPLAY-PSTAT | TYPE=COUNTER,                 |     |
|               | LEVEL=BOARD, PEN=<number>;    |     |
|               | LEVEL=BOARD1, PEN=<number>;   |     |
|               | LEVEL=BOARD2, PEN=<number>;   |     |
|               | LEVEL=CIR, PEN=<number>;      | (1) |
|               | TYPE=CTRLTAB, [BOARD=<param>; |     |
|               | LEVEL=BOARD, [BOARD=<param>;  |     |
|               | LEVEL=BOARD1, [BOARD=<param>; |     |
|               | LEVEL=BOARD2, [BOARD=<param>; |     |
|               | LEVEL=CIR, [LINE=<param>;     | (2) |

## PSTAT - Peripheral Statistics

### Functions of the AMO

| Command Code | Parameter                   |     |
|--------------|-----------------------------|-----|
|              | TYPE=VECO, [ERROR=<param>]; | (3) |
|              | TYPE=LOCKTIM;               | (4) |
|              | TYPE=STABTIM;               | (5) |

### Examples

1. Display of counter on BOARD level for DIUC module in PEN 1-6-1.

Input:

```
DISPLAY-PSTAT:TYPE=COUNTER,LEVEL=BOARD1,PEN=1-6-1;
```

Output:

```
+-----+-----+-----+-----+-----+-----+
!  PEN              ! LEVEL ! COUNT1 ! COUNT2 ! COUNT3 ! COUNT4 !
+-----+-----+-----+-----+-----+-----+
! 1-6- 1           ! BOARD1 !    10 !    14 !     0 !    12 !
+-----+-----+-----+-----+-----+-----+
```

2. Display of all control tables for DIUC on level BOARD.

Input:

```
DISPLAY-PSTAT:TYPE=CTRLTAB,LEVEL=BOARD,BOARD=DIUC;
```

Output:

```
+-----+-----+-----+-----+-----+-----+
!
! CONTROL TABLES FOR THE LEVEL BOARD
!
+-----+-----+-----+-----+-----+-----+
! BOARD      !          ! CURRENT VALUE WITH DEFAULT BELOW IF DIFFERENT
! BOARD      ! FAULT    +-----+-----+-----+-----+-----+-----+
!            !          ! COUNTLOC ! MAXCOUNT ! COUNTACT !   TIME   !  DECREM  !
+-----+-----+-----+-----+-----+-----+
! DIUC       ! COUNT1 !  BYTE1  !    21   !    10   !     2    !     4    !
! DIUC64     +-----+-----+-----+-----+-----+-----+
!            ! COUNT2 !  BYTE2  !     5   !     0   !     2    !     2    !
!            +-----+-----+-----+-----+-----+-----+
!            ! COUNT3 !  BYTE3  !     0   !     0   !  65535  !     0    !
!            +-----+-----+-----+-----+-----+-----+
!            ! COUNT4 !  BYTE4  !    19   !    10   !  65535  !     0    !
+-----+-----+-----+-----+-----+-----+
```

3. Display of all control tables for level CIR, other modules (valid as from SP300-V3.2)

Input:

```
DISPLAY-PSTAT:TYPE=CTRLTAB,LEVEL=CIR,LINE=DIUC;
```

Output:

```
+-----+-----+-----+-----+-----+-----+
!
! CONTROL TABLES FOR THE LEVEL CIR
!
+-----+-----+-----+-----+-----+-----+
```

| !        | !        | ! CURRENT VALUE WITH DEFAULT BELOW IF DIFFERENT |            |            |   |        |   | !        |
|----------|----------|-------------------------------------------------|------------|------------|---|--------|---|----------|
| ! LINE   | ! FAULT  |                                                 |            |            |   |        |   | !        |

## PSTAT - Peripheral Statistics

### Functions of the AMO

```
!          +-----+-----+-----+-----+-----+-----+
!          ! COUNT4 !  WORD3 !      301 !   65535 !   65535 !      0 !
!          +-----+-----+-----+-----+-----+-----+
```

#### 6. Display the veco statistics

Input:

DISPLAY-PSTAT:TYPE=VECO;

Output:

```
+-----+
| STATISTICS PERIOD FROM 13.02.92, 12:00 TILL 14.02.92, 09:13 !
| MODE = ONWMSG                                         PERIOD = 24 HOURS |
+-----+-----+-----+-----+-----+-----+
| ERROR | LEVEL | COUNTER | SWITCH | CPTYPE | DHTYPE |
+-----+-----+-----+-----+-----+-----+
| CPBCHL | 10 | 0 | ON | ----- | ----- |
| CPDEV  | 10 | 0 | ON | 0-48 | ----- |
| CPKONS | 10 | 0 | ON | 0-48 | ----- |
| CPNOANSW | 10 | 0 | ON | 0-48 | ----- |
| CPNWCR | 10 | 0 | ON | ----- | ----- |
| CPSBCRI | 10 | 0 | ON | ----- | ----- |
| DHCONF | 10 | 0 | ON | ----- | 0-5A |
| DHDEV  | 10 | 0 | ON | ----- | 0-5A |
| DHLINE | 10 | 0 | ON | ----- | 0-5A |
| DHLINK | 10 | 0 | ON | ----- | 0-5A |
| DHNWCR | 10 | 0 | ON | ----- | ----- |
| DHSBCRI | 10 | 0 | ON | ----- | ----- |
| DHSIU  | 10 | 0 | ON | ----- | ----- |
+-----+-----+-----+-----+-----+-----+
```

#### 7. Display the lock-times

Input:

DISPLAY-PSTAT:LOCKTIM;

Output:

```
+-----+
| LOCK TIMES (MINUTES)
| OF THE REPEATED AUTOMATIC REACTIVATION
+-----+-----+-----+-----+-----+-----+
| LEVEL | TIM1 | TIM2 | TIM3 | TIM4 | TIM5 | TIM6 | TIM7 | TIM8 |
+-----+-----+-----+-----+-----+-----+
| BOARD ACTUAL | 02 | 03 | 09 | 15 | 00 | 00 | 00 | 00 |
|        INIT  | 02 | 03 | 05 | 09 | 20 | 20 | 20 | 20 |
+-----+-----+-----+-----+-----+-----+
| CIR    ACTUAL | 02 | 03 | 05 | 09 | 15 | 00 | 00 | 00 |
|        INIT  | 02 | 03 | 05 | 09 | 20 | 20 | 20 | 20 |
+-----+-----+-----+-----+-----+-----+
| DEV    ACTUAL | 02 | 03 | 05 | 09 | 20 | 20 | 20 | 20 |
|        INIT  | 02 | 03 | 05 | 09 | 20 | 20 | 20 | 20 |
+-----+-----+-----+-----+-----+-----+
| LTUC   ACTUAL | 02 | 03 | 05 | 09 | 20 | 20 | 20 | 20 |
|        INIT  | 02 | 03 | 05 | 09 | 20 | 20 | 20 | 20 |
+-----+-----+-----+-----+-----+-----+
```

**Note:**

The INIT-values displayed are the initial values after the first start of the switch. At this state, the INIT and ACTUAL values are identical. The INIT values can not be changed by the AMO PSTAT.

**153.4.3 REGENERATE-PSTAT**

## 1. Regeneration of the control tables

The differences between the current control table and the default initialization are output as CHANGE commands.

The output can be restricted to a specific level and/or to a certain type of module.

## 2. Regeneration of the control parameters of the veco statistics.

## 3. Regeneration of the lock times.

The CHANGE-command is only output, if at least one of the actual lock times TIM1 - TIM8 for the entered level differs from the init-value.

## 4. Regeneration of the stabilisation times .

The change-COMMAND is only output, if the stabilisation time for the entered level differs from the init-value.

## 5. Regeneration of all types.

**Overview of Procedures**

| Command Code     | Parameter                       |     |
|------------------|---------------------------------|-----|
| REGENERATE-PSTAT | [TYPE=CTRLTAB],                 |     |
|                  | LEVEL=BOARD, [BOARD=<param>;    |     |
|                  | LEVEL=CIR, [LINE=<param>;       | (1) |
|                  | [TYPE=VECO], [ERROR=<param>;    | (2) |
|                  | [TYPE=LOCKTIM], [LEVEL=<param>; | (3) |
|                  | [TYPE=STABTIM], [LEVEL=<param>; | (4) |
|                  |                                 |     |
|                  | [TYPE=ALL];                     | (5) |

**Examples**

## 1. Regeneration of all control tables whose values deviate from the basic initialization.

Input:

```
REGENERATE-PSTAT;
```

**Output:**

```
CHANGE-PSTAT:CTRLTAB,BOARD ,DIUC ,COUNT1, 0, ,
,
CHANGE-PSTAT:CTRLTAB,CIR ,DIUC ,COUNT2, 201, 100,
,
CHANGE-PSTAT:VECOGEN, 24,STATOFF ;
CHANGE-PSTAT:VECOLEV,CPBCHL , 10;
CHANGE-PSTAT:VECOSWCH,CPBCHL , ,ON ;
CHANGE-PSTAT:VECOLEV,CPDEV , 24;
CHANGE-PSTAT:VECOSWCH,CPDEV , 0&&4E, ,ON ;
CHANGE-PSTAT:VECOLEV,CPKONS , 10;
CHANGE-PSTAT:VECOSWCH,CPKONS , 0&&4E, ,ON ;
CHANGE-PSTAT:VECOLEV,CPNOANSW, 10;
CHANGE-PSTAT:VECOSWCH,CPNOANSW, 0&&4E, ,ON ;
CHANGE-PSTAT:VECOLEV,CPNWCR , 10;
CHANGE-PSTAT:VECOSWCH,CPNWCR , ,ON ;
CHANGE-PSTAT:VECOLEV,CPSBCRI , 10;
CHANGE-PSTAT:VECOSWCH,CPSBCRI , ,ON ;
CHANGE-PSTAT:VECOLEV,DHCONF , 10;
CHANGE-PSTAT:VECOSWCH,DHCONF , 0&&4C,ON ;
CHANGE-PSTAT:VECOLEV,DHDEV , 10;
CHANGE-PSTAT:VECOSWCH,DHDEV , 0&&4C,ON ;
CHANGE-PSTAT:VECOLEV,DHLINE , 10;
CHANGE-PSTAT:VECOSWCH,DHLINE , 0&&4C,ON ;
CHANGE-PSTAT:VECOLEV,DHLINK , 10;
CHANGE-PSTAT:VECOSWCH,DHLINK , 0&&4C,ON ;
CHANGE-PSTAT:VECOLEV,DHNWCR , 10;
CHANGE-PSTAT:VECOSWCH,DHNWCR , ,ON ;
CHANGE-PSTAT:VECOLEV,DHSBCRI , 10;
CHANGE-PSTAT:VECOSWCH,DHSBCRI , ,ON ;
CHANGE-PSTAT:VECOLEV,DHSIU , 10;
CHANGE-PSTAT:VECOSWCH,DHSIU ,ON ;
CHANGE-PSTAT:LOCKTIM,BOARD,02,03,09,15,00,00,00,00;
CHANGE-PSTAT:STABTIM,CIR,15;
CHANGE-PSTAT:STABTIM,DEV,10;
```

- 2. Regenerate the control tables for board type DIUS2.

**Input:**

```
REGENERATE-PSTAT:TYPE=CTRLTAB,BOARD=DIUS2;
No deviation from default values for DIUS2 (no output).
```

**153.5 Parameter description**

|               |                                                                      |
|---------------|----------------------------------------------------------------------|
| BOARD         | Module type for determination of class of table                      |
| Type of input | : Single value<br>mandatory (CHANGE)<br>optional (CHANGE,REGENERATE) |

Possible Values : LEVEL = BOARD CDG DIUC DIUC64 DIUN2 DIUN4  
DIU2U  
DIUS2 NCUI SLMB16 SLMC SLMO  
SLMQ SLMS SLMU16 SLMY STHC  
STMA2T STMAS STMI STMIHFA STMIIGW  
STMI2IGW TMDN VCM  
WAML1 WAML2 OTHER

LEVEL = BOARD1 DIUC DIUC64  
LEVEL = BOARD2 DIUC64

The value OTHER is not valid for the actions CHANGE and REGENERATE.

**COUNTACT**

Counter action

Action on reaching counter limit

Type of Input : Single value, optional

Possible Values : 0 Counter remains unchanged  
2 to 254 Reset by n  
(only even values permitted)  
255 Reset to 0

**CPTYPE**

CP device type

Type of Input : Single value, linked single values,  
ranges, up to 12 values, hexadecimal,  
optional

Possible Values : 0 to 48

Default value : all device types

**DECREM**

Decrement

Decrement on reaching the interval defined with TIME

Type of Input : Single value, optional

Possible Values : 0 Counter remains unchanged  
2 to 254 Reset by n  
(only even values permitted)  
255 Reset to 0

**DHTYPE**

DH device type

Type of Input : Single value, linked single values,  
ranges, up to 12 values, hexadecimal,  
optional

Possible Values : 0 to 5A

Default value : all device types

## PSTAT - Peripheral Statistics

### Parameter description

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |

A suitable module must be configured to the slot addressed by PEN (AMO BCSU).

The possible LTU and Slot values for PEN depend on the systems architecture and can be found in the BCSU AMO description.

The possible Line values depend on the module type and its functionality.

They can be listed using DISP-BCSU: TYPE=PEN1 [,LTG=, LTU=, SLOT=, CCT=]; which will also output the actual PEN status (e.g. NOT CONNECTED).

## 153.6 Fault Messages and Advisories

### Explanation of the variable message fields

<pen> : <ltg>-<ltu>-<slot>  
<ltg>-<ltu>-<slot>-<cir>  
<fault> : value specified for parameter FAULT  
no text, if parameter FAULT not specified  
<ltg> : number of the actual LTG  
<name> : name of parameter (DECREM, MAXCOUNT or COUNTACT)  
<board> : name of module type  
<time> : parameter TIM1 ... TIM8  
<n> : numbers 1...7

### 153.6.1 Fault Messages

F01: PEN <pen> INVALID.  
F02: LTG <ltg> IS NOT ASSIGNED.  
F03: LTU <ltg>-<ltu> IS NOT ASSIGNED.  
F04: BOARD ^ltg^-^ltu^-^ebt^ IS NOT ASSIGNED.  
F05: MODULE <pen> IS NO DIU-CAS.  
F06: LTG <ltg> IS NOT AVAILABLE.  
F07: PARTNER TASK IN LTG <ltg> DOES NOT RESPOND.  
F08: NEGATIVE ACKNOWLEDGEMENT BY PARTNER TASK IN LTG <ltg>.  
F09: THE PARAMETER <name> MUST BE ODD OR ZERO.  
F10: THE PARAMETER <name> MUST BE EVEN OR EQUAL TO 255.  
F11: FOR <level> <board>, THE COUNTERS OF FAULT LEVELS 3 AND 4 MUST NOT BE MODIFIED  
F12: AFTER ENTRY "0", NO FURTHER LOCKTIME ENTRIES ARE POSSIBLE.  
F13: PARAMETERS <time> CAN ONLY BE ENTERED,  
IF THE LOCK-TIMES 1 - <n> ARE GREATER THAN ZERO.  
TO DISPLAY, ENTER:  
DISPLAY-PSTAT:LOCKTIM;

### 153.6.2 Advisories

H01: BOARD <pen> <level> COUNTER <fault> RESET.  
H02: THE CONTROL TABLE APPLIES TO <board> [...]  
H04: THE FAULT COUNTER HAS BEEN DEACTIVATED.

H05: THE FAULT COUNTER HAS BEEN ACTIVATED.

H06: INCREASING THE LOCK TIME TO  $\geq 10$  MINUTES MAY ACTIVATE THE ALARM  
ASSIGNED TO THIS <level>.

H07: THE LOCK TIME MAY BE TOO SHORT, A SECOND REACTIVATION COULD RESULT.

### **153.6.3 Use of the messages per action**

# 154 PTIME - Timers for Peripheral Processing

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> | <a href="#">Appendix 2 Initblocks general</a> |

The following modules or device types use timers which are set using AMO PTIME.

## 1. SLMA ( Q2041, Q2141, Q2157 )

These modules are parameterized in the branch TYPE=SLMA. The preset values apply to all modules of the above type used in the system, can be changed by AMO and are preinitialized in the database.

Changeable parameters of specified modules:

(see Procedure Overview CHANGE-PTIME)

Q2041 only the parameters RNGON0 to RNGON5.

Q2141 und Q2157: all parameters

On interrogation of the peripheral timers of SLMA the values of all parameters added in the database are displayed, but only the values of parameter RNGON0 to RNGON5 are valid for all SLMA types. The other parameters RNGON61 to FLASH are only valid for SLMA type Q2141 and Q2157 (see Output example DISPLAY-PTIME:SLMA;)

### Note:

All parameter RUFAN../RUFAB., except RUFAN5, will be also valid for the Optiset-/OptiPoint family. These timers will be not loaded onto the module and medd therefore no deactivation/activation with AMO DSSU.

## 2. SLMA1 ( Q2141, Q2157, Q2146, Q2191, Q2184, Q2227, Q2246, Q2480 )

These modules are parameterized in the branch TYPE=SLMA1. A maximum of 16 different parameter blocks are allowed for this module (parameter TBLK= 0 to 15). When configuring the terminals (only on these modules) with the aid of AMO SCSU, these modules are assigned the parameter CIRCIDX = 0 to 15.

The 16 parameter blocks are initialized with valid values (blocks 0 and 1 are preinitialized for "Spain" and block 2 is preinitialized for "France"). Blocks 3 and 15 are initialized in accordance with generally valid values (for values see Parameter Description). For

any applications (e.g. other countries) which have not been prepared the initialized times must be checked and, if necessary, changed for each parameter.

In the case of the SLMA1 module, trunk-specific parameterizations are possible (up to 16 different parameter blocks).

### Note:

When **DIAL** parameter in AMO SCSU is set to **VAR**, flash timing for SLMAV works between 80ms (even if default value for **FLASHMIN** is set to 40ms in AMO PTIME:SLMA1) to the value of the parameter **FLASHMAX** in AMO PTIME.

To use a flash timing less than 80ms with analog stations connected to a SLMAV board, then you need to change other settings.

The **DIAL** and **CCTIDX** parameters in AMO SCSU must be set to **DTMF** and table number from AMO PTIME, branch SLMA1, respectively. For example, DIAL=DTMF,CCTIDX=3.

Timing values used will be get from table block 3 (AMO PTIME:SLMA1).

**FLASHMIN** in AMO PTIME:SLMA1 must be set to desired value, in case it is set to greater value.

### 3. Analog trunk circuits of device type TSAC

Six different parameter blocks are reserved under TYPE = TSAC for this case. Parameter TBLK = 0 to 5 specifies the timer blocks which are assigned DEV = TSAC and CIRCIDX = 0 to 5 during circuit configuration. These 6 parameter blocks are initialized with the same, valid values.

By default, AMO TACSU assigns block 0.

### 4. Analog trunk circuits with extended circuit data on the loadware (AMO TACSU)

A maximum of 32 different parameter blocks can be created in the database for these circuits under TYPE = REST. These blocks are initialized with CIRCIDX = 0 to 31 upon configuration of the circuits using AMO TACSU.

This applies to all devices listed in the parameter description of parameter DEV. For each device type, there is a parameter set with valid values on the hard disk (see Appendix).

The database also contains 32 parameter blocks which have been initialized as "empty" parameter blocks. Using the COPY-PTIME command the "initialized" blocks can be copied into these "empty" blocks and subsequently changed. Upon configuration of these circuits, AMO TACSU scans the 32 parameter blocks in the DB to find a parameter set suitable for the device to be configured. If no

suitable parameter set is found, the associated set will be copied from the hard disk into the DB and assigned the corresponding CIRCIDX.

If a suitable parameter set is found in the DB, the device will be assigned the corresponding CIRCIDX (e.g. when the second device of the same type is being configured). Provided that suitable parameters have been initialized, neither the AMO PTIME nor the parameter CIRCIDX must be specified in the AMO TACSU.

If different initializations are required for a device type, the "initialized" parameter block can be copied several times from the hard disk into "empty" parameter blocks in the DB and subsequently changed. In this case, the parameter CIRCIDX must be assigned selectively when configuring the circuits with the aid of AMO TACSU, or else AMO TACSU will assign the first parameter found.

Parameter P12 (AMO PTIME: REST) is used to program the extra impedance index for AMO TACSU on TMANI circuits (extends AMO TACSU, COEX parameter).

**Note:**

The times for the branches SLMA (only modules Q2141 and Q2157), SLMA1, TSAC and REST are loaded onto the modules when the respective circuits are taken into operation. If a subsequent change is required, all affected circuits must be deactivated and (re-)activated (unconditional loading) using the AMO DSSU (not valid for Optiset/OptiPoint).

## 154.1 Restrictions

This description is valid from HiPath 4000 V1.0

## 154.2 Interrelationships

- AMO DSSU : Device Switch of Switching Unit
- AMO SCSU : Subscriber Configuration of SWU
- AMO TACSU : Configuration of Analog Trunk Circuits in the SWU

## 154.3 Functions of the AMO

- [CHANGE-PTIME](#) : Change peripheral timers
- [DISPLAY-PTIME](#) : Interrogate peripheral timers
- [COPY-PTIME](#) : Copy an init block into a timer block
- [REGENERATE-PTIME](#) : Regenerate peripheral timers

### 154.3.1 CHANGE-PTIME

This action can be used to change the preinitialized values. In the branch TYPE = REST, the parameter ARTLSP was given a neutral name (LONG, SHORT, PARA) because the various parameters have different meanings depending on the type of device used. Device-specific definitions are given in the Appendix.

#### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <pre> , L5=&lt;number&gt;, L6=&lt;number&gt;, L7=&lt;number&gt;;  , BTYPE=SHORT,   {S1=&lt;number&gt;, S2=&lt;number&gt;, S3=&lt;number&gt;, S4=&lt;number&gt;   , S5=&lt;number&gt;, S6=&lt;number&gt;, S7=&lt;number&gt;, S8=&lt;number&gt;   , S9=&lt;number&gt;, S10=&lt;number&gt;, S11=&lt;number&gt;, S12=&lt;number&gt;   , S13=&lt;number&gt;, S14=&lt;number&gt;;}  , BTYPE=PARA,   {P1=&lt;number&gt;, P2=&lt;number&gt;, P3=&lt;number&gt;, P4=&lt;number&gt;   , P5=&lt;number&gt;, P6=&lt;number&gt;, P7=&lt;number&gt;, P8=&lt;number&gt;   , P9=&lt;number&gt;, P10=&lt;number&gt;, P11=&lt;number&gt;, P12=&lt;number&gt;   , P13=&lt;number&gt;, P14=&lt;number&gt;;} </pre> |

### 154.3.2 DISPLAY-PTIME

If parameter DEV is not specified, all parameter blocks (0 - 31) which were copied into the DB will be output.

#### Procedure Overview

| Command Code  | Parameter                                                                        |
|---------------|----------------------------------------------------------------------------------|
| DISPLAY-PTIME | <pre> TYPE=SLMA;  TYPE:SLMA1;  TYPE:TSAC;  TYPE=REST, [DEV=&lt;param&gt;] </pre> |

#### Example

Interrogate the SLMA module resp. Optiset/OptiPoint timers:

Input:

```
DISPLAY-PTIME:SLMA;
```

Output:

```
SLMA TIMERS:
=====
```

```

RNGON0   = 1000 MS.   RNGOFF0  = 4000 MS.   RNGON11  = 300 MS.
RNGOFF11 = 400 MS.   RNGON12  = 300 MS.   RNGOFF12 = 4000 MS.
RNGON2   = 1000 MS.   RNGOFF2  = 1000 MS.   RNGON31  = 300 MS.
RNGOFF31 = 400 MS.   RNGON32  = 300 MS.   RNGOFF32 = 1000 MS.
RNGON5   = 500 MS.
RNGON61  = 200 MS.   RNGOFF61 = 200 MS.   RNGON62  = 200 MS.
RNGOFF62 = 200 MS.   RNGON63  = 200 MS.   RNGOFF63 = 4000 MS.
FLASHMIN = 40 MS.   FLASHMAX = 110 MS.   ONHOOK  = 100 MS.
INTERDIG = 100 MS.  SPCL      = 1000 MS.  FLASH   = 600 MS.

```

**PTIME - Timers for Peripheral Processing**  
Functions of the AMO

H01: CAUTION: THE MODIFIED TIME PARAMETERS WERE NOT LOADED INTO  
THE CIRCUIT MODULES.  
PLEASE PULL AND REPLUG THE MODULES CONCERNED.

**Note:**

Ignore the displayed values for RNGON61 to FLASH for the "old" SLMA modules Q2041, because they can't be loaded on the modules. They are only valid for the "new" SLMA modules Q2141 and Q2157.

**Example**

Interrogate individual SLMA1 module timers:

Input:

DISPLAY-PTIME:SLMA1;

Output:

```
SLMA1 TIMERS:
=====
TBLK = 0;  FLASHMIN = 50 MS.  FLASHMAX = 130 MS.
           ONHOOK   = 150 MS.  INTERDIG = 100 MS.
           SPCL     = 1000 MS.  FLASH    = 600 MS.
           PULSED   = 0 MS.    PAUSED   = 0 MS.

TBLK = 1;  FLASHMIN = 50 MS.  FLASHMAX = 1000 MS.
           ONHOOK   = 1100 MS. INTERDIG = 50 MS.
           SPCL     = 50 MS.   FLASH    = 0 MS.
           PULSED   = 0 MS.    PAUSED   = 0 MS.

TBLK = 2;  FLASHMIN = 190 MS. FLASHMAX = 350 MS.
           ONHOOK   = 500 MS.  INTERDIG = 2000 MS.
           SPCL     = 2000 MS.  FLASH    = 2000 MS.
           PULSED   = 0 MS.    PAUSED   = 0 MS.

TBLK = 3;  FLASHMIN = 40 MS.  FLASHMAX = 110 MS.
           ONHOOK   = 200 MS.  INTERDIG = 300 MS.
           SPCL     = 1500 MS. FLASH    = 1000 MS.
           PULSED   = 0 MS.    PAUSED   = 0 MS.

H01: CAUTION: THE MODIFIED TIME PARAMETERS WERE NOT
LOADED INTO THE CIRCUIT MODULES.
PLEASE PULL AND REPLUG THE MODULES
CONCERNED.
```

**Example**

Interrogate the timers for device type TSAC:

Input:

DISPLAY-PTIME:TSAC;

Output:

## PTIME - Timers for Peripheral Processing

### Functions of the AMO

TSAC TIMERS:  
=====

|           |                    |                    |                    |
|-----------|--------------------|--------------------|--------------------|
| TBLK = 0; | IMPTYPE1 = 60 MS.  | IMPTYPE2 = 140 MS. | RLSPFW = 700 MS.   |
|           | RLSPBK = 2300 MS.  | ASSTYPE1 = 100 MS. | ASSTYPE2 = 120 MS. |
| TBLK = 1; | IMPTYPE1 = 40 MS.  | IMPTYPE2 = 80 MS.  | RLSPFW = 120 MS.   |
|           | RLSPBK = 120 MS.   | ASSTYPE1 = 35 MS.  | ASSTYPE2 = 35 MS.  |
| TBLK = 2; | IMPTYPE1 = 800 MS. | IMPTYPE2 = 800 MS. | RLSPFW = 4000 MS.  |
|           | RLSPBK = 4000 MS.  | ASSTYPE1 = 800 MS. | ASSTYPE2 = 800 MS. |
| TBLK = 3; | IMPTYPE1 = 100 MS. | IMPTYPE2 = 200 MS. | RLSPFW = 1000 MS.  |
|           | RLSPBK = 1000 MS.  | ASSTYPE1 = 40 MS.  | ASSTYPE2 = 40 MS.  |
| TBLK = 4; | IMPTYPE1 = 120 MS. | IMPTYPE2 = 220 MS. | RLSPFW = 2000 MS.  |
|           | RLSPBK = 2000 MS.  | ASSTYPE1 = 120 MS. | ASSTYPE2 = 150 MS. |
| TBLK = 5; | IMPTYPE1 = 140 MS. | IMPTYPE2 = 240 MS. | RLSPFW = 500 MS.   |
|           | RLSPBK = 500 MS.   | ASSTYPE1 = 700 MS. | ASSTYPE2 = 700 MS. |

### Example

Interrogate the timers for the remaining device types e.g. DEV = DIDLRB:

Input:

DISPLAY-PTIME:REST,DIDLRB;

Output:

REST TIMERS:  
=====

```

INIBLOCK:  52      DEVICE: DIDLRB      TBLOCK:  0
-----
LONGTIME:
  L1 = 300,  L2 = 600,  L3 = 10000,  L4 = 2000,
  L5 = 0,    L6 = 0,    L7 = 0,
SHORTTIME:
  S1 = 32,   S2 = 32,   S3 = 32,   S4 = 32,
  S5 = 32,   S6 = 32,   S7 = 30,   S8 = 20,
  S9 = 72,   S10 = 80,  S11 = 12,  S12 = 70,
  S13 = 0,   S14 = 0,
SHORT-PARA:
  P1 = 1,    P2 = 1,    P3 = 0,    P4 = 0,
  P5 = 2,    P6 = 2,    P7 = 4,    P8 = 0,
  P9 = 90,   P10 = 0,   P11 = 2,   P12 = 0,
  P13 = 0,   P14 = 0.

```

## 154.3.3 COPY-PTIME

Copying a timer block (REST branch) from the hard disk to the DB. (for TBLK see Appendix)

**PTIME - Timers for Peripheral Processing**

Functions of the AMO

If INIBLOCK = 0 is specified, this command has the same effect as a DELETE command.

In this case, the parameter TBLK is mandatory. See also "Explanations" given in the Introduction

**Procedure Overview**

| Command Code | Parameter                           |
|--------------|-------------------------------------|
| COPY-PTIME   | INIBLOCK=<number>, [TBLK=<number>]; |

**154.3.4 REGENERATE-PTIME**

**Procedure Overview**

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-PTIME | ;         |

**Example**

Regenerate the peripheral timers.

Input:

REG-PTIME;

Output:

```
CHANGE-PTIME:SLMA, 1000, 4000, 300, 400, 300, 4000, 1000, 1000, 300, 400,
                300, 1000, 500, 200, 200, 200, 200, 200, 4000, 40,
                110, 200, 100, 1000, 600;
CHANGE-PTIME:QSWES,0, 60,140, 700,2300,100,120;
CHANGE-PTIME:QSWES,1, 40, 80, 120, 120, 35, 35;
CHANGE-PTIME:QSWES,2,800,800,4000,4000,800,800;

## 154.4 Parameter Description

|                 |                                                           |
|-----------------|-----------------------------------------------------------|
| TYPE            | Desired peripheral processing timers options              |
| Type of Input   | : Single value, mandatory                                 |
| Possible Values | : REST<br>SLMA (resp. Optiset/OptiPoint)<br>SLMA1<br>TSAC |

### Parameters for the branch TYPE = SLMA:

Peripheral timers for SLMA modules resp. Optiset/OptiPoint, only ring timers.

The following condition must be satisfied:  
FLASHMIN < FLASHMAX < ONHOOK.

|                 |                                                |
|-----------------|------------------------------------------------|
| FLASH           | Time between detecting and reporting flash key |
| Type of Input   | : Single value, optional                       |
| Possible Values | : 0 - 2000 ms                                  |
| Default Value   | : 600 ms                                       |
| FLASHMAX        | Maximum flash time                             |
| Type of Input   | : Single value, optional                       |
| Possible Values | : 20 - 2000 ms                                 |
| Default Value   | : 110 ms                                       |
| FLASHMIN        | Minimum flash time                             |
| Type of Input   | : Single value, optional                       |
| Possible Values | : 20 - 2000 ms                                 |
| Default Value   | : 40 ms                                        |
| INTERDIG        | Interdigit pause                               |
| Type of Input   | : Single value, optional                       |
| Possible Values | : 50 - 2000 ms                                 |

## PTIME - Timers for Peripheral Processing

### Parameter Description

|          |                                                                     |                          |
|----------|---------------------------------------------------------------------|--------------------------|
|          | Default Value                                                       | : 100 ms                 |
| ONHOOK   | Minimum time for detection of on-hook state                         |                          |
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 2000 ms           |
|          | Default Value                                                       | : 200 ms                 |
| RNGOFF0  | Inter-ring pause, single burst ring 1<br>(also Optiset/OptiPoint)   |                          |
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 60000 ms          |
|          | Default Value                                                       | : 4000 ms                |
| RNGOFF11 | Inter-ring pause, double burst ring 1<br>(also Optiset/OptiPoint)   |                          |
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 999 ms            |
|          | Default Value                                                       | : 400 ms                 |
| RNGOFF12 | Inter-ring pause, double burst ring 1<br>(also Optiset/OptiPoint)   |                          |
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 60000 ms          |
|          | Default Value                                                       | : 4000 ms                |
| RNGOFF2  | Inter-ring pause, single burst ring 2<br>(also Optiset/OptiPoint)   |                          |
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 60000 ms          |
|          | Default Value                                                       | : 1000 ms                |
| RNGOFF31 | Inter-ring pause 1, double burst ring 2<br>(also Optiset/OptiPoint) |                          |
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 999 ms            |
|          | Default Value                                                       | : 400 ms                 |
| RNGOFF32 | Inter-ring pause 2, double burst ring 2<br>(also Optiset/OptiPoint) |                          |

|          |                                                                     |                          |
|----------|---------------------------------------------------------------------|--------------------------|
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 60000 ms          |
|          | Default Value                                                       | : 1000 ms                |
| RNGOFF61 | Inter-ring pause 1, triple burst ring 1<br>(also Optiset/OptiPoint) |                          |
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 60000 ms          |
|          | Default Value                                                       | : 200 ms                 |
| RNGOFF62 | Inter-ring pause 2, triple burst ring 1<br>(also Optiset/OptiPoint) |                          |
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 60000 ms          |
|          | Default Value                                                       | : 200 ms                 |
| RNGOFF63 | Inter-ring pause 3, triple burst ring 1<br>(also Optiset/OptiPoint) |                          |
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 60000 ms          |
|          | Default Value                                                       | : 4000 ms                |
| RNGON0   | Ring times, single burst ring 1<br>(also Optiset/OptiPoint)         |                          |
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 60000 ms          |
|          | Default Value                                                       | : 1000 ms                |
| RNGON11  | Ring times, double burst ring 1<br>(also Optiset/OptiPoint)         |                          |
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 999 ms            |
|          | Default Value                                                       | : 300 ms                 |
| RNGON12  | Ring times , double burst ring 1<br>(also Optiset/OptiPoint)        |                          |
|          | Type of Input                                                       | : Single value, optional |
|          | Possible Values                                                     | : 20 - 999 ms            |
|          | Default Value                                                       | : 300 ms                 |

## PTIME - Timers for Peripheral Processing

### Parameter Description

|         |                                                                                                                                                                     |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RNGON2  | Ring times, single burst ring 2<br>(also Optiset/OptiPoint)<br>Type of Input : Single value, optional<br>Possible Values : 20 - 60000 ms<br>Default Value : 1000 ms |
| RNGON31 | Ring time 1 , double burst ring 2<br>(also Optiset/OptiPoint)<br>Type of Input : Single value, optional<br>Possible Values : 20 - 999 ms<br>Default Value : 300 ms  |

| RNGON63 | Ring time 3, triple burst ring 1<br>(also Optiset/OptiPoint)                                                                                                        |

Type of Input : Single value, optional  
 Possible Values : 20 - 60000 ms  
 Default Value : 200 ms

SPCL Cleardown timeout for special station during power-out on a/b wires

Type of Input : Single value, optional  
 Possible Values : 50 - 2000 ms  
 Default Value : 1000 ms (TBLK 0-15)

### Parameters for the branch TYPE = SLMA1:

FLASH Time between detecting and reporting flash key

Type of Input : Single value, optional  
 Possible Values : 0 - 2000 ms  
 Default Value : 600 ms

FLASHMAX Maximum flash time

Type of Input : Single value, optional  
 Possible Values : 110 - 2000 ms  
 Default Value : 130 ms (TBLK=0 , Spain)  
                   1000 ms (TBLK=1 , Spain)  
                   350 ms (TBLK=2 , France)  
                   110 ms (TBLK=3 - 15)

FLASHMIN Minimum flash time

Type of Input : Single value, optional  
 Possible Values : 20 - 2000 ms  
 Default Value : 50 ms (TBLK=0 , Spain)  
                   50 ms (TBLK=1 , Spain)  
                   190 ms (TBLK=2 , France)  
                   40 ms (TBLK=3 - 15)

INTERDIG Interdigit pause

Type of Input : Single value, optional  
 Possible Values : 50 - 2000 ms  
 Default Value : 100 ms

ONHOOK Minimum time for detection of on-hook state

Type of Input : Single value, optional

## PTIME - Timers for Peripheral Processing

### Parameter Description

|        |                                                                     |                           |
|--------|---------------------------------------------------------------------|---------------------------|
|        | Possible Values                                                     | : 150 - 2000 ms           |
|        | Default Value                                                       | : 150 ms (TBLK=0 , Spain) |
|        |                                                                     | 1100 ms (TBLK=1 , Spain)  |
|        |                                                                     | 500 ms (TBLK=2 , France)  |
|        |                                                                     | 200 ms (TBLK=3 - 15)      |
| PAUSED | SLMAR call charge pulse - pause duration (in 10 ms steps)           |                           |
|        | Type of Input                                                       | : Single value, optional  |
|        | Possible Values                                                     | : 0 - 2550 ms             |
|        | Default Value                                                       | : 0 ms                    |
| PULSED | SLMAR call charge pulse - pulse duration (in 10 ms steps)           |                           |
|        | Type of Input                                                       | : Single value, optional  |
|        | Possible Values                                                     | : 0 - 2550 ms             |
|        | Default Value                                                       | : 0 ms                    |
| SPCL   | Cleardown timeout for special station during power-out on a/b wires |                           |
|        | Type of Input                                                       | : Single value, optional  |
|        | Possible Values                                                     | : 50 - 2000 ms            |
|        | Default Value                                                       | : 1000 ms (TBLK 0-15)     |
| TBLK   | Timer block                                                         |                           |
|        | Type of Input                                                       | : Single value, optional  |
|        | Possible Values                                                     | : 0 - 15                  |

### Parameters of the branch TYPE = TSAC:

|          |                                                                                                                                                                                                                                                                                   |                          |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| ASSTYPE1 | Assessment time for pulses to be received for IMPTYPE1. This establishes up to which length incoming pulses are evaluated as IMPTYPE1. Longer pulses are evaluated as IMPTYPE2 or, if the timer for evaluation range IMPTYPE2 (ASSTYPE2) has expired, result in timer overflow 1. |                          |
|          | Type of Input                                                                                                                                                                                                                                                                     | : Single value, optional |
|          | Possible Values                                                                                                                                                                                                                                                                   | : 35 bis 800 ms          |
|          | Default Value                                                                                                                                                                                                                                                                     | : 100 ms                 |
| ASSTYPE2 | Assessment time for pulses to be received for IMPTYPE2. The timer is started after it expires for ASSTYPE1 and establishes up to which length pulses are evaluated as IMPTYPE2. The maximum pulse length is the sum of ASSTYPE1 and ASSTYPE2.                                     |                          |
|          | Type of Input                                                                                                                                                                                                                                                                     | : Single value, optional |
|          | Possible Values                                                                                                                                                                                                                                                                   | : 35 bis 800 ms          |
|          | Default Value                                                                                                                                                                                                                                                                     | : 120 ms                 |

IMPTYPE1      Length of pulses to be sent for type 1 (in ms) for

- Seizure ( TIE - 1)
- Start-of-pulse signal
- Answer
- Seizure acknowledgement

Type of Input        : Single value, optional

Possible Values     : 40 to 800 ms in steps of 20ms

Default Value        : 60 ms

IMPTYPE2      Length of pulse to be sent for type 2 (in ms) for

- Gate seizure( TIE - 2 )
- End-of-selection

IMPTYPE2 must always be larger than IMPTYPE1.

Type of Input        : Single value, optional

Possible Values     : 80 to 800 ms in steps of 20ms

Default Value        : 140 ms

RLSPBK        Length of backward release/release  
acknowledgement pulse to be sent

Type of Input        : Single value, optional

Possible Values     : 120 bis 4000 ms

Default Value        : 2300 ms

RLSPFW        Length of forward release pulse to be sent

Type of Input        : Single value, optional

Possible Values     : 120 bis 4000 ms

Default Value        : 700 ms

TBLK           Timer block

Block in which the specified times are entered.

Type of Input        : Single value, optional

Possible Values     : 0 bis 5

### Description of the parameters of branch TYPE = REST:

BTYPE          Branching parameter for addressing LONGTIME, SHORTTIME and SHORTPARA-TBL for all  
remaining device types (TYPE=REST)

Type of Input        : Single value, mandatory

**PTIME - Timers for Peripheral Processing**

Parameter Description

|      |                                                         |                           |
|------|---------------------------------------------------------|---------------------------|
|      | Possible Values                                         | : LONG, SHORT, PARA       |
| DEV  | Device types                                            |                           |
|      | Device type to be specified for DISPLAY-PTIME:TYPE=REST |                           |
|      | Type of Input                                           | : Single value, optional  |
|      | Possible Values                                         | : see APPENDIX 1          |
| TBLK | Timer block                                             |                           |
|      | Block in which the specified times are to be entered.   |                           |
|      | Type of Input                                           | : Single value, mandatory |
|      | Possible Values                                         | : 0 bis 31                |

**Note on the parameters LONG, SHORT, PARA for BTYPE**

The above parameters are described in APPENDIX 2 because they vary with the device type used.

|          |                            |
|----------|----------------------------|
| L1 - L 7 | Parameters for LONG timer  |
| S1 - S14 | Parameters for SHORT timer |
| P1 - P14 | Parameters for PARA        |

**Description of the parameters of branch TYPE = REST:**

|          |                                                                 |
|----------|-----------------------------------------------------------------|
| INIBLOCK | Initialization block number in file on hard disk (see Appendix) |
|          | Type of Input : numerical, mandatory                            |
|          | Possible Values : 0 - 255                                       |
|          | If INIBLOCK = 0, a timer block will be deleted.                 |
|          | In this case, the parameter TBLK must be specified.             |
| TBLK     | Number of timer block in database                               |
|          | Block in which the specified times are entered.                 |
|          | Type of Input : Single value, mandatory (for INIBLOCK = 0)      |
|          | Single value, optional (for INIBLOCK > 0)                       |
|          | Possible Values : 0 to 31                                       |

\* High und low byte values are hexadecimal, which have to be converted into decimal to get the corresponding parameter value.

Example: Parameter P13: high byte :1  
low byte :1

} P13[Hex]=11 → P13[Dec]=17

\*\* The parameter P12, short timers S1, S2 and S14 are used for 12kHz and 16 kHz charge recognition.  
Any value changing of one of those parameter can influence the other parameter.  
The parameter P12, short timer S1 and S2 are used for 50 Hz charge recognition.

(88): DB\_AM\_DEV\_ANDIDLP1: ANDIDLP1

\*High and low bytes value are in hexadecimal, which have to be converted into decimal to get the corresponding parameter value.

Example:Parameter P13:high byte value:1  
low byte value:1

} P13[Hex]=11 → P13[Dec]=17

\*\*The parameter P12, short timers S1, S2 and S14 are used for 12kHz and 16 kHz charge recognition. Any value changing of one of those parameter can influence the other parameter.

\* High und low byte values are hexadecimal, which have to be converted into decimal to get the corresponding parameter value.

Example: Parameter P3: high byte :2  
low byte :0

} P3[Hex]=20 → P3[Dec]=32

(98): DB\_AM\_DEV\_QSTF4 : TSC4

|                 |         | 1                                                       | Release of time slots / highways by receiving the event DB_EE_E_KOMMEND_BTBT message | This parameter must be set if the COP ACKB and/or ACKF are <b>not</b> set! |

\* High und low byte values are hexadecimal, which have to be converted into decimal to get the corresponding parameter value.

Example: Parameter P3: high byte :2  
low byte :0

} P3[Hex]=20 → P3[Dec]=32

(99): DB\_AM\_DEV\_ QSTF5 : TSC5

|                |         | 0                                                                                                                     | Release of time slots / highways by receiving the event DB_EE_E_AUSLOESEN message<br>Works via COP ACKB <b>and</b> ACKF.                                              |
|                |         | 1                                                                                                                     | Release of time slots / highways by receiving the event DB_EE_E_KOMMEND_BTBT message<br>This parameter must be set if the COP ACKB and/or ACKF are <b>not</b> set!    |
|                |         | 2                                                                                                                     | Release of time slots / highways by receiving the event DB_EE_E_AUSLOESEN message<br>The M_ON will be sent 40ms after E_OFF fix independent from any message from DH. |

\* High und low byte values are hexadecimal, which have to be converted into decimal to get the corresponding parameter value.

Example! Parameter P3: high byte :2  
low byte :0

} P3[Hex]=20 → P3[Dec]=32

(100): DB\_AM\_DEV\_QSTF6: TSC6

| Longti-mer | Default (ms) | Description                                                                                                                                                                  | Remark |

| Parameter | Default | Description                                                                                  | Remark                                                                     |
|-----------|---------|----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
|           |         | 0<br>Release of time slots / highways by receiving the event<br>DB_EE_E_AUSLOESEN message    | Works via COP ACKB <b>and</b> ACKF                                         |
|           |         | 1<br>Release of time slots / highways by receiving the event<br>DB_EE_E_KOMMEND_BTBT message | This parameter must be set if the COP ACKB and/or ACKF are <b>not</b> set! |

\* High und low byte values are hexadecimal, which have to be converted into decimal to get the corresponding parameter value.

Example: Parameter P3: high byte: 2, low byte: 0 ==> P3[Hex]=20 --> P3[Dec]=32

\* High und low byte values are hexadecimal, which have to be converted into decimal to get the corresponding parameter value.

Example: Parameter P3: high byte: 2, low byte: 0 ==> P3[Hex]=20 --> P3[Dec]=32

\* High und low byte values are hexadecimal, which have to be converted into decimal to get the corresponding parameter value.

Example: Parameter P3: high byte: 2, low byte: 0 ==> P3[Hex]=20 --> P3[Dec]=32

(105): DB\_AM\_DEV\_EMDISC2: EMDISC2

\* High und low byte values are hexadecimal, which have to be converted into decimal to get the corresponding parameter value.

Example: Parameter P3: high byte: 2, low byte: 0 ==> P3[Hex]=20 --> P3[Dec]=32

(106): DB\_AM\_DEV\_OB2: OB2

\* High und low byte values are hexadecimal, which have to be converted into decimal to get the corresponding parameter value.  
Example: Parameter P3: high byte: 2, low byte: 0 ==> P3[Hex]=20 --> P3[Dec]=32

\* High und low byte values are hexadecimal, which have to be converted into decimal to get the corresponding parameter value.

Example: Parameter P3: high byte: 2, low byte: 0 ==> P3[Hex]=20 --> P3[Dec]=32

## 155 RCSU - Recorder Configuration in SWU

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
|                                    | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO RCSU makes it possible to ADD static data for recorders as well as to DISPLAY, REGENERATE, DELETE, and CHANGE the associated data.

Recorders can be provided for in advance by entering the recorder data, but without activating the recorders (set ACT to 'N'). To activate a recorder with the ADD command, set the parameter ACT to 'Y'. Recorders already configured are activated or deactivated only by using AMO DSSU. When a random start recorder is deactivated, it should be an immediate deactivation (DEA-DSSU:DI,...) whereas the fixed start recorder may be deactivated either conditionally (DEA-DSSU:DC,...) or likewise immediately.

Since recorders can only have an attenuation value for an interface to a special device, this value is defaulted by the AMO and is inaccessible to the craftsperson. The attenuation is defaulted to multiple connections on a line basis.

Recorders may be connected to the following SLMA boards: SLMA, SLMAB, SLMA3, SLMA24.

When configuring a recorded announcement device on an SLMA2 board which resides on other than an LTUW shelf, only the first sixteen circuits can be used. Otherwise, all twenty four circuits of the SLMA24 board can be used on all other shelves.

There are three kinds of recorders: announcements, music recordings and music-on-hold recordings. The total number of recorders in the system may not exceed 255 but the maximal number of recorders is limited in each category: for recorded announcements by 206, for ACD Music by 32 and for music-on-hold by 150.

Each of the 206 ACD recorded announcements (RECAPL=ACDR) is assigned a unique logical recorder number (RECNUM) from 1 to 206. These logical numbers are used by AMO DNIT and AMO ACDRT to reference the ACD recorded announcements. Each of the 32 ACD Music recorders (RECAPL=MUSIC) is assigned a unique logical music number (MUSNUM) from 1 to 32 which is used by AMO ACDRT to reference the ACD Music recorders. For music-on-hold recorders (RECAPL=HMUSIC) the music number is called HMUSIC with the range 1 to 150.

## RCSU - Recorder Configuration in SWU

### Interrelationships

Because of the direct relationship between AMO DNIT and AMO ACDRT on one hand and AMO RCSU on the other hand cross-checks are made between these AMOs to ensure that recorders are created before being referenced and similarly to ensure that all references are removed before a recorder can be deleted or have critical recorder information changed.

The ACD recorded announcements that are CONTINUOUS, RANDOM start will be used for audible source recorders and will be referenced in the Directory Number Information Table set up by AMO DNIT for AUDSRCID. These audible source recorders may be assigned a length of announcement time (LENGTH) from 1 to 16 seconds. A suggested length would be between 1 1/2 and 2 times the announcement length. An additional 2 seconds will be added by the AMO for internal processing. This additional time will not be displayed. If the length is not input for the ADD action, a default value of 3 seconds will be assigned to the audible source id.

The ACD recorded announcements that are DEMAND, FIXED start will be referenced in the ACD Route Step Tables set up by AMO ACDRT for RTREC. The fixed start recorded announcement must be assigned a length of time (LENGTH) in seconds for that announcement. The range goes from 1 to 14, increments of 1, and from 15 to 90, increments of 5. An additional 2 seconds will be added by the AMO for internal processing. This additional time will not be displayed. There will be no default time for the length of the fixed start announcement time. Therefore, this parameter will be required for the ADD when assigning a FIXED start recorder with RECAPL set to ACDR and required for the CHANGE action if changing a recorder to a FIXED start recorder with RECAPL set to ACDR.

ACD music recorders as well as music-on-hold recorders must be set up as CONTINUOUS, RANDOM start. Music recorders may be referenced by step RTMUS in the ACD Route Step Tables set up by AMO ACDRT.

## 155.1 Interrelationships

The following relationships exist between AMO RCSU and other AMOs in assigning recorder devices for use on the switch:

- AMO ACDRT : A DEMAND, FIXED recorder with the ACD recorder application may be assigned in the ACD route step tables as a route to recorded announcement. An ACD Music recorder may be assigned as a route to music.
- AMO BCSU : This AMO configures the SLMA boards which support connection for a recorder device.

- AMO DNIT : A CONTINUOUS, RANDOM recorder with the ACD music application may be assigned as an audible source id in the DNI table.
- AMO DSSU : This AMO is used to activate and deactivate the boards used to support recorder devices.
- AMO SBCSU : This AMO shares the SLMA boards with AMO RCSU.
- AMO SCSU : This AMO shares the SLMA boards with AMO RCSU.
- AMO SSC : This AMO shares the SLMA boards with AMO RCSU.

## 155.2 Functions of the AMO

- [ADD-RCSU](#) : ADD static recorder data
- [CHANGE-RCSU](#) : CHANGE static recorder data
- [DELETE-RCSU](#) : DELETE static recorder data
- [DISPLAY-RCSU](#) : DISPLAY static recorder data
- [REGENERATE-RCSU](#) : REGENERATE static recorder data

### 155.2.1 ADD-RCSU

A new recorder is created by means of the function ADD-RCSU. Parameter PEN (Port Equipment Number) describes the physical port location to be associated with the created recorder. The remaining parameters describe the recorder attributes to be created.

A recorded announcement may be connected to either the SLMA or SLMAB, SLMA3, SLMA24 board. The recorder device must have the RANDOM start bit set for operation mode CONTINUOUS and the FIXED start bit set for operation mode DEMAND.

The following relationships exist in the 'ADD' command for AMO RCSU between parameters PEN (port equipment number) and NO (number):

- Neither parameter 'PEN' nor 'NO' is entered:

The AMO searches from the beginning of the system for the first available port suitable for a recorder device. The search is carried out in the Host System and in the Access Points<sup>1</sup> which belong to Source Group SRCGRP=1.

If a suitable port exists, a recorder is created there and the location at which the recorder is created is displayed.

---

1. An LTU shelf operating out of the Host System. The APs can be configured in the LTU range from 17 to 99.

See details at feature #9206 IPDA (IP Distributed Architecture).

## RCSU - Recorder Configuration in SWU

### Functions of the AMO

- Parameter 'PEN' is entered, parameter 'NO' is not entered:

The AMO checks whether the requested port is suitable for recorders. If the check is positive, the recorder is created at the specified port and the location at which the recorder is created is displayed. If for any reason the port is unsuitable, the recorder is not created and an error message is output. No search is made by the AMO for another suitable, available port.

- Parameter 'PEN' is not entered, parameter 'NO' is entered:

The AMO searches from the beginning to the end of the Host System for as many suitable ports as specified in NO and creates recorders there. All associated ports are output. Free ports are searched only in the Host System.

- Both parameter 'PEN' and parameter 'NO' are entered:

The AMO searches for as many suitable, to the same Source Group belonging ports as specified in NO and creates recorders. Parameter PEN describes the port at which the search for available ports starts. If PEN is entered and NO=1, the AMO will check if the port is suitable and available. If so, the recorder is created. But if the port fails, the AMO will search to the end of the system for another suitable, available port for this recorder. If a port still is not found, the AMO begins at the first port of the system and searches up to the PEN entered. If no available ports are found, an error message is output.

Only those LTUs are considered during the search which belong to the same Source Group like the PEN entered.

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-RCSU     | [PEN=<GG-UU-BBB-SS>], [NO=<number>], [ACT=<param>]<br>,OPMODE=<param>,OPTYPE=<param><br>, [COFIDX=<number>], [CCTIDX=<number>], [CLASSMRK=<param>]<br> ,RECAPL=ACDR, [RECNUM=<number>], [LENGTH=<number>];<br> ,RECAPL=ACDMUS, [MUSNUM=<number>];<br> ,RECAPL=HMUSIC, [HMUSIC=<number>]; |

### Examples:

1. Create an on-demand, fixed start recorded announcement for ACD at PEN 1-2-13-05.

Input:

```
ADD-RCSU: PEN=1-2-13-05,OPMODE=DEMAND,OPTYPE=FIXED,RECAPL=ACDR,RECNUM=1,LENGTH=14;
```

**Output:**

H01: THE RECORDER HAS BEEN CONFIGURED AT PORT 01-02-013-05.

2. Create three continuous, random recording announcements for ACDMUS, beginning at 1-3-67-0.

**Input:**

ADD-RCSU: PEN=1-3-67-00, NO=3, OPMODE=CONT, OPTYPE=RANDOM, RECAPL=ACDMUS;

**Output:**

H01: THE RECORDER HAS BEEN CONFIGURED AT PORT 01-03-067-00.  
H01: THE RECORDER HAS BEEN CONFIGURED AT PORT 01-03-067-01.  
H01: THE RECORDER HAS BEEN CONFIGURED AT PORT 01-03-067-02.

## 155.2.2 CHANGE-RCSU

Parameters of a created recorder can be changed by means of the function CHANGE-RCSU. With the exception of PEN, all parameters are optional, but at least one of the optional parameters must be entered.

A recorder which is in the ready state cannot have data changed unless deactivated by AMO DSSU. When a random start recorder is deactivated, it should be an immediate deactivation (DEA-DSSU:DI,...) whereas the fixed start recorder can be deactivated conditionally (DEA-DSSU:DC,...) or immediate. To determine the status of the recorder, use AMO SDSU (DIS-SDSU:,,PEN,PER3,<LTG>,<LTU>,<SLOT>,<CIRC>;).

The entered parameters are checked together with the unchanged parameters, as in the case for the function ADD.

The recorder application type (RECAPL) may be changed. If changed to ACDR and the parameter RECNUM is not input, it will be defaulted to the first logical recorder number available for ACD recorded announcements. The LENGTH parameter will be defaulted if the OPTYPE is RANDOM; but if the recorder is FIXED, the LENGTH must be entered. If changed to ACDMUS, the parameter MUSNUM will be defaulted to the first available number for ACD music recorders.

A recorder that is referenced by either AMO DNIT or AMO ACDRT can not have the following parameters changed: OPMODE, OPTYPE, RECAPL, RECNUM or MUSNUM. The parameter LENGTH may be changed even if the recorder is referenced.

## RCSU - Recorder Configuration in SWU

Functions of the AMO

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                           |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-RCSU  | PEN=<GG-UU-BBB-SS>, [OPMODE=<param>], [OPTYPE=<param>]<br>, [COFIDX=<number>], [CCTIDX=<number>], [CLASSMRK=<param>]<br> , [RECAPL=ACDR], [RECNUM=<number>], [LENGTH=<number>];<br> , [RECAPL=ACDMUS], [MUSNUM=<number>];<br> , [RECAPL=HMUSIC], [HMUSIC=<number>]; |

#### Examples:

1. Change the RECNUM of a recorded announcement for ACD at 1-2-13-5.

Input:

```
CHANGE-RCSU: PEN=1-2-13-05, RECAPL=ACDR, RECNUM=4;
```

Output:

```
H06: RECORDER AT PORT 01-02-013-05 HAS BEEN CHANGED.
```

2. Change RECAPL,OPMODE, and OPTYPE for recorder at 1-5-13-0;

Input:

```
CHANGE-RCSU: PEN=1-5-13-00, OPMODE=CONT, OPTYPE=RANDOM, RECAPL=ACDMUS;
```

Output:

```
H06: RECORDER AT PORT 01-05-013-00 HAS BEEN CHANGED.
```

### 155.2.3 DELETE-RCSU

Created recorders are deleted by means of the function DELETE-RCSU. Only the port location has to be entered to cancel a recorder.

A recorder which is in the ready state cannot be deleted unless deactivated by AMO DSSU. When a recorder is to be deleted, it should be deactivated immediate (DEA-DSSU:DI,...).

To determine the status of the recorder, use AMO SDSU (DIS-SDSU:,,PEN,PER3,<LTG>,<LTU>,<SLOT>,<CIRC>;).

A recorder may not be deleted if referenced by AMO DNIT or AMO ACDRT.

## Procedure Overview

| Command Code | Parameter           |
|--------------|---------------------|
| DELETE-RCSU  | PEN=<GG-UU-BBB-SS>; |

### Examples:

1. Delete the recorder at port 1-2-13-5.

Input:

```
DEL-RSCU;PEN=1-2-13-5;
```

Output:

```
H02: RECORDER AT PORT 01-02-013-05 HAS BEEN DELETED.
```

2. Delete the recorder at port 1-4-13-3.

Input:

```
DEL-RSCU;PEN=1-4-13-3;
```

Output:

```
H02: RECORDER AT PORT 01-04-013-03 HAS BEEN DELETED.
```

## 155.2.4 DISPLAY-RCSU

The parameters of recorders can be displayed by means of the function DISPLAY-RCSU. Additionally the Source Group of each port is displayed.

There are several ways to request a display:

- The recorders may be displayed by a range of pen numbers with PEN (lower) and PEN2 (upper) delimiting the range requested.
- If neither PEN nor PEN2 are entered, all recorders on system are displayed.
- If only PEN is entered, PEN2 will default to PEN, and only display the one port.
- If only PEN2 is entered, PEN will default to the first port on the system. If PEN2 is less than PEN, all ports from PEN to PEN2 will be displayed.
- If PEN is entered incorrectly, the incorrect parameter part (LTG, LTU, SLOT, CIRC) will be replaced with the appropriate minimum value for that part.

## RCSU - Recorder Configuration in SWU

### Functions of the AMO

- If PEN2 is entered incorrectly, the incorrect parameter part (LTG, LTU, SLOT, CIRC) will be replaced with the appropriate maximum value for that part.
- Configured recorders may also be displayed by their application type (RECAPL). For RECAPL=HMUSIC it is possible to specify music-on-hold numbers and/or to ask for a list of station numbers that have a reference (introduced through AMO SBCSU) for the music-on-hold recorders being displayed (REFRN=YES).
- Unoccupied ports suitable for recorders may also be displayed (TYPE=CFIG). This is useful when determining all available ports that support recorder devices in preparation for ADDing a recorder. Since any recorder application may be created at an appropriate port, the parameter RECAPL will be ignored if input with TYPE=CFIG.
- Recorders may be displayed by their activation status: activated (A) or deactivated (D). If a recorder is deactivated conditional or immediate by AMO, blocked by dependability due to a fault, blocked remotely or blocked by a hierarchical block, then the status ACT is displayed as 'B' for blocked and the recorder will be displayed for TYPE=D. If the recorder is deactivated long term, then the status ACT is displayed as 'N' and the recorder will be displayed for TYPE=D. If the recorder is not blocked or deactivated, then the status ACT is displayed as 'Y' even if the board is not present or is not the correct type and the recorder will be displayed for TYPE=A.  
To determine the status of the recorder, use AMO SDSU (DIS-SDSU:,,PEN,PER3,<LTG>,<LTU>,<SLOT>,<CIRC>;).

### Examples

|                                           |                              |
|-------------------------------------------|------------------------------|
| Display all recorders for announcements   | DISP-RCSU:RECAPL=ACDR;       |
| Display all recorders for music           | DISP-RCSU:RECAPL=ACDMUS;     |
| Display all recorders for music-on-hold   | DISP-RCSU:RECAPL=HMUSIC;     |
| Display all available ports for recorders | DISP-RCSU:TYPE=CFIG;         |
| Display all recorders deactivated         | DISP-RCSU:TYPE=D;            |
| All recorders                             | DISP-RCSU;                   |
| One specific pen                          | DISP-RCSU:1-1-49-1;          |
| Recorders within a certain range          | DISP-RCSU:1-1-49-0,1-2-67-3; |

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-RCSU | [PEN=<GG-UU-BBB-SS>], [PEN2=<GG-UU-BB-SS>]<br>, [TYPE=<param>]<br> , [RECAPL=ACDR];<br> , [RECAPL=ACDMUS];<br> , [RECAPL=HMUSIC], [HMUSIC=<number>], [REFRN=<param>]; |

**Examples:**

1. Display a specific recorder at 1-2-37-0.

**Input:**

DISP-RCSU:PEN=1-2-37-0;

**Output:**

|          |              |              |              |              |
|----------|--------------|--------------|--------------|--------------|
| PEN      | 01-02-037-00 | 00-00-000-00 | 00-00-000-00 | 00-00-000-00 |
| SRCGRP:  | 1            |              |              |              |
| ACT      | Y            |              |              |              |
| OPMODE   | CONTINUOUS   |              |              |              |
| OPTYPE   | RANDOM       |              |              |              |
| COFIDX   | 3            |              |              |              |
| CIRCIDX  | 5            |              |              |              |
| CLASSMRK | G711         |              |              |              |
| RECAPL   | ACDMUS       |              |              |              |
| RECNUM   |              |              |              |              |
| MUSNUM   | 1            |              |              |              |
| HMUSIC   |              |              |              |              |
| LENGTH   |              |              |              |              |

2. Display a range of recorders from 1-2-37-0 to 1-2-37-3.

**Input:**

DISP-RCSU:PEN=1-2-37-0,PEN2=1-2-37-3;

**Output:**

|         |              |              |              |              |
|---------|--------------|--------------|--------------|--------------|
| PEN     | 01-02-037-00 | 01-02-037-01 | 01-02-037-02 | 01-02-037-03 |
| SRCGRP: | 1            | 1            | 1            | 1            |
| ACT     | Y            | B            | N            | Y            |
| OPMODE  | CONTINUOUS   | DEMAND       | CONTINUOUS   | CONTINUOUS   |
| OPTYPE  | RANDOM       | FIXED        | RANDOM       | RANDOM       |
| COFIDX  | 3            | 2            |              |              |

## RCSU - Recorder Configuration in SWU

### Functions of the AMO

|          |        |      |      |        |
|----------|--------|------|------|--------|
| CCTIDX   | 5      | 2    |      |        |

## 155.2.5 REGENERATE-RCSU

The function REGENERATE-RCSU differs from the function DISPLAY-RCSU only in the format of its output, in that position-oriented commands are formed for the function ADD-RCSU.

There are no error/advisory messages associated with the verb REGENERATE-RCSU.

### Procedure Overview

| Command Code    | Parameter                                                      |
|-----------------|----------------------------------------------------------------|
| REGENERATE-RCSU | [PEN=<GG-UU-BBB-SS>], [PEN2=<GG-UU-BBB-SS>], [RECAPL=<param>]; |

**Examples:**

1. Regenerate all recorders on system.

**Input:**

```
REGEN-RCSU;;
```

**Output:**

```
ADD-RCSU:1-02-37-0,1,Y,CONT,RANDOM,3,5,G711,ACDMUS,1;
ADD-RCSU:1-02-37-1,1,Y,DEMAND,FIXED,2,2,G711,ACDR,1,14;
ADD-RCSU:1-02-37-2,1,N,CONT,RANDOM,,G711,ACDR,2,3;
ADD-RCSU:1-02-37-3,1,Y,CONT,RANDOM,,,G711,ACDMUS,2;
ADD-RCSU:1-03-67-1,1,Y,DEMAND,FIXED,,,G711,ACDR,4,25;
```

**155.3 Parameter Description**

|          |                                                                                                                                                                                          |                                                                         |

|          | G729                                                                                                                                                                                     | voice compression (mandatory) according to G.729A                       |
|          | G729OPT                                                                                                                                                                                  | voice compression (optional) according to G.729A                        |
|          | INIT                                                                                                                                                                                     | initialisation of classmarks to default                                 |
|          | NONE                                                                                                                                                                                     | deactivation of all classmarks                                          |

## RCSU - Recorder Configuration in SWU

### Parameter Description

|                 |                                                              |                    |
|-----------------|--------------------------------------------------------------|--------------------|
|                 | ML                                                           | multiple listeners |
|                 | VIAHHS                                                       | connection via hhs |
| Default Value   | G711                                                         |                    |
| COFIDX          | index of cofi data file to be loaded                         |                    |
| Type of Input   | : Single value, optional                                     |                    |
| Possible Values | : 0 = Data block for Germany                                 |                    |
|                 | 1 = Data block for Austria                                   |                    |
|                 | 2 = Data block for Australia                                 |                    |
|                 | 3 = Data block for Spain and Belgium (L > 2x250 Ohm)         |                    |
|                 | 4 = Data block for Spain and Belgium (L <= 2x250 Ohm)        |                    |
|                 | The default value to be assigned for Spain and Belgium is 4. |                    |
|                 | 5 to 7 reserved for future use                               |                    |
| Default Value   | : 0                                                          |                    |
| HMUSIC          | Number of music-on-hold recording                            |                    |
| Type of Input   | : Single value, optional                                     |                    |
| Possible Values | : numeric, 1-150                                             |                    |
| Default Value   | : lowest available number                                    |                    |
| LENGTH          | Length of recorded announcement in seconds                   |                    |
| Type of Input   | : Single value, optional                                     |                    |
| Possible Values | : numeric, 1-90                                              |                    |
|                 | 1 - 16 for ACDR, RANDOM                                      |                    |
|                 | 1 - 14, 15 - 90 in increments of 5                           |                    |
|                 | for ACDR, FIXED START                                        |                    |
| Default Value   | : 3 seconds for ACDR, RANDOM                                 |                    |
|                 | none for ACDR, FIXED START                                   |                    |
| MUSNUM          | Number of music recording                                    |                    |
| Type of Input   | : Single value, optional                                     |                    |
| Possible Values | : numeric, 1-32                                              |                    |
| Default Value   | : lowest available number                                    |                    |
| NO              | Number of recorders to be created                            |                    |
| Type of Input   | : Single value, optional                                     |                    |
| Possible Values | : numeric, 1-30                                              |                    |
| Default Value   | : 1                                                          |                    |
|                 | When the parameter NO is entered, the parameter PEN, which   |                    |

describers the starting port, can also be entered.

A suitable module must be configured to the slot addressed by PEN (AMO BCSU).

The possible LTU and Slot values for PEN depend on the systems architecture and can be found in the BCSU AMO description.

The possible Line values depend on the module type and its functionality.

They can be listed using DISP-BCSU: TYPE=PEN [,LTG=, LTU=, SLOT=, CCT=]; which will also output the actual PEN status (e.g. NOT CONNECTED).

## RCSU - Recorder Configuration in SWU

### Parameter Description

|                 |                                                                                                                                                                                                     |

## 155.4 Error Messages and Advisories

### 155.4.1 Error Messages

- F01: INVALID PORT POSITION:'LTG' (LINE TRUNK GROUP) FOR 'PEN' OUT OF RANGE.
- F02: INVALID PORT POSITION:'LTU' (LINE TRUNK UNIT) FOR 'PEN' OUT OF RANGE.
- F03: INVALID PORT POSITION:'SLOT' (BOARD SLOT NUMBER) FOR 'PEN' INCORRECT.
- F04: INVALID PORT POSITION:  
'CIRCUIT' (BOARD CIRCUIT NUMBER) FOR 'PEN' INCORRECT.
- F05: MEMORY RESERVED FOR SUBSCRIBERS (NEEDED FOR THE  
CONFIGURATION OF ANNOUNCEMENT RECORDERS) IS INSUFFICIENT.  
ALLOCATE ADDITIONAL MEMORY WITH THE FOLLOWING COMMAND:  
ADD-DIMSU:STN=<?>;
- F06: NO DEVICE CONFIGURED. INCORRECT TYPE OF BOARD AT 'SLOT' OF 'PEN'.
- F07: BEFORE ACTIONS CHANGE/DELETE PLEASE DEACTIVATE  
THE RECORDER WITH THE FOLLOWING COMMAND:  
DEACT-DSSU:OFFTYPE=DI,TYPE=PEN,PEN1=<?>;
- F09: THE 'PEN' SPECIFIED IS ALREADY USED.  
(AMO @@@@,PEN=@@-@@-@@@-@@@)  
(AMO @@@@,STNO=@@@@@)
- F10: NO PERIPHERAL MODULE CONFIGURED YET FOR THE 'SLOT' OF 'PEN'.  
(SEE AMO BCSU,MTYPE=PER)
- F11: NO FREE PORT FOR RECORDERS FOUND ON THE APPROPRIATE MODULES.
- F12: NO RECORDER CAN BE ATTACHED TO THE GIVEN 'SLOT' OF  
'PEN'. BOARD MISSING OR OF INCORRECT TYPE:  
ONLY MODULES OF TYPE 'SLMA, SLMAB, SLMA3, SLMA24'  
ARE ALLOWED (SEE AMO BCSU, MTYPE=PER).
- F13: CANNOT CHANGE DATA - NO RECORDER CONFIGURED YET  
FOR PORT PEN=@@-@@-@@@-@@.
- F15: MEMORY RESERVED FOR LODEN VALUES (LOGICAL DEVICE  
TABLE NUMBERS FOR CALL PROCESSING) IS INSUFFICIENT.  
ALLOCATE ADDITIONAL MEMORY WITH THE FOLLOWING COMMAND:  
ADD-DIMSU:LODEN=<?>;
- F16: MEMORY RESERVED FOR DEVICE TABLE ENTRIES  
(DEVICE HANDLER) IS INSUFFICIENT.  
ALLOCATE ADDITIONAL MEMORY WITH THE FOLLOWING COMMAND:  
ADD-DIMSU:LTGNO=<?>,DTILTG=<?>;
- F17: MEMORY RESERVED FOR SUB-UNIT POOL  
(CALL PROCESSING) IS INSUFFICIENT.  
ALLOCATE ADDITIONAL MEMORY WITH THE FOLLOWING COMMAND:  
ADD-DIMSU:SU=<?>;
- F18: MEMORY RESERVED FOR  
DEVICE INDICATOR POOL (DEVICE HANDLER) IS INSUFFICIENT.  
ALLOCATE ADDITIONAL MEMORY WITH THE FOLLOWING COMMAND:  
ADD-DIMSU:LTGNO=<?>,DILTG=<?>;
- F19: THIS COMMAND INPUT DOES NOT INDUCE CHANGES IN CURRENT CONFIGURATION DATA.
- F20: THE 'PEN' SPECIFIED IS USED BY A DIFFERENT TYPE  
OF DEVICE (NOT AN ACD RECORDER).

## RCSU - Recorder Configuration in SWU

### Error Messages and Advisories

F21: CANNOT CHANGE DATA - NO RECORDER CONFIGURED YET  
FOR PORT PEN=@@-@@-@@@-@@.  
BOARD MISSING OR OF INCORRECT TYPE:  
ONLY MODULES OF TYPE 'SLMA, SLMAB, SLMA3, SLMA24'  
ARE ALLOWED (SEE AMO BCSU, MTYPE=PER).

F25: MUSIC-ON-HOLD HMUSIC=@@@ HAS ALREADY BEEN ASSIGNED.

F26: THE UPPER LIMIT FOR THE NUMBER OF RECORDERS  
IN THE SYSTEM HAS BEEN ATTAINED.

F27: OPTYPE=RANDOM IS NOT ALLOWED TO BE SET WITH OPMODE=DEMAND.

F28: OPTYPE=FIXED IS NOT ALLOWED TO BE SET WITH OPMODE=CONT.

F29: FEATURE "FLEX+TDM" HAS BEEN ATTAINED. USE 'DISP-CODEW'

F34: THERE IS NO RECORDER CONFIGURED FOR THE 'PEN' ENTERED.

F35: THE UPPER LIMIT FOR THE NUMBER OF RECORDERS  
WITH THIS APPLICATION HAS BEEN ATTAINED.

F36: ACD ANNOUNCEMENT RECNUM=@@@ HAS ALREADY BEEN CONFIGURED.

F37: ACD MUSIC MUSNUM=@@ HAS ALREADY BEEN CONFIGURED.

F38: THE RECORDED ANNOUNCEMENT LENGTH (LENGTH)  
ENTERED IS INCORRECT FOR OPTYPE=FIXED.  
POSSIBLE VALUES: 1,2,...,13,14,15,20,...,85,90.

F39: THE RECORDED ANNOUNCEMENT LENGTH (LENGTH)  
ENTERED IS INCORRECT FOR OPTYPE=RANDOM.  
POSSIBLE VALUES: 1,2,...,15,16.

F40: AN ACD RECORDED ANNOUNCEMENT WITH OPTYPE=FIXED  
MUST HAVE AN ANNOUNCEMENT LENGTH (LENGTH).  
POSSIBLE VALUES: 1,2,...,13,14,15,20,...,85,90.

F43: CANNOT DELETE RECORDER - IT IS STILL REFERENCED BY DNI TABLES.  
(SEE AMO DNIT, TBL=DNI, AUDSRCID)

F44: CANNOT DELETE RECORDER - IT IS STILL  
REFERENCED BY ACD ROUTING TABLES.  
(SEE AMO ACDRT, ACT=RTREC, ACT=RTMUS)

F45: THE FIELDS 'OPMODE, OPTYPE, RECAPL, RECNUM, MUSNUM'  
CANNOT BE CHANGED - THE RECORDER IS STILL  
REFERENCED BY ACD ROUTING TABLES.  
(SEE AMO ACDRT, ACT=RTREC, ACT=RTMUS)

F46: THE FIELDS 'OPMODE, OPTYPE, RECAPL, RECNUM'  
CANNOT BE CHANGED - THE RECORDER IS STILL  
REFERENCED BY DNI TABLES.  
(SEE AMO DNIT, TBL=DNI, AUDSRCID)

F47: A MUSIC-ON-HOLD RECORDER (RECAPL=HMUSIC)  
MUST HAVE OPMODE=CONT AND OPTYPE=RANDOM.

F49: A MUSIC RECORDER (RECAPL=ACDMUS)  
MUST HAVE OPMODE=CONT AND OPTYPE=RANDOM.

F50: THE MODULE OF PORT PEN=@@-@@-@@@-@@ HAS BEEN DEACTIVATED. (SEE AMO BSSU)

F51: RECORDER CANNOT BE CHANGED OR DELETED - IT IS STILL  
BEING ASSIGNED TO SUBSCRIBERS.  
(DISP-RCSU:RECAPL=HMUSIC,HMUSIC=@@@,REFRN=YES;)

F52: THE CLASSMRK VALUES 'INIT' OR 'NONE' MAY NOT BE"  
CONCATENATED.

## 155.4.2 Advisories

H01: RECORDER HAS BEEN CONFIGURED AT PORT PEN=@@-@@-@@@-@@.

H02: RECORDER AT PORT PEN=@@-@@-@@@-@@ HAS BEEN DELETED.  
H03: NO RECORDER CONFIGURED.  
H04: RECORDER HAS BEEN SET UNDER CALL PROCESSING CONTROL.  
H05: NO FREE PORT FOR RECORDERS FOUND ON THE APPROPRIATE MODULES.  
H06: RECORDER AT PORT PEN=@@-@@-@@@-@@ HAS BEEN CHANGED.  
H07: PARAMETER 'CCTIDX' ENTERED FOR PORT  
PEN=@@-@@-@@@-@@ HAS BEEN IGNORED.  
SEE DESCRIPTION OF PARAMETER CCTIDX IN AD.  
H08: THE CONTRACTED NUMBER OF FLEX+TDM LICENSES IS EXCEEDED. THIS LICENSE IS MARKED  
AS TRIAL ENTITY. IT WILL BE DEACTIVATED, IF TRIAL MODE EXPIRES WITHOUT  
SUFFICIENT LICENSES.  
H09: THE AUTOMATIC SEARCH OF FREE LINES STARTS WITH THE GIVEN PEN BECAUSE THE  
PARAMETER NO IS ENTERED AND UNEQUAL 1.THEREFORE IT CAN HAPPEN THAT THE  
ASSIGNED PEN DIFFERS FROM THE SPECIFIED PEN.  
H10: VIAHHS IS NOT SET. MOH AND ANNOUNCEMENTS WILL NOT BE SWITCHED OVER HHS.  
H11: PLEASE ENSURE THE CORRESPONDING WAV FILE FOR THIS ANNOUCEMENT IS CONFIGURED IN  
THE SOFTGATE.

# 156 RCUT - Administration of the Route Code Conversion Table

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

This table assigns customer-specific CDR codes to route codes (dialed number prefixes).

An entry in the table is necessary only, when a dialed route code is to be converted in the customer-specific CDR code.

If no corresponding CDR code is found for a dialed route code, then the actual dialed route code will be transferred to the charge data block.

A maximum of 512 entries are possible.

## 156.1 Interrelationships

- AMO-SELG : Administration of the Selection Groups and Tables
- AMO-GRZW : Administration of the Limit Values for CDR

## 156.2 Functions of the AMO

- [ADD-RCUT](#) : Enter CDR code allocations
- [CHANGE-RCUT](#) : Change CDR code entries
- [DELETE-RCUT](#) : Delete table entries
- [DISPLAY-RCUT / REGENERATE-RCUT](#): Interrogate table entries / Regenerate table entries

### 156.2.1 ADD-RCUT

Enter a CDR code allocation.

The customer-specific CDR code and the allocated route code are entered.

Part qualified entries are possible (i.e. 00 for all route codes which with 00 begin, that are international calls).

Procedure Overview

| Command Code | Parameter                        |
|--------------|----------------------------------|
| ADD-RCUT     | RTECD=<string>,CDRCODE=<number>; |

Example

1. The route code 123456 is to be allocated the customer-specific CDR code 654321.

Input:

ADD-RCUT:RTECD=123456,CDRCODE=654321;

2. A system contains several trunk groups for outgoing calls. For the CDR (call detail recording) output, however, all calls are to be output under ONE code (9).

Trunk Group Codes: 5, 6, 7

Solution:

The same customer-specific CDR code is allocated to all outgoing trunk groups (see AMO- SELG).

Input:

ADD-RCUT:RTECD=5,CDRCODE=9;  
ADD-RCUT:RTECD=6,CDRCODE=9;  
ADD-RCUT:RTECD=7,CDRCODE=9;

NOTE:

1. Add for example

ADD-RCUT:RTECD=0,CDRCODE=0;  
ADD-RCUT:RTECD=01,CDRCODE=0;

is not possible. 2nd entry is covered with 1st entry.

2. Add a new entry, which is used to add a valid entry 123 into the charge data block without routing code.

ADD-RCUT:RTECD=DDDDDD,CDRCODE=123;

156.2.2 CHANGE-RCUT

Change an entry in the Route Code Conversion Table.

This action assigns a new CDR code to a route code.

## Procedure Overview

### Command Code

CHANGE-RCUT

### Parameter

RTECD=<string>, [CDRCODE=<number>];

### Example

1. The (dialed) route code 123456 is to be allocated the new customer-specific CDR code 11.

Input:

CHANGE-RCUT:RTECD=123456,CDRCODE=11;

## 156.2.3 DELETE-RCUT

Delete an entry or the entire Route Code Conversion Table. If the parameter RTECD is specified, only the specified entry is deleted from the table.

## Procedure Overview

### Command Code

DELETE-RTECD

### Parameter

[RTECD=<string>];

### Example

1. Delete the route code 123456 from the table.

Input:

DELETE-RCUT:RTECD=123456;

## 156.2.4 DISPLAY-RCUT / REGENERATE-RCUT

1. Interrogate the entries of the Route Code Conversion Table with output in list form (DISPLAY).
2. Interrogate the entries of the Route Code Conversion Table with output in position-oriented commands (REGENERATE).

The user can choose whether one entry or the entire table is to be output.

Procedure Overview

| Command Code    | Parameter        |     |
|-----------------|------------------|-----|
| DISPLAY-RCUT    | [RTECD=<string>; | (1) |
| REGENERATE-RCUT | [RTECD=<string>; | (2) |

Examples

1. Interrogate the Route Code Conversion Table

Input:

DISPLAY-RCUT;

Output:

| ROUTE CODE CONVERSION TABLE |            |          |
|-----------------------------|------------|----------|
| ENTRY NUMBER                | ROUTE CODE | CDR CODE |
| 1                           | 0          | 0        |
| 2                           | 123456     | 11       |
| 3                           | 5          | 9        |
| 4                           | 6          | 9        |
| 5                           | 7          | 9        |
| 6                           | DDDDDD     | 123      |

If a list is totally devoid of entries, the output is as follows:

Input:

DISPLAY-RCUT;

Output:

| ROUTE CODE CONVERSION TABLE |            |          |
|-----------------------------|------------|----------|
| ENTRY NUMBER                | ROUTE CODE | CDR CODE |

2. Interrogate the Route Code Conversion Table with output in position-oriented commands.

Input:

REG-RCUT;

Output:

ADD-RCUT:0,0;  
ADD-RCUT:123456,11;  
ADD-RCUT:5,9;  
ADD-RCUT:6,9;  
ADD-RCUT:7,9;  
ADD-RCUT:DDDDDD,123;

## 156.3 Parameter Description

|                 |                                                                      |
|-----------------|----------------------------------------------------------------------|
| CDRCODE         | Customer specific CDR code                                           |
| Type of Input   | : Single value, optional<br>mandatory (ADD)<br>BCD-Array             |
| Possible Values | : Max. 6 digits<br>0 to 999999                                       |
| RTECD           | Route code (dialed number prefix)                                    |
| Type of Input   | : Single value, optional<br>mandatory (ADD, CHANGE)<br>Keyed Numeral |
| Possible Values | : Max. 6 digits<br>0 to 9, *, #, A to D                              |

## 156.4 Error Messages and Advisories

### 156.4.1 Error Messages

# 158 REGEN - Regenerate Customer Data from Data Base

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The AMO REGEN is used for creating a MML batch (MML = Man-Machine-Language) to allow the transfer or backup of a complete or partial system database in a 'portable' form (e.g. version upgrades). Reentry of the database via MML batch is then performed at a later date with the aid of AMO GENDB.

A REGEN takes the form of a sorted file of REGEN MML commands read sequentially whereby the REGENERATE action of the various AMOs is started via the USER-TASK. A REGEN control file exists for each HW module with the appropriate REGEN MML commands and the name:

```
:PDS:APSU/RS@@<x><y>
resp.
:PDS:APSU/RSMF<a><x><b>
resp.
:PDS:APSU/RS@X<x><c>
```

with :

```
<a>:  X  (80CMX, 600ECX)  from version V3.5 on
      @  (80CM)

<b>:  D  (ADS)

<c>:  S  (SWU, 80CMX, 600ECX) from version V3.5 on

<x>:  D  (German)
      E  (English)

<y>:  D  (ADS)
      S  (SWU)
```

The response messages of the various started AMOs are stored in the result files. If PROT=Y was declared, then error and execution files are also created. The result files and error and execution files have the following name syntax:

PAS:<xxxxxx>/<yyyyyyyyyyyy>/<zz>/<aaa>

- <xxxxxx>: first 6 digits of the system number (read from VEGAS file)
- <yyyyyyyyyyyy>: remaining 11 digits of system number
- <zz>: RE (REGEN result file), RA (REGEN execution file)
- <aaa>: ADS, SWU, ALL (If all HW modules are regenerated, only the result files are combined), NOU (If parameter NOUN was specified).

## REGEN - Regenerate Customer Data from Data Base

REGEN control files are included on hard disk with each new release. However, the user has the option of using his/her own files for the REGEN run. Filenames of private production files can be declared with the parameter MMLFILE.

Caution: The specified file must be a SAM file with variable record length and may contain only one NOUN per line.  
The contents could look like this:

### An example for the regeneration with a private MML-File

Let's create the private MML-File **TESTMMLDAT** in the directory **:PAS:APSI/TEMP/** of the hard disk with the following content:

```
BCSM
LCSM
CODEW
ANSU
UCSU
BCSU
```

Use this commands to create the REGEN:

```
STA-REGEN:USERCODE=NOBODY,MMLFILE=":PAS:APSI/TEMP/TESTMMLDAT",
SYSNO=NICHT-EINGETRAGEN,CONT=N,PROT=Y;
```

```
H500: AMO REGEN STARTED
H01: REGENERATION STARTED
H17: HW-MODULE SWU IS REGENERATING
H27: HW MODULE SWU REGENERATION SUCCESSFUL
H17: HW-MODULE ADS IS REGENERATING
H27: HW MODULE ADS REGENERATION SUCCESSFUL
H90: REGENERATION FINISHED
AMO-REGEN-92 REGENERATE CUSTOMER DATA FROM THE DATABASE
START COMPLETED;
```

The following REGEN result file is obtained:

```
STA-LIST":PAS:APSI/TEMP/TESTMMLD/E",,,T;
```

```
H500: AMO LIST STARTED
```

LIST FINISHED
STATUS  =  H'0000
AMO-LIST -92      LISTING OF FILES
START COMPLETED;
```

If any other type of file is used, then a successful completion of the REGEN run cannot be guaranteed.

If a private control file is used, the entire system is checked to see if all modules are available. The advisory H13 is displayed for each not available module. The REGEN-run is started for available modules. If the control file does not contain a noun for an available module only the advisories H17 and H27 are displayed.

If a filename was declared with the parameter MMLFILE, then only a result file is created. This file will have the same name as the MMLFILE except that the last two characters of the filename are replaced with "/"E". The filename for the execution file (if PROT=Y was declared) is also taken from the MMLFILE name. However, in this case the last two characters are replaced by "/A".

If the last-but-third character of the MMLFILE name is "/", the AMO REGEN is terminated abnormally. If an MMLFILE name is specified beginning with :AMD:, then the AMO REGEN assumes that a REGEN job has been started by remote administration and maintenance (RMA). In this case, a result file is created for each NOUN in the MMLFILE with the following name syntax:

```
:AMD:FBT/FAMUP/NOUNN/<x>/<yyyyy>
```

```
<x> :      A (ADS) / S (SWU)
```

```
<yyyyy>:  Regenerated NOUN
```

When a REGEN run is started, the AMO attempts to enter the appropriate status information on each HW module in the VEGAS administration file.

If the AMO is unable to enter the necessary information (reservation codes) in the VEGAS file (e.g. if an entry already exists for another system) then the regenerating run is refused for the entire system.

**REGEN - Regenerate Customer Data from Data Base**

**Restrictions**

For REGENERATION with DATYPE=ALL the SWU must be marked "FREE" in the VEGAS-file, because several SWU-Amos will be started.

If a value other than NONE is specified for the DATYPE parameter, then the SWU database must contain the same system number as the ADS. The status of the SWU must be 'FREE'.

Parameter DATYPE at present not evaluated.

**158.1 Restrictions**

This discription is valid from SP300-V3.1

**158.2 Interrelationships**

- AMO GENDB : Database generation with MML CMD batches
- AMO VEGAS : Administration of database generation runs on support system

**158.3 Functions of the AMO**

- [START-REGEN](#) : Start the regenerating run

**158.3.1 START-REGEN**

Start the regenerating run for creation of MML command file.

**Procedure Overview**

| Command Code | Parameter                                                                                                                                                                                                                                                                                                           |

## Functions of the AMO

[illegible]

Input:

### Note

2056

restarted. In some cases, the REGEN run is continued with the AMO called prior to the interrupted AMO, so that the REGEN result file may contain the same command sequence twice over after an interrupt. Superfluous command sequences must be manually deleted from the RE file if errors occur during loading (i.e. during a GENDB run).

## 158.4 Parameter Description

|          |                                                                                                                                                            |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APSVERSn | Version of software load to be generated<br>Type of Input : Single value, optional<br>Possible Values : APS Version, 17 chars.                             |
| ARCHIVE  | Storage of end messages from DAGEN functions in the ADS<br>Type of Input : Single value, optional<br>Possible Values : No, Yes<br>Default Value : No       |
| BSACCNO  | Charge account number for BS2000<br>Type of Input : Single value, mandatory<br>Possible Values : Any valid BS2000 account number (max. 8 chars.)           |
| BSLOGID  | User ID for host with BS2000 operating system<br>Type of Input : Single value, mandatory<br>Possible Values : Any valid BS2000 user IDs<br>(max. 8 chars.) |
| BSPTNR   | Symbolic name of BS2000 host in CMS format<br>Type of Input : Single value, mandatory<br>Possible Values : NETW name of connected BS2000 host              |
| BSPWD    | BS2000 password<br>Type of Input : Single value, mandatory                                                                                                 |

## REGEN - Regenerate Customer Data from Data Base

### Parameter Description

Error Messages and Advisories

## 159 REN - Rename Files

|                                    |                                       |                                               |
|------------------------------------|---------------------------------------|-----------------------------------------------|
| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

This function makes it possible to rename one or more files. This is only possible, if the new, fully qualified file name is not already cataloged. The old and the new file name can be specified partially qualified.

A list of the renamed files is output on the operating terminal.

### Note

- The renaming of files is possible on the hard disk, DAT and flash memory only.
- In addition, the disk drives must be specified identically.
- It must also be noted, that a file can be renamed only, if the associated directory already exists. If this is not the case, the file can be copied to the new name using COPY and then deleted using DEL.

### 159.1 Restrictions

This description is valid from SP300- EV3.0

### 159.2 Interrelationships

- AMO-complex FIDES : File and device service  
(see System AMO Section 'ISY startup system')

### 159.3 Functions of the AMO

- [START-REN](#) : Rename one or more files

159.3.1 START-REN

Procedure Overview

| Command Code | Parameter                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------|
| START-REN    | SRCFILE=<string>, DESTFILE=<string>, [SEL=<param>]<br>, [ANS=<param>], [DIALOG=<param>], [UNIT=<param>]; |

Example

The file APSN/S/DATE@ in the logical area PDS is renamed to APSN/S/DATUM.

Input:

STA-REN:":PDS:APSN/S/DATE@/",":PDS:APSN/S/DATUM/";

159.4 Parameter Description

# 160 REST - Restart of a Functional System Unit

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

The AMO REST enables restart of a system unit by means of a command on the service terminal.

A distinction is made between three forms of restart:

- **Soft restart (SR):**  
The processor concerned resets and boots. Neither code or static data nor the peripheral units are loaded. Through-connected two-party calls are retained.  
Both duplex and simplex soft restarts are possible. A simplex soft restart is always carried out when the standby system half either does not exist or is not in the standby state.
- **Hard restart:**  
The processor resets and boots. All checksums are checked. Any subsystems showing inconsistencies are reloaded, as is the peripheral device data.  
If the processor concerned is an active 'controller half' in a duplicated configuration and a soft restart with switchover is not possible (e.g. because of a hardware fault in the standby processor), all existing connections are cleared down.
- **Reload:**  
As for hard restart, but all subsystems are reloaded.
- **Change the switch that indicates whether the rescue SW from default load table to be used. (CHANGE-REST:YES/NO)**
- **Rescue SW:**

A basic Hicom 300E System (rescue SW) is introduced for increasing the remote reliability of the Hicom System.

In case of no stable SW release is available on the Hicom Harddisk, neither the primary Load on the :PDS nor the gold load on the GLA, RMX will try to bring up an reduced switch which allows an remote access by LINUX means. For this the startup the ADP part is sufficient including the linux loader and TCP/IP.

The remote reliability can only be achieved, if the remote service access is realized via:

- a modem connected to a separate line, which is not looped back via the Hicom

## REST - Restart of a Functional System Unit

- a customer LAN in which the WAN access is not routed via a Hicom trunk.

Due to this prerequisite, the escalation level to Rescue SW will be configurable by administration.

- The dynamic state of the unit can also be displayed with the help of AMO REST.
- New switch **CONFREST** in AMO FUNCT:

When the switch **CONFREST** (Suppress REST warning) in AMO FUNCT is unchanged (default is **ON**), then a soft restart, hard restart or reload is performed without asking for acknowledge (works as nowadays).

If **CONFREST=OFF**, the AMO REST will ask for acknowledge from user if the AMO should continue with the command execution or break.

### Notes

- Soft Restart is possible only for active system units.
- Restart/Reload of LTG or CSN is only allowed for Hicom 390 and 391.
- Should a major error occur during the processing of a soft restart, an escalation to a hard restart is possible.
- Restarts occurring in servers are logged statistically with integrity counters. Multiple restarts at a lower level can thus escalate to a higher level restart.
- An SWU controller half undergoing a restart is allocated the dynamic state NOT\_AVAILABLE.
- During the restart of an SWU, an overlapping of restarts can occur due to the independent triggering by the fault analysis complex. The restart level specified in the AMO will only apply when it is higher than that of any dependability restart.
- Servers are not accessible during a restart, hence making restart overlapping impossible.
- The correct initiation of a restart by the AMO (output of advisory H1) doesn't guarantee the actual execution by the dependability. System parameters which can't be checked by the AMO may prevent success. E.g. a soft resp. hard restart of CC declines when DB is empty (reload possible). The reasons of error in this case are shown by the SIT report.

**Stand Alone Operation**

Duplex systems offer the option of using the standby processor for service functions, e.g. to load a new APS, without any interruptions to normal system operation. For this stand alone mode, two new processor states, 'stand alone' and 'stand alone finished', have been defined. The desired state must be entered on AMO callup. The AMO then checks whether this state is possible under consideration of the following restrictions:

SWU: CC-A or CC-B.

Restart level: Hard restart or reload.

It must be noted however that the user is ultimately responsible for the careful and correct usage of the stand alone mode commands.

**160.1 Restrictions**

This description is valid beginning from versions HiPath 4000 V1.0.

**160.2 Interrelationships**

- AMO FUNCT : System switches

**160.3 Functions of the AMO**

- EXECUTE-REST : Restart a system unit
- CHANGE-REST : Set the system to use or not the default load table/rescue software
- DISPLAY-REST : Display system unit state
- REGENERATE-REST : Regen the CHANGE comand.

**160.3.1 EXECUTE-REST**

The following actions are possible:

## REST - Restart of a Functional System Unit

### Functions of the AMO

#### a) Conditional restart of an SWU

These actions are tested as to their executability.

1. Soft restart with switchover (duplex soft restart):  
Reset and booting (hard restart) of the active controller half, assuming that the partner controller is able to soft restart (i.e. is in STANDBY), otherwise output of an error message. The partner controller then becomes the ACTIVE processor via a soft restart.
2. Soft restart without switchover (simplex soft restart):  
The active processor is reset and restarted, if the partner processor is either not present or not restartable (i.e. not in standby state). The AMO checks that the active processor is restartable (fault analysis state ACTIVE).

Although both types of restart are possible, the AMO itself treats all soft restarts as simplex restarts. The type of restart to be initiated is decided by the dependability check.

#### b) Unconditional action

Unconditional actions are actions carried out without consideration of dynamic module states. However, such an action is possible only if the unit as a whole is READY. The system dependability determines the appropriate action in all cases.

1. Unconditional reset and booting of a controller half:  
A controller is reset and makes a hard restart.
2. Reload (only for loadable redundant units CC and LTG):  
An unconditional reset is made, together with reloading of code and static data as well as booting.
3. System restart:  
An unconditional reset and booting/restarting of all system controllers (all SWU processors hard restart and all servers, soft restart) is carried out.

#### c) Server restart

A prerequisite for a server restart is that the server be in service. Any escalation to another level is determined by SYSLOAD, independent of the system dependability (hence not a conditional action). The actual restart level can be read from the resulting error message.

In a monoprocessor system the server A1 can be restarted only by restarting the SWU.

### d) System restart:

Unconditional reset, reloading of code and static data, and booting of all system controllers. The loading device can be assigned to the standard device HD, to the alternative device such as MO or to :GLA: on HD containing the rescue SW.

Gold Load Area:

The gold load area will contain a particular software maintenance release (SMR).

In the fall back situation, where the system escalated to the gold load area, an alarm to the service center has to be generated.

### e) Restart/Reload of 80CMX-DSC Coprocessor

The new DSC processor board with its Motorola coprocessor can be restarted too. This coprocessor can not be soft-restarted. The parameter COPRO will be ignored if the switch has no DSC coprocessor or if both the parameter PRSTATE and the parameter COPRO parameter is entered.

## Notes

STANDBY means, in the case of duplicated processors, that the particular processor concerned is in a position to soft restart at any time, but inactive. ACTIVE means that the particular controller's hardware is functional and is in service.

## Procedure Overview

| Command Code | Parameter                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXECUTE-REST | TYPE=UNIT, UNIT=<param>, RSLEVEL=<param>,<br>[ PRSTATE=<param> ], [ COPRO=<param> ];<br><br>  TYPE=SYSTEM<br>[ , RSLEVEL=RESTART ] ;<br><br>  [ , RSLEVEL=RELOAD, [ DEVICE=<param> ] ] ; |

## Examples

### 1. Restart of an LTG (Line Trunk Group)

Input:

EXECUTE-REST:UNIT,GP1A,HARD

Output:

**REST - Restart of a Functional System Unit**  
Functions of the AMO

H01: RESTART HAS BEEN INITIATED

2. Reload of an LTG (Line Trunk Group)

Input:

EXECUTE-REST:UNIT,GP13A,RELOAD

Output:

F07: LTG NOT POSSIBLE IN THIS SYSTEM

3. Incorrect command for stand alone operation (from SP-300 V3.2)

Input:

EXECUTE-REST:UNIT,BP,HARD,STAL;

Output:

F09: ENTRY OF THE PARAMETER PRSTATE IS ADMISSIBLE ONLY FOR THE FOLLOWING  
VALUE COMBINATIONS: UNIT: BPA OR BPB, RSLEVEL: HARD OR RELOAD.

**160.3.2 CHANGE-REST**

This verb has one parameter to specify wheather RESCUE-SW (from Default Load Tables)  
  
is to be used at system reload escalation.  
  
Thus Loader has to consider the escalation step to load only a minimum RMX software to offer  
  
a base IS functionality.

**Procedure Overview**

| Command Code | Parameter       |
|--------------|-----------------|
| CHANGE-REST  | RESCUE=<param>; |

**Examples**

1. Set the system to use the rescue software

CHANGE-REST:RESCUE=YES;

**160.3.3 DISPLAY-REST**

Displays:

1. whether rescue software is used,
  2. output the state of a functional unit.
- If the SWU unit (CC, LTG or CSN) is entered in the input command, the unit's dependability state (FA or 'fault analysis' state) is queried.
  - If the parameter UNIT is not entered in the input command, the output will contain the dependability state (FA or 'fault analysis' state) of all functional units.

### Procedure Overview

#### Command Code

DISPLAY-REST

#### Parameter

[UNIT=<param>;

### Examples

1. Display the fault analysis state of SWU units

Input:

DISPLAY-REST:BPB&GP1A&GP1B&GP7A&GP7B;

Output:

|                 |                       |
|-----------------|-----------------------|
| +-----+-----+   |                       |
| USE RESCUE SW   | NO                    |
| +-----+-----+   |                       |
| +-----+-----+   |                       |
| FUNCTIONAL UNIT | FAULT ANALYSIS STATUS |
| +-----+-----+   |                       |
| BPB             | INACTIVE              |
| GP1A            | STANDBY               |
| GP1B            | ACTIVE                |
| GP7A            | NOT AVAILABLE         |
| GP7B            | NOT AVAILABLE         |
| +-----+-----+   |                       |

## 160.3.4 REGENERATE-REST

Regenerate is used to print out the given CHANGE-command (indicating if rescue software is used).

### Procedure Overview

#### Command Code

REGENERATE-REST

#### Parameter

<NONE>

**REST - Restart of a Functional System Unit**

Parameter Description

**Examples**

- 1. Regenerate the command to set the value for using rescue software’s default load table

Input:

REGEN-REST;

Output:

CHANGE-REST:DEFLT=YES;

**160.4 Parameter Description**

|        |                                                                   |                                |                                                  |
|--------|-------------------------------------------------------------------|--------------------------------|--------------------------------------------------|

|        |                                                                   |                                | (DISPL                                           |
|        |                                                                   |                                | AY)                                              |

|                 |   |               |                     |       |
|-----------------|---|---------------|---------------------|-------|
| Possible Values | : | BP            | active CC           | (EXEC |
|                 |   | BPS           | standby CC          | UTE)  |
|                 |   | BPA, BPB      | CC controller side  | (EXEC |
|                 |   | GP1 - GP32    | active LTG          | UTE)  |
|                 |   | GP1S - GP32S  | standby LTG         |       |
|                 |   | GP1A - GP32A  | LTG controller side | (EXEC |
|                 |   | GP1B - GP32B  | LTG controller side | UTE)  |
|                 |   | IOC1A - IOC4A | CSN controller side | (EXEC |
|                 |   | IOC1B - IOC4B | CSN controller side | UTE)  |

PRSTATE Desired processor state

Type of Input : Single value, optional

|                 |   |        |                         |
|-----------------|---|--------|-------------------------|
| Possible Values | : | STAL   | standalone              |
|                 |   | STALFI | standalone finished     |
|                 |   | REST   | other (active, standby) |

RSLEVEL Restart level

Type of Input : Single value, mandatory

|                 |   |         |                |                       |
|-----------------|---|---------|----------------|-----------------------|
| Possible Values | : | SOFT    | Soft restart   | (only TYPE=UNIT/LTUR) |
|                 |   | HARD    | Hard restart   | (only TYPE=UNIT/LTUR) |
|                 |   | RELOAD  | Reload         |                       |
|                 |   | RESTART | System restart | (only TYPE=SYSTEM)    |

TYPE Branch parameter indicating whether the restart is intended for the entire system, or only for a particular unit.

Type of Input : Single value, mandatory

Possible Values : UNIT = Restart/reload of a unit  
SYSTEM = System restart

## 160.5 Error Messages and Advisories

### 160.5.1 Error Messages

F01: UNIT NOT ACCESSIBLE  
F02: PARTNER CONTROLLER NOT STANDBY  
F03: SWU CONTROL INACTIVE  
F04: NO RELOAD FOR CSN  
F05: FUNCTIONAL UNIT NOT PRESENT  
F06: FUNCTIONAL UNIT DEFECTIVE

## REST - Restart of a Functional System Unit

### Error Messages and Advisories

F07: LTG NOT POSSIBLE IN THIS SYSTEM  
F09: ENTRY OF THE PARAMETER PRSTATE IS ADMISSIBLE ONLY FOR THE FOLLOWING VALUE  
COMBINATIONS: UNIT: BPA OR BPB, RSLEVEL: HARD OR RELOAD.  
F11: UNIT NOT AVAILABLE  
F12: LTU NOT POSSIBLE IN THIS SYSTEM ( LTU MAX = <number> )  
F13: UNIT=A1 IS NOT ALLOWED IN A MONOPROCESSORSYSTEM.  
TO RESTART A1 USE MODUL=BP.  
F14: STANDBY PROCESSOR CAN ONLY BE RESTARTED WITH HARD RESTART OR RELOAD.

## 160.5.2 Advisories

H01: <RESTART/RELOAD> HAS BEEN INITIATED  
H02: <unit> NOT POSSIBLE IN THIS SYSTEM  
H08: BP-STANDBY NOT AVAILABLE  
H10: BP-ACTIVE NOT AVAILABLE  
H11: RELOAD OF THE COPROCESSOR IS ONLY POSSIBLE IN CASE OF DSC80 PROCESSOR BOARD  
H12: PARAMETER COPRO IS ONLY VALID IN CASE OF RSLEVEL=RELOAD/HARD  
H13: THIS ACTION IS SERVICE IMPACTING. DO YOU WISH TO PROCEED?(YES / NO)  
THIS HINT IS CONTROLLED BY AMO FUNCT PARAMETER CONFREST

## **161 RICHT - Trunk Routing**

The description of this AMO is only available in html format!

## 162 RUFUM - Direct Inward Dialing Number Conversion

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

In certain cases in systems it is necessary to convert an externally dialed number, for which there is no internal destination to a number for which a destination is assigned.

Such cases are:

- 1-digit up to 6-digit station numbers (digits 1-9). (DPLN, DAR=STN)  
The station number to which the dialed number is converted must be assigned to an existing station.
- Combination codes for FAX, DTE (DPLN, DAR=FAXNO, DTENO for data exchange analog, and DTEDNO for data exchange digital via DIU-CAS)  
These are entered in the dial plan (DPLN, AMO WABE) if the service code plus station number in system internally amount to more than 6 digits and the station is to be available externally via an exchange, since external call numbers are limited to call numbers with a maximum of 6 digits. Conversion is always necessary in this case.
- Codes for release order (DPLN, DAR=STNREL).  
By using these codes users without override- / release- authorisation can setup a connection to specific internal or external destinations with prophylactic release order. These codes lead to DAR=TLN\_EMERGENCY\_DISC in DPLN with the information of the destination number of the node, where one can find the specific destination user. The conversion is done in the node, where the destination user is added ( DESTNO=0 ).

Conversion takes place after digit analysis.

### 162.1 Restrictions

This description is valid from HiPath 4000 V1.0

162.2 Interrelationships

- AMO SCSU/SBCSU : Subscriber Configuration in SWU
- AMO WABE : Dialling Plans, Feature Access Codes

162.3 Functions of the AMO

- ADD-RUFUM : Add call number conversion
- DELETE-RUFUM : Delete call number conversion
- DISPLAY-RUFUM : Display call number conversion
- REGENERATE-RUFUM : Regenerate call number conversion

162.3.1 ADD-RUFUM

1. TYPE=DID: 1 to 6 digit station number
2. TYPE=COMB: combination codes for FAX and DTE

Existing destination station numbers are overwritten, making the action CHANGE-RUFUM unnecessary.

Procedure Overview

| Command Code | Parameter                                                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------|
| ADD-RUFUM    | TYPE=DID, DID1=<number>, DID2=<number>;<br><br>  TYPE=COMB, [FAX1=<number>], [FAX2=<number>]<br>, [DTE1=<number>], [DTE2=<number>]; |

Example

Add destination station number 2114 for external combination numbers for DTE 62 and 63.

Input:

AD-RUFUM:TYPE=COMB,DTE1=62&63,DTE2=2114;

## 162.3.2 DELETE-RUFUM

### Procedure Overview

| Command Code | Parameter       |
|--------------|-----------------|
| DELETE-RUFUM | STNO1=<number>; |

With this function, the conversion of external dialing numbers to destination dialing numbers is deleted.

## 162.3.3 DISPLAY-RUFUM

If no station numbers are specified, only the TYPE, all entries with the requested TYPE are output.

In the branch TYPE=STNO2, all station numbers are output which will be converted to the specified station number. If TYPE is not specified, all entries are output.

### Procedure Overview

| Command Code  | Parameter                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-RUFUM | [TYPE=DID], [DID1=<=<number>];<br><br>  [TYPE=COMB], [FAX1=<number>], [DTE1=<number>];<br><br>  [TYPE=STNO2], STNO2=<number>; |

### Example

Input:

DIS-RUFUM:TYPE=COMB;

Output:

| TYPE     | DIALLED CODE | CONV. CODE |
|----------|--------------|------------|
| COMB-FAX | 60           | 2110       |
| COMB-FAX | 61           | 2111       |
| COMB-FAX | 64           | 2112       |
| COMB-FAX | 65           | 2113       |
| COMB-FAX | 62 - 63      | 2114       |

162.3.4 REGENERATE-RUFUM

Procedure Overview

| Command Code     | Parameter |
|------------------|-----------|
| REGENERATE-RUFUM | ;         |

Example

Input:

REG-RUFUM;

Output:

ADD-RUFUM: DID , 5 , 2100;  
ADD-RUFUM: COMB , 60 , 2110;  
ADD-RUFUM: COMB , 61 , 2111;  
ADD-RUFUM: COMB , , 64 , 2112;  
ADD-RUFUM: COMB , , 65 , 2113;  
ADD-RUFUM: COMB , , , 62 , 2114;  
ADD-RUFUM: COMB , , , , 63 , 2115;

162.4 Parameter Description

DTE1 } DTE1 must lead to DAR=DTENO in the DPLN  
DTE2 }

DTE1 and DTE2 = as for FAX1 and FAX2

DID1 1 to 6 digit station number must lead to DAR=STN or DAR=STNREL with DESTNO=0 in DPLN  
Type of Input : single value, linked single values, range(s max. 16 input values  
mandatory (ADD)  
optional (DISPLAY)  
Possible values : decimal number (1 to 6 chars.)

DID2 Destination number In the dial plan (DPLN) this must lead to DAR "STN".  
Type of Input : single value, mandatory  
Possible values : decimal number (1 to 6 chars.)

FAX1 Combination code for FAX for CO subscriber number  
In the dial plan (DPLN) this must lead to DAR=FAXNO  
Type of Input : single value, linked single values, range(s) max. 16 input values,  
optional

|       |                                                                                                                                                                                                                                                        |

| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The administration and maintenance order SAVCO (SAVe COnfig.) changes the CONFIG information of a SUSY (subsystem) in the PGLIB (program library).

### 164.1 Restrictions

This description is valid from SP300-V3.3

### 164.2 Interrelationships

- AMO-complex FIDES : File and device service  
: (see System AMO Section 'ISY startup system')
- AMO APS : Software load upgrade

### 164.3 Functions of the AMO

- [START-SAVCO](#) : Execute CONFIG change

#### 164.3.1 START-SAVCO

With this function it is possible to change the CONFIG information of the specified SUSY in the PGLIB.

All specified parameters are changed. All omitted parameters retain their values.

For safeguarding reasons, the existing CONFIG contents and the newly created CONFIG are logged and the caller is requested in DIALOG mode to confirm the changes.

## SAVCO - Save Config. File of a Subsystem (SUSY)

Functions of the AMO

### Procedure Overview

| Command Code | Parameter                                                                                                                                                                                                                                                                                                                                                    |

## SAVCO - Save Config. File of a Subsystem (SUSY)

### Parameter Description

|         |                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IADDRS  | <p>Initializing task address selector<br/>(selector part of address)</p> <p>Type of Input : single value<br/>optional</p> <p>Possible Values : 0 - FFFF</p> <p>Default Value : old value from SUSY</p>                                                                                                                                                                                                                      |
| JOBFLAG | <p>Job attributes</p> <p>The following attributes for the new job can be specified here:</p> <ul style="list-style-type: none"><li>- Parameter check</li><li>- Clearing of segments/buffers</li><li>- Job deletable</li></ul> <p>For values see Nucleus description</p> <p>Type of Input : single value<br/>optional</p> <p>Possible Values : 0 - 255</p> <p>Default Value : old value from SUSY</p>                        |
| MAXPRIO | <p>Maximum priority for this subsystem</p> <p>Highest priority which a task in the job can have,<br/>or 0 if MAXPRIO of the parent job is to be taken over.</p> <p>Type of Input : single value<br/>optional</p> <p>Possible Values : 0<br/>25 - 255</p> <p>Default Value : old value from SUSY</p>                                                                                                                         |
| MAXTASK | <p>Maximum number of tasks for this subsystem</p> <p>Maximum number of tasks which the job can contain at the same time (incl. its children jobs),<br/>or 0FFFF if the number of tasks is unlimited. Note that a job contains an internal system task<br/>in addition to the user tasks.</p> <p>Type of Input : single value<br/>optional</p> <p>Possible Values : 2 - 65535</p> <p>Default Value : old value from SUSY</p> |
| MEMMAX  | <p>Maximum free memory space for this subsystem</p> <p>Maximum size of the free memory which the job can be assigned during the run time, in 16-<br/>byte paragraphs</p>                                                                                                                                                                                                                                                    |

max. 1048575\*16 = 16MB

Type of Input : single value  
optional

Possible Values : 0 - 1048575

Special Case : 0FFFF does not have a defined upper limit

Default Value : old value from SUSY

### MEMMIN

Minimum free memory space for this subsystem

Size of the free memory which the job is to be assigned during creation, in 16-byte paragraphs

max. 1048575\*16 = 16MB

Type of Input : single value  
optional

Possible Values : 0 - 1048575

Default Value : old value from SUSY

### STACKSIZ

Stack size of the initializing task  
(in bytes)

Type of Input : single value  
optional

Possible Values : 250 - 65000

Default Value : old value from SUSY

### SUSYNAME

Name of the subsystem to be reconfigured

Name of the HD file whose CONFIG is to be changed.

Type of Input : single value  
mandatory

Possible Values : file name (max. of 32 digits)

### SUSYTYPE

Type of subsystem

Type of Input : single value  
optional

|                 |           |                                   |
|-----------------|-----------|-----------------------------------|
| Possible Values | : NORMAL  | normal subsystem                  |
|                 | DATABASE  | Subsystem with database           |
|                 | DATAFILE  | Subsystem is data file            |
|                 | MULTILOAD | Subsystem may/must be multiloaded |
|                 | SWUFILE   | SWU dependability indicator       |

Default Value : old value from SUSY

| <a href="#">Restrictions</a>       | <a href="#">Functions of the AMO</a>  | <a href="#">Error Messages and Advisories</a> |
| <a href="#">Interrelationships</a> | <a href="#">Parameter Description</a> |                                               |

The AMO SAVE (save subsystem) processes the saving of subsystems.

### 165.1 Restrictions

This description is valid from SP300- E V3.0

### 165.2 Interrelationships

None

### 165.3 Functions of the AMO

- [EXEC-SAVE](#) : Saving subsystems

#### 165.3.1 EXEC-SAVE

The AMO saves the data (it depends on which request parameter is entered) of an subsystem on HD, if there are load texts available.

**Note:**

Are all three request parameters answered with 'NO', the error message F4 will be displayed and the AMO will be ended with 'NOT COMPLETED'.

**Procedure Overview**

| Command Code | Parameter                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------|
| EXEC-SAVE    | UNIT=<param>, SRCFILE=<string>, DESTFILE=<string><br>, [CODEREQ=<param>], [CONREQ=<param>], [VARREQ=<param>]; |

**Example**

Input:

**SAVE - Save Subsystem**

Parameter Description

```
EXEC-SAVE:A1," :PDS:APSZ/ADM/DP/ABS/ZOPFGLIB0"," :PDS:TMP/SAVE";
```

**165.4 Parameter Description**

|          |                                                                                                                                                                                                                                                                                                                          |

None

# 166 SBCSU - Station and S0 bus Configuration of SWU

|                                       |                                               |
|---------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>    | <a href="#">Parameter Description</a>         |
| <a href="#">Parameter Description</a> | <a href="#">Error Messages and Advisories</a> |

The AMO SBCSU configures terminal devices (stations) at S0 bus connections, S0 interfaces, Up0/E interfaces, IP interface and on the ATM switch. A maximum of one voice terminal may be assigned to an S0 bus. A maximum of three terminals with three different station numbers can be set up per Up0/E access. Apart from *configuring stations*, the AMO SBCSU offers the options of displaying, regenerating and changing the associated data, as well as cancelling station assignments.

The AMO SBCSU assigns all station combinations which contain the following terminals. All other station combinations are assigned with the aid of the AMOs SCSU or SSCSU.

The following terminals are configured for the VOICE service:

- OPTISET: Digital telephone for Up0/E interface and CorNet-TS protocol
- OPTIP500: Digital telephone for Up0/E interface and CorNet-TS protocol
- OPTIIP: Digital telephone for IP interface and CorNet-TS protocol
- SET600: Digital telephone for S0 interface and EDSS1 (EURO-ISDN) or NI-BRI protocol
- ANADEV: Analog voice terminal  
(connected to Up0/E via terminal adapter a/b)
- Terminal equipment for Cordless Multicell Integration (CMI Version >= V2.2):  
 BASE: CMI base station with Up0/E interface and CorNet-TS protocol  
 RADIO: CMI mobile user with Up0/E interface and CorNet-TS protocol  
 EXTLINE: CMI Extension connection with S0 interface and EDSS1 (EURO-ISDN) protocol
- Voice terminal equipment with SIP or S0 or S2 interfaces

The following terminals are configured for non-voice services only:

- API: Workstation protocol interface and CorNet protocol (DATA service)

## SBCSU - Station and S0 bus Configuration of SWU

- ANADEV: analog non-voice terminal  
(connected to Up0/E via terminal adapter a/b)
- ANADTE: analog DTE (connected to Up0/E via terminal adapter a/b)
- ANAFAX: analog FAX (connected to Up0/E via terminal adapter a/b)
- DTE:
  - digital DTE with S0 interface,  
EDSS1 (EURO-ISDN) protocol
  - digital DTE with U2B1Q interface, NI-BRI protocol
  - digital DTE with X.21 interface (connected via terminal adapter)
  - digital DTE with V.24 interface (connected via terminal adapter),  
EDSS1 (EURO-ISDN) protocol
  - digital DTE with U2B1Q interface (connected via terminal  
adapter),  
NI-BRI protocol
  - analog DTE (connected to S0 via terminal adapter a/b and  
modem)
- FAX:
  - Group 2 and 3 (connected to S0 via terminal adapter a/b)
  - Group 4, EDSS1 (EURO-ISDN) or NI-BRI protocol
- Non-voice terminal equipment with S0 or S2 interfaces, e.g. DP  
systems, LANs, Servers.

The type of non-voice terminal equipment for DTE and FAX connected to S0 (analog, digital S0, digital X.21) is not taken into account for the purpose of assignment in this AMO. In addition to the terminal name, only the protocol type parameter DPROT resp. FPROT must be declared. The terminal attributes, which are not relevant for assignment purposes, are determined when the terminal first responds to a polling message at the bus connection or the station line circuit.

The terminals are assigned to the following modules:

|                |                                                                                            |
|----------------|--------------------------------------------------------------------------------------------|
| SLMS           | (S0 interface)                                                                             |
| STMD, STMD2    | (S0 interface)                                                                             |
| DIU-N2, DIU-N4 | (S2 interface)                                                                             |
| DIU-S2         | (S2 interface)                                                                             |
| SLMQ           | (ANSI-U interface)<br>In the case of extremely long lines<br>(from 1-2 km up to 9 km), use |

|                                    |                                                                    |
|------------------------------------|--------------------------------------------------------------------|
| SLMQ3                              | (U2B1Q interface)                                                  |
| SLC24                              | (Up0/E interface)                                                  |
| SLMO, SLMO16, SLMO24, SLMOP, SLOP2 | (Up0/E interface)                                                  |
| STHC, STHC2                        | (combination of STMD and SLMO, i.e. S0 as well as Up0/E interface) |
| STMA                               | (IWU to the ATM switch)                                            |
| STMI-HFA                           | (HFA gateway version# 1 to IP)                                     |
| STMI2-HFA                          | (HFA gateway version# 2 to IP)                                     |
| STMI2-SIP                          | (SIP Subscriber)                                                   |

In particular, the following combinations are possible:

1. Functional bus with 3 alternative connection paths  
 >> refer to Feature Usage Example Terminal Configuration, Digital S0 and UP0 <<  
  - Direct connection to SLMS or STMD via S0 line
  - Connection to SLMQ or SLMQ3 via PNT
  - Connection to STMD as external station

Non-voice terminals connected to a functional bus do not have associated voice terminals. Thus, only terminals with an independent dialing circuit may be connected.

With this bus type, only one station number can be assigned per bus connection, and a maximum of one terminal per service.

To assign additional station numbers, please refer to chap. "Multiple Subscriber Numbers (MSN) - MSN on the S0 bus".
2. OPTISET configuration with 3 connection options  
 >> refer to Feature Usage Example optiset E Configuration << resp.  
 >> refer to Feature Usage Example optiPoint Up0E Configuration << resp.  
 >> refer to Feature Usage Example optiPoint IP Configuration <<  
  - Connection via PNT-Q to SLMQ-EXT (parts number Q2153 -X only)  

or SLMQ3
  - Connection via the Up0/E line direct to SLMO (w/o FCTID)  

or SLMO (FCTID=1)
  - Connection via the Up0/E line direct to STMA (FCTID=4)  
as ATM-IWU in the PSW (Port Switching) operating mode

With an OPTISET connection to the SLMO, SLMQ-EXT or STMA-PSW a maximum of three terminals under a maximum of three different station numbers can be set up. Permitted terminals for this purpose are: CorNet-TS terminals (OPTISET, OPTIP500), analog terminals (ANADEV, ANAFAX, ANADTE) or terminals with an S0 interface (API, SET600, FAX, DTE).

One OPTISET or OPTIP500 must always be set up for the main station number. A further OPTISET or OPTIP500 may be set up for a secondary station number; i.e. a maximum of two OPTISET / OPTIP500 devices can be operated per OPTISET connection. Per main station number or per secondary station number, a maximum of two S0 devices can be installed.

Unlike with the S0 bus, functional terminals can also be set up for a secondary station number, providing these all have the same call number. For administration all functional terminals (SET600, FAX, DTE) then count collectively as just one device.

Only one analog terminal (regardless of which type) can be set up on an OPTISET connection: either an analog non-voice terminal (i.e. ANAFAX or ANADTE) on the main station number or a general analog terminal (ANADEV) under a secondary station number. A functional terminal of one type can be set up only once per OPTISET access. However, up to a maximum of two CorNet-TS and CorNet-T terminals of the same type can be installed. Functional terminals can also be reached via MSN station numbers (see also Chapter "Multiple Subscriber Numbers (MSN) - MSN for OPTISET configurations").

Within each service, terminals with different protocols may be installed; i.e. via the OPTISET configuration, the voice terminals OPTISET / OPTIP500 (CorNet-TS) and SET600 (functional protocol) or a functional DTE can be operated at the same time.

In order to connect additional terminals, the following OPTISET / OPTIP500 Adapters may be necessary:

- a maximum of one OPTISET E / OPTIPOINT500 Slave Phone Adapter  
\*\*\* cannot be specified explicitly, but is instead generated implicitly by AMO \*\*\*  
\*\*\* and displayed in the OPTISPA field of the DISPLAY mask \*\*\*  
to connect a second OPTISET / OPTIP500 device
- a maximum of one OPTISET E / OPTIPOINT500 S0 Adapter  
\*\*\* cannot be specified explicitly, but is instead generated implicitly by AMO \*\*\*  
\*\*\* and displayed in the OPTIS0A field of the DISPLAY mask \*\*\*  
to connect S0 devices

- a maximum of one OPTISET E / OPTIPOINT500 a/b Adapter  
\*\*\* cannot be specified explicitly, but is instead generated implicitly by AMO \*\*\*  
\*\*\* and displayed in the OPTIABA field of the DISPLAY mask \*\*\*  
to connect analog devices
- a maximum of one OPTIPOINT500 USB Adapter (integrated) (optionally working as S0 Adapter, Control Adapter or Data Adapter)  
\*\*\* cannot be specified explicitly, but is instead generated implicitly by AMO \*\*\*  
\*\*\* and displayed in the OPTIUSB field of the DISPLAY mask \*\*\*  
to connect S0 devices
- a maximum of two OPTISET E Control Adapters (OPTICA parameter)  
to connect a PC dialer
- a maximum of two OPTISET E Data Adapters (OPTIDA parameter)  
to connect a data terminal
- OPTISET E / OPTIPOINT500 Slave Phone Adapter (OPTISPA) and  
OPTISET E / OPTIPOINT500 a/b Adapter (OPTIABA) are mutually exclusive
- The total of OPTIS0A, OPTISPA, OPTIABA, OPTIUSB (each implicitly configured),  
OPTICA and OPTIDA must not exceed two

Also, per OPTISET voice terminal, a maximum of four add-on devices or a maximum of three add-on devices and one identity card reader (IDCR) can be connected.

Per OPTIP500 voice terminal, a maximum of two add-on devices or a maximum of one add-on device and one SmartCard Reader (IDCR) or application module (APPM) can be connected.

For the different connection alternatives via the OPTISET configuration

>> refer to Feature Usage Example optiset E Configuration << resp.

>> refer to Feature Usage Example optiPoint Up0E Configuration << resp.

>> refer to Feature Usage Example optiPoint IP Configuration <<

For ATM specific connection alternatives via the OPTISET configuration

>> refer to "Hicom 300/300 E/300 H ATM Connectivity Phase 1 to

3"<<

>> ATM Usage Example STMA Station and Trunk Module  
for ATM <<

For HFA specific connection alternatives via the OPTISET  
configuration

>> refer to Feature Usage Example HiPath Feature Access <<

3. CMI configuration ( CMI version >= V3.0 )

- Connection directly to SLC24 via Up0/E line

For a CMI it is possible in each case to set up one of 4 different CMI  
terminals each with its own station number. CMI-CorNet-TS  
terminals (BASE, RADIO) and CMI terminals with an S0 interface  
(EXTLINE) are permitted here.

It should be noted that the various CMI terminals can only seize  
specific circuits in the SLC24 module :

|         |          |
|---------|----------|
| BASE    | 0 - 23   |
| EXTLINE | 24 - 87  |
| RADIO   | 88 - 215 |

Table 166-1

Starting with CMI Version V3.0 CMI expansion lines and CMIADM  
devices are no longer used. CMI Version 2.3 is not released for  
HiPath 4000 V3.0.

Up to four add-ons can be set up for a CMI-CorNet-TS terminal  
(CMIADM, BASE, RADIO).

Functional CMI terminals (EXTLINE) cannot be accessed under MSN  
station numbers.

4. Point-to-point connections for functional S0/S2 terminals

>>refer to Feature Usage Example Adding an S2 station <<

- Direct voice/non-voice connection with a maximum of two b-  
channels to STMD via an S0 line.  
For short lines a SLMS can be used instead of an STMD.
- Direct voice/non-voice connection with a maximum of 30 b-  
channels to DIU-S2, DIU-N2 or DIU-N4 via an S2 line
- Direct voice/non-voice connection with a maximum over IP to  
STMI2-SIP

The individual b-channels of the SIP/S0/S2 line will no longer be  
permanently assigned to different call numbers - instead, any  
number of MSN station numbers are assigned to the termination, of  
which up to 2 (for S0) or 30 (for S2 and SIP) MSN station numbers  
may be in the calling condition simultaneously. Which b-channel is

used for the connection is left to chance.

Point-to-point connections can be set up for non-voice terminals with S0/S2 interfaces, e.g. DP-systems, LANs, servers.

To assign additional station numbers, please refer to chap. "Multiple Subscriber Numbers (MSN) - MSN for functional point-to-point connections".

Figure 24

Connection of a terminal with 2 b-channels (S0 or Up0)

Figure 25

Connection of a terminal with 30 b-channels (S2)

## 5. Multiple Subscriber Numbers (MSN)

MSN on the S0 bus

>> refer to Feature Usage Example EURO-ISDN Terminals <<

For the bus type described above:

- Functional bus  
there is also the possibility of enhancing the existing bus configuration to include so called Multiple subscriber numbers (MSN). In this way
- an existing functional device, which belongs to the main station number, can be reached using different station numbers (whereby the actual dialled number is always displayed)
- further functional devices for a service already configured on the bus can be attached and reached respectively by their own station numbers.

A restriction to functional devices of a special service is not possible.

The devices attached to the bus must be set to the station numbers used.

Fundamentally the following distinction applies:

- An MSN station number  
is a new number on the bus by which each existing functional device of the main station number can be reached.  
In this respect, there is no limitation as to the number of MSN station numbers which can be configured on the bus.

MSN for OPTISET configurations

>> refer to Feature Usage Example optiset E Configuration <<  
resp.

>> refer to Feature Usage Example optiPoint Up0E  
Configuration <<

Via the OPTISET configuration, the existing device constellation can be expanded by so-called MSN station numbers (Multiple Subscriber Numbers). This has the following advantages:

- An existing functional device set up for a main station number or a secondary station number can be reached at several station numbers; (however, it is always the dialed station number that is displayed).
- Other functional devices of a service already configured via an OPTISET configuration can be connected and can be reached at their own station numbers.

Restricting this to functional terminals with certain services is not possible.

The functional terminals connected via the OPTISET configuration must be set to the station numbers that have been set up.

The following distinction must always be made:

- An MSN station number  
is an additional station number for the OPTISET configuration at which any existing functional terminal can be reached.  
There is no restriction on the number of MSN station numbers per OPTISET configuration.
- An MSN secondary station number  
is an existing station number without functional services that is connected via the OPTISET configuration (irrespective of whether main or secondary station number) and that is extended in such a manner that each existing functional terminal of the OPTISET configuration can also be reached at this station number. If the functional services are set up for a secondary station number, unlike with the S0 bus, the main station number can also be an MSN secondary station number. The number of MSN secondary station numbers via the OPTISET configuration is subject to the following restrictions: The total number of CorNet-TS terminals, CorNet-T terminals, functional terminals (each service here counting individually), and MSN secondary station numbers must not exceed eight; however, the MSN share of a station number counts only as a single terminal, irrespective of how many functional services are in fact thus reachable.

MSN for functional point-to-point connections

>> refer to Feature Usage Example Adding an S2 station <<

The Point-to-Point connections for functional S0/S2/SIP terminals described before may also be extended by so called MSN station numbers (Multiple Subscriber Numbers).

A restriction to functional devices of a special service is not possible.

- An MSN station number  
is a new number on the bus by which each existing functional device of the main station number can be reached.  
In this respect, there is no limitation as to the number of MSN station numbers which can be configured on the bus.

### 6. Signed-off subscribers

>> refer to Feature Usage Example AUTOSET RELOCATE Applications <<

Terminals OPTISET and OPTIP500 can also be installed as signed-off subscribers. These are not assigned a location. Locations entered for signed-off subscribers are ignored. Signed-off subscribers can sign on by means of a registration code number and PIN at any suitable terminal, or they can sign on via a suitable terminal at the appropriate location, or they can be signed on at a suitable location by means of AMO DSSU.

Suitable locations for the various terminals are:

- for OPTISET / OPTIP500:
  - with PNT-Q to SLMQ or SLMQ3
  - direct to SLMO
  - with OPTISPA to an OPTISET / OPTIP500 master terminal (except if connected to SLMQ3).

However, the location or the TSI at which a signed-off subscriber can be signed on must be signed off.

### 7. Associated devices

In the context of *user-oriented licensing*, one user can have maximum 4 Associated Devices.

- One user's main device which consumes a FLEX license.
- One client device which consumes a Standard license (except Unify Phone client which requires an extra additional "Unify Phone License")
- Two additional devices. One additional device consumes a Standard license.

Associated device can be configured with AMO SBCSU or SCSU

```
ADD-SBCSU:STNO=12675,...,PRIMDEV=12201;
```

or

```
ADD-SCSU:STNO=12150,...,PRIMDEV=12201;
```

together with existing

```
ADD-SBCSU:STNO=12000,...,CLNTDESK=12201;
```

or eventually

```
ADD-
```

```
SBCSU:STNO=12000,...,CLNTDESK=12201,CLNTTYPE=UNIPHONE;
```

With this commands

- 12201 becomes Primary Associated Device

- digite 12675 and anate 12150 become Secondary Associated Devices linked to 12201 as main device.
- in the background permanent PIN of main number 12201 is activated on devices 12675 and 12150. The user is not able to delete the PIN manually, so it will be activated as long the secondary associated device exists.
- 12201 becomes DESK.
- 12675 becomes CLIENT.
- Notes
  - Secondary Associated Device cannot have or be clients, i.e. they cannot be part of DESK/CLIENT configuration
  - Primary Associated Device cannot be Secondary Associated Device or CLIENT
  - CLIENT or a Secondary Associated Device cannot be Primary Associated Device
  - A user may have maximum 4 Associated Devices:
    - One main phone number device (Primary Associated Device)
    - One CLIENT (first secondary associated device)
    - Two additional Secondary associated devices (Third and fourth secondary associated device)
  - **Primary Associated Device** can be either:
    - TDM phone (Up0/SBCU only)
    - HFA or SIP phone
    - all SoftClients except OSMO, Circuit, Unify Phone Clients
    - No CMI device allowed!
  - **CLIENT device** - existing CLIENTs (First Secondary associated device) can be either:
    - OSMO client
    - Circuit client
    - Unify Phone client.
    - No other devices allowed!
    - Second device is always reserved for client device (existing configuration of Client/DESK)
    - A user cannot have more than one client device.

## SBCSU - Station and S0 bus Configuration of SWU

### Interrelationships

- **Third and fourth devices** (Secondary associated device) can be either:
  - TDM phone (Up0/SBCSU or analog/SCSU)
  - HFA or SIP phone
  - all SoftClients except OSMO, Circuit, Unify Phone Clients
  - CMI (config is allowed)
- As prerequisite, **Primary Associated Device** must set parameter `PRIMDEV=YES` for at least one of the COPIN numbers.
- The relation between associated devices cannot be modified, it is created or destroyed only at the time of add or deletion of the secondary associated device.
- With PIN activated, all outgoing calls from secondary associated devices will signal main number.
- Secondary associated devices, except CLIENTS, can be called individually on their configured number.
- Incoming calls to user's main number will ring main device, or will follow autopilot routing (CLIENT/DESK)
- If the user wants to be called on a specific device, he can set the preferred device in UC.
- For a customer not using UC, he can program a forward to the device where he wants to be reached.

## 166.1 Interrelationships

- AMO ACDRT : ACD Routing Tables
- AMO AUN : Call Pickup Group
- AMO BCSU : Board Configuration, Switching Unit  
The AMO BCSU configures the following modules:  
DIU-N2, DIU-N4, DIU-S2, SLC24, SLMO, SLOP2, SLMQ, SLMQ3, SLMS, STHC, STHC2, STMA, STMD, STMD2, STMI-HFA, STMI2-HFA and WAML2
- AMO BDAT : Configuration of STMA Module Data
- AMO BERUM : Class of Service Switchover
- AMO CHESE : Executive/Secretary Arrangements
- AMO CODEW : Administration of System Code word
- AMO COMGR : Communications Group Calling

- **AMO COSSU** : Class-of-Service, Switching Unit  
The AMO COSSU creates classes-of-service, which can be assigned to a station line circuit with the parameters COS1 and COS2.  
The same AMO can be used to create the LCR classes-of-service (for services VOICE and DTE), which can be assigned to a subscriber line with parameters LCOSV1 and LCOSV2 or LCOSD1 and LCOSD2.
- **AMO DIMSU** : Dimensioning of Features, Switching Unit  
The AMO DIMSU administers the database layout for device memories and additional memories required by the call processing system and the device handler.
- **AMO SLCB** : Configuration of CMI from Version V3.0 onward
- **AMO DNIT** : Directory Number Information and Translation
- **AMO DSSU** : Device Switch of Switching Unit  
The AMO DSSU can be used to put an S0 bus and its terminals into service or to block it.
- **AMO FEASU** : Customer Feature List
- **AMO HFAB** : Configuration of STMI-HFA and STMI2-HFA board data
- **AMO KCSU** : Keysystem configuration in Switching Unit
- **AMO LRNGZ** : Central Speed Calling Dialing Lists
- **AMO LWPAR** : Loadware Parameters for Networking Modules
- **AMO NAVAR** : Administration of Static Night Switch Option Data
- **AMO PERSI** : Personal Identification Data
- **AMO PRODE** : Protocol Descriptor for Networking
- **AMO RCSU** : Recorder Configuration in SWU
- **AMO SA** : Hunting Arrangements
- **AMO SCSU** : Station Configuration of Switching Unit  
The AMO SCSU is used to assign virtual stations for associated terminal adapters
- **AMO SDAT** : Administration of Subscriber Attributes and Data
- **AMO SSCSU** : Special Subscriber Configuration of Switching Unit  
AMO SSCSU configures the terminals additionally required for the remote user
- **AMO STMIB** : Configuration of STMI2-IGW board data
- **AMO TAPRO** : Key Programming for OPTISET / OPTIP500 / OPTIIP
- **AMO TGER** : Station/Device Allocation, Incoming
- **AMO UCSU** : Unit configuration of Switching unit
- **AMO VADSU** : Administering NMC alarms in the SWU
- **AMO VBZ** : Internal Traffic Restrictions
- **AMO WABE** : Dialing Plans, Feature Access Codes
- **AMO ZAND** : System Data  
The AMO ZAND is used to define terminal pre-settings valid for new OPTISET / OPTIP500 / OPTIIP terminal devices to be configured.  
The AMO ZAND also loads the option table(s) relevant to the functional terminal devices from Hard Disk and allows their subsequent modification.

## SBCSU - Station and S0 bus Configuration of SWU

### Functions of the AMO

- AMO ZANDE : System Data  
AMO ZANDE is used to configure the used CMI version.
- AMO ZIEL : Destination addresses for subscribers
- AMO ZIELN : Administrative Destinations for Network-wide Teams
- AMO ZRNGZ : Central Speed Calling Digit Series

## 166.2 Functions of the AMO

- **ADD-SBCSU** : Configuring the static and dynamic memories in the CC and the LTGs for the above-described device combinations as well as entering the static device data
- **CHANGE-SBCSU** : Changing the static device data
- **DELETE-SBCSU** : Deleting specific service assignments or an entire station configuration
- **DISPLAY-SBCSU** : Interrogating existing station configurations
- **REGENERATE-SBCSU** : Regenerating existing station configurations

### 166.2.1 ADD-SBCSU

The action ADD-SBCSU is used to assign station terminals. One assignment order is required for each station number. The first station number is called the main station number. It is used as a reference, if further station numbers (secondary or MSN station numbers) of a bus, OPTISET or S0/S2 point-to-point connection will be assigned. The following alternatives are possible:

- Assigning a functional bus connection (OPT=FBUS).
- Assigning the main station number of a CorNet-TS-OPTISET configuration (OPT=OPTI).
- Setting up the main station number for the components (base station, mobile user, extension connection) of a CorNet-TS-CMI configuration (OPT=CMI).
- Expanding an OPTISET configuration by a secondary station number (OPT=OPTIEXP).  
A maximum of two secondary station numbers can be set up per OPTISET configuration.
- Assigning a MSN station number for a FBUS/OPTISET configuration (OPT=MSN).
- Expanding an OPTISET configuration with an MSN secondary station number (OPT=MSN).

- Expanding station capabilities by adding a service which is not currently assigned to the station number (bus connections and OPTISET configuration) (OPT=SVC).  
MSN station numbers or MSN secondary station numbers already assigned to the bus will be automatically extended to the new service(s).
- Setting up the main station number for an S0/S2 point-to-point connection (OPT=FPP).
- Assigning a MSN station number via an S0/S2 point-to-point connection (OPT=MSN).  
A S0/S2 connection may be extended by any number of MSN station numbers.

Each OPTISET configuration can be expanded by further station numbers with OPT=OPTIEXP, providing the usual general conditions for the OPTISET configuration are complied with (maximum three terminals, maximum three station numbers).

The parameter PEN specifies the location or port equipment number (LTG-LTU-SLOT-CCT) at which the station devices are connected with the station number STNO. If this parameter is not specified, then the first free location in the system is taken, which corresponds to the other parameter values specified (OPT, CONN, DVCFIG).

The device configuration, to which a port equipment number or location is to be assigned, is declared with the parameter DVCFIG.

The parameters OPT, STNO, PEN, CONN, and DVCFIG, as well as TSI and if required, are used to define what devices are to be assigned and where they are to be assigned. The remaining parameters are used to describe device attributes.

The parameter INS does not reflect the exact state of a terminal device. For INS=Y the trunk will be released for call processing, but it will not necessarily be active. A deviation of the terminal devices states and the trunk state is not possible. The exact states of terminal devices and trunks can be interrogated via the AMO SDSU. In the actions DISPLAY and REGENERATE of the AMO SBCSU INS=Y will be output for trunk states different from long term deactivation. A trunk assigned with INS=N is in the state long term deactivation.

The parameters are divided into the following groups:

1. Addressing parameters :  
OPT, CONN, PEN, TSI, MAINO.
2. General parameters (for all device types):  
STNO, DVCFIG, COS1, COS2, LCOSV1, LCOSV2, LCOSD1, LCOSD2, DPLN, ITR, SSTNO, COSX, SPDI, SPDC1, SPDC2, INS, RCBKB, RCBKNA, CBKBMAX, ALARMNO, HMUSIC, DTMFCTRD, DTMFBLK.

## SBCSU - Station and S0 bus Configuration of SWU

### Functions of the AMO

3. Parameters for CorNet terminals:  
IDCR, REP, STD, SECR, DSSTNA, DSSTNB, DIGNODIS, OPTICA, OPTIDA, OPTICOM, HEADSET, HSKEY, CBKNAMB, TEXTSEL, CALLOG, PMIDX, COMGRP, APICLASS, SECAPPL, DNIDSP, DCFWBUSY, APMOBUSTR, APPM.
4. Parameter for IP terminals:  
IPCODEC (for bandwidth calculation SIP and HFA subscribers in RESMAN), IPPASSW (for HFA subscribers only) and the SIP specific parameters IPADDR, PASSWD, USEID, SECZONE, FIXEDIP, AUTHREQ.
5. Parameters for general analog terminal:  
DFSVCANA, FLASH.
6. Parameters for functional terminals:  
SPROT, FPROT, DPROT, PERMACT, SOPTIDX, FOPTIDX, DOPTIDX, BASICSVC.  
The optional protocol type parameters must be declared, if a terminal has already been declared for the relevant service with parameter DVCFIG, e.g. DPROT for DTE.  
The BASICSVC parameter must be declared, if the NI BRI protocol has been specified for a protocol type parameter, e.g. DPROT=SBNIIBRI for DTE.
7. Parameters for S0/S2/SIP point-to-point connections:  
PERMACT, PROT, OPTIDX.
8. Board-specific parameters  
EXTBUS, ASYNCT, PATTERN, VPI, VCI, LWPAR.

If an existing OPTISET configuration is expanded with a secondary station number (OPT=OPTIEXP), then the values specified for the main station number are used as default values, as far as possible.

If a data terminal (DTE) is assigned together with a voice terminal, then the voice terminal is always associated with the data terminal.

---

**NOTE:** An UFIP client must be linked to an actual desktop phone via parameter CLNTDESK and marked as client by means of CLNTTYPE parameter.

Example:

The client must be linked to an actual desktop phone via parameter CLNTDESK as CLIENT:

```
ADD-SBCSU:STNO=<UFIP_STN>,OPT=OPTI,CONN=IP2,PEN=<X-Y-Z-T>,DVCFIG=UFIP,CLNTDESK=<DSKTP_PHN_STN>,CLNTTYPE=OTHER;
```

or via CLNTSDESK as OSMO or Unify Phone:

ADD-SBCSU:STNO=<UFIP\_STN>,OPT=OPTI,CONN=IP2,PEN=<X-Y-Z-T>,DVCFIG=UFIP,CLNTDESK=<DSKTP\_PHN\_STN>,CLNTTYPE=OSMO;  
 ADD-SBCSU:STNO=<UFIP\_STN>,OPT=OPTI,CONN=IP2,PEN=<X-Y-Z-T>,DVCFIG=UFIP,CLNTDESK=<DSKTP\_PHN\_STN>,CLNTTYPE=UNIPHONE;  
 depending on the case.

### Procedure Overview

| Command Code | Parameter                                          |
|--------------|----------------------------------------------------|
| ADD-SBCSU    | STNO=<number>                                      |
|              | OPT=FBUS                                           |
|              | , CONN=<param>                                     |

|              | , [DTMFCTRD=<param>];                    |

### Examples

1. Connecting an OPTISET configuration directly to an SLMO with an OPTISET voice terminal with three add-on devices and a functional non-voice terminal of service FAX. The necessary S0 adapter OPTIS0A is implicitly configured by the AMO SBCSU.

#### Input:

```
ADD-SBCSU:STNO=3427,OPT=OPTI,CONN=DIR,PEN=1-1-67-1,
DVCFIG=OPTISET&FAX,DPLN=0,ITR=0,COS1=5,COS2=6,LCOSV1=11,LCOSV2=12,
LCOSD1=21,LCOSD2=22,REP=3,FPROT=SBDSS1,FOPTIDX=10;
```

#### Output:

```
H05: 3427      THIS STATION IS ASSIGNED AT PEN 1- 1- 67- 1
H35: 3427      THE TERMINAL ADAPTER OPTIS0A
                FOR CONNECTING S0 DEVICES
H08: 3427      MUST BE PLUGGED AT MAIN STATION NUMBER    3427.
                STATION RELEASED FOR CALL PROCESSING
```

2. Expand the OPTISET configuration (of example no.1) with an OPTIP500. The OPTISET configuration to be expanded is specified with the parameter MAINO.

#### Input:

## SBCSU - Station and S0 bus Configuration of SWU

### Functions of the AMO

ADD-

SBCSU:STNO=3428,OPT=OPTIEXP,MAINO=3427,DVCFIG=OPTIP500,DPLN=0,  
ITR=0,COS1=5,COS2=6;

Output:

H05: 3428 THIS STATION IS ASSIGNED AT PEN 1- 1- 67- 1  
H35: 3428 THE TERMINAL ADAPTER OPTISPA  
FOR CONNECTING THIS OPTIP500  
MUST BE PLUGGED AT MAIN STATION NUMBER 3427.  
H08: 3428 STATION RELEASED FOR CALL PROCESSING

3. Expand the OPTISET configuration (of example no.2) with a MSN secondary station number

Input:

ADD-SBCSU:STNO=3428,OPT=MSN,MAINO=3427;

Output:

H22: 3428 MSN STATION NUMBER HAS BEEN ASSIGNED  
FOR THE SERVICE FAX.  
H08: 3428 STATION RELEASED FOR CALL PROCESSING

4. Assign a MSN station number to the OPTISET configuration (of example no.3)

Input:

ADD-SBCSU:STNO=4999,OPT=MSN,MAINO=3427;

Output:

H22: 4999 MSN STATION NUMBER HAS BEEN ASSIGNED  
FOR THE SERVICE FAX.  
H08: 4999 STATION RELEASED FOR CALL PROCESSING

5. Expand the Main Station Number (of example no.4) with a functional non-voice terminal with DTE service

Input:

ADD-

SBCSU:STNO=3427,OPT=SVC,DVCFIG=DTE,DPROT=SBDSS1,DOPTIDX=10;

Output:

H05: 3427 THIS STATION IS ASSIGNED AT PEN 1- 1- 67- 1  
H24: 3428 MSN STATION NUMBER HAS BEEN EXTENDED  
BY THE SERVICE DTE.  
H24: 4999 MSN STATION NUMBER HAS BEEN EXTENDED  
BY THE SERVICE DTE.

6. Configure an S0 bus connection with NI-BRI protocol via PNT (SLMQ3 module) with a SET600 voice terminal and functional non-voice terminals with DTE and FAX services.

Input:

ADD-

```
SBCSU:STNO=3525,OPT=FBUS,CONN=PNT,DVCFIG=SET600&DTE&FAX,DPLN=
0,ITR=0,COS1=5,COS2=6,LCOSV1=11,LCOSV2=12,LCOSD1=21,LCOSD2=22
,SPROT=SBNIBRI,DPROT=SBNIBRI,FPROT=SBNIBRI,BASICSVC=UDI64;
```

Output:

```
H05: 3525      THIS STATION IS ASSIGNED AT PEN 1- 3- 67- 1
H08: 3525      STATION RELEASED FOR CALL PROCESSING
```

**7. Assign an S2 point-to-point connection as an external station.**

Input:

ADD-

```
SBCSU:STNO=3460,OPT=FPP,CONN=EXT,DVCFIG=S2PP,COS1=15,COS2=16,
LCOSV1=11,LCOSV2=12,LCOSD1=21,LCOSD2=22,DPLN=0,ITR=0,PROT=SBD
SS1,OPTIDX=10,INS=N;
```

Output:

```
H05: 3460      THIS STATION IS ASSIGNED AT PEN 1- 2- 25- 0
H09: 3460      THE STATION IS NOT ACTIVATED
```

**166.2.2 CHANGE-SBCSU**

The parameter STNO is mandatory. This parameter is used to specify the station to be changed. All other parameters are optional. However, at least one of these parameters must be declared. The parameter OPT must only be specified if OPT-specific parameters are to be changed.

MSN station numbers will also be processed!

The following users cannot be assigned a new station number (parameter NEWNO):

- Users who have already been entered as a Route-to-Extension destination in an ACD Routing Table (AMO ACDRT).
- Users for whom ACD attributes have already been set (AMO SDAT).

ZIEL/DSS entries are updated when station number is changed (parameter NEWNO).

Example: Station X is configured as DSS destination for station A

- If station A's number is changed, then the ZIEL/DSS entry is updated with new number of A and X stays as DSS destination.
- If station X's number is changed, then the ZIEL/DSS entry is updated for station A with new number of X as DSS destination.

The parameters are divided into the following groups:

## SBCSU - Station and S0 bus Configuration of SWU

### Functions of the AMO

1. General parameters (for all device types):  
STNO, NEWNO, COS1, COS2, LCOSV1, LCOSV2, LCOSD1, LCOSD2, DPLN, ITR, SSTNO, COSX, SPDI, SPDC1, SPDC2, TRACE, ALARMNO, RCBKB, RCBKNA, CBKBMAX, HMUSIC, OPT, DTMFCTRD, DTMFBLK.
2. Parameters for CorNet terminals:  
IDCR, REP, SECR, DSSTNA, DSSTNB, DIGNODIS, OPTICA, OPTIDA, OPTICOM, HEADSET, HSKEY, CBKNAMB, TEXTSEL, CALLOG, PMIDX, COMGRP, APICLASS, SECAPPL, DNIDSP, DCFWBUSY, APMOBUSR, APPM.
3. Parameter for IP terminals:  
IPCODEC (for bandwidth calculation SIP and HFA subscribers in RESMAN), IPPASSW (for HFA subscribers only) and the SIP specific parameters IPADDR, PASSWD, USEID, SECZONE, FIXEDIP, AUTHREQ.
4. Parameters for general analog terminal:  
DFSVCANA, FLASH.
5. Parameters for functional terminals:  
SPROT, FPROT, DPROT, PERMACT, SOPTIDX, FOPTIDX, DOPTIDX, BASICSVC.  
The protocol type parameters are ignored, unless a terminal has also been specified for the relevant service, e.g. DPROT for DTE. The BASICSVC parameter is ignored, unless the NI BRI protocol has also been specified for a protocol type parameter, e.g. DPROT=SBNI BRI for DTE.
6. Parameters for S0/S2/SIP point-to-point connections:  
PERMACT, PROT, OPTIDX.
7. Board-specific parameters  
EXTBUS, ASYNCT, PATTERN, VPI, VCI, LWPAR.

If SECR has to be changed, the circuit must be locked. This can be done by AMO DSSU or by specifying parameter OFFTYPE in the CHANGE command.

Changes for the circuit specific parameters

ASYNCT, EXTBUS, IPPASSW, LWPAR, PERMACT, PATTERN, VPI, VCI will only become effective after having the new data downloaded into the module.

Downloading will be triggered by

- de- and re-activation "with unconditional loading" (e.g. RESTART-DSSU)

- parameter OFFTYPE=DC (Default) or OFFTYPE=DI. The circuit must be in READY or UNACH state (can be interrogated by AMO SDSU). In UNACH state, data is loaded automatically when hierarchy becomes ready.

**Restriction:** please note, that parameter CLNTDESK cannot be changed via CHANGE-SBCSU. To change it, the UFIP client has to be deleted and reconfigured with ADD new CLNTDESK/OSMO value.

### Procedure Overview

| Command Code | Parameter                                               |
|--------------|---------------------------------------------------------|
| CHANGE-SBCSU | STNO=<number>                                           |
|              | , [NEWNO=<number>], [COS1=<number>], [COS2=<number>]    |

### 166.2.3 DELETE-SBCSU

The DELETE action is used to delete

- specific service assignments to a station number (by specifying STNO and SVC).  
MSN station numbers or MSN secondary station numbers assigned to the S0 bus or at the OPTISET configuration will be automatically shortened by the service deleted for the Main Station Number.
- specific MSN station numbers or MSN secondary station numbers (by specifying STNO and SVC=MSN).
- specific station numbers (by specifying STNO and SVC=ALL).

Ranges and concatenated single values can be specified for parameter STNO in both cases.

Any station-device allocations which exist (assigned with AMO TGER) are automatically deleted.

The following services or stations cannot be deleted:

- Services assigned to a hunting group.
- Stations which belong to a call pickup group.
- Stations which belong to an executive/secretary system or are assigned to a night option.  
In these cases, the relevant assignment must first be explicitly deleted using the AMOs CHESE and NAVAR.
- Users who are still entered as a Route-to-Extension destination in an ACD Routing Table (AMO ACDRT).
- Users for whom ACD attributes are still set (AMO SDAT).
- Users who are logged on to a SLMPX as teleworkers.  
In this case the user must first be signed off.
- Voice terminals which are upgraded to keysystem terminals (AMO KCSU).

## SBCSU - Station and S0 bus Configuration of SWU

### Functions of the AMO

#### Note

The configuration to be deleted must either first be deactivated (blocked) with the AMO DSSU or by using parameter OFFTYPE with the DELETE command.

This does also apply to signed-off subscribers !

#### Procedure Overview

| Command Code | Parameter                                                          |
|--------------|--------------------------------------------------------------------|
| DELETE-SBCSU | STNO=<number>, SVC=<param>, [OFFTYPE=<param>], [DELPBOOK=<param>]; |

#### Examples

1. Delete specific service from main station number (camp-on deactivation)

Input:

```
DEL-SBCSU:STNO=3427,SVC=FAX;
```

Output:

```
H06: 3427    STATION DATA DELETED.
H25: 3428    MSN STATION NUMBER HAS BEEN SHORTENED
              BY THE SERVICE FAX.
H25: 4999    MSN STATION NUMBER HAS BEEN SHORTENED
              BY THE SERVICE FAX.
```

2. Delete MSN secondary station number from OPTISET configuration (immediate deactivation)

Input:

```
DEL-SBCSU:STNO=3428,SVC=MSN;
```

Output:

```
H23: 3428    MSN STATION NUMBER HAS BEEN DELETED
              FOR THE SERVICE DTE.
```

3. Delete MSN station number from OPTISET configuration (immediate deactivation)

Input:

```
DEL-SBCSU:STNO=4999,SVC=MSN,OFFTYPE=DC;
```

Output:

```
H06: 4999    STATION DATA DELETED.
```

4. Delete secondary station number from OPTISET configuration (camp-on deactivation)

Input:

```
DEL-SBCSU:STNO=3428,SVC=ALL,OFFTYPE=DC;
```

**Output:**

```

H36: 3428    THE TERMINAL ADAPTER OPTISPA PLUGGED AT MAIN
STATION NUMBER    3427
                FOR CONNECTING THIS OPTIP500 IS NO LONGER NEEDED.
H06: 3428    STATION DATA DELETED.

```

5. Delete main station number of OPTISET configuration (immediate deactivation)

**Input:**

```
DEL-SBCSU:STNO=3427,SVC=ALL,OFFTYPE=DI;
```

**Output:**

```

H36: 3427    THE TERMINAL ADAPTER OPTIS0A PLUGGED AT MAIN
STATION NUMBER    3427
                FOR CONNECTING S0 DEVICES IS NO LONGER NEEDED.
H06: 3427    STATION DATA DELETED.

```

**166.2.4 DISPLAY-SBCSU**

With the DISPLAY action, terminal data, bus configurations and MSN links can be interrogated.

The type of output can be specified by declaring the parameter TYPE:

- TYPE=TERMDATA  
The parameter values with which the terminals in the specified range were configured are output in tabular form for each STNO (even if MSN).
- TYPE=BUS  
The bus/OPTISET configurations in the specified station number range are output. For each bus/OPTISET configuration, a table is displayed with the following data: type of bus, type of connection, port equipment number, all STNOs allocated to the bus, terminal configurations of each station number with corresponding TSI numbers allocated and MSN station numbers or MSN secondary station numbers eventually assigned.
- TYPE=BUSDATA  
Combination of TYPE=TERMDATA and TYPE=BUS for all configurations in the station number range specified.
- TYPE=FPP  
This outputs the corresponding MSN station numbers for all existing S0/S2 point-to-point connections. For each connection, a table is output with the following data: type of connection, port equipment number and a list of all MSN station numbers assigned.

## SBCSU - Station and S0 bus Configuration of SWU

### Functions of the AMO

- TYPE=MSN  
Those station numbers in the specified station number range are output, which have been configured with DVCFIG=MSN.
- TYPE=OPTIDAT  
For all OPTISET / OPTIP500 / OPTIIP terminals installed within the specified station number range, the assigned individual terminal data (phone ID, asset ID, SW version, self-test result) and the currently valid hardware settings (ringing volume, ringing tone, warning signal volume, call volume via handset, call volume via loudspeaker, hands-free characteristics, display contrast, Self- Labelling Keys display contrast, rollover volume) are output.

For all OPTIIP terminals installed within the specified station number range, also the HFA data (IP address, emergency number, LIN, SW capabilities) reported by the IP terminal are output.

- TYPE=SEARCH  
Those station numbers in the specified station number range are output, which meet a certain search criterion as specified by the optional parameters CONN, DEV, COSNO, LCOSV, LCOSD, TRACE, KEYSYS and INS.

### Procedure Overview

| Command Code  | Parameter                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY-SBCSU | [STNO=<number>]                                                                                                                                                                          |
|               | , [TYPE=TERMDATA\BUS\BUSDATA\FPP\MSN\OPTIDAT];                                                                                                                                           |
|               |                                                                                                                                                                                          |
|               | , [TYPE=SEARCH],                                                                                                                                                                         |
|               | { [CONN=<param>] [,DEV=<param>] [,COSNO=<number>]<br>[,LCOSV=<number>] [,LCOSD=<number>]<br>[,TRACE=<param>] [,KEYSYS=<param>]<br>[,INS=<param>] };<br>[TYPE=IPSEARCH], IPADDR=<string>; |

### Examples

1. Display the configuration data for STNO 12121 (DVCFIG = OPTIIP)

Input:

DISP-SBCSU:STNO=12121;

Output:

```
----- USER DATA -----
STNO    =12121      OPT    =OPTI      COS1    =33      DPLN    =0

## SBCSU - Station and S0 bus Configuration of SWU

### Functions of the AMO

HUNT CD :N

----- SUBSCRIBER ATTRIBUTES (AMO SDAT) -----

PARARNGS

The output data for a station is subdivided into 6 groups:

1. Data which is also contained in the input command.
2. License State information (only if restrictions apply).
3. Mobile HFA status information (only if OPTIIP terminal).
4. Activation identifiers for the features.
5. Features and group memberships which are not assigned by the AMO SBCSU
6. Subscriber attributes which are assigned by the AMO SDAT. If the shelf default value is used for SRCGRP or TCLASS, this value is displayed in parentheses.

Explanation of MOBILE HFA STATE :

- IP PHONE INACTIVE = Flag if OPTIIP terminal is currently not available, because
- it is either visited by a different subscriber via Mobile HFA LOGON (so displayed subscriber cannot be reached anymore when dialing his/her usual station number)
  - or after Mobile HFA LOGOFF there is simply no home phone plugged (so displayed subscriber cannot be reached either when dialing his/her station number)

Explanation of ACTIVATION IDENTIFIERS FOR FEATURES:

- |         |                                                         |
|---------|---------------------------------------------------------|
| FWDS    | = Call forwarding for voice (speech)                    |
| FWDF    | = Call forwarding for FAX                               |
| FWDD    | = Call forwarding for data terminal equipment (DTE)     |
| HTOS    | = Hunting group out, voice (release from hunting group) |
| HTOF    | = Hunting group out, FAX                                |
| HTOD    | = Hunting group out, DTE                                |
| DND     | = Do-not-disturb                                        |
| VCP     | = Voice call protection                                 |
| CWT     | = Call waiting - terminating                            |
| TWLOGIN | = Teleworking LOGIN Status                              |

Explanation of FEATURES AND GROUP MEMBERSHIPS :

- |       |                                           |
|-------|-------------------------------------------|
| PUGR  | = Station assigned to a call pickup group |
| ESSTN | = Station in executive/secretary system   |

ROLE = Role in the executive/secretary system (see AMO CHESE)  
 KEYSYS = Station upgraded to a Keysystem (AMO KCSU)  
 NOPTNO = Station assigned to a night option  
 HUNT CD = Station assigned to a hunting group

### Explanation of SUBSCRIBER ATTRIBUTES (AMO SDAT) :

see AMO SDAT

## 2. Display the configuration data for STNO 12671 (DVCFIG = UFIP)

Input:

DISP-SBCSU:STNO=12671;

Output:

```
----- USER DATA -----

THE MSN STATION NUMBERS HAVE BEEN ASSIGNED  
FOR THE SERVICES FAX,DTE

### 5. Interrogate the MSN station numbers for an S0/S2 point-to-point connection

Input:

```
DISP-SBCSU:STNO=3460,TYPE=FPP;
```

Output:

```
MAINO  =3460      CONN  =EXT      PEN  = 1- 2- 25- 0
DVCFIG  =S2PP
----- MSN STATION NUMBERS -----
3461      3462
-----2 IN TOTAL-----
```

### 6. Interrogate all stations to which COS 6 is assigned (COS1 or COS2)

Input:

```
DISP-SBCSU:TYPE=SEARCH,COSNO=6;
```

Output:

```
----- SUBSCRIBER WITH -----
DEV      :      CONN      :
TRACE    :      COSNO    : 6
KEYSYS   :      LCOVS    :
INS      :      LCOSD    :
```

## SBCSU - Station and S0 bus Configuration of SWU

### Functions of the AMO

```
-----
3400      3401      3402      3403      3404      3405
3427      3428      3525
-----9 MATCH (ES) -----
```

#### 7. Interrogate all signed-off keysystems

Input:

DISP-SBCSU:TYPE=SEARCH,KEYSYS=Y,INS=SIGNOFF;

Output:

```
----- SUBSCRIBER WITH -----
DEV      :                      CONN      :
TRACE    :                      COSNO     :
KEYSYS   : Y                    LCOSV     :
INS       : SIGNOFF             LCOSD     :
-----
2189      2190
-----2 MATCH (ES) -----
```

#### 8. Interrogate all MSN station numbers/ MSN secondary station numbers

Input:

DISP-SBCSU:TYPE=MSN;

Output:

| STNO | MAINO | VOICE    | FAX | DTE |
|------|-------|----------|-----|-----|
| 3428 | 3427  | OPTIP500 | MSN | MSN |
| 3461 | 3460  | MSN      | MSN | MSN |
| 3462 | 3460  | MSN      | MSN | MSN |
| 4999 | 3427  |          | MSN | MSN |

#### Note:

All MSN station numbers/MSN secondary station numbers for a specific main station number of a bus or OPTISET configuration may be found with

DISP-SBCSU: TYPE=BUS, STNO=...;

All MSN station numbers for a specific FPP main station number may be found with

DISP-SBCSU: TYPE=FPP, STNO=...;

#### 9. Interrogate individual OPTISET / OPTIP500 / OPTIIP terminal data and hardware settings.

Input:

DISP-SBCSU:STNO=2190,TYPE=OPTIDAT;

Output:

## Functions of the AMO

2135

## 166.2.5 REGENERATE-SBCSU

The REGENERATE action outputs the data of an S0 bus configuration as one or more position-oriented command listings for the ADD action of this AMO. The type of data output corresponds to that of the DISPLAY action with TYPE=TERMDATA.

By specifying any station number of a bus, OPTISET configuration or S0/S2 point-to-point connection all ADD commands will be regenerated.

### Procedure Overview

| Command Code     | Parameter        |
|------------------|------------------|
| REGENERATE-SBCSU | [STNO=<number>]; |

### Examples

1. Regenerate the OPTISET configuration with STNO 3427

Input:

```
REGEN-SBCSU:3427;
```

Output:

```
ADD-SBCSU:3427,OPTI,DIR,1-1-67-1,OPTISET&DTE&FAX,1&5&2,
5,6,11,12,21,22,0,0,N,0,0,,,N,0,0,N,
"SBDSS1","SBDSS1",Y,0,N,N,N,Y,N,10,10,
,,,,5,,,,N,NORMAL,
Y,SPANISH,0,,,0,,,,,;
ADD-SBCSU:3428,OPTIEXP,3427,OPTIP500,3,
5,6,11,12,21,22,0,0,N,0,0,,,N,0,0,N,
,,,0,N,N,N,Y,N,,,,,5,N,NORMAL,,
Y,SPANISH,0,,,0,,,,,;
ADD-SBCSU:3428,MSN,3427,,5,6,11,12,21,22,0,N,0,0,,,Y,N,N,5,;
ADD-SBCSU:4999,MSN,3427,,5,6,11,12,21,22,0,N,0,0,,,Y,N,N,5,;
```

2. Regenerate the S0 bus configuration with STNO 3525

Input:

```
REGEN-SBCSU:3525;
```

Output:

```
ADD-SBCSU:3525,FBUS,PNT,1-3-67-1,SET600&DTE&FAX,
5,6,11,12,21,22,0,0,N,0,0,,,
"SBNIBRI","SBNIBRI","SBNIBRI",Y,Y,0,7,7,7,UDI64,,N,N,,5,0,;
```

3. Regenerate the S2 point-to-point connection with STNO 3460

Input:

```
REGEN-SBCSU:3460;
```

Output:

```
ADD-SBCSU:3460,FPP,EXT,1-2-25-
0,S2PP,5,6,11,12,21,22,0,0,N,0,0,,,
      "SBDSS1",Y,Y,0,10,N,N,,,5,0;
ADD-SBCSU:3461,MSN,3460,,5,6,11,12,21,22,0,N,0,0,,,Y,N,N,5,;
ADD-SBCSU:3462,MSN,3460,,5,6,11,12,21,22,0,N,0,0,,,Y,N,N,5,;
```

4. Regenerate the UFIP client STNO 12674 - Unify Phone client with DESK = 12100

Input:

```
REGEN-SBCSU:12674;
```

Output:

```
ADD-SBCSU:12674,OPTI,IP2,1-26-7-
14,UFIP,1,63,63,1,1,1,1,0,0,N,0,0,0,,N,0,21,N,,,Y,0,N,N,
N,Y,N,,,,,,,,1,,,N,NORMAL,Y,GERMAN,0,,,0,,,,,,,,,G711P,
,,,,12100,,,UNIPHONE,;
```

5. Regenerate the secondary device STNO 12111 with primary device 12100

Input:

```
REGEN-SBCSU:12111;
```

Output:

```
ADD-SBCSU:12111,OPTI,IP2,1-26-7-
19,UFIP,1,63,63,1,1,1,1,4,0,N,0,0,0,,N,0,21,N,,,Y,0,N,N,
N,Y,N,,,,,,,,1,,,N,NORMAL,Y,ENGLISH,0,,,0,,,,,,,,,G711P,
,,,,,,,,,12100;
```

## 166.3 Parameter Description

|        | <sup>1)</sup>        | : | Only certain circuits of the SLC16 module can be used for this terminal (see Chapter 166 Point "3. CMI configuration ( CMI version >= V3.0 )" ) |                                                                          |

A list of possible connection types and device configurations for the modules is shown below (see Table 6 Terminal configuration assignments to the line modules).

An SLMQ-EXT can be used instead of an SLMQ.

An STMD2 can be used instead of an STMD.

An STHC or STHC2 (only circuits 16 - 19 each) can also be used instead of an STMD.

An SLMO (without FCTID), SLMO16, SLMO24, SLMOP or SLOP2 can be used

## SBCSU - Station and S0 bus Configuration of SWU

### Parameter Description

instead of an SLMO (FCTID=1).

An STHC or STHC2 (only circuits 0 - 15 each) can also be used instead of an SLMO (FCTID=1).

## 166.4 Error Messages and Advisories

### Explanation of symbols used in the Error Messages and Advisories

<xxxxxxx> denotes the station number, to which the message refers. The station number is not output in the messages, if the AMO is still verifying parameter entries. Variable text strings are enclosed in pointed brackets and separated with a slash. Only one of these variables is actually contained in the output, depending on the cause of the error.

### 166.4.1 Error Messages

F01: <xxxxxxxxxxxx> THIS STATION NUMBER IS NOT PROPERLY ASSIGNED  
(AMO WABE AND AMO KNDDEF)

## SBCSU - Station and S0 bus Configuration of SWU

AS A KEYSYSTEM  
( DEL-KCSU:STNO=<xxxxxxxxxxxx>; )

## SBCSU - Station and S0 bus Configuration of SWU

### Error Messages and Advisories

- F51: THE STATION NUMBER RANGE <xxxxxxxxxxxx> - <yyyyyyyyyyyy> CONTAINS NO VALID STATION NUMBER
- F52: <xxxxxxxxxxxx> THE ADD-ON DEVICES MAY ONLY BE REMOVED, IF ALL AFFECTED LINE KEYS WITH KYNO >= <kyno> HAVE BEEN RESET  
( DISP-KCSU:STNO=<xxxxxxxxxxxx>,TYPE=PRIM; )
- F53: <xxxxxxxxxxxx> THE SERVICE <DTE|FAX> IS ALREADY ASSIGNED
- F54: <xxxxxxxxxxxx> STMI2-HFA MODULE IS CURRENTLY DEFINED AS A STANDBY BOARD, WHICH CANNOT BE USED FOR SUBSCRIBER CONFIGURATION  
( DISP-HFAB:MTYPE=STMIHFA2,LTU=<uu>,SLOT=<sss>; )
- F55: <xxxxxxxxxxxx> THE MAIN STATION NUMBER IS ASSIGNED WITH  
<OPT/DVCFIG>=<opt/dvcfig>
- F56: <xxxxxxxxxxxx> PARAMETER <SECAPPL/APMOBUSR> CAN ONLY BE SET FOR AN <OPTIP500/OPTIIP> EQUIPPED WITH A SIGNATURE MODULE (IDCR=Y)
- F57: <xxxxxxxxxxxx> PARAMETER <REP/NEWNO> CANNOT BE PROCESSED WHILE THE STATION IS STILL MARKED AS <EXECUTIVE/SECRETARY> OF A (NETWIDE) TEAM  
( CHANGE-SDAT:STNO=<xxxxxxxxxxxx>,TYPE=ATTRIBUT, DATTR=<TEAMEXEC/TEAMSECR>; )
- F58: <xxxxxxxxxxxx> THIS STATION IS ALREADY ASSIGNED BY AMO <ACSU/RUFUM/SBCSU/SCSU/SSCSU>
- F59: <xxxxxxxxxxxx> THE STATION CANNOT BE PROCESSED. IT IS ALREADY CONFIGURED IN THE EXECUTIVE TELEPHONE SYSTEM <mmmm> AS <EXECUTIVE/SECRETARY>
- F60: <xxxxxxxxxxxx> ALARMNO <nnnn> IS NOT YET ASSIGNED (AMO VADSU).
- F61: <xxxxxxxxxxxx> AN OPTISET/OPTIP500/OPTIIP NOT EQUIPPED WITH A DISPLAY (DIGNODIS=Y) MAY NOT BE RESERVED AS A SECRETARIAL STATION (SECR=Y)
- F62: <xxxxxxxxxxxx> DIGNODIS=Y MAY NOT BE SET  
SINCE STATION HAS BEEN RESERVED AS A SECRETARY  
OR ASSIGNED IN AN EXEC/SECR CONFIGURATION.
- F63: <xxxxxxxxxxxx> A KEYSYSTEM MAY NOT BE RESERVED AS A SECRETARIAL STATION  
( DISP-KCSU:STNO=@@@@@@@@@@@@; )
- F65: <xxxxxxxxxxxx> FOR THE CONFIGURATION WITH MAINO <yyyyyyyyyyyy> NO FUNCTIONAL SERVICES HAVE BEEN ASSIGNED - THEREFORE MSN STATION NUMBERS CANNOT BE ASSIGNED.
- F66: <xxxxxxxxxxxx> FOR THE CONFIGURATION WITH MAINO <yyyyyyyyyyyy> A FUNCTIONAL DEVICE HAS BEEN ASSIGNED ONLY FOR SERVICE = VOICE - THEREFORE MSN STATION NUMBERS CANNOT BE ASSIGNED.
- F67: <xxxxxxxxxxxx> ONLY ONE OF THE ANALOG NON-VOICE TERMINALS  
ANADTE, ANAFAX CAN BE SPECIFIED
- F68: <xxxxxxxxxxxx> THE STATION CANNOT BE PROCESSED BECAUSE THE NECESSARY  
TERMINAL ADAPTER <OPTIABA/OPTISPA> FOR CONNECTING  
<ANALOG DEVICES/THIS OPTISET/THIS OPTIP500>  
MUST NOT BE PLUGGED AT MAIN STATION NUMBER <yyyyyyyyyyyy> TOGETHER  
WITH THE ALREADY EXISTING TERMINAL ADAPTER <OPTISPA/OPTIABA>
- F69: <xxxxxxxxxxxx> STNO IS A MSN STATION NUMBER  
WHICH CAN ONLY BE DELETED WITH SVC=MSN.
- F70: <xxxxxxxxxxxx> STNO IS A MSN SECONDARY STATION NUMBER  
WHICH CAN ONLY BE DELETED WITH SVC=ALL RESP. SVC=MSN.
- F71: <xxxxxxxxxxxx> STNO IS MAIN STATION NUMBER OF A <BUS/OPTI/CMI> CONFIGURATION  
AND THEREFORE CANNOT BE DELETED WITH SVC=MSN -  
ALL OTHER SVC-VALUES ARE POSSIBLE IF CORRESPONDING  
DEVICES ARE ASSIGNED.
- F72: <xxxxxxxxxxxx> STNO IS NO MSN STATION NUMBER  
AND THEREFORE CANNOT BE DELETED WITH SVC=MSN -  
ALL OTHER SVC-VALUES ARE POSSIBLE IF CORRESPONDING  
DEVICES ARE ASSIGNED.
- F73: <xxxxxxxxxxxx> STNO HAS ALREADY BEEN ASSIGNED AS A MSN STATION NUMBER  
FOR <THE SERVICE/THE SERVICES> <VOICE/FAX/DTE>.

- F74: <xxxxxxxxxxxx> THIS STATION CANNOT BE PROCESSED WHILE THE RELATED MSN STATION NUMBER <yyyyyyyyyyyy> IS STILL ASSIGNED IN A <VOICE/FAX/DTE> HUNTING GROUP.
- F76: <xxxxxxxxxxxx> MEMORY SPACE FOR COMGRP @@@@ IS NOT YET ASSIGNED  
( ADD-DIMSU:COMGR=@@@@; )
- F77: <xxxxxxxxxxxx> THE STATION CANNOT BE PROCESSED BECAUSE THE REQUIRED CONFIRMATION BY CALL PROCESSING HAS NOT BEEN RECEIVED YET  
- REPEAT COMMAND LATER
- F78: <xxxxxxxxxxxx> THE STATION CANNOT BE PROCESSED WHILE STILL ENTERED AS AN ACD ROUTING DESTINATION  
( DISP-ACDRT:ART=<nnnnn>; )
- F79: <xxxxxxxxxxxx> THE STATION CANNOT BE PROCESSED WHILE ACD ATTRIBUTES ARE STILL SET  
( CHANGE-SDAT:STNO=<xxxxxxxxxxxx>,TYPE=ATTRIBUT, DATTR=SUPER&AGENT&AUTOLOG&CAF; )
- F80: <xxxxxxxxxxxx> THE STATION CANNOT BE PROCESSED WHILE STILL LOGGED IN AS A TELEWORKER - SIGNOFF VIA TELEWORKING SERVER BEFORE REPEATING THIS COMMAND
- F81: <xxxxxxxxxxxx> STNO IS SETUP WITH DVCFIG=<S0PP/S2PP/ANAEV> AND CAN ONLY BE DELETED IF SVC=ALL.
- F82: <xxxxxxxxxxxx> FOR PARAMETER IPPASSW EITHER "NONE" OR AT LEAST 6 ALPHA-NUMERICAL CHARACTERS MUST BE ENTERED
- F83: <xxxxxxxxxxxx> THE LAST FUNCTIONAL TERMINAL CANNOT BE DELETED SINCE THE FOLLOWING ASSOCIATED MSN NUMBERS CANNOT BE DISABLED AND THEREFORE NOT BE DELETED: <yyyyyy> <zzzzzz> ...
- F84: <xxxxxxxxxxxx> WITH OPT=<OPTI/OPTIEXP> FOR DVCFIG=<OPTISET/OPTIP500/OPTIIP/ANAEV> ONLY TSI=<1/8> IS ALLOWED.
- F87: <xxxxxxxxxxxx> FUNCTIONAL TERMINALS CAN ONLY BE SET UP UNDER ONE STATION NUMBER IN THE OPTISET CONFIGURATION. THIS IS THE REASON WHY THEY MUST BE SET UP UNDER STATION NUMBER <zzzzzzzzzzzz> .  
TO BE ABLE TO ALSO ACCESS THESE TERMINALS UNDER <xxxxxxxxxxxx>, THE COMMAND  
ADD-SBCSU:STNO=<xxxxxxxxxxxx>,OPT=MSN,MAINO=<yyyyyyyyyyyy>;  
MUST BE EXECUTED SUBSEQUENTLY.
- F88: <xxxxxxxxxxxx> AN <OPTISET/OPTIIP> CONFIGURATION ON THE <WAML (FCTID=2)/SLMQ3/STMI-HFA (FCTID=3)> MODULE CANNOT BE EXTENDED TO INCLUDE ADDITIONAL DEVICES.
- F89: <xxxxxxxxxxxx> A MAXIMUM NUMBER OF <ONE/2> <ANALOG DEVICE/OPTISET DEVICES> CAN BE SET UP IN THE OPTISET CONFIGURATION.
- F90: <xxxxxxxxxxxx> FOR A SIGNED OFF STATION DVCFIG=<OPTIIP/SET600/DTE/FAX/BASE/RADIO/CMIADM/EXTLINE> IS NOT ALLOWED.
- F91: <xxxxxxxxxxxx> THE TERMINAL ADAPTER OPTIDA CANNOT BE DELETED, BECAUSE AT MAIN STATION <yyyyyyyyyyyy> THERE IS NO SOCKET LEFT FOR THE OPTISOA TERMINAL ADAPTER NEEDED FOR CONNECTING S0 DEVICES
- F93: <xxxxxxxxxxxx> OPTICOM=Y CANNOT BE SET UNLESS ALL KEY FUNCTIONS OF THE ADD-ON DEVICES 3 AND 4 ARE SET TO "VACANT" (AMO TAPRO)
- F94: <xxxxxxxxxxxx> THE MAIN STATION NUMBER MAY NOT BE SIGNED OFF.
- F95: <xxxxxxxxxxxx> THE STMA MODULE DATA HAS NOT YET BEEN SET UP  
( ADD-BDAT:LTG=<g>,LTU=<uu>,SLOT=<sss>,TYPE=STMA,OPMODE=GLOBAL, )
- F96: <xxxxxxxxxxxx> WITH VPI=<nnnnn>, FOR THIS STMA MODULE THE VALUE VCI=<mmmmmm> IS NOT WITHIN THE PERMISSIBLE RANGE OF <aaaaa> AND <zzzzz>  
( DISP-BDAT:LTG=<g>,LTU=<uu>,SLOT=<sss>,TYPE=STMA,OPMODE=GLOBAL; )

Error Messages and Advisories

# 167 SCREN - Screening of calling or connected numbers

|                    |                       |                               |
|--------------------|-----------------------|-------------------------------|
| Restrictions       | Functions of the AMO  | Error Messages and Advisories |
| Interrelationships | Parameter Description |                               |

With the AMO SCREN the screening data and screening patterns are configured to a virtual source node number SNNO. The connection between screening patterns and the source node number is the screening pattern plan which the screening patterns have been assigned to. The configured data and patterns will be used to check the screening of a calling or connected number to a E-DSS1 connection. The number will be assigned to the virtual node number by the B-channel (AMO TDCSU: NNO, see also AMO KNDEF: TYPE=FOREIGN).

## parameter SCRP

The following rules must be obeyed for the screening patterns:

A screening pattern consists of up to 22 characters, following characters are valid: "0" to "9" and "\*", the wildcard "x" and "#". After the character "#" no other characters may be entered. After the character "x" only "x" or "#" may follow.

## parameter SNNO

The following rules must be obeyed for the virtual source node number:

The SNNO consists of up to 3 levels in the form <level2> - <level1> - <level0>.

Possible Values:

level0 : 0-999

level1 : 0-253

level2 : 0-29

The input 0 for SNNO and the form x-0-x even with valid values for level2 and level0 will be rejected.

## 167.1 Restrictions

This description is valid from HiPath 4000 V1.0

## SCREN - Screening of calling or connected numbers

### Interrelationships

## 167.2 Interrelationships

|           |                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AMO DIMSU | Dimensioning of features, switching unit                                                                                                                        |
| AMO TDCSU | Configuration of digital circuits<br>For CP the used circuit must be configured with the virtual node number (parameter NNO) so the screening data can be used. |

## 167.3 Functions of the AMO

- [ADD-SCREN](#) Create screening data or patterns
- [CHANGE-SCREN](#) Change screening data
- [DELETE-SCREN](#) Remove screening data or patterns
- [DISPLAY-SCREN](#) Interrogate screening data or patterns
- [REGENERATE-SCREN](#) Regenerate screening data or patterns

### 167.3.1 ADD-SCREN

This action can:

- assign up to 200 screening patterns (max. 10/command) to a screening pattern plan,
- assign the screening data and/or the screening pattern plan to a source node number.

After performing the data for a source node number an advisory message is displayed.

First the screening patterns must be assigned to a plan which then can be assigned to one or more source node numbers. If a not existing plan is entered, when configuring the screening data, the plan will be ignored.

If no screening pattern plan SCRPLAN but the type of plan SCRPTON is entered, the SCRPTON will be ignored.

If no default number operator DNO but the type of default number operator DNOTON is entered, the DNOTON will be ignored.

#### Procedure overview

| Commandcode | Parameter |
|-------------|-----------|
|-------------|-----------|

|            |                                                                                                                                                                                                                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD-SCREEN | <pre> TYPE=SCRPATT, SCRPLAN=&lt;number&gt;, SCR=&lt;string&gt;;   TYPE=SCRDATA, SNNO=&lt;number&gt;, [DNO=&lt;key-num&gt;],   [DNOTON=&lt;param&gt;], [TOSCAL=&lt;param&gt;], [PRESCAL=&lt;param&gt;],   [TOSCOL=&lt;param&gt;], [PRESCOL=&lt;param&gt;],   [SCRPLAN=&lt;number&gt;], [SCRPTON=&lt;param&gt;],   [LOCDEST=&lt;key-num&gt;]; </pre> |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

1. Assign five valid screening patterns to screening pattern plan 35

Input:

```
ADD-SCREEN:TYPE=SCRPATT,SCRPLAN=35,
```

```
SCR=<00994873&337467883934000&783*7784X&987564566677XX#&89989899
0004455#>;
```

2. Assign some screening data (DNO, DNOTON, TOSCOL, SCRPLAN, SCRPTON) to source node number 12-343

Input:

```
ADD-SCREEN:TYPE=SCRDATA,SNNO=12-
343,DNO=0099487*6778,DNOTON=UNKNOWN,TOSCOL=SCREEN,
SCRPLAN=35,SCRPTON=INTERNAT;
```

## 167.3.2 CHANGE-SCREEN

This action changes the screening data and/or the screening pattern plan of a source node number.

Before the screening pattern plan of a source node number can be changed the plan must have been configured with screening patterns.

If no screening pattern plan SCRPLAN but the type of plan SCRPTON is entered, the change command will not be performed.

If no default number operator DNO but the type of default number operator DNOTON is entered, the change command will not be performed.

### Procedure overview

| Commandcode   | Parameter                                                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHANGE-SCREEN | <pre> SNNO=&lt;number&gt;, {(min 1) [DNO=&lt;key-num&gt;],   [DNOTON=&lt;param&gt;], [TOSCAL=&lt;param&gt;], [PRESCAL=&lt;param&gt;],   [TOSCOL=&lt;param&gt;], [PRESCOL=&lt;param&gt;],   [SCRPLAN=&lt;number&gt;], [SCRPTON=&lt;param&gt;],   [LOCDEST=&lt;key-num&gt;]}; </pre> |

**Example**

- 1. Change the screening data (DNO, TOSCAL, SCRPTON) of source node number 12-343.

Input:

```
CHANGE-SCREN:SNNO=12-343,DNO=56667*88787,TOSCAL=SPECARR,SCRPTON=NATIONAL;
```

**167.3.3 DELETE-SCREN**

This action can:

- remove seperate screening patterns (max. 10/commando) or the screening pattern plan itself including all patterns,
- remove seperate screening data and/or the screening pattern plan or the source node number itself including all data.

If certain screening data has been deleted for a source node number and therefore no data is configured for this number the source node number will be deleted and an advisory message displayed.

If a screening pattern plan SCRPPPLAN has been deleted and it is still assigned to one or more source node number(s) this assignment(s) will be deleted. If the type of the plan SCRPTON is configured, it will be deleted too.

If the default number operator DNO has been deleted and the type of this number DNOTON is still configured, the type will be deleted.

**Procedure overview**

| Commandcode  | Parameter                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------|
| DELETE-SCREN | TYPE=SCRPATT, SCRPPPLAN=<number>, [SCRP=<string>];<br>  TYPE=SCRDATA, SNNO=<number>, [DATATYPE=<param>]; |

**Examples**

- 1. Delete the screening pattern plan 2

Input:

```
DEL-SCREN:TYPE=SCRPATT,SCRPPPLAN=2;
```

- 2. Delete seven screening patterns of screening pattern plan 1100

Input:

DEL-SCREN:TYPE=SCRPAAT,SCRPLAN=1100,

SCRPA=0998883&8822\*9989&989XXX&765X#&876454#&78987654345678765432&X;

### 3. Delete source node number 3-135-2

Input:

DEL-SCREN:TYPE=SCRDATA,SNNO=3-135-2;

### 4. Delete screening data (DNO, DNOTON, TOSCOL, SCRPLAN, SCRPTON) of source node number 46

Input:

DEL-  
SCREN:TYPE=SCRDATA,SNNO=46,DATATYPE=DNO&SCRPTON&SCRPLAN&DNOTON&TOSCOL;

## 167.3.4 DISPLAY-SCREN

This action can:

- interrogate one or more screening pattern plans with the screening patterns,
- interrogate one or all source node number with the screening data. If there are exists a assignment to a screening pattern plan and the pattern should be output the screening patterns will be displayed,
- interrogate all screening pattern plans including the screening patterns and all source node numbers including the screening data

### Procedure overview

| Commandcode   | Parameter                                                                                    |
|---------------|----------------------------------------------------------------------------------------------|
| DISPLAY-SCREN | [TYPE=SCRPAAT], [SCRPLAN=<number>];<br>  [TYPE=SCRDATA], [SNNO=<number>], [SCRPOUT=<param>]; |

### Examples

#### 1. Interrogate all screening pattern plans

Input:

DISP-SCREN:TYPE=SCRPAAT;

Output:

+-----+  
| |

### 167.3.5 REGENERATE-SCREEN

- regenerate one or more screening pattern plans with the screening patterns,
- regenerate one or all source node number with the screening data. If there are exists a assignment to a screening pattern plan and the pattern should be output the screening patterns will be displayed,
- regenerate all screening pattern plans including the screening patterns and all source node numbers including the screening data

## SCREN - Screening of calling or connected numbers

### Parameter Description

|         |                                           |
|---------|-------------------------------------------|
| PRESCAL | = presentation of calling line number     |
| PRESCOL | = presentation of connected line number   |
| SCRPLAN | = screening pattern plan                  |
| SCRPTON | = type of screening pattern plan          |
| TOSCAL  | = type of screening calling line number   |
| TOSCOL  | = type of screening connected line number |

**DNO** Default number operator

Type of Input : single value, 1. parameter of a min-1-group, up to 22 characters (CHANGE)  
single value, optional, up to 22 characters (ADD,TYPE=SCRDATA)

Possible Values : 0-9,\*

**DNOTON** Type of default number operator

Type of Input : single value, 2. parameter of a min-1-group (CHANGE)  
single value, optional (ADD,TYPE=SCRDATA)

Possible Values : INTERNAT = international number  
NATIONAL = national number  
SUBSCR = local subscriber number  
UNKNOWN = unknown number

Default Value : none (field is empty for DISPLAY/ REGENERATE)

**LOCDEST** Origin local destination code

Type of Input : single value, 9. parameter of a min-1-group, up to 6 characters (CHANGE)  
single value, optional, up to 6 characters (ADD,TYPE=SCRDATA)

Possible Values : 0-9,\*,#,A-D

**PRESCAL** Presentation of calling line number

Type of Input : single value, 4. parameter of a min-1-group (CHANGE)  
single value, optional (ADD,TYPE=SCRDATA)

Possible Values : CLIPPERM = presentation of permanent A-subscriber, no restriction  
CLIPDEF = presentation of default A-subscriber, restriction per call  
CLIRPERM = restriction of permanent A-subscriber, no presentation  
CLIRDEF = restriction of default A-subscriber, presentation per call

Default Value : CLIPDEF

## SCREEN - Screening of calling or connected numbers

### Parameter Description

|                 |                                                                                                                                                                                                                                                                                          |

## SCREN - Screening of calling or connected numbers

### Parameter Description

Type of Input : single value, 8. parameter of a min-1-group (CHANGE)  
single value, optional (ADD,TYPE=SCRDATA)

Possible Values : INTERNAT = international number  
NATIONAL = national number  
SUBSCR = local subscriber number  
UNKNOWN = unknown number

Default Value : none (field is empty for DISPLAY/ REGENERATE)

#### SNNO

Source node number

Type of Input : 1 to 3 single values, concatenated with -, mandatory  
(ADD,TYPE=SCRDATA / DELETE,TYPE=SCRDATA / CHANGE)  
1 to 3 single values, concatenated with -, optional  
(DISPLAY,TYPE=SCRDATA / REGENERATE,TYPE=SCRDATA)

Possible Values : numeric, 0-999 (level2-level1-level0)  
level0: 0-999  
level1: 0-253  
level2: 0-29

#### TOSCAL

Type of screening calling line number

Type of Input : single value, 3. parameter of a min-1-group (CHANGE)  
single value, optional (ADD,TYPE=SCRDATA)

Possible Values : NOSCR = no screening  
SCREEN = number permitted for screening  
SPECARR = any national or international number permitted

Default Value : NOSCR

#### TOSCOL

Type of screening connected line number

Type of Input : single value, 5. parameter of a min-1-group (CHANGE)  
single value, optional (ADD,TYPE=SCRDATA)

Possible Values : NOSCR = no screening  
SCREEN = number permitted for screening  
SPECARR = any national or international number permitted

Default Value : NOSCR

#### TYPE

Type of screening data

Type of Input : single value, mandatory (ADD / DELETE)  
single value, optional (DISPLAY / REGENERATE)

Possible Values : SCRDATA = screening data  
SCRPATT = screening patterns

## 167.5 Error Messages and Advisories

### 167.5.1 Error Messages

F01: NO DATA CONFIGURED FOR THIS SOURCE NODE NUMBER <level2-level1-level0>  
 F02: NO VALID SCREENING PATTERN <scrp> ENTERED,  
 POSSIBLE CHARACTERS (0-9, \*, X, #),  
 AFTER 'X' ONLY 'X' OR '#' MAY FOLLOW,  
 AFTER '#' MAY NOT ENTERED ANY CHARACTERS  
 F03: THE SCREENING PATTERN <scrp> HAS BEEN ALREADY CONFIGURED  
 FOR THIS SCREENING PATTERN PLAN  
 F04: MAX. AMOUNT (<maxval>) OF SCREENING PATTERNS HAS BEEN REACHED FOR THIS PLAN  
 F05: THE SCREENING PATTERN <scrp> HAS NOT BEEN CONFIGURED  
 F06: NO MORE MEMORY IN DATABASE (AMO DIMSU:TYP = CC, PARAMETER <param>)  
 F07: WRITE TO DATABASE FAILED, INTERNAL DB-ERROR  
 F08: THE SOURCE NODE NUMBER MAY NOT BE 0  
 F09: LEVEL<level> OF SOURCE NODE NUMBER MAY NOT EXCEED VALUE <maxval>  
 F10: LEVEL1 OF SOURCE NODE NUMBER MAY NOT BE 0  
 IF LEVEL2 AND LEVEL0 ARE NOT 0  
 (EXAMPLE: 1-0-1 IS NOT POSSIBLE)  
 F11: THE SCREENING DATA FOR SOURCE NODE NUMBER <level2-level1-level0> HAS ALREADY  
 BEEN CONFIGURED  
 F12: NO VALID DEFAULT NUMBER OPERATOR <dno> ENTERED,  
 POSSIBLE CHARACTERS (0-9, \*)  
 F13: NO VALUE FOR PARAMETER DNO CONFIGURED,  
 CHANGEING THE PARAMETER DNOTON IS NOT POSSIBLE  
 F14: THE SCREENING PATTERN PLAN <scrpplan> HAS NOT BEEN CONFIGURED  
 F15: FOR THE SOURCE NODE NUMBER <level2-level1-level0> THE SCREENING PATTERN PLAN  
 HAS NOT BEEN CONFIGURED, CHANGEING THE PARAMETER SCRPTON IS NOT POSSIBLE  
 F16: IF PARAMETER SCRPPPLAN IS SPECIFIED, PARAMETER SCRPTON IS NEEDED AS WELL

### 167.5.2 Advisories

H01: NO VALUE FOR PARAMETER DNO ENTERED, PARAMETER DNOTON WILL BE IGNORED  
 H02: FOR THE SOURCE NODE NUMBER <level2-level1-level0> THE PARAMETER SCRPPPLAN  
 HAS BEEN CONFIGURED AS 0, THE SCRPTON WILL BE IGNORED  
 H03: THE CIRCUIT WHICH REFERS TO THE NODE NUMBER MUST BE CONFIGURED  
 (AMO TDCSU: PARAMETER NNO)  
 H04: THE SCREENING PATTERN PLAN <scrpplan> HAS NOT BEEN CONFIGURED  
 H05: THE SCRPPPLAN <scrpplan> HAS BEEN DELETED FOR THE SOURCE NODE NUMBER <level2-  
 level1-level0>,  
 THEREFORE THE VALUE FOR PARAMETER SCRPTON WILL BE DELETED  
 H06: NO DATA FOUND  
 H07: THE SCREENING PATTERN <scrp> HAS NOT BEEN CONFIGURED,  
 OR HAS ALREADY BEEN DELETED

## SCREN - Screening of calling or connected numbers

### Error Messages and Advisories

H08: NO DATA CONFIGURED FOR THIS SOURCE NODE NUMBER <level2-level1-level0>  
H09: FIRST THE SCREENING PATTERN PLAN HAS TO BE ADDED,  
THE PARAMETER SCRPPPLAN WILL BE SET TO 0 NOW  
H10: THE VALUE FOR PARAMETER DNO HAS BEEN DELETED,  
THE VALUE FOR PARAMETER DNOTON WILL ALSO BE DELETED  
H11: THE SCRPPPLAN <scrppplan> HAS BEEN DELETED FOR THE SOURCE NODE NUMBER <level2-level1-level0>  
H12: ALL CONFIGURED DATA HAS BEEN DELETED,  
THEREFORE THE SOURCE NODE NUMBER <level2-level1-level0> WILL ALSO BE DELETED  
H13: THE SCREENING PATTERNS HAVE NOT BEEN CONFIGURED  
FOR THE FOLLOWING SOURCE NODE NUMBER(S)  
H14: THE SCRPTON SHOULD BE ADAPTED TO THE MODIFIED SCRPPPLAN

# 168 SCSU - Subscriber Configuration of Switching Unit

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <a href="#">Interrelationships</a>   | <a href="#">Parameter Description</a>         |
| <a href="#">Functions of the AMO</a> | <a href="#">Error Messages and Advisories</a> |

AMO SCSU is used to configure ports for the connection of the following terminals:

- ANATE to SLMA, SLMA1, SLMA2, SLMA3, SLMA24, SLMAB, SLMAR, SLMAC
- Charge Metering ANATE (ANATECM) to SLMAR
- AUXDIGI to SLMB, SLMB4

The digital terminals at S0/Up0/UpoE such as SET600/OPTISET/OPTIP500 are set up using AMO SBCSU.

Special subscribers (e.g. Hicom Trading Board subscribers) are configured by AMO SSCSU.

Each STN number can be assigned personalized data such as names or personal identification numbers (PIN) using AMO PERSI.

AMO TGER is used to assign additional station numbers to non-voice terminals which have already been assigned a number (AMO SCSU/SBCSU).

It is also possible to configure "virtual" ports for all device types which have not been assigned to a module but are configured in the same way as regular physical ports. Virtual ports are identified as INS=FLOAT or INS=ACLSTN. These ports are used by any ID card user who identifies himself at another terminal by inserting his ID card or by keying in the PIN, and who then makes the call using the features of his virtual port such as classmarks, speed dialing digit series etc..An ANATECM is not allowed to be configured as virtual port.

If an AUXDIGI station is configured as "virtual" port, it is set to the READY state (in contrast to an ANATE).

It is also possible to install a signed off fictive station by depicting INS=SIGNOFF. A signed off station can only be an ANATE. Signed off stations can be signed on

- by entering a PIN-Number and a key number at the specific terminal or
- by being signed on terminal by means of service staff
- by administration command (AMO DSSU)

## SCSU - Subscriber Configuration of Switching Unit

### Interrelationships

Signed off stations can be added to communication groups such as pick up groups, hunting groups etc. This allows a complete preconfiguration of subscribers.

For "virtual" ports (e.g. INS=FLOAT) PEN-specific parameters (e.g. COFIDX) are ignored.

A suffix-dialing connection is required for connecting special facilities such as VMX servers. This connection is identified as SPEC=SUFIDIAL and parameterized using the parameter DHPAR.

For special stations (e.g. COMTEL) and for special country specific adaptations in SLMA1/SLMA2/SLMA3/SLMA24/SLMAB/SLMAR/SLMAC-Loadware parameterization can be done by using parameter DHPAR.

Some special subscribers like Voice Pagers etc. are configured using parameter SPEC.

Secondary associated devices can be configured using parameter PRIMDEV. For more details, please check AMO SBSCU.

## 168.1 Interrelationships

- AMO ACDRT : Configuration of ACD Routing Tables
- AMO AUN : Configuration of Pick Up Groups
- AMO BCSU : Board Configuration, Switching Unit
- AMO COSSU : Class-of-Service, Switching Unit  
The AMO COSSU creates classes-of-service (for all services), which can be assigned to a station line circuit with the parameters COS1 and COS2.  
AMO-COSSU also creates LCR classes-of-service (for VOICE and DTE services), which can be assigned to a station line circuit with the parameters LCOSV1 and LCOSV2 resp. LCOSD1 and LCOSD2.
- AMO DCIC : Configuration of DCI (used only for AUXDIGI)  
The AMO DCIC is used for assigning associated voice terminals to DCIs.
- AMO DIMSU : Dimensioning of Features, Switching Unit  
The AMO DIMSU administers the database layout for device memories and additional memories required by the call processing system and the device handler.
- AMO DNIT : Administration of "Directory Number Information and Translation"-Table
- AMO DSSU : Device Switch of Switching Unit  
The AMO DSSU can be used to put a terminal into service or to block it or to sign on/off a station.
- AMO KNMAT : Configuration Replacement of Extension Number for  
SSTNO=ONLYEXT(ONLYEX0):  
CHA-KNMAT:NPI=ISDN,ONNOL=OWN,DNNO=...,  
LEVEL=.,MODCON=REPEXT&OUT,NUMEXT=replacement number;
- AMO NAVAR : Administration of Static Night Switch Option Data

- AMO RCSU : Configuration of recorder of SWU
- AMO SA : Hunting Arrangements
- AMO SBCSU : S0-Bus and Optiset E Configuration of Switching Unit
- AMO SDAT : Configuration of Station Attributes
- AMO SSCSU : Configuration of special subscribers (e.g. Trading E)
- AMO TGER : Station/Device Allocation, Incoming
- AMO UCSU : Unit Configuration of Switching Unit (LTG and LTU)
- AMO VADSU : Alarm Configuration in Switching Unit
- AMO WABE : Dialing Plans, Feature Access Codes
- AMO ZAND : Central System Data
- AMO ZIEL : Destinations for various station features

## 168.2 Functions of the AMO

- [ADD-SCSU](#) : Assign subscriber data
- [CHANGE-SCSU](#) : Change subscriber features
- [DELETE-SCSU](#) : Delete individual features or an entire station
- [DISPLAY-SCSU](#) : Interrogate subscriber data
- [Interrogate all data for subscriber 12112 which is an associated device.](#) : Regenerate subscriber data

### 168.2.1 ADD-SCSU

The ADD command will only be completed successfully if the following preconditions are met: the required station numbers must be entered in the dial plan (DAR=STN), the relevant module must have a free circuit and the required classes-of-service must be set up.

The parameter PEN designates the port equipment number (LTG-LTU-SLOT-CCT) to which the device with the STNO (station number) is connected. If this parameter is missing, a search is made automatically for an available equipment number in the system which is compatible with the other parameter values. For signed off and floating stations the PEN is ignored without an advisory message.

The connection type (parameter CONN) defines how a station is connected to the system: Either via direct line (DIR) or off premised via TMDNH or SLMA board (OPST1/OPSSLMA). This information is kept

## SCSU - Subscriber Configuration of Switching Unit

### Functions of the AMO

in a PEN-specific memory. This is the reason why it does not move with the subscriber during signoff/signon process but remains tied together the physical port (PEN).

Please note when specifying ranges:

Ranges and/or strings of single values may be entered for STNO, but not for the parameter PEN. In this case, a single entered PEN is used as a starting point for the automatic port search.

Exception: Automatic port search for ANATE's does not consider SLMAR-PEN, even if a SLMAR-PEN is entered as starting point for the search.

Automatic port search for ANATECM's considers only SLMAR-PEN's.

The device configuration for which the PEN is to be assigned is defined by the parameter DVCFIG.

Non-voice terminals can only be used by the user if the basic classmark (BASIC) for the relevant service has been added (AMO COSSU) to his class-of-service.

If INS=Y (default), the added connection together with all voice and non-voice terminals will be transferred to the dependability system for further processing. When all preconditions are met, the relevant terminal will be taken into operation.

If INS=N, the subscriber remains in a state which will not be processed by the dependability system, the terminal will not be taken "into operation", and advance provision will only be made with respect to the data required. AMO DSSU allows the terminal to be "ACTIVATED", "DEACTIVATED" at a later stage. The exact state of the terminal can be queried using AMO SDSU.

The LCOS-Parameters for voice and data are mandatory, because of path selection is always done by Least Cost Routing mechanism. If a device has no data equipment, the LCOSD-Parameters are required but without effect.

### Procedure Overview

| Command Code | Parameter                                           |
|--------------|-----------------------------------------------------|
| ADD-SCSU     | STNO=<number>, [PEN=<gg-u-sss-cc>], DVCFIG=<param   |
|              | , DPLN=<number>, ITR=<number>,                      |
|              | , COS1=<number>, COS2=<number>                      |
|              | , LCOSV1=<number>, LCOSV2=<number>                  |
|              | , LCOSD1=<number>, LCOSD2=<number>                  |
|              | , [SPDC1=<number>], [SPDC2=<number>]                |
|              | , [COSX=<number>], [SPDI=<number>], [COFIDX=<param> |

| Command Code | Parameter                                              |

|              | , [DTMFBLK=<param>], [PMIDX=<number>]                  |
|              | , [NEONMWI=<param>];                                   |

### Examples

1. Create Station 311 as AUXDIGI. The PEN is determined automatically by the AMO.

Input:

ADD-

SCSU:STNO=311,DVCFIG=AUXDIGI,DPLN=0,ITR=0,LCOSS1=1,LCOSS2=1,L  
COSD1=2,LCOSD2=2,COS1=1,COS2=6;

Output:

H06: 311 THIS STATION IS CONFIGURED AT PEN 1-1-97-1.

H11: 311 CONTROL HAS BEEN PASSED TO CALL PROCESSING FOR  
STATION ACTIVATION

2. Assign subscriber 3653 with an ANATE voice terminal at a specific PEN.

Input:

ADD-SCSU:STNO=3653,PEN=1-2-121-  
5,DVCFIG=ANATE,DPLN=0,ITR=0,COS1=9,

COS2=9,LCOSV1=9,LCOSV2=9,LCOSD1=9,LCOSD2=9,DIAL=VAR;

Output:

H06: 3653 THIS STATION IS CONFIGURED AT PEN 1-2-121-5.

H11: 3653 CONTROL HAS BEEN PASSED TO CALL PROCESSING FOR  
STATION ACTIVATION

3. Assign 3 ANATEs with charge metering. The required SLMAR-Port is determined automatically by AMO. The search for free PENs should start at 1-1-43-0 (in this example, the circuits 0,1,3 are assumed to be already seized)

Input:

ADD-SCSU:STNO=2161&&2163,PEN=1-1-43-  
0,DVCFIG=ANATECM,DPLN=0,ITR=0,COS1=9,COS2=8,  
LCOSV1=7,LCOSV2=6,LCOSD1=5,LCOSD2=4,PULSTYPE=POL12,PULSLEV=VE  
FF5;

Output:

## SCSU - Subscriber Configuration of Switching Unit

### Functions of the AMO

```
H45: THE AUTOMATIC PEN SEARCH FOR FREE PENS TAKES PLACE IN
LTU SHELVES WITH SOURCE-GROUP=1 (SEE AMO UCSU).
H33: 2161    FOR DVCFIG = ANATECM CHARGE PULSE DURATION AND
PAUSE CAN BE CHANGED BY AMO PTIME.
H06: 2161    THIS STATION IS CONFIGURED AT PEN 1-1-43-2
H11: 2161    CONTROL HAS BEEN PASSED TO CALL PROCESSING FOR
STATION ACTIVATION
H33: 2162    FOR DVCFIG = ANATECM CHARGE PULSE DURATION AND
PAUSE CAN BE CHANGED BY AMO PTIME.
H06: 2162    THIS STATION IS CONFIGURED AT PEN 1-1-43-4
H11: 2162    CONTROL HAS BEEN PASSED TO CALL PROCESSING FOR
STATION ACTIVATION
H33: 2163    FOR DVCFIG = ANATECM CHARGE PULSE DURATION AND
PAUSE CAN BE CHANGED BY AMO PTIME.
H06: 2163    THIS STATION IS CONFIGURED AT PEN 1-1-43-5
H11: 2163    CONTROL HAS BEEN PASSED TO CALL PROCESSING FOR
STATION ACTIVATION
STATION ACTIVATION
```

4. Create Station 12112 as secondary associated device for primary device 12100.

#### Input:

ADD-

```
SCSU:STNO=12112,DVCFIG=ANATE&FAX,DPLN=0,ITR=0,COS1=13,CO
S2=13,LCOSV1=1,LCOSV2=1,LCOSD1=1,LCOSD2=1,
```

```
SPDC1=0,SPDC2=1,COSX=0,SPDI=10,COFIDX=0,SPEC=SUFIDIAL,DIA
L=DTMF,DHPAR=DTMFST,TEXTSEL=ENGLISH,INS=YES,
```

```
SSTNO=NO,HMUSIC=0,CONN=DIR,FLASH=YES,DTMFBLK=NO,PMIDX=0,
PRIMDEV=12100;
```

#### Output:

```
H34: SLMAR-PEN'S ARE SKIPPED FOR AUTOMATIC PEN SEARCH (ADD
MORE THAN 1 STNO OR NO PEN IN COMMAND) FOR DVCFIG = ANATE,
ANATE&...
```

```
H45: THE AUTOMATIC PEN SEARCH FOR FREE PENS TAKES PLACE IN
LTU SHELVES WITH SOURCE-GROUP=1 (SEE AMO UCSU).
```

```
H06: 12112    THIS STATION IS CONFIGURED AT PEN 1-1-1-8.
```

```
H11: 12112    CONTROL HAS BEEN PASSED TO CALL PROCESSING
FOR STATION ACTIVATION.
```

## 168.2.2 CHANGE-SCSU

All data except

- the device configuration,
- the Port Equipment Number (PEN)

can be changed.

AMO SXSU is used for changing the DVCFIG or PEN and for exchanging station numbers (between two stations).

If TEXTSEL has to be changed, the circuit must be locked. This can be performed by AMO DSSU or by specifying parameter OFFTYPE in AMO SCSU.

Changing some circuit specific data requires downloading into the module. Such data includes the parameters COFIDX, CCTIDX, PULSTYPE, PULSLEV and DHPAR=[LEDSIGN, MWLED, RING1] and DIAL. The data is loaded using

- the commands DEACTIVATE and (re-)ACTIVATE-DSSU "with unconditional loading" (e.g. RESTART-DSSU)
- parameter OFFTYPE=DC (Default) or OFFTYPE=DI. The circuit must be in READY or UNACH state (can be interrogated by AMO SDSU). In UNACH state, data is loaded automatically when hierarchy becomes ready.

A station number cannot be changed to another station number if the original station number is in an ACD Routing Table or has assigned an ACD-Attribute.

### Procedure Overview

| Command Code | Parameter                                              |
|--------------|--------------------------------------------------------|
| CHANGE-SCSU  | STNO=<number> ,                                        |
|              | , { [DPLN=<number>] , [ITR=<number>]                   |
|              | , [COS1=<number>] , [COS2=<number>]                    |
|              | , [LCOSV1=<number>] , [LCOSV2=<number>]                |
|              | , [LCOSD1=<number>] , [LCOSD2=<number>]                |
|              | , [SPDC1=<number>] , [SPDC2=<number>]                  |
|              | , [COSX=<number>] , [SPDI=<number>] , [COFIDX=<param>] |
|              | , [CCTIDX=<number>] , [SPEC=<param>] , [DIAL=<param>]  |
|              | , [DHPAR=<param>] , [RCBKB=<param>] , [RCBKNA=<param>] |
|              | , [TEXTSEL=<param>] , [NEWNO=<number>]                 |
|              | , [ACKST=<param>] , [SSTNO=<param>]                    |
|              | , [COTRACE=<param>] , [ALARMNO=<number>]               |
|              | , [PULSTYPE=<param>] , [PULSLEV=<param>]               |
|              | , [HMUSIC=<number>] , [OFFTYPE=<param>]                |
|              | , [CONN=<param>] , [FLASH=<param>] , [DTMFBLK=<param>] |
|              | , [PMIDX=<number>] , [NEONMWI=<param>] } ;             |

## SCSU - Subscriber Configuration of Switching Unit

### Functions of the AMO

#### Example

Change COS 1 and 2 for subscriber 261.

Input:

```
CHANGE-SCSU:STNO=261,COS1=5,COS2=6;
```

Output:

```
H09: 261      STATION DATA CHANGED.
```

### 168.2.3 DELETE-SCSU

This action can be used to delete

- specific STN data (parameter CMIND) or
- the connection as such (CMIND=ALL).

Prior to deleting the connection, the connection must be blocked:

- the station is locked by AMO DSSU or
- in command the parameter OFFTYPE=DC is specified and the station is not busy in call processing (DC is the default value of OFFTYPE)
- in command the parameter OFFTYPE=DI is specified

It should be noted that a connection can only be deleted if it is not part of one of the following groupings:

- Hunting group (AMO SA)
- Night variant (AMO NAVAR)
- Call pickup group (AMO AUN)
- ACD Routing Table (AMO ACDRT)
- ACD-Attribute assigned (AMO SDAT)

All other assignments of the station number such as DSS destinations, call forwarding destinations, individual night station, call backs etc. are cleared automatically upon deletion.

Deleting CMIND=DHPAR or CMIND=SUFIDIAL requires eventually downloading of changed data to the board. For that, the cross reference to AMO DSSU respectively parameter OFFTYPE has to be considered (as specified for action CHANGE).

## Procedure Overview

| Command Code | Parameter                                          |
|--------------|----------------------------------------------------|
| DELETE-SCSU  | STNO=<number>, CMIND=<param> [, OFFTYPE=<param>] ; |

### Example

Delete subscriber 280 with all its features.

#### 1. Blocking the subscriber

Input:

```
DEACTIVATE-DSSU:TYPE=STNO,STNO=280;
```

Output:

```
H03: 280      DEACTIVATED
```

#### 2. Cancel the subscriber after explicit locking

Input:

```
DELETE-SCSU:STNO=280,CMIND=ALL,OFFTYPE=NL;
```

Output:

```
H08: 280      STATION DATA DELETED.
```

#### 3. Lock and cancel the subscriber

Input:

```
DELETE-SCSU:STNO=280,CMIND=ALL,OFFTYPE=DI; /* IMMEDIATE LOCK */
```

or

```
DELETE-SCSU:STNO=280,CMIND=ALL; /* CAMP-ON LOCK */
```

or

```
DELETE-SCSU:STNO=280,CMIND=ALL,OFFTYPE=DC; /* CAMP-ON LOCK */
```

## 168.2.4 DISPLAY-SCSU

The following data can be displayed:

1. Station numbers of users who have been assigned a specific COS.
2. Station numbers of users with specific characteristics (see parameter STNTYPE).
3. Station numbers of users who have been assigned a specific LCOSV.
4. Station numbers of users who have been assigned a specific LCOSD.

- 5. Station numbers with a specific attribute (see parameter ATTR).
- 6. Station numbers with a specific connection type.
- 7. All connection-specific data.

Procedure Overview

| Command Code | Parameter                           |
|--------------|-------------------------------------|
| DISPLAY-SCSU | [ STNO=<number>]                    |
|              | , [ TYPE=COS ], COSNO=<number>; (1) |
|              |                                     |
|              | [ TYPE=HW ], STNTYPE=<param>; (2)   |
|              |                                     |
|              | [ TYPE=LCOSV ], LCOSV=<number>; (3) |
|              |                                     |
|              | [ TYPE=LCOSD ], LCOSD=<number>; (4) |
|              |                                     |
|              | [ TYPE=ATTR ], ATTR=<param>; (5)    |
|              |                                     |
|              | [ TYP=CONN ], CONN=<param>; (6)     |
|              |                                     |
|              | [ TYPE=ALL ]; (7)                   |

Examples

- 1. Interrogate all subscribers with COS=1 assigned

Input:

DISPLAY-SCSU:TYPE=COS,COSNO=1;

Output:

|                      |      |      |      |      |      |
|----------------------|------|------|------|------|------|
| -----                |      |      |      |      |      |
| STATION WITH COS = 1 |      |      |      |      |      |
| -----                |      |      |      |      |      |
| 2100                 | 2109 | 2110 | 2111 | 2112 | 2113 |
| 2114                 | 3105 | 3106 | 3107 | 3114 | 3115 |
| 3153                 | 3154 | 3158 | 3160 |      |      |
| -----                |      |      |      |      |      |

- 2. Interrogate all analog subscribers with charge metering equipment

Input:

DISPLAY-SCSU:TYPE=HW,STNTYPE=ANATECM;

Output:

## SCSU - Subscriber Configuration of Switching Unit

### Functions of the AMO

| STATION(S) WITH CHARGE METERING |     |     |     |     |     |
|---------------------------------|-----|-----|-----|-----|-----|
| 450                             | 451 | 452 | 453 | 454 | 455 |
| 470                             | 471 | 472 | 473 | 474 | 475 |

3. Interrogate the subscribers in the directory number range 200 to 230 with the subscriber class of service DTMF (dual tone multifrequency pushbutton dialing).

Input:

DISPLAY-SCSU:STNO=200&&230,TYPE=HW,STNTYPE=DTMF;

Output:

| STATION WITH DUAL TONE MULTIPLE FREQUENCY |     |     |     |     |     |
|-------------------------------------------|-----|-----|-----|-----|-----|
| 200                                       | 201 | 202 | 203 | 204 | 205 |
| 206                                       | 207 | 208 | 209 | 220 | 221 |
| 222                                       | 223 | 224 | 225 | 226 | 227 |
| 228                                       |     |     |     |     |     |

4. Interrogate all signed off stations

Input:

DISPLAY-SCSU:TYPE=ATTR,ATTR=SIGNOFF;

Output:

| SIGNED OFF STATION(S) |      |      |
|-----------------------|------|------|
| 2140                  | 2141 | 2142 |

5. Interrogate all data for subscriber 2110

Input:

DISPLAY-SCSU:STNO=2110;

Output:

| ----- USER DATA -----                           |               |         |       |          |     |         |    |        |     |  |  |
|-------------------------------------------------|---------------|---------|-------|----------|-----|---------|----|--------|-----|--|--|
| STNO                                            | =2110         |         |       | COS1     | =22 | DPLN    | =0 | SPDI   | =10 |  |  |

## 168.2.5 REGENERATE-SCSU

### Procedure Overview

| Command Code    | Parameter        |
|-----------------|------------------|
| REGENERATE-SCSU | [STNO=<number>]; |

#### Example

Regenerate the subscribers with station numbers 2100, 2102 and 2103.

#### Input:

```
REGENERATE-SCSU:STNO=2100&2102&2103&12112;
```

#### Output:

```

ADD-SCSU:2100,1-1-25-
0,ANATE,0,7,22,1,1,1,1,0,1,0,10,0,,,DTMF,,,,,YES,,NO,,,0,DIR,
YES,NO;
ADD-SCSU:2102,1-1-25-
2,ANATE,0,7,2,4,1,1,1,1,0,,1,10,0,,,DTMF,,,,,YES,CHR&TE,NO,,,0,
DIR,YES,NO;
ADD-SCSU:2103,1-1-25-
3,ANATE,0,0,3,4,1,1,1,1,,,1,10,0,,,DTMF,,,,,YES,CHR,NO,,,0,DIR,
YES,NO;
ADD-SCSU:12112,1-1-1-
8,ANATE&FAX,0,0,13,13,1,1,1,1,0,1,0,10,0,,SUFIDIAL,DTMF,DTMFST,,,
ENGLISH,YES,,NO,,,0,DIR,YES,NO,0,,12100;

```

## SCSU - Subscriber Configuration of Switching Unit

### Parameter Description

## 168.3 Parameter Description

|         |                                                                                                                                                                           |   |                                                                                                                                                 |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|-------------------------------------------------------------------------------------------------------------------------------------------------|
| ACKST   | Acknowledgement variants between DPI and DPS<br>(DPS = DP center-controlled connection setup) only for ANATE<br>(for effects and logistics of these values see AMO DAPPL) |   |                                                                                                                                                 |
